THE BUILDERS' JOURNAL

AND ARCHITECTURAL REVIEW

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb. . . . . .

An Enlargement and an Edition de Luxe.

We have to announce that a further Enlargement of The Builders' Journal and Architectural Review, as issued each week, has been decided upon. This will be the third enlargement since the inception of the paper, exactly eighteen months ago. It will be of quite as substantial a nature as its predecessors, and it will salute, if we may be permitted to say so, the opening of the Winter Session. After the holiday interregnum, therefore, our readers will find a further four pages of current professional matter in their Journal each week, making—with the absolutely Complete Contract List and Tenders—twenty-two pages of first-hand and exclusively written Architectural criticism and news. We have also to announce the publication as a monthly Magazine, of an *Edition de Luxe*, containing the most permanent illustrated features of the "Journal;" a complete record of all Architectural information throughout the World; and as the monthly Magazine develops — permanent and exclusive features of its own. In all this we are simply pursuing the bold and spirited policy which has given our "Journal" the largest Architectural sale of any professional organ in the country, and which, during the last twelve months of its career, has won for it an equal, if not a premier position, to the only other authoritative organ on what we have designated (and others before us, though the dignity of the phrase seemed likely to be forgotten) the Art of Building. The keynote of our attitude to Architecture is so well sounded in a letter we recently received from one of the most eminent of Scots Architects that we would quote a sentence: "Your 'Journal' is sufficiently comprehensive in its scope to embrace Architects, Designers and Craftsmen, and has acumen enough to recognise their true unity. A 'Journal' recognising this has, manifestly to my mind, its face in the right direction." It has been this recognition of the *personal* in Art,—not the tattle of Personality, but Personality's Influence, that has sent The Builders' Journal and Architectural Review, we have full reason for believing, to every Architectural office in the country. It was but one step further—but how far the journey—to judge by the then existing standpoint of professional journalism!—to the equal recognition of the elements and influences of Design and Craftsmanship. There has thus become, modestly, as yet, but of growing influence, a certain commonwealth of Art within the covers of this "Journal." The Architect, the Surveyor, the Designer, the Craftsman, the Contractor, the Builder, have to be regarded, and as the pressure upon our space grows from week to week, it is quite impossible to adequately represent the whole of those co-mingling and yet divergent interests without, from time to time, increasing the provision of pages. With the applications we have received from many Surveyors we have decided to include the proceedings of the well-directed Surveyors' Institution in our columns. With the courteous co-operation of Mr. Julian C. Rogers, the Secretary, arrangements have already been made to that effect. By reason of the increased

DESIGN FOR CEILING OF SMOKING ROOM: BY PROFESSOR G. AITCHISON, ARCHITECT.

mechanical facilities announced in the Spring of this year, we shall be enabled in the forthcoming Session as in the latter half of the one concluded, to fully report (so far as the Council permit any one of the Professional Press) the proceedings of the Royal Institute of British Architects and upon each occasion several days before any of our contemporaries. We are gratified to feel that the Institute long ago came to regard us a factor making for the advancement of Architectural Art and the prestige of the Profession, and it is with distinct pleasure we are enabled to include Professor Aitchison, A.R.A., in our current number, among "Men who Build." To very many members of the Council we are indebted for suggestions and active support. The Architectural Association's proceedings are always of so manifest an interest that to do other than justice to them, is to ignore the one source of ardour and enthusiasm among Professional Societies. But apart from these organizations of professional prominence there are others—in the press passed over—who will in the coming Session be adequately regarded. Thus the enlargement becomes compulsory. The *Edition de Luxe* of the "Journal," published monthly, under a new title, with a cover in artistic sympathy from the *bizarre* and brilliant fancy of Mr. G. C. Haite, will appeal to thousands of interested "laymen" outside the Profession; it will bring the work and personality of the Architect, the Designer, the Craftsman, into the hands of those who meditate the building of their own houses in obedience to the Home Spirit; that exquisite Mediæval Spirit which, walking not in the Early Victorian Era, has at last re-arisen to teach Middle Class England the dignity of a mullion, the coquetry of an ingle, the hearth warmth of copper, the welcome of a gable, that sense of rest and soft night settling down among the warm chimneys which so long has been the perquisite, the poetry, of the patrician.

HUNSTANTON'S NEW TOWN HALL.

LADY COTTENHAM performed the ceremony of opening the new Town Hall on the 6th instant. The building has been erected from the designs of Messrs. G. J. and F. W. Skipper, Architects, of Norwich, whose plans were chosen in a limited competition. The walls are constructed of brown carr stone, relieved by window and door dressings of Monk's Park Bath stone. The roofs are covered with Broseley flat tiles and the whole presents a picturesque "old English" building, standing next the Golden Lion Hotel, facing the Green south-west. The main entrance is by a wide flight of stone steps, through an arched doorway into a spacious vestibule, on either side of which are ladies' and gentlemen's Cloak Rooms and a Ticket Office. Thence are two entrances into the large Hall, which is 77 feet long, and 37 feet wide, with an open timbered roof of massive principals. At one end is a Gallery and at the other, a broad, deep platform or stage, provided with retiring rooms. Beneath this is an ample Store-room which can also be used as a retiring room for artistes at concerts when required. The windows are mullioned and transomed, and the walls, which are coloured green grey, have a dado of matchboarding to window height. This room, as the opening ceremony proved, has excellent acoustic properties. Crush doors are provided, with a separate entrance for front seats. The Council Offices are approached by a side entrance in an octagonal annexe, and are also coloured green grey with pompeian red dado. The Council Chamber is on the ground floor, and adjoining it is the Clerk's Office, and on the floor beneath the Surveyor's Office is situated. The heating is by hot water pipes on the low pressure system. Mr. Solden Hinwell, of Wisbech, was the contractor, and Mr. Walker, the surveyor, has acted as clerk of the works.

CAMBRIDGE AND ITS EARLY HISTORY.

By J. W. CLARK, M.A.

AT the summer meeting of the University Extension Students, Mr. J. W. Clark, M.A., Trinity College, gave a lecture on "The History of Cambridge" in the large Lecture Room at the Anatomical Museum. In consequence of the short time at his disposal it was impossible, he said, to go with any minuteness into so long and intricate a subject as the history of the University of Cambridge. He proposed to give them a sketch of that history almost entirely from the side of its buildings. The great landmark of the town was the river. He believed the river had not altered appreciably since historic times. Then the street which ran right through the town, roughly speaking from north to south, was a Roman road. It was now called Hills Road, Regent Street, St. Andrew's Street, and Bridge Street, from the great Bridge, the one Bridge in former times across the river. The third landmark was the Castle. There was a considerable eminence on the left bank of the river, just at the bend, crowned by a great earthwork. That earthwork, he believed, was now decided by competent persons to be British. They found from a notice in "Doomsday" that 27 houses were destroyed for building the Castle. The Castle was built by William the Conqueror when he came to Cambridge to fight in person against the fortified Monasteries of Ely. From Castle Hill could be seen the remnants of earthworks, ditches, and so forth. The Castle was put in some sort of defence by the Parliament troops, under the Earl of Manchester, during the Civil War, and a great many of the earthworks, he believed, were constructed at that period. Nowadays, the river was called the Cam and the town Cambridge, but in the "Saxon Chronicle" it was called Grantebridge. In "Doomsday" it was called Gret and later it was Granta. The conclusion he had come to was that the name of the river was derived from the town and not the town from the river. In the little Church of St. Peter they could see Old Norman work unrestored. The Church of St. Giles had been entirely restored. That Church was very interesting as having been a portion of the great Priory of Barnwell. Still more, they saw evidences of Norman occupation in the Church of Holy Sepulchre, which he strongly recommended as one of the few round Churches in England. Coming to Cambridge proper, is the fine Church of St. Benet. It was the fashion to call the Tower of that Church Saxon, but he thought it was more desirable to speak of it as pre-Norman. There was no Norman work about it whatever. He questioned whether there was any Norman work in Cambridge itself. Therefore, he felt very much disposed to accept the theory which, he believed, was first started by Mr. Freeman, that the founders of the town were at first entirely distinct and that gradually they came together. Of course, the houses would go down the great Roman Road, and the parish which was around St. Benet Church and the parish around the old Roman Station gradually became united. In estimating the importance of Cambridge they must always keep in mind how very valuable the river was. Monastic orders came here at a very early time; they were the first persons they could take note of as modelling the town. King John took steps for surrounding the town with some sort of fence. What he did they did not know, but Henry III. did a much more important work, and what was meant to be a much more important work; he determined to surround the town with a fortified ditch. He only had time to dig the ditch and the fortifications were never completed. A portion of the ditch remains at this day. It started from King's Mill and it ran in a north-easterly direction across the site of the Museums and then went close by St. Andrew's Church, across the St. Franciscan site until it got into the river again just opposite Magdalene College. That was done in 1267. By the end of the thirteenth century the town had become a compact collection of buildings. Now they came to the period of the foundation of the University. That was an event which was involved in impenetrable mystery. They could not say at any given year, or at any given period, it entered somebody's head to found a University, either here or anywhere else. It seemed to him quite clear the University grew up in a sort of spontaneous way. Probably the whole thing was fostered by the great religious houses in the neighbourhood. At the end of the century the first College was founded. Merton College, Oxford, was founded in the year 1264. The Bishop of Ely was not slow to follow the example which had been set and Peterhouse was founded in the year 1284. They must not suppose that the College system became suddenly what it was to-day. A mediæval College was as different as possible from a College they saw and admired now. The founder of a College intended his College to be not for undergraduates but for teachers. The founder contented himself by buying one or two houses. The houses were selected as near as possible to a Parish Church in order that his Fellows might have a place for their devotions. The undergraduates lived where they could, but before long they began to live in communities; they took houses and established themselves there. All those houses were called Hostels. The next Hostel was called Michael House, absorbed in Trinity College. Then came the foundation of King's Hall. King's Hall was rather different from any of the others; it was, in fact, a school—boys were to be educated there. It was a royal foundation, and the King gave orders that no one was to be admitted who was older than 14. Then came a number of Colleges in succession. First of all Clare Hall, which was in its original position. It was founded in 1338. By that time it had evidently become the fashion to found Colleges. They got four in rapid succession. Pembroke Hall in 1347 and then Gonville, Trinity Hall, and Corpus. Buckingham College, now Magdalene College, was exceedingly interesting as representing the efforts of the Benedictine orders. To come back to King's, the King devised a great scheme for building a magnificent College, which, if realised, would have been one of the most magnificent Colleges in the world. Its foundation was immediately succeeded by Queens'. Catherine Hall grew out of King's. The Bishop of Ely in 1497 suppressed the Rhadegund Monastery and turned it into a College. Jesus College was well worthy a visit. Then Lady Margaret founded Christ's College during her life and lived to see it completed. She took steps for suppressing Augustine's House and built the magnificent foundation of St. John's College on its site. It was done after her death by her executors. Then they got Trinity College. Henry VIII. was determined to outdo everybody by a foundation on wider lines and greater extent than any that had preceded. Two hundred years elapsed before the College of Downing was built. Downing College was gigantic in extent and he might mention gigantic in its failure. They thought they were going to do wonders. They did do wonders in one respect; they got a splendid site, but funds fell short, and the buildings were restricted. He supposed most people imagined that Colleges were built much as they saw them now. Nothing could be more erroneous. The beginning was a very tentative one.

GLAMORGANSHIRE and Pembrokeshire are famed for their ancient crosses, some not so well preserved and looked after as they should be; but, according to Mr. Westwood, the cross near the old village of Carew is the most beautiful. It dates from the eleventh century.

ALDERMAN T. W. HARDING, who a few months ago commissioned Mr. William Bakewell, Architect, to design for him a scheme for the laying out of Leeds City Square, which was partly adopted by the Corporation, has offered to provide the proposed central monument and bronze ornaments on the circular balustrade, the estimated cost of which is from £3,000 to £5,000. Mr. Harding has already conferred with an eminent English sculptor as to the preparation of the model to be submitted to the committee, and has commissioned Mr. Drury, the sculptor of the Circe now in the Queen's Room of the Leeds Art Gallery, to prepare a model for the figure lamps intended for the circular balustrade.

ABBEYS OF THE PAST.

THE THAMES OF OUR MEDIÆVAL ANCESTORS.

THE River Thames, says Mr. Grant Allen in a contemporary, was once as remarkable as the Rhine itself for Architectural magnificence. The scanty remains which still exist of its monastic establishments, for the most part built into modern mansions, hardly convey an idea of its former splendour in this respect; while its long chain of Castles, once comparable to those which line the great gorge between Coblentz and Bingen, have now (with one conspicuous exception, Windsor) so utterly disappeared that scarce a mound remains to mark the site of their former Keeps. Yet it is certain that the Thames, in its palmiest days, must fully have equalled the German river in the number and magnitude of its fortified Castles; while in conventual establishments it far surpassed its Continental rival. It is in respect of the great succession of Abbeys which once fringed the banks from Oxford to London that we purpose briefly mentioning in this article. In mentally restoring the Thames of our mediæval ancestors, we must forget altogether the artificial canalised stream which we know to-day, bounded through all its course by definite banks, confined by the shameful humiliation of concrete, and curbed at every point by locks, weirs, or lashers. In its place, we have to imagine a far broader, swifter, and more variable river, spreading out here and there into lake-like expansions, not remotely recalling the Broads of Norfolk. The most unobservant spectator must have noticed, however, that while the Castle usually crowns the crest of the hill or rising ground for purposes of defence, the Abbey or Nunnery nestles snugly, as a rule, in a picturesque nook by the bends of the river. For this choice of site there were many sufficient reasons. In the first place, the Castle must needs be placed high on military grounds; and the village clustered in most cases round its feet for protection—the monks alone, in those ages of violence, could afford to consult their æsthetic tastes in the selection of a place for their habitation. Then, again, they had need of wood and water, while a navigable river afforded them a cheap and convenient highway for their building stone, their bells, and their stained glass windows, in days when roads as yet were not. Lastly, they were an industrious folk, and they loved to reclaim the marshy meadows. All these things combined to make landowners yield them readily the outlying manors by the river side which, from the feudal lord's point of view, were scarcely worth the trouble of drainage and cultivation. Hence it came to pass that by the period of the Dissolution almost the whole of the Thames was fringed with

A LONG LINE OF NOBLE MONASTERIES

or of dependent granges, each snugly ensconced in its wooded corner, and looking out from its Cloisters upon the rushing stream, which afforded it at once a safe highway for its goods and a store of fish for its Friday's dinner. Those who have gone over the Carthusian buildings of the Certosa de Pavia, or the great Benedictine Monastery at Fécamp before its last fire, will be able to restore for themselves in fancy the magnificence of these buildings; while even in our own country the existing remains of Fountains Abbey will serve to suggest the wealth and beauty of those great structures which have passed away at Abingdon and Dorchester. Taking only into consideration here the reaches of the river now familiar to boating men, from Oxford to London, the first great group of Monastic buildings upon which we come were those of Oxford itself and its immediate neighbourhood. Highest up of these stood the famous Nunnery of Godstow, where the too-celebrated Fair Rosamund lived and died. This vast establishment, of which little now remains save the boundary wall, included a noble gateway, leading into a spacious court, with an immense Church, cathedral-like in size, a glorious Cloister, and two beautiful little Chapels. When first built by Edith, the wife of Robert D'Oiley (nephew and namesake of the founder of Oxford Castle) it was of sufficient importance to be consecrated by Alexander, the great Bishop of Lincoln, in the presence of King Stephen, Queen Matilda, and Eustace, their heir-apparent. To-day it is hardly even a picturesque ruin. A couple of miles lower down, at Osney, the same Edith also founded an Abbey for men of the Augustinian order, whose soaring Priory and Church, 24 Altars, two Campaniles, and numerous Chapels rendered it one of the most famous Monasteries in England. Its chime of bells was particularly celebrated; the biggest, inscribed to St. Thomas of Canterbury, once bore the quaint dedicatory inscription, in a limp rhyming hexameter, "In Thomae laude resono Bim Som zine fraude." Later on the Protestant canons carried it off to Wolsey's new College at Oxford, where it still preserves some memory of its name as "Great Tom of Christ Church." Oxford town itself was full, in its day, of monastic establishments, which ante-dated the Colleges. Chief among these was the Priory of St. Frideswide, the revered local saint, the Church of which is now the Cathedral; while that part of Christ Church known as the Old Library consists of a portion of the ancient Refectory. Most of the other religious houses have

HOPELESSLY DISAPPEARED.

The Franciscans had a Monastery near the river, of which Paradise Square was at one time the garden; the Dominicans settled near them, but only the names of Blackfriars Road, Friars Street, and Abbey Place, now attest their former existence. The North Western Railway Station disfigures the spot that was once Rewley Abbey; while portions of the Benedictine house may still be seen built into the mass of Worcester College. These, however, are but a tithe of the once flourishing monastic establishment of which Oxford could boast, since almost every leading Monastery in England—such as Malmesbury, Evesham, St. Albans, and Tavistock—had branches for education in the city of learning. All, all are gone, the old familiar places. We are scarcely out of the Oxford group again, when we are into the equally important Abingdon circle. The "Minchery" or Nunnery of Benedictines at Littlemore belongs to the first, as does also the Preceptory of the Templars at Sandford; but Cumnor Hall, associated in most minds only with the foolish and probably apocryphal story of Amy Robsart's murder, was long a country seat of the Abbots of Abingdon, where they retired for health from the malaria of the river. A little lower down beyond the

EXQUISITE SMALL NORMAN CHURCH

of Iffley, we come upon Radley, which was also a Manor of the mighty abbots. Abingdon itself grew around its Abbey, one of the oldest, largest and most important in England. It was a Benedictine house, with a mitred abbot, and its enormous Church, now utterly destroyed, must have ranked in beauty with any Cathedral in the country. The monastic buildings themselves were on a sumptuous scale; nothing now remains of them save one splendid gateway, enclosed in a brewery. The river on either side, both up and down, was fringed for many miles with the abbot's outlying Manors and granges. The next great conventual establishment, as we descend the river, was at Dorchester—the Oxfordshire Dorchester—which had a narrow escape of becoming the ecclesiastical metropolis of England. For it was here that Birimus, the apostle of the West Saxons, set his Bishop-stool; and since the Kings of the West Saxons grew slowly to be kings of England and of Britain, it might naturally have been expected that the original West Saxon See would wrest the supremacy from far-eastern Canterbury. The diocese, indeed, included all the counties now distributed between Lincoln, Winchester, Salisbury, Bath and Wells, Lichfield, Worcester, and Hereford. When the seat of the bishopric was removed to Lincoln, the old Cathedral of Dorchester became the Church of a Priory of Austin canons. It was afterwards rebuilt in

THE PERPENDICULAR STYLE,

and still remains the chief Architectural glory of the river. Scarcely a trace exists of the conventual buildings, which must once have been most extensive. Yet large and handsome as is Dorchester Church, we may judge of the losses we have sustained in this respect when we reflect that it was not half the size of the one so utterly and ruthlessly destroyed at Abingdon. Passing by the little Norman shrine of Crowmarsh, and the ruined Chapel of St. Nicholas at Wallingford, we get next to Goring, with its Nunnery of Augustinians, of whose stately Chapel the existing Church formed a small fragment. And here we begin to touch the domain of those princely churchmen, the Abbots of Reading, who possessed a fine manor house at Bere Court, near Pangbourne, and who pervaded with their granges all the neighbouring reaches of the river. The great Benedictine Abbey at Reading itself was numbered among the first three in England. It was enormously rich and very magnificent. The existing ruins, however, are little more than masses of shapeless masonry. From this point we will not attempt to do more than just mention in passing the chief monastic remains—Medmenham, a severe Cistercian house, whose slight relics have been built up into the sham Rabelaisian Abbey of Wilkes and his associates; Bisham, now also converted into a county seat, but bearing witness to this day to its former magnificence; Chertsey, left almost without a trace of its former glory; and, last of all, Westminster itself. These are but a few of the numerous Monastic buildings which lined the banks in long procession; and if we add to these the occasional Chantreys, the Pilgrimage Chapels on the hills, the Hospitals and Lazar Houses, the little Oratories which stood at the middle of the bridges, and the great Castles which looked down from the neighbouring hills, it will be clear that the Thames of the early Tudor period must have equalled or surpassed the gorge of the Rhine to-day in architectural interest.

MR. HAMO THORNYCROFT, R.A., has been commissioned by Mr. Howley Palmer, one of the governors of St. Paul's School, to execute a statue of Dean Colet. This will be placed under a canopy in front of the School at West Kensington.

THE family of the late W. H. Waddington have agreed to sell to the French Government for 500,000 francs (£20,000) his fine collection of coins, which pecuniary losses prevented him from bequeathing to it, as he originally intended.

AT the weekly meeting of the Newport Board of Guardians, a resolution was adopted to the effect that in all contracts entered into by the Board the persons employed must be paid the trade union rate of wages and observe the recognised hours.

A SHRINE of great beauty, designed by Mr. Bentley, and executed under his immediate direction, was recently dedicated at St. Mary's, Chelsea. The new statue is of wood, gracefully carved and delicately coloured. It is surmounted by a gilded canopy that tapers up to the Chapel roof, and stands on a pillared pedestal and altarino of green and grey marble.

IN Trinity Episcopal Church, Keith, a Memorial stained-glass Window has been erected in fulfilment of a request of the late Mrs. Bryson, of Strathlene. The Window is composed of three Gothic lights with tracing. The figures represent the Saviour, Moses, and the Apostle Paul. The artists entrusted with the work were Messrs. A. Ballantine and Gardiner, Edinburgh.

THE cable tramway to Upper Douglas, the construction of which has been somewhat delayed through difficulties with gas and water mains, has, so far as the lines are concerned, been completed, and only needs the threading of the cable and some finishing touches at the lower house to make it ready for traffic working. The line was estimated to cost some £15,000, but that figure will be exceeded by several thousands.

THE fifty fifth annual report of the Registrar-General contains as a supplement a tabular record by Dr. John Tatham showing that as a result of improved sanitation the average span of human life has increased during the past fifty years. In the decennial period from 1871 to 1880 there was a diminution of the rate of deaths to the thousand as compared with the previous term. In the period from 1881 to 1890 that diminution was maintained and improved upon.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

MEN WHO BUILD.

No. 44.

PROFESSOR GEORGE AITCHISON, A.R.A.

"DO you see that house to which a mansard roof has been added; not a particularly attractive 'back' to gaze upon through the windows, is it? and I cannot have it removed because I have not dwelt here long enough, you see, to establish an 'ancient light!'"

I looked through the windows above the drawing board and saw Light—felt no lack of air, compared with the cramped quarters of many a City Architect. The equal, diffused light of a perfect Architectural room, cast no shadows on Professor Aitchison's papers. But if you live in a very charming house at the upper end of Harley Street, within sight of the green of Regent's Park, within hail of soughing trees, you are not naturally inclined to pardon a mansard roof of consumptive-eyed windows with streaky slates—seen through your rear windows.

But it was not at the roof, as a roof, but as an illustration, that Mr. Aitchison pointed a controversial finger. We were chatting on the Architectural tendencies of the day:

"The charming drawings so many of the younger men are able to make—why, they could make a 'pretty perspective' of that mansard roof!—are most happy—if men wish to be artists. But the artistic facility with the pencil is not necessarily Architecture. The designing, the planning, the sense of style are other and more important factors. I am not sure but that the pretty sketching of the day—the picturesque inconsequential note, difficult to localise, is not alien to the true knowledge of Architectural line."

It was easy to pass from this authoritative

view of the present President of the Institute to a more general chat of men and things—a subject upon which Professor Aitchison is at once delightful and genially inconsequential. He has known so many artists and Architects; his almost life-long friendship with Lord Leighton—ever since they were in Rome, together with Poynter and George Mason—has its souvenir upon almost every wall. In the Drawing Room, for instance, two of those rare bits of water-colour, all too rarely painted by the late President of the Academy; wonderful little bits of vivid, virile colour—women's heads—and a "Roman Mother," by the same artist, which happily recalls an interesting little incident, high bred and mutually generous, one ventures to think:—"When I was engaged upon the decoration of the Arab Hall, in the late Lord Leighton's house, it suddenly struck me that three or four of those fine old Persian tiles, previously given me by my friend—and of which I had made a little panel—were just what was wanted to complete a certain wall space in the Hall itself. Leighton was away at the time, and so I took the tiles back and placed them in the position chosen. He returned, was pleased by the whole effect, instantly noted that the little present he had made me some while back had been utilised, and said: 'I see, Aitchison, those tiles!' 'Well, yes; I thought as you were good enough to give me them, you would be good enough to let me replace them!' 'Now, Aitchison, you must accept a picture at once instead,' and so there came down this 'Roman Mother.'"

There is just in that simple little anecdote the true hint of Professor Aitchison's ability to turn a courtly phrase—and, indeed, there is a charming old-world courtesy about the man; one rare and gentle, that sees you to the door of Harley Street with a little bend over the hand-shake and an almost schoolboyish naïvette, utilising the stool in the drawing office while you are waved—over the snuff-box—to the one old mahogany chair not groaning beneath a weight of books. The wonderful mastery of books and papers! How they settle steadily down from the table to the chairs, from the chairs to the floor; rippling and billowing down with thunder; receding, recoiling, defeating you at your grasp.

In a room where bits of prized Roman mosaic hang on the walls, and the Professor's

DECORATION FOR DRAWING ROOM, 52, PRINCES GATE, S.W.: G. AITCHISON, A.R.A., ARCHITECT.

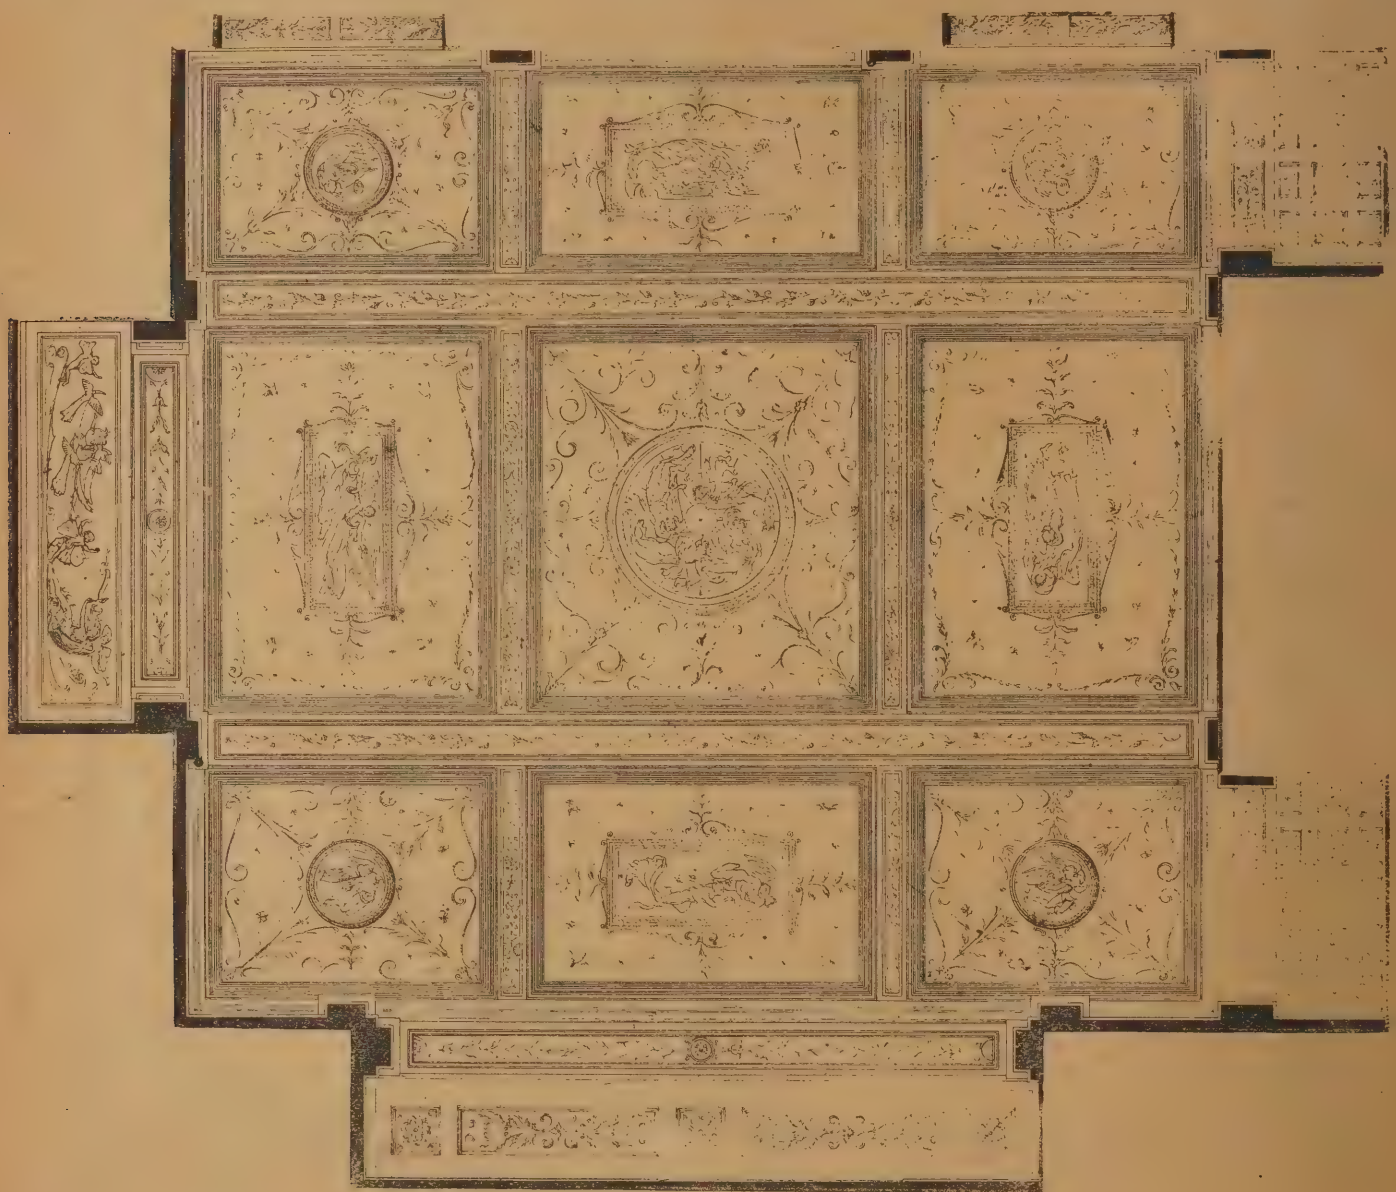
books have been such constant friends that their topography, and their nomenclature and their significance—especially their bearing upon the Arts of Egypt and Greece, Rome and Florence—become immediately bye-words, so to speak, we handle together, he with evident and obvious love, some of the precious Editions of Vitruvius, the collection of which has constituted one of his life-long hobbies. Here is a wonderfully bound *Editio Princeps* of exquisite typography—French—and a quaint one in Spanish; another of 1513 with the signature of Rondelete, who gave the Pantheon its gilded dome—a copy Mr. Aitchison secured in Palermo. Are there not some forty of these prized Editions more than Gwilt mentions? Some with the quaint and curious "cuts" and engravings, others without, French, Italian, Spanish, all but the Polish — which came later. Your host flows easily along in discussion of Vitruvius, pointing out the common misunderstanding with regard to him, to his ignorance of Proportion and Construction — outcome of Roman debasement of the Greek treatises. And having humoured what Mr. Aitchison is sane enough to call his "mania," he chats on of his own career—"if you can call it a career," he says, with a little rhetoric in the "r's" of that word that belongs also to the Older School.

It was in the Edgware Road, then just a rural neighbourhood, that your host was born, but he has the diplomat's objection to revealing his age, for the difference as he humorously puts it, between "a young fool and an old one, is not that great!" The Merchant Taylors' School taught him a good deal in those six years, and then he was articled to his father—Mr. George Aitchison—for the usual seven, becoming a student at the Academy of which he was ultimately to become an Associate. Matriculating at the London University forty-eight years ago, he became student of University College and took his B.A. three years later. Then he assisted his father for a year, next travelled in France, Switzerland and Italy for three years, and on his return was taken into partnership until that father's all too sudden death.

"Now it was a strange thing, was it not? That one who began by taking up his father's duties as Architect to the St. Katharine Dock Company building warehouses at the Victoria Docks (upon that Company's amalgamation with the London Dock Company) should ultimately find his chief *mêtier* in Decorative Design? Those first warehouses of mine, covering several acres, and costing close upon £70,000, were succeeded by other warehouses and wharves on the banks of the Thames, by schools and offices in the city. Then I built a house for Lord Stalbridge, and the chance for other work came when I was asked to alter and decorate a house in Belgrave Square, occupied by the Hon. Percy Wyndham. In those days the halls and staircases of many houses in old London squares were as dark as the night itself. By cutting walls into what may be vernacularly described as the line of the 'dog's hind-leg,' and doubling the roof light, using tinted and Arabesque glass in door panels, and so forth, I was able to make it possible for one to read by daylight."

ROYAL EXCHANGE ASSURANCE CORPORATION OFFICES, PALL MALL: PROF. G. AITCHISON, A.R.A., ARCHITECT.

On the walls of the Hall and stairways at 150, Harley Street, may be seen the water-colour drawings of many of Professor Aitchison's designs — schemes of Decoration always tending to Greek or Egyptian or the Arabesque. Here a remarkable Library fitment in ebony, above which that man of genius and delightful line — Britten — contrived a sea-frieze and rise of sun, there a wall treated in green and gold with brown oak panelling, again a black door inlaid with Mother-o'-Pearl and the walls of that iridiscence and silver with white herons by Walter Crane for the frieze. In the Drawing Room are replicas of the book-cases made for that famous house in Holland Park Road; two chairs to which Sir Frederic himself carved the surmounting dogs' heads; the sense of Classic in all your host's Decorative Work—what a leap of thought and scholarly research from those Thames-side wharves! It was thus that the Hon. Percy Wyndham found his house transformed at No. 44, Belgrave Square; thus the Duke of Montrose at No. "45;" other houses at Lancaster Gate, Kensington Park Gardens, Berkeley Square; the houses also of Lord Hillingdon and Sir Wilfrid Lawson; the apartments of Princess Louise in Kensington Palace; No. 9, Chesterfield Gardens, for Lord Leconfield—some of the best houses in London (and out of it) called for the Professor's services. And among these designs upon the walls and stairways of the house in Harley Street are interspersed surely one of the most delightful collections of little gems of Art, the scintillation of many styles, to be found in London. Two magnificently-drawn female figures by Britten, in crayon, figures with life in every curve and line, full stepping from their frames with the lilt of Spring in the eyes—wonderful figures that subdue even those of Albert Moore. There are Albert Moore's on the stairs above, graceful as ever, reposeful; the bucolic notes of Caldicott; an original sketch for a Venus by Leighton (rescued in those Rome days from a waste-paper basket), the vigour and breadth and breeze of that great artist, George Mason, of whom your host says, "Surely the most charming man Nature ever knew; a wonderful fellow," and this word of Leighton:



"I think he was, indeed, the most accomplished man of his time, a type so un-English, it is true, as to be unfamiliar, and one which, by its widespread attainment, perplexed all save the people privileged to know him well."

Then Mr. Aitchison falls upon name after name in the Architectural World—even some of the names have passed away—sending out signals of these, of their rigid adherence to line, of their stern faith in their Art, of their *camaraderie*

spirit. And by the natural evolution of talk one is directly back to Palladio and Brunelleschi, and Giotto, and all the early Art influences of the World. Upon the question of the Institute Mr. Aitchison smiled in non-committal fashion, reminding me that he was "only one of sixteen gentlemen, many of whom have strong ideas," and there was a delicate touch of satire in that, one thought, but he said:—

"I am not sure but what the Examination System is not dangerously encouraging 'cram.' Mind you, I am not of Mr. T. G. Jackson's view that examination at all is fatal to Architectural development. Why should it be? The necessity of every man, in his Art or his profession, is that he should know something of its history and its elements. Let us take a very homely illustration: the man who bakes bread. You expect him to know something of the qualities of flour, of the conditions of yeast, of the heat of ovens, of the proper process of baking, and finally, you ask yourself: 'Is this good bread?' But you do not, necessarily, go so far as to demand that your baker should understand all these conditions as implicated in the bakeries of Pharaoh's day."

Professor Aitchison was elected Associate of the Royal Academy in 1881, and from 1882 to 1887 he gave lectures at the Royal Academy, ultimately becoming Professor of Architecture at Burlington House. He is also one of the Examiners in Architecture, and sole Examiner in the Principles of Ornament at South Kensington. The year 1879 saw him made Officer of Public Instruction by the French Government, and the Society Centrale des Architects, Paris, knows him for a Corresponding Member. Your host has gold medals won at the Salon and the Melbourne Exhibition; bronze medals at Philadelphia, Sydney, Melbourne, Adelaide and the World's Columbian Exhibitions. He has travelled much. Every country in Europe has charmed him in turn, he has doubled the Cape of Good Hope; has studied Colour from the Netherlands to Constantinople.

DESIGN FOR CEILING: BY PROF. G. AITCHISON, A.R.A., ARCHITECT.

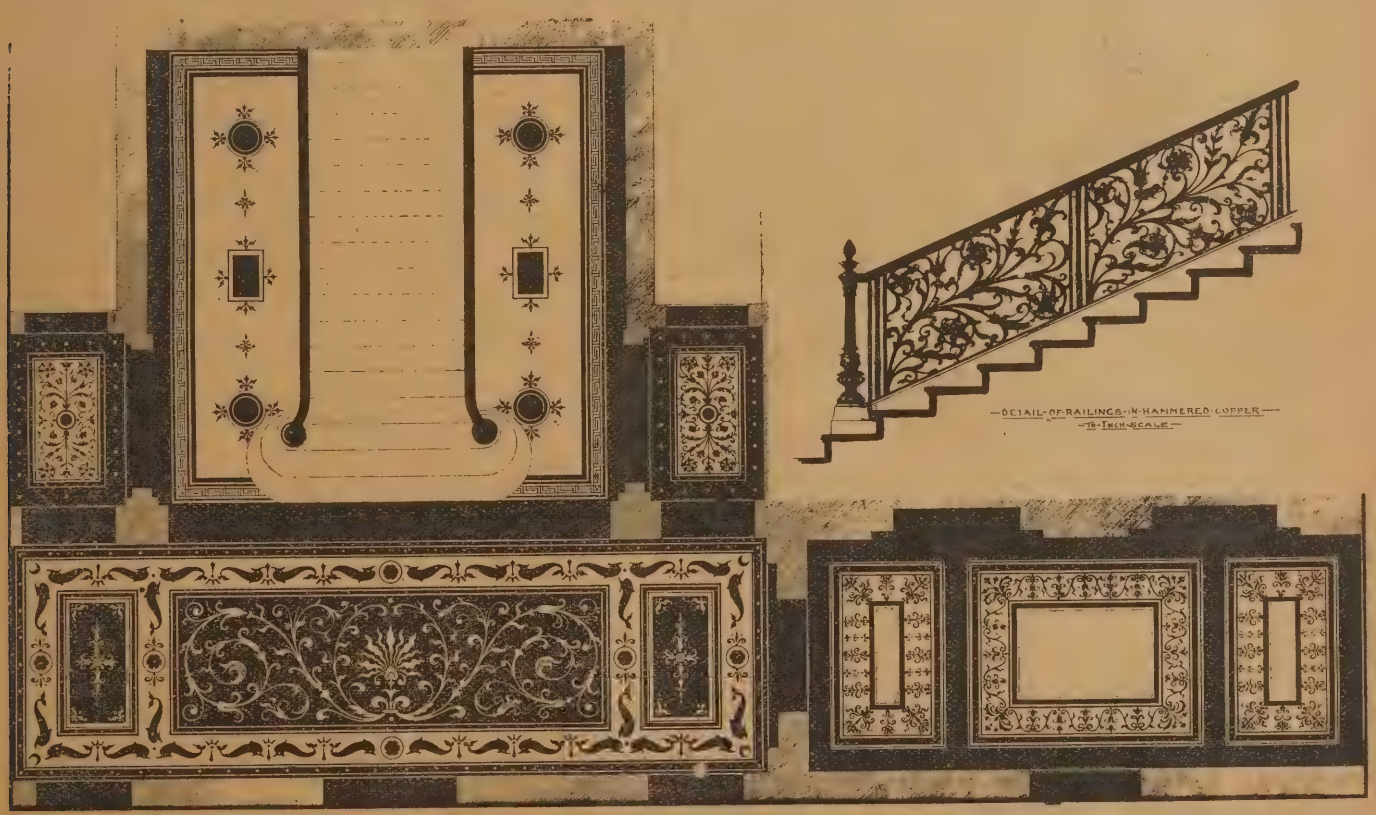
AN INTERESTING RUIN.

IT is doubtful if there is in Ireland a more interesting ruin than Cong Abbey. Its situation is beautiful, between two great lakes, with a background of some of the wildest mountains in Ireland. John O'Donovan says in a note in his translation of the "Four Masters" that Roderick O'Connor founded and endowed the Abbey of Cong. That a religious house of some kind was founded in it by St. Fechin there can be no doubt at all, for up to a recent period it was known as Cunga Fechin, or Cong of Fechin. It was, like most of the very early Churches and religious houses of ancient Ireland, built entirely of wood, and has consequently long ago disappeared. The Abbey, the remains of which still exist, was founded in 1128 by the Augustinians, during the reign of Roderick O'Connor's heroic father, Turloch. It is an interesting and suggestive fact that most of the great religious establishments of Ireland were not only founded but built in the material that now remains of them before the Anglo-French invasion, showing clearly that that event put a stop to almost everything that could be called progress. The invaders, although professing the same faith as the invaded, were much more anxious to build Castles than Churches. There was hardly a Castle in Ireland before the time of Strongbow. This was not caused by ignorance of the art of building among the Irish, for some of the round Towers and Churches erected long before the time of Strongbow are as perfect specimens of Architecture as were erected in any country at the same period. The native Irish king, or chief, was contented with a wooden house surrounded by an embankment, capped with a palisade of wood; but the Norman raised mighty edifices of stone to protect him from the wrath of those he had robbed. Cong Abbey is a large building nearly 150 ft. in length. Few of the ancient Churches of Ireland are any longer, and many of them are not nearly so long. It would be a mistake to say that the ruins at Cong are in a good state of preservation, for traces of violence and vandalism are apparent almost everywhere on them. The whole place has a dilapidated look. Ivy has prevented great masses of masonry from falling. It is sad to know that there is hardly

an old religious edifice in Ireland that has not suffered from the animosity of so-called reformers. The ruins of Mellifont, near Drogheda, have been torn up from their foundations, so that hardly a trace of that once magnificent Abbey now remains except the of its glory remains" to show that it must have been a

BUILDING OF EXQUISITE BEAUTY.

Some of its floral capitals carved on limestone, are as fine specimens of the carver's Art as can



DECORATION FOR SMOKING ROOM: BY PROF. G. AITCHISON, A.R.A.

Crypts and the vast walls and fosses by which it was surrounded. Ruthless vandals tried their best with sledges and hammers to overthrow the great cross of Monasterboice in Louth; but the stone of which it consists was too hard for them, for they only succeeded in mutilating what they could not destroy. In its present dilapidated condition it is hardly possible to form a correct idea of what Cong Abbey was in the days of its splendour. It is almost impossible also to form an exact idea of its general plan, for many comparatively modern additions have evidently been made to it. Its having been used as a burying place within recent times has, as the same thing has done at Clonmacnoise, sadly interfered with its picturesqueness. But, as at Mellifont, "enough be found anywhere in the world. Both Sir William Wilde and Doctor Petrie agree in this. There was probably no Abbey in Ireland that contained more beautiful specimens of the carver's Art than Cong. Vast numbers of its sculptured stones have been defaced by vandalism or carried away to build walls or outhouses. It is not easy to know what was the exact extent of the gardens or mensal grounds of the Abbey, for the walls that enclosed them cannot be fully traced, and are not intact like the walls around the Abbey of Boyle, in the county Roscommon. The Abbey of Cong seems to have been the great depository for the precious things of the province of Connacht. The Order of Augustinians, to whom it belonged, was very rich, and had vast possessions in the province, and it would seem that no Abbey in it was as rich as that of Cong. In it were kept deeds, books, records and many other precious things, all of which have disappeared save the marvellously beautiful Cross now to be seen in the Dublin Museum, and which artists and connoisseurs have pronounced to be "the finest piece of metal work of its age to be found in Europe." It has been gathered from the Gaelic inscription on the Cross of Cong that it was made in Roscommon, for the name of the maker is identified with that town. The fact of such a priceless relic and such a gem of art having been kept in the Abbey of Cong shows that it was considered to be the most important and most secure place in the province. The Abbey of Cong was never plundered by the Danes: if it was, no record of its having been plundered is to be found in the Annals of the Four Masters, or in the Annals of Loch Key. This fact of Cong not having suffered from the Danes would seem to show that it did not contain much wealth during the ninth and tenth centuries, when the mauraudings of the Norsemen were at their worst. If the Abbey of Cong was worth plundering it is hard to conceive how it could have been spared by them. It is probable that the Church founded there by St. Fechin was very small, and that the establishment became important only when the O'Connor family rose to prominence in the province, for it was richly endowed by Turloch and by Roderick O'Connor, both of whom claimed to be chief kings of Ireland.

IT has been decided that the Armenian Martyrs' Memorial at Hawarden shall take the form of a Cross in the churchyard in addition to the stained glass window which is to be placed in the South Aisle of the Church. The material for the pedestal will be contributed from quarries in England, Ireland and Wales, and the Cross itself will be of Scotch granite.

NEW Club Rooms for the Junior Liberal and Radical Association were formerly opened by Commissioner Seymour, at Kilwinning. The new premises, which are substantirlly built of brick with a frontage of stone, consist of a Billiard Room, as also Reading and Recreation Rooms and Keeper's House. They occupy a central position in the town, being situated at Garden Square, and have been erected at a cost of £700.

STAIRCASE AND MOSAIC PAVEMENT, 9, CHESTERFIELD GARDENS: PROF. G. AITCHISON, A.R.A.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
August 12th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."
—JOHN RUSKIN.

AT the top of Palace Street, Pimlico, and facing the Royal Stables at Buckingham Gate, is to be seen a Church of an old-fashioned pattern. Beside it stands a curious survival—a little country villa—which was left behind or forgotten. It stands at a right angle to the street, and the space in front was clearly a garden, and it has on its face a tablet, with an inscription and date, just over the attenuated porch. The Church has the sort of poorish "tradesman-like" cut that was in favour at the beginning of the century, suggesting a conventicle with an angular and three large windows. This is the "Chapel of Ease" to St. Peter's, in Eaton Square. Entering, we find the old regulation dispensation—a great broad and ugly Gallery running round—after the favourite Wren pattern. The sanctuary, as it may be termed, is a square recess sunk in the wall, richly decorated with a "High Altar" and cross, and other ornaments. At one side is a little Pulpit raised high in the air, and with but little accommodation for the preacher.

IN reply to a question as to whether any conclusion had been come to with reference to the completion of the decoration of the Lobby of the House of Commons, by filling up the vacant spaces on the wall in harmony with Mr. Poynter's mosaic of St. George, Mr. Akers-Douglas said he had been in communication with Mr. Poynter on the subject, but had not yet completed such enquiries as he thought necessary before coming to a decision.

THERE seems to be something of an epidemic for the destruction of the waterfalls of Scotland. All are familiar with the fate of Foyers, and now danger threatens the very beautiful Linn of Corrymulzie, which is a few miles above Braemar, on the estate of the Duke of Fife. The two cases are hardly on the same footing, but if a waterfall is to be spoiled the cause is a detail. The Deeside high road crosses the head of the Linn of Corrymulzie, and every visitor to the locality stops to admire the fall and linger over its widely known charms. But just at present there is an ominous pile of black iron pipes lying near by. It appears that the power of the stream is to be utilised in order to generate a supply of electricity for the new Castle which the Duke of Fife is building at Old Mar Lodge. The Duke of Fife would no doubt say that by such a scheme he preserves the Linn of Corrymulzie, while at the same time he gets electricity. He might wish to add that Highland homes like Mar Lodge are usually in full occupancy only during the autumn months, and that for the rest of the year there would be little, if any, call on the electric supply. But the position goes further—much further. There is no great body of water flowing over the falls, but just an average sized burn such as may be met with between any two Highland hills. Given a 12-inch water pipe pouring out of a reservoir, a 30 or 40 horse-power turbine to drive, a big Palace to light, most likely to heat also, even if the electricity is not to be called in for cooking purposes—given these things, and the Linn of Corrymulzie will, it is to be feared, almost be dry.

KNEBWORTH, the home of the Lyttons, amid shrubberies and gardens raises on high its quaint gables, its twisted chimneys, and its heraldic griffins. The Hall, indeed, does not strike one with a sense of grandeur, nor would it were it four times the size. It is not architecturally beautiful, but it is intensely quaint, resembling in its rococo style one of those weird châteaux of Touraine which Gustave Doré loved to depict. Within, the fantastic idea is still further carried out, and the heraldic banners mingle in the apartments with coats of arms and arabesques. Close by the Hall is the Church, with its square Tower, Norman archway, and the various styles which have become blended by time and necessity into one picture whole—a Church such as Washington Irving would have delighted in, and Birket Foster place with effect in any one of his charming compositions. The principal grave is by the left of the Porch, and a grey stone cross tells us it is the resting place of the mother of Lady Lytton, Elizabeth Charlotte Villiers, widow of the Hon. Edward Ernest Villiers, who died on April 14th, 1890, at the advanced age of 82 years. But if the Church be attractive outside, it is even more so within. The narrow Nave is lined on each side with old black oak seats, the Lytton family pew being immediately opposite the finely-carved pulpit, dating from 1567, embellished with incidents from the life of the Saviour; while the beautiful painted glass windows beside it representing the text, "Suffer little children to come unto Me," were put to the memory of two little sons lost in infancy by the late Lord and the present Lady Lytton. To the right of the Chancel, looking down the Nave, is the Mortuary Chapel of the Lyttons, containing an interesting collection of monuments, brasses, statues, and hatchments. The space is small, but every inch has apparently been made available. Some few hundred yards beyond the Church, and farther from the Hall, stands a small, gloomy-looking stone erection of Classic design, surmounted by a sculptured sarcophagus. Over the main entrance are the Lytton arms, and above them the inscription: "This Mausoleum was erected by Mrs. Bulwer-Lytton, and consecrated by the Lord Bishop of Lincoln, the 31st of May, 1818."

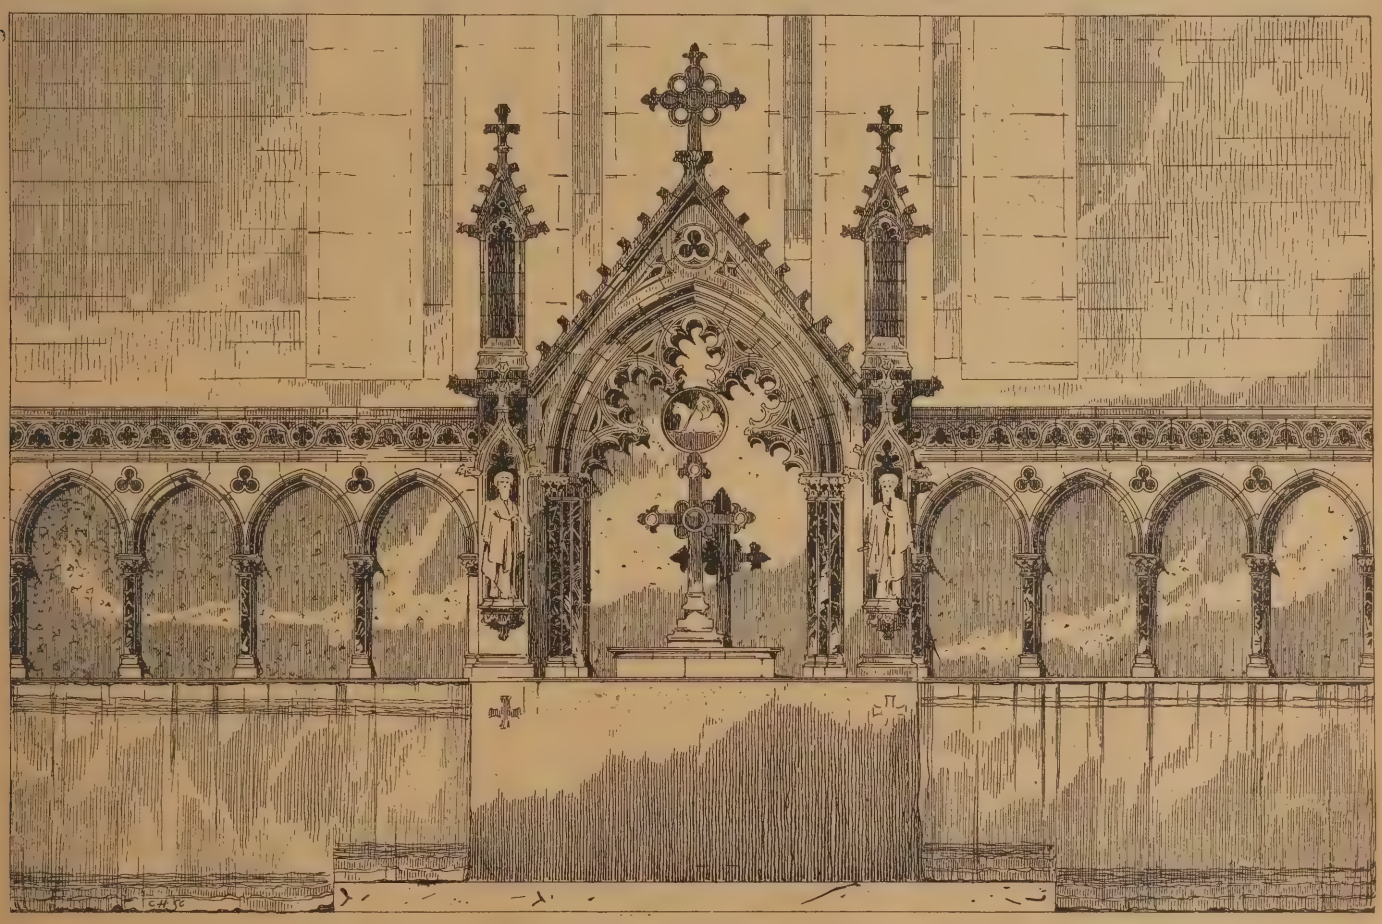
FEW parish Churches have undergone the ordeal that Sittingbourne Church has without curtailment, which was at one time imminent, or the total rebuilding in an unsympathetic style. The existing building is traced from a smaller Romanesque beginning, the only portions of which now standing above ground are the eastern and western walls of the Transept, and part of the pier mass; the first enlargement of the early Church took place in the thirteenth century, near that portion of the Chancel which includes the mural arcades and the lancet windows. The Lady Chapel was erected by Simon of Chilton, early in the fourteenth century, and the Tower was increased in height from a well marked place in the fabric. In July, 1762, a great catastrophe happened. The whole of the roofing was destroyed in an hour "by a plumber's fire during a high wind, and this stately building, hitherto little injured by fanatical violence, with all its ornaments and most of its furniture was destroyed, the exceptions being the bells, clock, and chimes." It stood in complete ruin for over two years, in consequence of delay concerning the four Chancels. In the following December the Parochial Committee, that had been immediately appointed after the fire, and empowered by the parishioners to "speedily rebuild and ornament the Church," sent Mr. George Dance, one of the most celebrated Architects of the day, to visit the Church. He reported to them that, in his opinion, the pillars, walls, and arches were strong and good, and fit to be built upon, Under the direction of one John Baykett, of Milton, the Nave and Aisles were repaired at a cost of £488.

AN Exhibition of Mediæval Art, which has been organised by the Society of Antiquaries, and which can be now witnessed in their rooms, is one of surpassing interest. From the very nature of the Exhibition much that is of great excellence throughout the country is absent from the collection. Wall paintings, for instance, which are part of the edifice, furnish a case in point, but their absence is well supplied by carefully executed and coloured drawings of the frescoes of our great Cathedrals. These are satisfactory substitutes under the circumstances, but the student will, no doubt, turn to the specimens of original work, of which this Exhibition is full—portraits, panels, rood screens, illuminated missals, and service books, illuminated manuscripts, some Middle Age volumes, and other treasures, drawn both from ecclesiastical and private sources. From the Norwich Cathedral, for instance, comes a beautiful Reredos of 1380; from Winchester came some panels; from Westminster the famous painted table of 1270; while there are a striking series of portraits of our Edwards, Henries, and Richards. The Duke of Northumberland sends some MSS. from Sherborne Abbey; the Duke of Devonshire sends St. Etholwold's Benedictional of the date 970; and Mr. Wm. Morris and the Duke of Westminster lend several volumes, dating between the twelfth and the fourteenth centuries.

LAST April the Louvre at Paris bought for 250,000 francs a wonderful tiara that purported to have been found in the Crimea. This tiara (as an inscription upon it declared) had been presented by the inhabitants of Olbia, the Greek colony on the Black Sea, to a Scythian king called Saitaphernes, to buy off his invasion. It was adorned with representations of Homeric legend, and a splendid necklace and earrings were thrown in. We now learn that the gold may have come from Johannesburg, but is certainly not Greek; every one of the decorations has been traced remorselessly back to the books on Greek or Scythian antiquities from which they were copied. The Greeks are made to present the King to the tiara, instead of the tiara to the King. Finally, a Russian scholar says that the tiara was certainly manufactured at Oschakow, which is a Russian rival to Birmingham in the manufacture of antiquities! The Louvre authorities are feebly expostulating that the "find" is genuine, and unsuccessfully endeavouring to find the man who sold it to them.

AN interesting relic of old London will shortly be on view in the Central Court of the South Kensington Museum. This is the carved oak fireplace that formerly stood in the Dining Hall of the old "Palace" of James I. at Bromley-by-Bow, which was pulled down some time since to make room for a Board School. The woodwork, which was thickly covered with paint and dirt of years, has been most successfully treated, and now looks as fresh and sharp as if it had been carved yesterday. The Royal arms—the English lion and Scottish unicorn—are singularly beautiful examples of carved work; and the chimneypiece as a whole is among the most perfect specimens of Jacobean internal Architecture to be seen in London. The date is about 1604. The ceiling and panelling of the room, which have also been obtained, are worthy of attention, the designs being of high merit and the wood well preserved. A cast of the chimneypiece of old Crosby Hall is among the other and more important recent acquisitions of this kind obtained for the Art Museum.

THE range of farm buildings known as Old Walls at Bishopsteignton were recently gutted by fire. The buildings, which consisted of cattle sheds, linhays, pound-house, and barns, formed three sides of a square, while the fourth side is occupied by the remains of the ancient private Chapel of the mediæval Bishops of Exeter, who had their residence here. Fortunately this interesting relic has suffered no damage. It is thirteenth century in character. The east and south walls only are standing, the former being pierced by three narrow lancet windows, while the south wall has windows, doorway, now walled up, and the remains of a holy water stoup on the inside face of the wall. Lysons says that Bishop John de Grandisson mentioned this residence in a letter written to Pope John XXII. in the early part of his episcopate, in which he says that there were fair buildings at Teignton, but that the temporalities of the See had been so often seized by the Crown, and on such occasions the houses had been so injured and dilapidated, that the Bishop had nowhere to lay his head. Bishop Bronscombe is known to have occasionally resided there, and ordinations were held in the Chapel.



THE proposed Memorial of the late Archdeacon Bardsley is to take the form of a thorough restoration of the Bradford Parish Church. Messrs. T. H. and F. Healey, Architects, will make a careful inspection of the structure, and a report will be prepared as to the best way of carrying out the restoration and the probable cost of the work recommended. It seems to be taken for granted that, if the structure is to be dealt with at all, it will be necessary to take down both the remaining Galleries. That measure would, of course, substantially reduce the accommodation offered by the Church, and the next question would be the consideration of means of making up for this loss of seating. Some little difficulty will be felt in dealing with the latter aspect of the matter, inasmuch as an extension on the north side would involve the removal of a large portion of the older part of the structure, whilst, on the other hand, an extension on the south side would occasion the pulling down of a portion of the Church which is of later construction, and is in good condition. It is desired to retain as much of the old building as can reasonably be preserved, but if the subject is looked at merely from the utilitarian point of view it would undoubtedly be of greater service to the structure to carry out the extension on the north side.

THE Church of Chart-next-Sutton, Valence, was unfortunately struck by lightning and burnt down about 120 years ago, the Tower alone escaping. In that careless age, when little was thought either of reverence in worship or beauty of Architecture, the parish authorities were content to put up four bare walls and a roof, and the Church is said to be the only one in Kent without a Chancel. An attempt is now being made by the parishioners to restore the building to a condition more suitable to its purpose. Their means, however, are limited. The bulk of the tithe goes to the Ecclesiastical Commissioners, who, although thus the lay rectors of the parish, deny any liability to rebuild the Chancel, and without this it would be almost impossible to make anything of the rest of the Church. Chart Sutton has been for 600 years in the unfortunate position of contributing large sums yearly in the shape of tithes for the benefit of other people. Originally they were handed over to Leeds Abbey, and at the Reformation transferred to the Dean and Chapter of Rochester, but in both cases with strict conditions as to the repairing and rebuilding the Chancel as often as necessary. This duty the Chapter managed, after the fire, somehow to evade, and this is now pleaded by the Commissioners as releasing them from any liability. They offer a subscription, but as a favour—not as an obligation. The bazaar and fête, which it is proposed to hold at Chart next month, will, it is hoped, furnish the means of opening the Tower-arch, which is still perfect, and showing a very beautiful west window, and also of removing the unsightly plaster ceiling and of uncovering the oak beams above it. If the negotiations with the Commissioners, which are still going on, end favourably, there is hope of changing a peculiarly unsightly edifice into a neat little country Church.

FOR the first time for several centuries the historical Bredenstone will be dispensed with at the installation of the Marquis of Salisbury as Lord Warden of the Cinque Ports on the 15th of this month. After the preliminary ceremony at Dover Castle, in the ancient Roman Church of St. Mary's-in-the-Castle, the Court of Shepway, at which the ceremony of installation is to take place, will be held in the Dover College Close, instead of at the Western Heights, on the site of the Bredenstone. The stone, which is carefully fenced in, is situated in the Drop Redoubt, and although an uninteresting object to look at, is zealously guarded as a landmark of the country's history.

A MOST interesting landmark in the West End is now being removed, and one which will be much missed. It is impossible for anyone to walk down Regent Street without having his attention arrested by the bold and finely-proportioned Portico of Hanover Chapel, which projects over the pavement just where the street begins to curve away to the north. Few buildings in London are so happily placed, and few are so worthy of such a fine site. Hanover Chapel was built some sixty years back by the greatest classical Architect of his century—Professor Cockerell, R.A.—and this Portico is certainly the best example of revived Greek Architecture in this country. From an artistic point of view its destruction is an irreparable loss, and when it is gone thousands will realise the fact that they have lost a real architectural gem.

AT a recent meeting of the Belfast Corporation, the question of the construction of houses, especially with regard to the floors, hearths, and staircases, was strongly commented on by Mr. Barklie, who referred to a fire which recently occurred on the Albertbridge Road, and which resulted in the loss of one life; and he said he had it on the strongest statement of the Superintendent of the Fire Brigade that, had it not been for a flat roof on a building behind, three additional lives would have been lost—lost on account of the bad construction of the house, the plans for which were passed as recently as November, 1895. The house, which had a 28-foot frontage, had only a single brick dividing any of the apartments of the house, which was practically a three-story building, except a single bit of wall that divided what was intended to be a confectioner's shop in the front from the room behind. The rooms on the first floor of the house were entirely separated by wooden partitions or lath and plaster walls, and the staircase was supported in part on the studs of such a wall. It was a great mercy that it was a lath and plaster wall, as otherwise all the people in the house would have been consumed. It appears that twenty-four fires had occurred in the city during the past year from circumstances connected with the bad construction of the houses, from defective hearths and defective flues—from the construction of houses on the matchbox principle.

Scale

REREDOS, ST. PETER'S CHURCH, PONTARDAWE: MESSRS. WILSON AND MOXHAM, ARCHITECTS, SWANSEA.

AT Shooters Hill, the Hospital, which is the first of three to be provided by the Metropolitan Asylums Board to meet the growing needs of London in respect of accommodation for fever patients, is almost completed. The Hospital, which is admirably situated, will afford accommodation for 488 patients. There is space for bringing up the accommodation to 506 beds; and the hospital staff is expected to number 325. The general plan of the Hospital has been arranged upon the principle of keeping the administrative buildings as separate and distinct as possible from the wards and their appurtenances. By this arrangement the nurses and others of the staff, when off duty will be free from the ordinary hospital surroundings. There are twelve main Ward Pavilions—eight for scarlet fever and four for enteric fever and diphtheria—each being two stories in height, with an open space varying from 4 ft. to 8 ft. in height under the ground floor. The Isolation Pavilions are very similar to the main Wards. The arrangements include Airing Courts, Discharge Wards, a Mortuary, Administrative Buildings, "Homes" for the nurses and servants, Laundries, &c. A Water Tower has been erected, with a storage tank capable of holding 20,000 gallons, this tank being filled without pumping by the ordinary pressure of the water company. As the water of the Kent Water Company is somewhat hard, a water-softening apparatus has been provided, capable of softening 60,000 gallons per day of ten hours; but the water mains have been so arranged that water to be employed for drain flushing or fire-extinguishing will not be softened. The fire-extinguishing appliances, heating apparatus, electric lighting, telephones, and alarms, are all on the latest principles. The cost of the Hospital, including all fittings, apparatus, and machinery, but exclusive of land and furniture, has been £240,000 The Architect is Mr. Thomas W. Aldwinckle, and the building contractors employed upon the works are Mr. C. Wall, of Chelsea (who had five-sixths of the whole); Messrs. H. Wall and Co., of Kentish Town; and Messrs. Shillitoe and Son, of Bury St. Edmunds.

DOMESDAY survey does not mention a Church at Bredgar, Kent, but the moulding of the western doorway, now in the Tower of the Church dedicated to St. John the Baptist proves that a Norman Church existed here before the middle of the 12th century. From the existing Architecture it may be inferred that the Norman Church was not used during more than 250 years, from about 1140 to 1390. Nor did it remain so long as that unaltered. In the walls there are four or five windows of the Decorated style, which must have been inserted in the Norman walls, and again used when the present walls were set up. The Church was erected to assume its present plan and appearance about 1390 or 1400. One of the prominent features of the Church when it was first completed was a long rood screen. Not a trace of it now remains. There is a brass monument to a priest named Thomas Coley, who was Master of the College of the Holy Trinity, at Bredgar, and died in 1519. Records of Canterbury Priory and of the archiepiscopal see say that in the 16th year of Richard II., July 19th, 1392, a good clergyman who was learned in the law founded and endowed a small College here, to consist of three members, namely, a chaplain who was to be master, and two scholars, clerks.

AT Worcester Cathedral the dedication services in connection with the new electric organ recently took place. This electric organ is the first of its kind erected in a Cathedral, and is said to be one of the most powerful Cathedral organs in the country. The new instrument, the construction of which is the work of Mr. Hope-Jones, of Birkenhead, will supersede the great organ which stood in the south Transept and the organ in the north Choir Aisle. Hitherto all organ tone has been produced from two classes of pipes—the fan and reed—but in this one is introduced for the first time a new method of producing tone. This consists of a soft valve, moved by a motor and governed by a resonator. The organ is divided into three portions. The "swell" is placed beneath the arch immediately behind the Cantori Choir stalls; whilst the "great," and the "choir," and a portion of the "pedal" are in a similar position behind the Decani stalls. The enclosed "solos," and the main "pedal" organs rest against the southern wall of the south-west Transept. The large and handsome case of the former Nave organ (the gift of the late Earl of Dudley) has been moved back so as to screen these latter departments, and at the same time has opened to view the fine Norman arch between the Transept and St. John's Chapel. For the organ-loft is substituted a portable "console," placed just within the Chancel Screen on the Cantori side, the Chancel Lectern, which formerly stood there, having been removed to the middle of the Aisle. This "console" is connected with the various parts of the organ by means of a single flexible cable, 1½ in. in diameter, and is mounted on castors and enclosed in a handsome carved oak case. The cost of the new organ is £3,000. The cost of the two organs which it replaces was £11,000. The wind for the organ will be supplied by a new form of iron-blowing machine, driven by an alternating current electric motor. There will be no bellows in the ordinary acceptation of the term. The current which communicates between the key desk and pipes is produced by dry cells.

LOVERS of the Forest of Dartmoor should be glad to hear that the subject of its purchase from the Duchy of Cornwall has been seriously taken in hand. The initiative of this action seems to have come from the "Dartmoor Preservation Society," but it is rumoured that the Devon County Council has already approached the Duchy upon the question. The present time is certainly an auspicious one, for the long-period leases which the Duchy has granted to private individuals are shortly to expire. Certainly there are impediments in the way, for an Act of Parliament would be necessary to authorise the Devon County Council to purchase, and it is quite possible that the Duchy, in view of rights of mining, which seem to be prized perhaps in excess of their value, may be less anxious to sell than the representatives of the county to buy. Still, not only Devonians, who draw their drinking supplies largely from the Mother of Devonshire waters, and archæologists, who lament the yearly disappearance of prehistoric huts, circles, and kistvaens, but also the greater public who have climbed her hills and fished her streams, will probably join in hoping that the renewed public discussion of the matter before the Devonshire Association at Ashburton will not be allowed to end merely in talk.

A SCHEME is on foot to secure Fortune Green, Hampstead, as a public recreation ground. The land is situated in West End Lane, Hampstead, and has an area of about 2¼ acres. It is about a mile from the nearest point of Hampstead Heath. At one time, as the land was unenclosed, it was supposed to be public property; but the owners have now established their rights to it. The price asked for the land is £8,000, towards which the Vestry of Hampstead have promised to contribute £3,000 and the London County Council has agreed to contribute £3,000 on the understanding that the balance of the purchase money would be found by the Hampstead Vestry and private subscribers.

UPON the recommendation of the Improvements Committee, the London County Council has recently sanctioned the expenditure of several sums of money upon street improvements in various parts of the metropolis. In one case it has agreed to contribute £3,600, three-fourths of the net cost of widening Robin Hood Lane, Poplar, at the junction with High Street. The eastern side of Robin Hood Lane is about to be set back in connection with the formation of a northern approach to the new Blackwall Tunnel, and it has now been decided that the houses on the western side of the road at its junction with High Street shall also be set back, so as to increase the width of the road from 30 ft. to about 50 ft. The opening of the Blackwall Tunnel, it is pointed out by the Poplar District Board, would cause a large amount of traffic to pass along this thoroughfare, and, although the road will chiefly accommodate through traffic, they are willing to contribute one quarter of the cost of the widening. The Council has agreed to expend £300 on widening High Street, Tooting, and £600 on widening Merton Road, Tooting. A suggestion has also been made, the consideration of which has been postponed, that the Council should expend £1,760 on the acquisition of sufficient land on the eastern side of Wellington Street, Strand, at Nos. 138 and 138a, Strand, to widen the thoroughfare to 80 ft. It has already been agreed to widen the Strand at the corner of Wellington Street, and the present suggestion is in continuance of that improvement. It is proposed that in the event of the National Telephone Company, which has acquired these premises for increasing the size of its building at the corner of Wellington Street, being unwilling to sell at a reasonable sum the land necessary for the widening, the Strand District Board should be asked to acquire it compulsorily under Michael Angelo Taylor's Act on behalf and at the cost of the Council.

THE directors of the M.S. and L. Railway Company, in the course of their half yearly report to the shareholders, refer to the progress of the new line to London. They state that they have again been over the works very recently, and were gratified at the manner in which they are proceeding. The engineers' report on the Northern Division of the new railway works states: A considerable portion of this length is now formed, and is being trimmed, bottom ballasted, &c., in preparation for the permanent way. The number of men employed is 4,167, locomotives 50, steam navvies 21, and 128 horses. Out of 5¾ millions cubic yards of excavations, 4 millions, or over two-thirds, have now been removed to embankment. Of the seven large viaducts upon the division, four are completed, and of the remaining three that at Bulwell is also nearly completed, and those at Nottingham and Leicester are both in an advanced state. Out of a total of 170 bridges, 143 are in various stages of progress, most of them being actually, or very nearly completed. The steel work for several of the larger bridges is either in process of erection, or well forward in the maker's yard. Most of this, it is anticipated, will be completed during the next six months. Out of a total of 120 culverts, 115 have been commenced, all of which are entirely, or very nearly completed. Of the five tunnels upon this division, those at Sherwood Rise, East Leake, and Dunton Bassett are finished except the fronts. The new bridge and subway which will form the approach to the railway station at the bottom of Ely Lane, Lutterworth, is being rapidly pushed forward. Rather more than one-half the arch lining of the Mansfield Road and Victoria Street tunnels in the town of Nottingham is also completed. Twelve miles of permanent way (single line) have been laid. Assisted by the fine weather during the half-year, rapid progress has also been made with the works of the Southern and Metropolitan Divisions. The number of men employed is 5,454 with 47 locomotives, 18 steam navvies, and about 100 horses.

IN the report of Mr. Francis Fox, the engineer to the Snowdon Railway Company, referring to the accident a short time since, he states:—"We have found from personal enquiries in Switzerland since the accident, that cases of rack-mounting have occurred on several lines, both 'Abt' and 'Riggenbach,' and that the foreign engineers had themselves come to the conclusion that additional safeguards are necessary to keep the pinions of the engines and carriages in the rack, the brakes then being thoroughly efficient. Having, with the approval of Major Marindin (Board of Trade Inspector) and Sir Benjamin Baker (consulted by the contractors), determined what form of protection to recommend, we consulted Mr. Hall, of Lausanne, the Winterthur Company, and Herr Locher, of the Pilatus Railway, and received their approval, the final design being settled with the Winterthur Company, who are supplying the necessary attachments. The board would not, in our opinion, be justified, after what has occurred, in permitting the tram road to be opened for public traffic until the safeguard has been added, as there is certainly an element of danger at present, especially in descending the hill, should there be any irregularity in the permanent way."

DURROW ABBEY, recently visited by the Royal Society of Antiquaries, situated four miles from Tullamore, on the road to Kilbeggan, is well worth a visit. The demesne contains the ruins of a famous Monastery, founded by St. Columbkille A.D. 553. Portions of the walls of this ancient monastic retreat are still in a good state of preservation, as is also a great Celtic cross, said to have been brought from Clonmacnoise by the saint. Here also the famous "Book of Durrow" is said to have been written. Close by the ruins of the Abbey is St. Columbkille's Well, the waters of which are credited by the people of the adjoining country with miraculous properties. Some years ago the agent of the property, Mr. Toler R. Garvey, J.P., had a nice stone covering built over the well, which previously had been allowed to fall into a neglected condition, and a stone slab bears the inscription: — "St. Columba used this well when he preached the Gospel, and built an Abbey near it.—A.D. 553." The old graveyard surrounding the ruins was held in great veneration as a place of interment, but had to be closed some years ago owing to overcrowding. The Abbey was suppressed in the reign of Henry VIII., and in 1560 was handed over to Nicholas Herbert, who was endowed with the lands and tithes. About 1770 the present residence of the Toler family, which is a handsome and imposing limestone structure, was erected by a Mr. Stepney, to whom the property had descended from the Herberts, and the mansion was subsequently enlarged and improved by Lord Norbury, ancestor of the present owner, who acquired the estate.

EVERY commendation must be awarded to the County Council for the excellent results of some of their innovations on Hampstead Heath, and the benevolence of the intentions which have prompted them in others. The recent resolution of the Parks Committee to preserve the Heath as far as possible in its natural state is wholly praiseworthy, but it does not go far enough, since there exists something to be undone. Unfortunately, in providing some nine thousand trees, it does not appear to have occurred to the Council that the planting and artistic arrangement of trees is a matter of taste no more at the command of every public body than it is the endowment of every individual. The result is that mingling with the wild natural beauties of London's great northern playground is to be found an incongruous assortment of young trees, many of them planted so as to disfigure rather than to beautify the scene. So far as any addition of the kind might have been necessary, it should have been placed in the hands of experts, and it is in no unreasonable spirit that public opinion demands that some person or persons of taste, and, we may add of experience, should be appointed to overlook all work done on the Heath, and especially to rearrange, as far as possible, the position of the misplaced trees.

SIR GILBERT SCOTT, writing of St. Mary's-in-the-Castle, Dover, said that it was the most perfect of any pre-Norman Church in existence in England. "There is no question whatever," he says, "as to its belonging to that variety of Romanesque Architecture which we know on the fullest evidence to have prevailed in this country before the Norman Conquest. I know that there is no Saxon period early enough to satisfy the cravings of some of the investigators of its history, who are disposed to carry it out of the Saxon into the British period. I will content myself with a strong opinion that it is Saxon." One of the most eminent authorities on the subject holds that the Church was built as far back as the middle of the fourth century, and that it was originally a memorial to the first English martyr, St. Alban. Be that as it may the annals of the Castle show that it has been in existence and has been used as a military Chapel for many centuries. Of course, so ancient a building as this has passed through many troubles, and for a considerable period the military authorities used it as a store and coal house. In 1860, the funds being supplied by the House of Commons, however, the work of restoration was commenced, and in 1862 it was re-dedicated by the Bishop of Sierra Leone. Sir Gilbert Scott, with the discretion that one is bound to admit did not characterise all his work, left "the ancient parts without attempting to cover them either with plaster or other method of decoration." The west and east arches of the lantern are unquestionably the original work. The Church is cruciform, the Tower being in the centre, at the intersection of the Nave and Transepts. A doorway, too, is clearly, if not earlier, at any rate Saxon. The sedilia and piscina are also very interesting, though much later, being very fine specimens of early thirteenth century Architecture. A small window at the west end is a very curious feature, and one which shows that religious faith was a matter of no small importance when the Church was built. This window commands a view of an Altar in the south-east corner of the Nave, and at all times of the day and night voluntary sentinels—a sergeant and one guard—elected each day by the garrison were placed on duty to watch this light before the Tabernacle.

IF the book "Made in Germany" does nothing more than draw public attention to the fact that foreigners are evidently quite as able to manufacture machines and other industrial products as we are, it will do a great deal of good. We have heard an English practical engineer say that he never saw cleaner ironwork in his life than he saw at the last French International Exhibition, and his opinion is by no means singular. The French are great as engineers and mathematicians; the modern art of war was largely developed by them, as many of our military terms will show; they originated what we mistakenly call "Gothic" Architecture. In physical science they are at least equal to the English and German, and they have a reputation for the construction of the finer scientific apparatus, such as telescopes, which is unsurpassed, if not matchless. It was true for a time, no doubt, that England had the start in industrial matters; but the early days of steam engines, railways, and telegraphs are past, and other nations are now successfully competing with, and sometimes excelling, her.

A MEETING of the council of the National Trust was held recently at 1, Great College Street, Westminster, Sir Robert Hunter presiding. There were present among others Miss Octavia Hill, Miss Harriot Yorke, Mr. A. Waterhouse, R.A., Mr. K. Goss, Professor Baldwin Brown, and Canon Rawnsley. It was reported that, up to the present, £194 had been received or promised towards the sum of £505 required for the purchase of Barras Head, the well-known headland which commands the best view of Tintagel Castle, and it was decided to again urge the public generally, and Cornishmen in particular, to enable the Trust to secure the Head for the nation. It was also reported that only £96 of the £350 required to preserve the well-known Alfriston old pre-Reformation Clergy House had been received, or promised. This included a sum of £25 which Miss Octavia Hill has promised to give, on condition that £150 is raised in time to allow the work of repair to be proceeded with before another winter causes further damage to the building. The monument commemorating the deaths at the Battle of Newbury of the Earl of Carnarvon, Lord Falkland, and Lord Sunderland (the husband of "Sacharissa"), raised in 1878 at a cost of over £800, on a site given for the purpose by Mr. Walter Money, F.S.A., has been offered to the National Trust by the sole surviving trustee, Mr. W. G. Mount, M.P., in order that it may be permanently secured for the nation. The council decided to accept the trusteeship.

THE restoration works which are being carried out in the Norman Church at Aldermaston, near Reading, at the cost of Mr. Charles E. Keyser, who purchased the Aldermaston Court estate two or three years since, are disclosing some features of great antiquarian interest. The old Church was originally a Chapelry of Monk Sherborne Priory, which was situated between Aldermaston and Basingstoke. The Norman work which remains dates from the twelfth century, and on the stonework of the Norman doorway have been found carved a number of well-cut votive crosses. In dealing with the south Transept, known as the Congreve Chapel, some most interesting wall paintings have been brought to light, the most distinct of these being a well-defined full-length figure of St. Christopher, who is depicted as crossing a stream bearing the Infant Christ. On the other side of the chantry window there are represented two figures, one being in kneeling posture, and the other an angel descending, with a mitre, while above is drawn some fine canopied work. The side wall is found to be decorated with a series of paintings, the subjects of which have not as yet been clearly defined. In removing the plaster in the Nave, the Decalogue, in well-written old English characters, has been uncovered.

AT Glasgow the opening of New Rutherglen Bridge was the chief event last week. The bridge has been erected by the Joint Bridges Committee of the City of Glasgow, the Burgh of Rutherglen, and the County of Lanark, to replace an old structure erected in 1775. That bridge was of masonry work, and had five arches of simple design. It cost only £2,000, but the foundations were inadequate, and it was exceedingly narrow, being only 16 feet 6 inches between the parapets. It was finally closed in April, 1890, and in the interim the traffic has been conducted by means of a substantial service bridge. Plans of the new or permanent bridge were submitted by Messrs. Crouch & Hogg in January, 1891, and the consent of the Board of Trade, with a conveyance of that Department of the foreshore and bed of the river, which is here tidal, having been obtained, alternative specifications were prepared, and relative tenders by contractors advertised for. The offer of Messrs. Morrison & Mason, Limited, was accepted in January, 1892. Operations were commenced by the contractors in February of the following year, and the memorial stone was formally laid in June, 1895, by Councillor John M'Farlane. The new structure consists of three segmental arches, the centre one having a span of 100 ft. and a rise of 12 ft. 6 in., and those on either side of it a span of 90 ft. and a rise of 11 ft. 7 in. The clear width between parapets is 60 ft.—a roadway of 36 ft. wide and two footpaths of 12 ft. each. There is ample room for two lines of tramway, as well as for the ordinary traffic, and the gradient of the approaches is 1 in 60. The arches are of granite, and the abutments, spandrils, and piers are faced with granite supplied from Aberdeen, Dalbeattie, and Cornwall. The courses are chamfered and the piers are formed with starlings or cutwaters at either end, surmounted by massive caps, from which pilasters are carried up between the arches, and there are larger pilasters at the abutments. A bold cornice, with classic mouldings runs along the whole length of the Bridge, and is carried through the abutment and pier pilasters, and the parapet, which is solid, rises above this. Being built of granite, no ornamental work in the shape of carving has been attempted, but the endeavour has been to obtain a satisfactory Architectural effect by a well-proportioned and graceful outline. The total estimated cost for ground and approaches, construction of the new and removal of the old Bridge, including engineering, &c., fees, inspector's wages, and miscellaneous, was £70,000, of which the county of Lanark contributed a sum of £12,000, the burgh of Rutherglen £5,104, and the city of Glasgow the balance of £52,895.

THE design of Messrs. Bodley and Garner for a Memorial, to be erected by public subscription to the late Bishop Durnford in Chichester Cathedral, has been approved by the Executive Committee. It is to cost £2,000 and will consist of an Altar Tomb of Clunch, having square tracery panels divided by panelled niches of Purbeck marble, containing shields bearing emblems of the Passion. The Tomb will have a moulded base and slab of Purbeck marble, and upon the slab will be a recumbent effigy of the bishop in episcopal habit, and executed in alabaster. Above this will be a rich canopy of Clunch. A separate Memorial, subscribed for by the late bishop's confirmation candidates, will probably take the form of a new reredos and stained glass window.

CHURCH STREET, West Hartlepool, is to be the site of the Statue which Mr. Onslow Ford, the eminent sculptor, is executing of the late Mr. Ralph Ward-Jackson, the founder of the town, at the cost of Colonel Cameron, who will present it to the borough. The locality is, perhaps, not the best that could be chosen for such a purpose, but it appears to be the general wish that the Statue should be placed in some portion of the town familiar to the late Mr. Ward-Jackson during his lifetime, and the site at the head of Church Street, which overlooks the Docks, which gave West Hartlepool its start, is deemed to be most suitable.

IN dark and dismal rooms at Spring Gardens are stored away many interesting records of the early Government of London, before it knew a County Council, or was vexed with unification, and distracted with improvement schemes that never get beyond discussion. Admirably preserved as these documents have been by the Council's Record Keeper, Mr. Dickens, they have hitherto been uncatalogued, but that defect has been remedied by Mr. G. L. Gomme, the Chief Statistical Officer, who has compiled an excellent index, which future historians will find of inestimable use. Many of the records relate to the minor details of local administration; but they extend as far back as the reign of Elizabeth, and some of the entries give amusing glimpses into the customs of those days. In the minutes of the Surrey and Kent Court it is recorded that Queen Elizabeth was ordered to repair "walls and banks adjoining and about the Queen's slaughter-house at Deptford," which were said to be "in great ruin and decay." The Court gave instructions that a letter should be sent to the Lord Treasurer, "to the end that he may be rectified how the case standeth and that some redress may be had for the same." The letter explains the necessity for having the walls and banks new made, without which speedy performance "great dommage and hurte will accrue to Her Majesty and Her Highness's subjects." It is satisfactory to note that according to a subsequent entry the Queen was not above unbending from great affairs of State, or of the heart, to take an interest in ruined and decayed walls at Deptford, which were satisfactorily restored and "great dommage and hurte" thereby avoided.

WE beg to notify that the premises in Great George Street in which the offices of the Tribunal of Appeal are situate, being about to be rebuilt by the Surveyors' Institution, the offices of the Tribunal will be temporarily removed to Savoy Hill, Victoria Embankment, and that until further notice all communications should be addressed to the clerk of the Tribunal of Appeal, London Building Act, 1894, Savoy Hill, Victoria Embankment, W.C. The Tribunal of Appeal will return to the new premises of the Surveyors' Institution in Great George Street, on their completion, in about eighteen months' time.

A REMARKABLE discovery was made lately, says *South Africa*, in Adderley Street, Cape Town. Workmen engaged in excavating came upon a large stone about three feet below the surface, of hexagonal shape, about five feet in diameter, and bearing an inscription in Old English lettering, with the date "1622" plainly visible. On account of the very considerable size of the stone it was impossible to get it out at once. It is said that it is a postal stone, under which mariners, either outward or homeward bound in those days deposited their correspondence. Of course, in those days what is now Adderley Street was then an open space, strewn with boulders and large stones, and hence this inscription on the stone for identification.

ONE of the most curious clocks in the World is that which an American has constructed during the past summer. The machinery, which is nothing but a face, hands, and lever, is connected with a geyser, which shoots out an immense column of hot water every 38 seconds. This spouting never varies to the tenth of a second, and, therefore, a clock properly attached to it cannot fail to keep correct time. Every time the water spouts up it strikes the lever, and moves the hands forward 38 seconds.

ST. MARY WOOLNOTH.

A LETTER of considerable importance appeared in the "Times" of the 10th inst. respecting this Church, bearing the signatures of Lords Meath, Dorchester and Teynham. It stated that the City and South London Railway Bill had passed the third reading in the House of Lords. "The object of this Bill, amongst other things, is to extend the time, which would otherwise expire this year, during which the railway company has legal power to secure the Church and churchyard of St. Mary Woolnoth for the purposes of a railway station. This Church stands in a most prominent position at the junction of Lombard Street and King William Street, close to the Mansion House. It is stated that for over 1,000 years a Christian Church has occupied this spot. The present edifice, dating from 1727, was built by Nicholas Hawksmoor, a pupil of Sir Christopher Wren, to replace an earlier structure that had been seriously damaged in the Great Fire. John Newton was its rector for many years, and was buried there, and it is the Parish Church of the Lord Mayors. In the opinion of those capable of judging, it is a building well worthy of its commanding situation. The Royal Institute of British architects recently passed a resolution 'that the council do take the most active steps in their power to preserve the Church of St. Mary Woolnoth from destruction, the Church being an architectural monument of the highest merit and in its particular position an adornment to the City of London.' How the Church authorities allowed a Railway Company to obtain powers over this hallowed spot it is not for us to say, but so far as the public were concerned the original Act of 1893 slipped through unobserved, as the name of the Church was not even mentioned in the Bill, and not until the present Bill was introduced this Session did the parishioners and others interested become aware of the danger. Thereupon active steps were taken to combat it. A public meeting was held on January 22 at the Mansion House, presided over by Sir Joseph Savory, Bart., M.P., in the unavoidable absence of the Lord Mayor. Amongst the speakers were the Dean of St. Paul's, Dr. Freshfield, Canon Newbolt, Mr. H. C. Richards, M.P., and Mr. F. C. Penrose, one and all of whom vigorously supported the preservation of the Church. The last-named speaker said the Church was 'one of the finest in the City,' a notable feature being 'its wonderful front towards Lombard Street.' As a result of this expression of public opinion, a protective clause was inserted in the Bill. This clause was necessarily in the nature of a compromise, but it so far modified the powers already acquired by the Railway Company as to compel the Company to safeguard the Church, and to restore to it its original condition on the completion or their underground Station, the Company being allowed to utilize the Church temporarily, and to appropriate a small part of the Churchyard. The Bill then went to the Upper House, when, without our being aware of their intentions, the Rector and Churchwardens, and not the promoters of the Bill, so it is reported, asked the select Committee of the House of Lords to strike out the clause protecting the Church. The railway company was not likely to object to this action, and, as there was no one else to do so, the clause was struck out. It was the reinsertion of this clause which two of us unsuccessfully endeavoured to secure on the third reading of the Bill. The Bill now goes back to the House of Commons, and we hope that Sir Joseph Savory and other members interested may induce that House to insist on the reinsertion in the Bill of the clause struck out by the Lords' Committee. Railway companies ought not to be allowed to commit unnecessary acts of vandalism on our historic and sacred Churches and churchyards, even though their proper guardians, the rector and churchwardens, may be oblivious of their trust."

As considerable structural alterations are necessary at Kendal Parish Church, it has been decided to engage an Architect to report as to what should be done.

WOOD PAVING.

THE MERITS OF HARD AND SOFT WOODS.

A SPECIAL Committee appointed by the Paddington Vestry in April last "to consider the whole subject of wood paving in the parish of Paddington, more especially in regard to annual renewals being brought within the limits of a specified amount," has issued a report, which will come up for consideration in October, on the relative merits of hard and soft wood for the paving of roads. The general description of wood paving in the parish is with soft wood and Portland cement joints. The tables prepared by the surveyor show that the life of soft wood pavements is not so long as formerly. This seems due to three reasons: (1) Traffic on the roads has increased; (2) the standard of roads, being higher, causes more frequent renewals; (3) the wood, owing to greater demand, is not so good as formerly. Hard wood roads have been extensively tried in London for about seven years, and, although at first they are more expensive than those made of soft wood, in the long run they are less costly, particularly when the traffic is heavy, in addition to which the great advantage of heavy traffic streets being less frequently closed for renewals is of considerable importance. If the life of hard wood as against that of soft wood be estimated by its wear, the Committee considers that at least 15 years may be taken for hard wood against a life of six years for soft wood on roads subject to heavy traffic, and they strongly recommend the Vestry to follow the example of other London parishes, and in future discontinue the use of soft wood for paving purposes, being confident that there will not only be a considerable saving by so doing, but the roads will be far better and more sanitary than at present. Assuming the average life of the present soft wood to be seven years, its renewal necessitates an estimated yearly expenditure of £8,750. Allowing the hard wood a life of 12 years only, the yearly renewals would cost £8,070, showing a saving of £680 per annum. A longer life would show a larger saving. There is no doubt that on roads with heavy traffic the saving would be very great. The Committee considers that a sum of £8,000 should be allowed yearly for the maintenance of wood roads, and in the event of any special circumstances arising, the extra charge ought to be met by loan. The London County Council, which fully recognises the economy of hard wood roads, will, for renewals of such material, grant a loan for seven years. In conclusion the Committee recommends "That the wood roads ordered to be renewed in 1896 be paved, as soon as practicable, with the best Jarrah wood."

LORD PENRHYN has given £300 to the fund of £2,000 which is being raised for the rebuilding of the Bangor Cathedral organ.

THE Attorney-General has consented to lay the Memorial Stone of the new buildings to be erected, at a cost of £37,000, for the Young Men's Christian Association at Newcastle-on-Tyne.

M. GIRAULT, an Architect of distinction, who won the Grand Prize of Rome, and has obtained honours in the Salons, has been selected to superintend the construction of the great Palace of the Exhibition of 1900. The works are to begin about September 15th next.

A COMPREHENSIVE scheme of town improvement has been laid before the Falmouth Urban Council. It is proposed to purchase the Gas and Waterworks at a cost of about £30,000, spend £2,500 on pavements, purchase the Market from Lord Kimberley for £3,000, and to extend the Pier to enable steamers to land passengers at all states of the tides.

A FURTHER contribution having this year been allowed in the Government Estimates for the preservation of the old Royal Palace of Linlithgow, workmen have been engaged for the past few weeks carrying out repairs on the eastern portion of the building. The walls have been "pointed" with cement, and other necessary repairs have been effected on the interior of the Palace. By these works a decided improvement has been made on the more delapidated portions of the old structure.

MONUMENTS OF THE "LORDS OF SHEPEY."

MINSTER CHURCH AND ABBEY.

THE date usually assigned to the dedication of Minster Church was about 675. Here Sexburga became the first prioress, but four years after she removed to Ely, her sister Alfrida having died, and her daughter Erminelda succeeded her. The site had peculiar attractions; its elevated position, insulated by the two branches of the Medway, with the Thames flowing in front, made it a conspicuous object to every voyager on the great Thames highway. The changes through which the name of the Island had passed were not without interest. The fame of its pasturage is preserved in its old Saxon name of "Schep-eye" (the island of sheep), which, in the harder language of the Norman, was Latinised into "Scapeia." St. Sexburga's religious house gave to it a new name, "Monasterium Scapieæ." This in the twelfth century was abridged into "Moynstre," in a little time into "Menstre," and eventually into "Minster," with the adjunct "in Sheppey," to distinguish it from the other in Thanet. Here Sexburga planted her Abbey and its Chapel for her 77 nuns. In the course of time there rose up by its side a Parish Church for the use of the outside multitude.

THE ABBEY HAS HAD A CHEQUERED EXISTENCE.

For well nigh 200 years its inmates may have enjoyed a peaceful period. In the ninth century came the Danes, swooping down on the sea-board of Kent, making two attacks on the Abbey, and desecrating the sacred place. In the eleventh century it fell a prey to the sacrilegious bands of the vanquished Earl Godwin. William the Conqueror found the Abbey almost empty, and transferred to it the sisters of the Newington Priory, whose devoted abbess had been murdered in her bed, and whose revenues he had appropriated. In 1130, Archbishop Corboil, after having held his grand dedication of Canterbury Cathedral, rescued the Abbey Chapel from ruin, and probably added to it a Parish Church. In 1322, a sad event befel the Monastery. It is vaguely stated in Archbishop Reynold's register at Lambeth, that both Church and Cemetery "suffered pollution from blood," and the Archbishop was entreated to send a faculty for holding a special "service of reconciliation" there. When we reflected that twelve centuries had passed since the pious Sexburga founded the building, and that after the Danes and Earl Godwin it sustained spoliation at the hands of the Tudors and fanatic destructiveness from the Puritans, one could hardly hope to find a vestige of the original fabric. Yet high up in the south wall of the Chapel, above the bays which separate it from the adjoining Parish Church, may be seen the circular arch of the old Clerestories, composed of Roman tiles, springing over rough stone jambs.

THE ARCHITECTURAL FEATURES

of the Church possess few points of interest compared with those of the monuments. They tell us of the successive families of note which, from the thirteenth to the sixteenth centuries, were "Lords of Shepey," for each family has its representative here — Shurland, Northwode, Cheney. One that claims priority in point of artistic and historic interest is that in the south wall of the Chancel. Here lies a knight in his shirt of mail, with his boy page close at his feet. A singular adjunct to the group is a horse's head, rising up as it were out of the waves. It represents Sir Robert de Shurland, who took part in the Crusade of 1271, under Prince Edward, afterwards Edward I., and was created knight banneret for gallantry at the siege of Carlaverock. In a daring exploit a favourite horse saved his life by swimming ashore, but on landing an old hag, commenting on his rashness, warned him that some day the horse would be the death of him. He killed the horse on the spot. Some years after, seeing the skeleton on the shore, he gave the head a contemptuous kick. In doing so he bruised his foot, the wound mortified, and he died. To perpetuate the tradition a horse's head was placed on the tomb, and also on the vane of the Church Spire, thus explaining why Minster Church is sometimes called "The Horse Church." The interest of this monument does not rest here. It is covered by a canopy of much later date, and here is a tomb, which must have been grand and beautiful, the imposts still retaining in wonderful perfection and sharpness the head of a veiled nun on one side, and on the other that of a man whose thick rolling curls suggest the times of Edward III. or Richard II. It may have been designed for some high-born prioress.

SCARCELY INFERIOR IN INTEREST

are two brasses in the centre of the Chancel, on either side of the Lectern. On a very massive tomb of Bethersden marble, with its sides and ends richly ornamented with sixteen escutcheons proclaiming the proud alliances of the Cheyney family, lies an alabaster figure of a knight in full Court costume of the latter part of the sixteenth century. A partially-effaced inscription shows that this Monument was in memory of Sir Thomas Cheyney, Knight of the Garter, Lord Warden of the Cinque Ports, Constable of Dover Castle, Treasurer of the Household to Henry VIII. and Edward VI., and Privy Councillor under Mary and Elizabeth. In spite of all his honours, his heart, as shown by his will reverted to the old family home: "I will," he said, "that my bodye be buryed in the Minster in the Isle of Sheppey, in a Chapel there, wheare my late wyef, Dame Frydeswith, and divers of myne ancestors are buryed." The Nunnery Gate House alone remains to bear witness to the former grandeur of the nunnery. Its arched entrance has been built up, and the whole utilised for the families of two farm labourers. In the east corner is still the spiral newel stair in the turret projection, which once led to two rooms, in which two priests, one confessor of the nuns, the other chaplain of the Church, used to live.

LONDON COMMONS.

THE RIGHT OF DIGGING GRAVEL.

THOUGH arising in a local form, a question which is really of much practical importance to London recently came before the justices at Bromley. The point which the justices were asked to determine is whether the road authority of the neighbourhood, the Rural District Council of Bromley, is to be allowed at will to take gravel for the repair of the roads from Hayes Common. The case has many interesting features. Hayes Common was the first common to be placed under local management, and thus to be dedicated to the public under the provisions of the Metropolitan Commons Act of 1866. The creation of a Board of Conservators was sanctioned by Parliament in the year 1868, and the common has consequently been dedicated to the public enjoyment for nearly thirty years. Such a common as Hayes, one would have thought, would have been recognised as peculiarly unfit for use as a gravel pit. The District Council, however, takes a different view. By the Highway Act of William IV., highway authorities were empowered to enter upon any open waste land, and, under certain conditions, to take from it gravel and stone for the repair of the road. When, in 1876, the question of preserving commons for recreation was under consideration, it was felt that when a common was definitely set aside for the enjoyment of the public it assumed the character of a public park rather than that of waste ground, and restrictions were therefore put upon the exercise of the powers conferred by the earlier Act. It was provided (by the Commons Act of 1876) that no digging for road materials should be lawful without the consent of the body in charge of the common, or without an order of justices; and the justices were empowered to point out where and to what extent digging might still be carried on. In the twenty years which have passed since this enactment came into force there has, we believe, been only one case before that of Hayes in which a highway authority has appealed to the justices. The Wandsworth District Board of Works applied many years ago for an order to dig on Wimbledon Common, the Conservators of the common having refused their consent, and the magistrates declined to make any order. At Hayes digging continued for some time after the Board of Conservators was constituted. But latterly the common has been so largely used and the gravel pits have so greatly extended that the Conservators have withheld their consent, and the recent appeal was the consequence. It was proved at the hearing that, in the opinion not only of the Conservators, but of the Parish Council, gravel could not be dug on the common without injuring its beauty and reducing the area available for recreation, and it was admitted that gravel could be obtained elsewhere. The case of the District Council appears to have been put on the singular ground that they had a statutory right to dig on the common, and that such right could not be taken away without compensation. It seems an obvious answer to this argument that the power conferred by statute has been also limited by statute and cannot now be exercised if the body in charge of a common and the justices of the district think such exercise is not in the public interests. The justices at Bromley have, however, been convinced that they had no discretion to refuse an order, and that their only function consisted in framing rules to be observed in the digging. This is a point of law which should certainly be cleared up, and we understand that the Conservators of Hayes Common will take the necessary steps to submit it for the decision of a competent legal tribunal. Within the area of the Bromley District Council are several other commons dedicated to the public enjoyment and of great value and beauty; among them may be mentioned West Wickham, Farnborough, and Chislehurst. The position of the justices and the view they may ultimately come to are matters of some concern, therefore, to all who are interested in metropolitan open spaces. It is an odd feature of the case that the District Council, which is thus seeking power to dig commons and disfigure them, is a body endowed by the Local Government Act of 1894 with large powers of protecting common land.

MOSAIC floors, laid with small pieces of different coloured stones in regular patterns, were known to the Egyptians 2,300 B.C. In Babylon floors of this kind dated from 1100 B.C.

LADY KORTRIGHT recently laid the Foundation Stone of the new In-patients' Department of the Grosvenor Hospital for Women and Children, Vincent Square, Westminster. The cost will amount to about £9,000.

A STAINED glass window has been erected over the south Porch of St. James's Church, West Teignmouth. The design of the window, which is in three large compartments or lights, with kite-shaped tracery, is to illustrate the Acts of the Apostles.

EARLY next month Mr. F. W. Pomeroy's colossal Statue of Burns is to be unveiled at Paisley by Lord Rosebery. The poet is represented standing in a contemplative attitude leaning on his plough. The pose is one suggested by the opening lines of "The Brigs of Ayr"; and the manner in which the artist has carried out his work seems to have given very widespread satisfaction.

AT a meeting of the Belfast Harbour Commissioners, the secretary (Mr. Currie) read a letter from Mr. William Chaine offering to sell, free of all encumbrances, the entire lands, wharves, plant, machinery, &c., at Larne Harbour, for a sum of £90,000. As the average net earnings of the Larne Harbour for the past three years exceeded £4,000 a year, the price asked represents 22½ years' purchase of £4,000.

NEARLY 300 of the prints contributed to the Photographic Survey of Warwickshire by the members of the Photographic Society are on exhibition at the Birmingham Art Gallery. Besides embracing many famous seats, sketches of landscape, Churches, and old roadside Inns, there are some excellent interiors, and quaint or peculiar relics, such as a photograph of a very old certificate of a woodman of Arden, and a print of Abraham Thornton's gauntlet. There are a number of pictures of Sutton Park, Maxstoke Castle, Warwick Castle, Kenilworth Castle, Middleton Hall, and Whitacre Hall, from different aspects.

Professional Items.

BRADFORD.—The Board of Management of the Infirmary has decided to build a new nurses' home in the Infirmary grounds, at an estimated cost of from £8,000 to £10,000.

MAESTEG.—A new Memorial Church is being erected to the late Miss Olive Talbot, the Architect being Mr. G. Halladay, of Cardiff, and the contractors Messrs. McGaul and Son, of Bridgend. It is designed to seat 600 people, and the total cost is estimated at £6,000.

NORTON, MALTON.—The laying of the new sewer in St. Nicholas Street, St. Peters Street, and Langton Road, for the Urban District Council, has been entrusted to Mr. A. Lyons, contractor, Norton. Mr. M. Nelson is the Surveyor.

SILVERDALE.—In connection with Trinity Wesleyan Church, the foundation stones of a new Sunday School were recently laid. The School is being built adjacent to the present Chapel on the east side. It will be stone built, harmonising in design with the existing Chapel, and will cost in all about £400.

HARROGATE.—A new Pavilion, 80 ft. by 40 ft., has been erected at a cost of £900, at the Harrogate Athletic Club Grounds. In front an open verandah is provided, 10 ft. wide, running the full length of 80 ft. The Dressing Rooms are placed at the ends, each having Lavatories and other accommodation. In the centre of the building is a Tea Room, 32 ft. by 20 ft., Kitchen, Bar, and other rooms. Mr. G. Bland, of Harrogate, was the Architect.

MIDDLETON.—A report has been submitted to the vicar and wardens of the Middleton Parish Church by Messrs. Bodley and Garner, Architects, of London, on the proposed restoration of the ancient fabric. After due consideration of the lengthy document it has just been decided that the restoration of the edifice should be carried out as opportunity afforded. Improvements of a most extensive and costly character are contemplated.

MORECAMBE.—A new Wesleyan Chapel, of which memorial stones were laid on the 11th inst., is being erected on a site at the West End of Morecambe, from designs by Mr. S. Wright, Architect, of Lancaster. The scheme includes a Chapel to seat 914 persons, and a new Schoolroom with Vestries, &c. The original Schoolroom, in which services have hitherto been held, will be adapted for Infants' Class Rooms and other purposes. The cost of the structnre is estimated at about £6,000.

STOCKPORT.—There has just been completed for the town of Stockport a gigantic sewer which intercepts the whole of the sewage of the town from entering the river Mersey, the total length of which is four and a half miles, and the cost of which has been nearly £100,000 (exclusive of the cost of the land). This important work was carried out by Mr. A. M. Fowler (late City Surveyor of Newcastle-on-Tyne). Mr. Fowler engineered the Leeds Sewage Works, which were on a similar scale to those at Stockport, and he has just commenced to build a great sewer at Bridgewater.

DARWEN.—The General Purposes Committee of the Darwen Town Council recently met to further consider the applications for the borough surveyorship, which is worth £300 a-year, and was rendered vacant on Mr. Stubbs's appointment to a similar position at Blackburn. Twelve names were before the committee, and the voting left the following five gentlemen in for the appointment:—Messrs. F. Thackeray, Darwen; W. H. Prescot, deputy engineer, Darwen; N. Greenshields, Leicester; A. W. Bradley, Bury; and R. W. S. Saville, Burton-on-Trent. The committee will meet again on the 27th inst., when the appointment will be made.

BARMOUTH. — Memorial Stones of a new English Congregational Chapel in course of erection in Jubilee Road, were recently laid by Miss Farningham. The Church will be of modern design and will be principally of stone obtained locally, the windows being bordered with Hellsby stone. In the front there will be a large arched window, while the side windows will be of Gothic design. The whole cost of erection will amount to £2,000, and £800 has been paid for the land. The architect is Mr. Blackburn and Mr. John Adams has accepted the contract.

PERTH.—At a recent meeting of the Work Committee of the Town Council, the Architect explained how the estimates for the work to the interior of the Middle Church had been considerably exceeded, particularly the mason's estimate. It was found that the bulk of the excess of the mason's work was caused by work on the groined roof, it being found impossible and undesirable to restore the plaster which had been removed. Various other improvements of a permanent nature had been found necessary to be carried out, and these, while they increased the expense, would have had to be done sooner or later.

HOWTH. — The old "Chapel" at Howth, which had served the people for close on a century, has proved entirely unsuitable and inadequate for present day requirements. Accordingly two years ago a movement was inaugurated to replace it. Through the generosity of Lord Howth, the present site in the centre of the town was secured, plans were invited from Mr. William H. Byrne, Architect, and the execution of this design was entrusted to a local builder, Mr. Lacy, of Howth. The new Church will be Romanesque in style, with Nave, Transepts, Side Chapels, and circular Apse. A Tower and Belfry will also be erected. The cost of the building will be about £10,000.

DUBLIN. — The Archbishop of Dublin recently visited Balbriggan to re-open St. Peter's Church. The Church, which is an old structure, has been completely remodelled, has been added to, and has been generally restored. It has been painted in white, grey, and lemon-coloured tints, has had new seats put in it, a new stained glass window, and a new organ. The Altars are of marble and of good design. The high Gothic arches which separate the Nave from the Aisles give an air of great lightness and airiness to the structure, which is still further aided by the appropriate painting of the walls and ceiling, so that the Church is now in every respect a new one. The Architect was Mr. Ashlin, the contractor Mr. Heeny, of Balbriggan.

PITLOCHRY.—The conditions for the competitive designs invited for the proposed new public School by the Board state that accommodation is to be provided for 620 pupils, together with the usual offices, including janitor's house; that the total cost of the buildings, including boundary and other walls and all requisite fittings and fixtures, is not to exceed £5,000; that the Board shall have the services of an eminent Architect to assist them in approving of a suitable design, which, until finally passed by the Department, shall not be held as selected; that the author of the selected design shall be employed as Architect for the School upon the usual terms of professional remuneration; that other competitors shall not be entitled to any premium; and that designs must be lodged with the Clerk of the Board before September 1st, 1896.

LEEK.—We give on this page an illustration of premises now approaching completion, and erected for Messrs. Overfield and Co., in Russell Street. The floor area of the basement alone is nearly 250 superficial yards, and there are five such stories in the building, besides an additional storage story in the roof. Timber construction of a substantial character has been largely adopted. The gables are rough cast in Nottingham gravel, and the work generally is of a plain but bold, effective character, the shop front only being enriched by a carved beam and 18th century curved fanlights. A spacious staircase and a large lift, terminating in a south gablet, give access from floor to floor. The buildings have been designed by Messrs. W. Sugden and Son, of Leek and Hanley. Mr. W. Hall executed the brick and stone-work, Mr. H. Hill the plastering, Mr. M. Carding the plumbing, painting, glazing and gasfitting, under the architects' personal supervision.

BUSINESS PREMISES, RUSSELL STREET, LEEK: MESSRS. WILLIAM SUGDEN AND SON, ARCHITECTS.

ST. AUSTELL.—The Public Rooms, which occupy an elevated site near the junction of the Truro and Bodmin Roads, have been opened by Mr. McArthur, M.P. The building has been erected from the designs of Mr. S. Trevail, in the Victorian style, its outer walls being of local blue and white granite. The chief feature is a Hall 80 ft. long, 40 ft. wide, and 33 ft. high. This is well lighted and ventilated, provided with an organ loft and platform at one end, and a Gallery at the other, and conveniently served by ante-rooms. It has four exits, emergencies

having been kept fully in view. The roof is circular, and ribbed with pitch pine, with brackets resting on corbels. Underneath this room are a Drill Hall, Council Chamber, Surveyor's Office, Rate Collector's Office, and a Fire Station, the whole of which, with the exception of the Drill Hall, has been taken for twenty-one years by the Urban District Council. Mr. T. Parsons has acted as clerk of the works, and the contractor was Mr. Thomas J. Smith, of St. Austell. It is expected that the building and furniture will cost about £5,000.

COOKSTOWN. — The Second Presbyterian Church which has been closed for some months, and has undergone very extensive repairs and alteration, was recently re-opened. The old pews fitted with doors have been removed and new seats without doors or divisions bave been substituted. The Pulpit has been replaced by a modern platform, neatly executed in pitch pine. In front of the Pulpit, and at a slight elevation, accommodation has been provided for the choir. The arrangement of the seats in the wings of the Church has been altered, and, while the sitting space has not been reduced, those who were formerly seated close to the back wall, and consequently somewhat behind the speaker, have now a moderately wide Aisle between them and the wall. The heating of the Church and School buildings was entrusted to Messrs. Musgrave, of Belfast, who have erected their high-pressure small-bore apparatus. Owing to the situation of the buildings very expensive and troublesome excavations had to be made at the rear of the Church for the heating furnaces, and the arrangement of these has been specially improved so as to provide the maximum of heat from the fuel consumed. The inside of the Church has been coloured, while all the woodwork is pine, varnished. The outside of the Church has also been painted, and all the improvements executed in a thorough manner. The joinery work has been carried out by Messrs. Henry Forrest and Sons, and the painting has been done by Messrs. W. H. Warnock and Sons.

ABERDEEN.—The opening of the new Hospital and Administrative Offices at the Aberdeen Royal Asylum recently took place. The site of the new Hospital is behind the main Asylum buildings, but on a higher level by about 13 feet. The Hospital building is designed to be the nucleus of the whole Institution—the centre of administration. The Hospital may be said to be a group of five blocks, connected together by corridors. Two other small blocks, for isolation purposes, flank the larger buildings. The central block contains the Administrative Offices, Admission Rooms, Waiting Rooms, &c. To the rear of this block is the general Dining Hall of the Hospital, with the Attendants' Dining Rooms and the necessary accommodation for service. The male and female observation blocks, immediately right and left of the central block, provide Living and Sleeping Rooms for recent patients, under special observation. Adjoined to these blocks are spacious corridors and large glass-covered courts for the use of the patients. The Side Ward blocks, male and female, are at the extreme ends of the group of buildings. They each contain, besides a number of single rooms, a large Hospital Ward. These Wards have been built L shaped, in order to avoid the monotonous effect of a long Ward. At the angle of the L there is in each Ward a large space, with bay windows, fitted up as Day Rooms for patients who during part of the day are able to be about. The central building is three stories high, the observation blocks two stories, and the Sick Wards one story, above the general ground floor level. As the ground to the east falls rapidly, a full story has been obtained under the Female Sick Ward, and has been utilised as additional ordinary accommodation for female patients. The buildings are electric lighted, mechanically ventilated, and sanitarily equipped in the most complete manner. The Hospital is connected to the main Asylum building by a glazed corridor, tile floored. The Architect was Mr. William Kelly, and £50,000 was set aside to cover cost of building and furnishing.

AN organ is to be erected at Hawick Parish Church costing £955.

AN OLD WOODEN STATUE.

A STATUE of General Washington, which was erected in New York City during the life of the First President, and which was practically lost for half a century, is now used as a cigar store sign up in Harlem. The statue is of colossal size. It is cut out of wood, and is a good example of the carving that was done during the early days of New York. The present owner bought it as part of the more or less worthless rubbish which went with the store when he bought out its former owner. The tradition surrounding the statue is peculiar, and if the statements made concerning it are true it may come to assume an important place among the relics of the city. It is claimed for the statue that it was erected in New York in 1792 to commemorate the taking of the oath of office by Washington in 1789. Doubtless it took its unknown sculptor three years to complete it. It is stated that it was erected with suitable ceremony in Battery Park, and stood there until 1843. It was then removed and bought by a collector of antiquities named Jacques. He kept it hoarded away for 40 years. Jacques died in 1883, and his effects were sold at public auction. Among other forgotten relics, the statue was brought to light. The bidding on it was spirited and brisk. Its value leaked out in some manner, and many were there to buy. The first call started the price at 50 dol. This was raised to 100 dol., and this to 150 dol., and so on, in jumps of 50 dol., until 300 dol. was reached, when it was knocked down to David J. Schiff. It was conveyed to his store, where it became locally celebrated. During the centennial celebration of the inauguration of Washington, in 1889, the statue was lent by Schiff to some relic hunters, who placed it on the top of the wooden Arch erected in Washington Square, prior to the erection of the present marble structure. The figure was doubtless viewed by thousands who crowded into Washington Square on the fête dayss After the celebration it again dropped from the general public view, and resumed its function. as a cigar-store sign. Mr. Schiff, after several years' possession of the statue, finally thought it advisable to give up his business. By some mistake, so he states, the statue was included in the fixtures of the store, and it passed out of his possession. This is the history of the statue as far as can be learned at present. There is no doubt that when this figure of Washington was new it presented a beauty of outline which must have caused it to be universally admired. It yet shows the fact that it was carved by no "prentice hand." But time, exposure to the elements, and the manner in which it has been knocked about have greatly blunted the original conception. The figure is heroic in features and size. It depicts Washington in Continental uniform—blue dress coat, brass buttons, buff breeches, riding boots, &c. The left hand holds a cocked hat. The right arm hangs down at the side, the hand being slightly raised. This hand once held a scroll, which decayed in time, and was cut off when the statue first went on duty as a cigar sign. A wide crack extends down the left side of the face from the crown of the head to the chin. The epaulets are cracked, broken, and half off. There is a crack nearly an inch wide extending from the neck down the body and part of the left leg. It is evident that the feet of the statue were new. Two cracks around the ankle show where they have been joined. Mr. Schiff has admitted that he placed the new feet on the statue.

FOR the proposed County Museum at St. Albans, the site for which has been given by Earl Spencer, it is estimated that at least a sum of £5,000 will be required, £3,000 of which would be spent for building the Museum and providing the necessary fixtures, and £2,000 as a nucleus of an endowment fund. It is suggested that the management of the Museum should be vested in a committee representing the County Council, the chief societies of Hertfordshire, and others interested in archæology and natural science. There would be four departments, viz.: Natural History, Geology, Archæology, and Arts and Crafts.

KEYSTONES.

A LARGE scheme of extension for the Aberdeen herring fleet is suggested by the Harbour Board.

THE Exeter City Lunatic Asylum Committee proposes to build an Isolation Hospital for infectious diseases, and suggests that the cost, rather over £1,000, should be paid out of revenue.

THE George Hotel, Wind Street, Swansea, is to be rebuilt on an area of 1,929 square feet. The Architects are Messrs. J. P. Jones and Margrave, and the cost is estimated at about £16,000.

PLANS have been prepared for the conversion of Brynhyfryd, Ruthin, into Intermediate Schools for boys and girls, and the premises have been valued by Messrs. Dew, of Bangor, on behalf of the Charity Commissioners.

AT the monthly meeting of the Helensburgh Police Commissioners it was agreed to obtain powers for borrowing a sum to cover the estimated total of £2,878 for streets improvements, increased lighting, parks and buildings, and waterworks extension.

IT is proposed by some wealthy Americans to erect a Statue to Pocahontas in the place of her death. The heroine of so many novels, plays, and burlesques deserves the honour. Her portrait still exists at Booton Hall, in Norfolk, the former seat of the Rolfe family, into which she married. It is by De Passe, and is very well painted.

VARIOUS plans have been prepared for the enlargement and improvement of the Aberdeen Joint Railway Station, but the difficulty of deciding as to the direction in which the extension should be made has yet to be solved. In the meantime arrangements are being made for relieving the present congestion of traffic at the terminus. Even were the work of extending the station proceeded with at once, it would probably take two years to have the scheme completed.

APPLICATION has been made to the Consistory Court of Southwell for a faculty authorising extensive alterations of St. George's Church, New Mills, Derbyshire, at an estimated cost of £960. It is proposed to form a Chancel at the east end of the Nave for the Choir, with a Vestry on the south side and an Organ on the north. The Nave is to be reseated with open benches, Choir seats, prayer desks, lectern, and Pulpit provided, in addition to a sedilia and credence niche in the Chancel. The Gallery and Organ are to be repaired.

AT Mellor Church, near Blackburn, it is proposed, amongst a number of alterations in the interior of the Church, to form a defined Chancel by screens of oak, relay the floor, put in a new oak front to the Gallery, and supply inner screen light doors to the two entrances and Reading Desks, to light the Church with gas, and rearrange the Heating Apparatus. It is also proposed to place the Font in a niche and substitute a new white marble Font on its site, to restore the Organ, and refloor the Gallery.

SIR JAMES BELL, the president, in opening the proceedings of the British Institute of Public Health, described the progress made by Glasgow during the last 50 years in respect of its sanitary arrangements, one result of which had been that the death rate had been reduced from 56 per thousand of the population in 1847 to 23 per thousand in 1893. Much still remained to be done, and the Corporation had just obtained power from Parliament for an extension of sewerage works with a view to the purification of the Clyde. The cost of this section of the scheme would be over £600,000.

DURING some recent excavations of the roadway in Chapel Lane, Bradford, nearly opposite the entrance to the Unitarian School building, a singular relic was brought to the surface in the shape of a bottle hermetically sealed, and nearly full of preserved gooseberries. From measurements taken by Mr. Cox, the Borough Surveyor, the bottle appears to have been originally placed upon a corner of the site of Cliffe's Foundry, namely, the portion of ground at the junction of Bower Gate with Chapel Lane. The glass is of a dark green or olive colour, and of a texture very different from that of the glass made at the present day.

SOCIETY MEETINGS.

National Association of Master Builders of Great Britain.—The National Association of Master Builders of Great Britain recently held its half-yearly meeting at the Waterloo Hotel, Prince's Street, Edinburgh, when representatives were present from London, Liverpool, Birmingham, Dublin, Edinburgh, Leeds, Glasgow, Bristol, Bradford, Huddersfield, Wolverhampton, Leicester, Shrewsbury, Cambridge, Barnsley, Burslem, Hanley, Newcastle, Staff, Leigh, &c. Mr. Thomas F. Rider, London, the President, was in the chair.—Mr. C. W. Green, of Liverpool, the hon. treasurer, submitted his audited accounts for the half-year, showing the financial position of the Association to be most satisfactory. — The President congratulated the members present on the improved position of the Association, and referred to the increased membership by the affiliation, during the past half-year, of eight branches. — Mr. Stanley G. Bird, of London, addressed the members respecting the form of contract.—Mr. James Bowden, of Burslem, spoke on the subject of apprentice indentures, and reverted to the form of indenture which had been submitted to the various local associations for their approval.—Mr. George Hardington, of Leicester, also spoke on the subject, and suggested to the meeting the desirability of obtaining counsel's opinion as to the best form of indenture to be adopted by the association for general use.—The strikes pending in Dublin and Leeds were discussed, and representatives from both places explained the difficulties which had arisen in the building trades between employers and workmen. It was resolved to hold the next meeting in Blackburn.

The Sanitary Institute.—The preliminary programme of the fifteenth congress, to be held in Newcastle-upon-Tyne from September 2nd to 9th, has now been issued. The president of the congress is the Right Hon. the Earl Percy, P.C., D.L., J.P. The meetings of the congress will consist of three general addresses and lectures. Three sectional meetings, dealing with (1) Sanitary Science and Preventive Medicine, presided over by Professor W. H. Corfield, M.A., M.D. (Oxon.), F.R.C.P.; (2) Engineering and Architecture, presided over by Sir Andrew Noble, K.C.B., F.R.S., M.Inst.C.E.; (3) Chemistry, Meteorology and Geology, presided over by Mr. W. H. Dines, B.A., F.R.Met. Soc. Five special conferences: Port Sanitary Authorities, presided over by Mr. Arthur Holt-Barber, chairman Port of London Sanitary Authority; Medical Officers of Health, presided over by Mr. Alfred Hill, M.D., F.R.S.E., F.I.C., F.C.S.; Municipal and County Engineers, presided over by Mr. Francis J. C. May, M.Inst.C.E.; Sanitary Inspectors presided over by Mr. George Reid, M.D., D.P.H.; Domestic Hygiene, presided over by the Mayoress of Newcastle-upon-Tyne. In connection with the Congress, a Health Exhibition will be held, and H.R H. the Duke of Cambridge, K.G., who is president of the Institute, has consented to perform the opening ceremony on September 2nd. Excursions to places of interest in connection with sanitation will be arranged for those attending the Congress. The local arrangements are in the hands of an influential local committee, presided over by the Mayor of Newcastle, with Dr. H. E. Armstrong, Medical Officer of Health for the city, and Dr. J. W. Hemborough, Medical Officer of Health for Northumberland, as honorary secretaries. It appears from the programme that over 160 authorities, including several County Councils, have already appointed delegates to the Congress, and, as there are also over 1,800 members and associates in the Institute, there will probably be a large attendance in addition to the local members of the Congress.

The Royal Archæological Institute at Canterbury.—Canterbury has recently been the centre of the meetings of the Royal Archæological Institute, from whence visits to surrounding places of interest have been made. At Fordwich, the Parish Church of St. Mary the Virgin was visited, under the guidance of the Rev. C. E. Woodruff, who thought the Church contained traces of pre-Norman work. The north Aisle was added in the thirteenth century, and the square-headed windows of Nave and Aisle in the fourteenth century. The curious shrine-like tomb which stands in the north Aisle was carefully examined, and pronounced by several gentlemen present to be twelfth century work. The party were then conveyed to Reculver, where an address on the history of the Roman camp was given by Mr. G. E. Fox, F.S.A. Mr. J. T. Micklethwaite having described the ancient Church at Reculver, the party proceeded to Herne, where a paper was read on the history of the Church, which is dedicated to St. Martin of Tours. There was no doubt a much older Church than that now existing, and some of its stones of Norman date could still be seen in the west front of the Nave. The present massive tower was built about 1350. Another day Dover was reached, where St. Mary's Church was examined. The Castle was described by Mr. E. Green, F.S.A., while the Church of St. Mary-in-the-Castle was described by Mr. J. T. Micklethwaite, and the Roman Pharos by Mr. G. E. Fox. Chartham and Chilham were also included included in the excursions. At Chartham Church the Rev. C. Randolph read a descriptive paper. The Church, which is mainly in the early decorated style, is a fine cruciform building, with a massive Tower at the west end. It was probably built between 1285 and 1295, and from the harmonious effect of the different portions, was no doubt entirely designed by one man, who probably was Henry de Estria, Prior of Christ Church, Canterbury, from 1285 to 1330, and builder of the Chapter House and the Choir Screen of the Cathedral. The Nave is much plainer in design than the Chancel, which is accounted for by the fact that the monks of Christ Church, who built the Chancel were rich, while the parishioners, who built the Nave were poor. The fine range of windows in the Chancel (four on each side of two lights each, and the great east window of four lights) are very beautiful, and form an almost unique series, the tracery being of the style known as "Kentish tracery." In the Church are some fine brasses, rubbings of which were taken by some of the visitors. The Church before its recent restoration by Mr. G. E. Street, was in a deplorable state, a huge Gallery blocking up the fine western arch, and all the fittings being of the poorest description. The restoration was a very careful one, and the Church is now nearly as possible in the same condition as when first built. Proceeding to Chilham, the vicar (Rev, G. Howard Wright), read a paper on the history of the Church and parish. The fine Church, which, excepting the Chancel, is in urgent need of restoration, is Cruciform, with Aisles to Nave and Chancel, and a noble western Tower. The earliest mention of a Church here occurs in Domesday Book, but a Church has existed from the earliest Christian times. The north and south Transepts (dating from thirteenth century) are the oldest portions of the present building; the Tower Arch is fourteenth century work, and the Nave of fifteenth century, while the Chancel was entirely rebuilt in 1863 at the cost of the late Mr. Charles Hardy. Portions of the building, especially the north wall and the south Transept, are now reported by Mr. J. Arthur Reeve (Architect) to be in such a condition that they must be taken in hand without delay, and funds are being raised for the purpose. At Chilham Castle the ancient portions were carefully examined. Mr. E. Green, F.S.A., said that the Castle was a difficult building to describe, much of it having been pulled down and the remaining portions greatly altered from time to time, but there was no doubt it was of Roman origin. Richborough was also visited, and the Roman Station described by Mr. G. E. Fox, F,S.A. From thence the route was to Ash, where the Church was described by Rev. E. S. Woods, M.A., Vicar, and effigies it contains by Viscount Dillon, F.S.A. One day was devoted to the Cathedral and Monastic buildings under the guidance of Mr. St. John Hope.

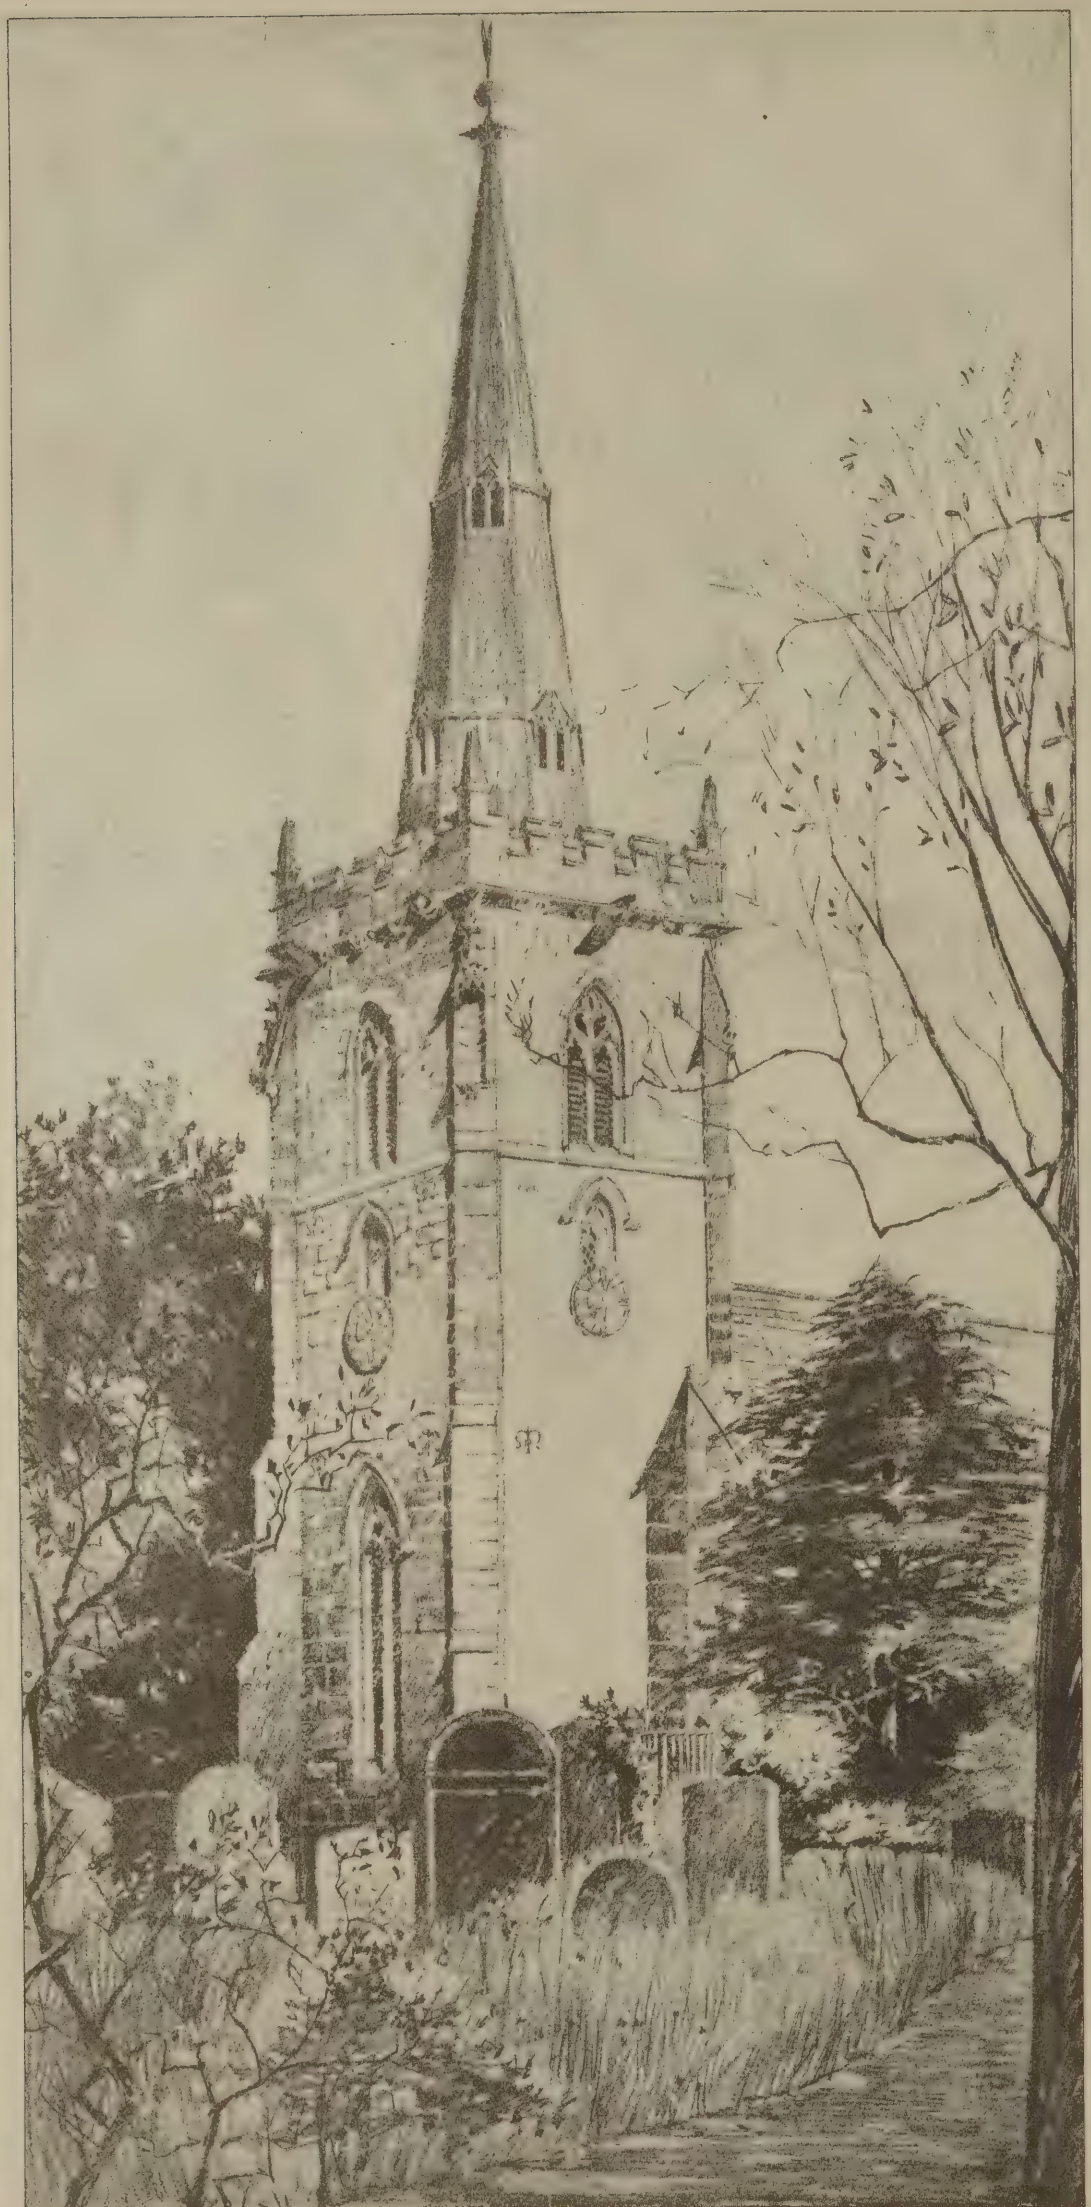
IT has been suggested that advantage be taken of the contemplated alteration in Parliament Street to construct a subway from some point in the vicinity of Downing Street to Palace Yard for the convenience of ministers, officials, and messengers.

NEW BOARD SCHOOL AT ROTHERHAM.

THE new Board Schools erected by the Rotherham School Board at the corner of Alma Road and Matilda Street were formally opened on the 8th inst. The structures will furnish accommodation for 689 children. The boys' and girls' departments, a two-story building, faces Matilda Street. The Boys' School is on the ground floor, where there is provided a large Cloak Room and Lavatory, leading from the entrance passage. The Schoolroom measures 21 ft, 6 in. by 42 ft. and two Class Rooms, each 28 ft. by 21 ft. 6 in., giving a total accommodation for 210. On the upper floor, approached by a wide stone staircase, is a Schoolroom and two Class Rooms with accommodation for a similar number of girls, and a Teachers' Room. The Infants' Department consists of a large School Room, 52 ft. 6 in. by 23 ft., and two Class Rooms, each 22 ft. 6 in. by 22 ft. The School and Class Rooms have a glazed brick dado round all the walls 3 ft. 9 in. high, as also have the Lavatories. The School has an extensive asphalted playground, the boys being separate from the girls and infants, and in each is erected a large playshed. The Latrines are centrally situated and flushed automatically at frequent intervals. In addition there are the usual Offices, viz.; Coal and Wood Stores, Ashes Place, &c. The whole is built of Dunford Bridge wallstones with ashlar dressings, and covered with Westmoreland slates. The floors of all Rooms except Lavatories, are of concrete, and wood blocks laid by S. Macfarlane, of Leeds. The Lavatories, &c., are of concrete, with cement surface. The School is on all sides surrounded by stone boundary walls—that to the streets having iron palisading. The general treatment is of a bold type of modern Classic Architecture. The Architect is Mr. H. L. Tacon, Rotherham; the contractors for the work were Messrs. Chadwick and Co.; and the clerk to the works, Mr. F. P. Jenkinson. The amount of the contract was £6,339.

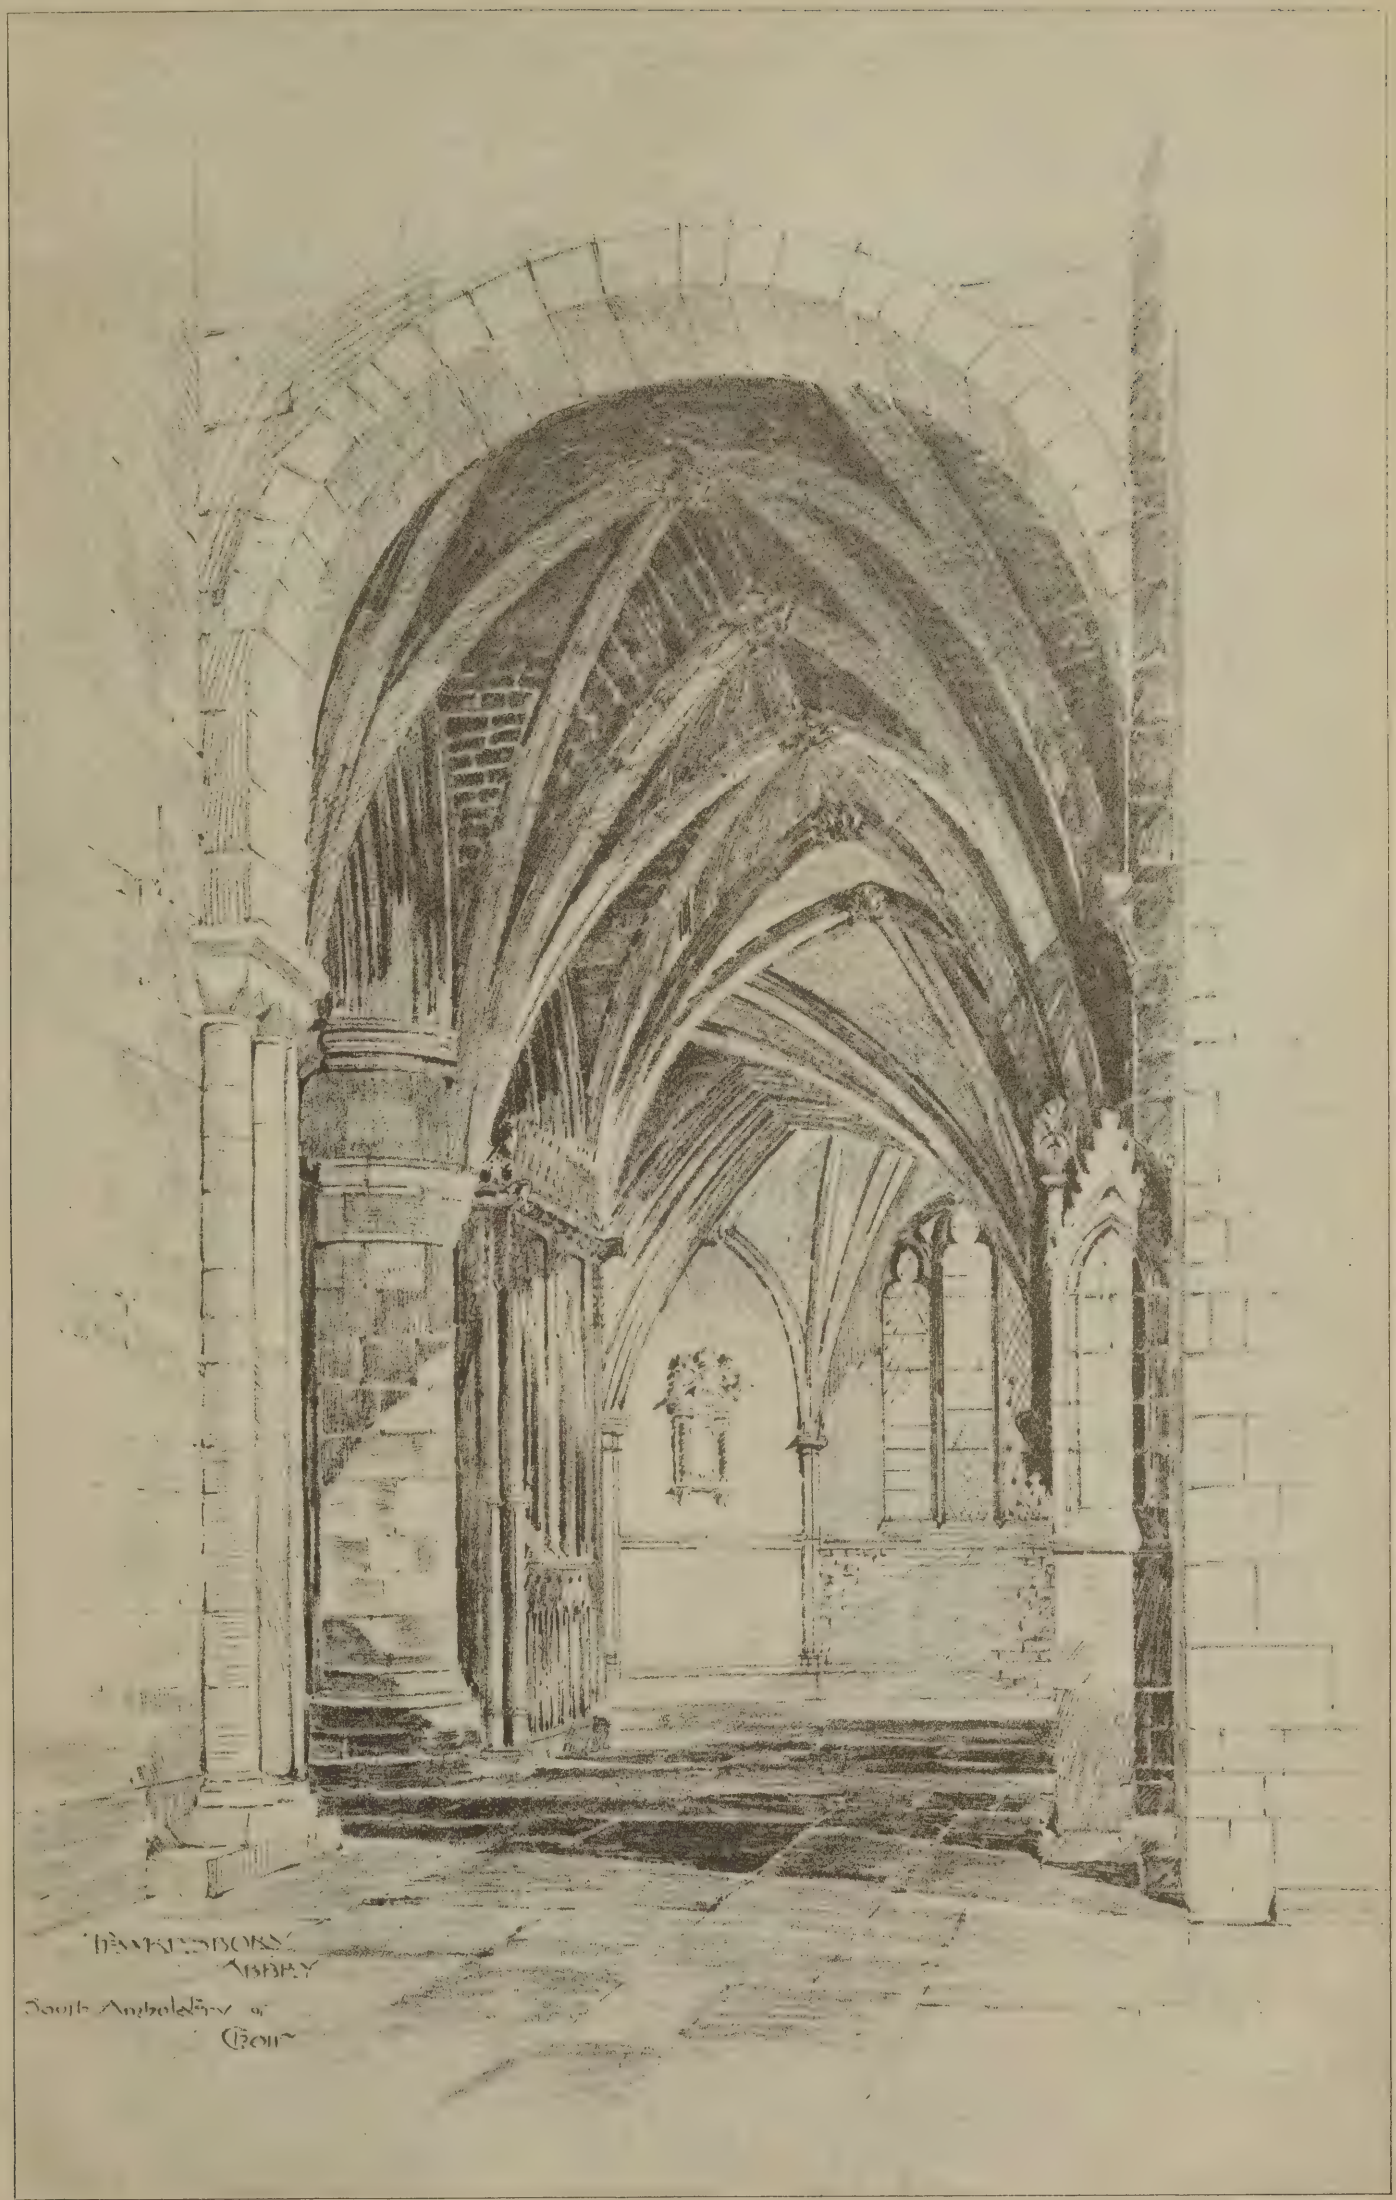
HIS Royal Highness the Prince of Wales has recently purchased two pieces of repoussé silver work by Mr. Gilbert Marks, of Croydon.

THE building of a Hotel on the site of the old Mermaid at Mumbles, will be commenced in the course of a fortnight. The Architects are Messrs. J. P. Jones, Rowlands and Margrave.



AT a recent meeting of the Gas Light and Coke Company, held at the Offices in Horseferry Road, Westminster, it was stated that the total number of automatic meters in use was now over 42,000, and applications were coming in faster than they could meet them.

SIR JAMES D. MACKENZIE, Bart., has written a work on "The Castles of England: their Story and Structure," giving historical, archæological, and architectural data about the 600 Castles and fortified Mansions which are known to have been erected from the Conquest to the reign of Henry VIII. It is to be published by Mr. Heinemann in two handsome volumes, fully illustrated with plates, plans, and other pictures.



MEMORIAL Stones have been laid of a new Baptist School at Nelson. The building is calculated to accommodate about 800 scholars, and the estimated cost is £4,280. The School is being built because of a want of accommodation in the present School, which will only hold 400 scholars, whilst there about 600 children on the School's registers.

The Secretary of State for Foreign Affairs learns from her Majesty's Ambassador at Madrid that the Spanish Government has invited tenders for the construction and working of a Telephone System in Mayagüez, in Porto Rico. October 8th is the date fixed for the consideration of tenders, and such particulars as her Majesty's Government have received may be inspected at the Commercial Department of the Foreign Office between the hours of 11 and 6 daily. Tenders are also invited for the construction and delivery at Manila of a steamship required by the Government of the Philippines in connection with the Lighthouse service of those islands.

"Chill October."

THE cold winds of loss have blown us back, in memory, to that wonderful painting by Sir John Millais. That he could paint landscape had been proved all the way from the "Ferdinand" to the "Flood," but here was something so human (yet devoid of human figure), so inevitable, so sad, you felt as one feels looking from ridge to ridge across a mist-laden and unknown valley—all the sense of possibility of joy and laughter; and of human tears. Only a reedy backwater of the Tay, yet with the beginning and ending—of all Art, of all ambition, suggested in its still, cold reflective face; another way—Millais' way—of saying "the paths of glory lead but to the grave." It is singular that in the hey-day of his robust years he should have painted that first of the unequal but vivid series of landscapes which at once made him the most virile and the most dominant of landscape painters. Sir John Millais knew how to touch the heart—that greatest instrument for any artist—and if he touched it sometimes in the more obvious way it was because he himself in his emotions was frank, and simple, and sincere. He could idealise; he could paint in the devout attitude to religion and to rite; there was a symbolism about him also, that was winning in its simplicity; but there was no morbid psychology nor even of that lusciousness which was the femininity of Rossetti. To use a simile, Millais' Art was not lacking in bone, and the masculine angularity sometimes pressed through the flesh. Yet, once the attack of Pre-Raphaelitism over, he was never crude, and he flung himself so far the other way that he became, as we all know, a very great colourist—perhaps the greatest colourist of his time. That abounding and fruitful sense of power, given to so few, was his, and he never abused or be-littled it, though some of us have regretted his frittering it away in the "Bubbles" epoch, helpful only to the splendour of that magnificent house at Palace Gate. He could afford to allow the steam to fret itself through the valve, for the power behind all his achievement was irresistible. It would be idle here to attempt to widen out in appreciation of so essentially, because so simply, great a man; that very gift of simplicity—breathing the fresh air of his fine altitude to Art—made him so versatile and many-sided. There is a temperament which is at once warrior and child, with the battle-axe of the one and the happy bell-rattle of the other; girding itself with masculine rigour to greatness; happy—the armour off—with a laugh in the sun at nothing more than a nibble at the end of a line. The man who painted "St. Agnes' Eve" invented a salmon "fly;" the painter of "Cherry Ripe," of "Kissing Lips," was the painter of "The Order of Release."

SIR JOHN MILLAIS, P.R.A. *From a photograph by Messrs. Elliott and Fry.*

The whitewashed cottage walls of England owe Millais a debt of gratitude, for in what numberless inns and hamlets have we not seen those reproductions (*vide* "The Graphic") of his work. There was a tolerance, a childish love of appreciation, too in his willingness to allow these popular pictures of his to be so *mercilessly* "reproduced" in "three or five colours," with the dot marks of each mechanical tint in the bottom left-hand margin, left by the colour printer to prove that his statement was genuine! Oh! that *other* guileless simplicity of mechanical Art! We can fancy even Sir John counting the tints, to be *quite sure*, in a great good humour and willing to chase "Cherry Ripe" with "Cinderella. It was a little odd, but it was essentially English. He was always heart-warmed by Colour, and popular applause is a very vivid vermilion; it may even get upon one's palette and that is what eclecticism calls "pandering to the popular taste." But while he stirred the multitude he made the individual, even a lonely soul, pause, as in "Chill October," as in "Ophelia," as in that other landscape, "Autumn Leaves," wherein four simple girls are taught the religion of a purple sunset, and the allegory of a weed fire in a garden. Such diversity in, such play upon, such comprehension of the Small and Great, was but another evidence of his mature mind, his ever-springing youthful fancy. It would be immodest to say in any jingle of sentence what English Art has lost in him, and we shall only know the full measure of deprivation as we seek elsewhere for the qualities which were so peculiarly, so generously, so greatly, his.

SIR JOHN MILLAIS, P.R.A.

A MEMOIR.

HIS position as a Painter. It is, perhaps, enough to mention that the English public will soon come into possession of several of the painter's finest works, for the Tate Gallery will contain "Ophelia," "The North-West Passage," "The Vale of Rest," and three or four more. Owners of many pictures by him were the late Mr. W. Graham, the late Mr. Price of Queen Anne Street, and Mr. Matthews; it is said that Mr. C. Wertheimer has a whole room full of the more decorative pictures, such as "Cherry Ripe" and "Christmas Eve." To attempt to fix the artistic position of all these, or of the artist and his work as a whole, would be as premature as it would be difficult. Time alone can judge, for to time alone must be left the task of assigning to modern Art its relative place by the side of the Art of bygone centuries. At least, however, it may be said that our age has seen no English painter at once so varied and so powerful. He passed, in the course of 50 years of healthy strenuous work, from the ideal represented by "The Huguenot" to the ideal represented by "Saint Theresa," and at least every year he produced what the best judgment of the day pronounced a masterpiece. What exquisite quality and finish in the early work—in the flowers of the "Ophelia," for example! What an understanding of childish beauty in "My First Sermon" and in "The Minuet"! What brilliancy of painting, what sympathy with the root-sentiments of our British nature in "The Boyhood of Raleigh"! What grasp of character, and what power of pictorial effect, in such portraits as the "Gladstone," the "Tennyson," and the "J. C. Hook!" What a power of rendering external nature as the eye of ordinary humanity perceives it in "Chill October"! Immense range, unswerving fidelity, and an almost invariable distinction—these are the qualities in Millais's Art which are admitted by all the World.

THE NOTE DOMINANT.

In all his life that dominant nature of his kept him to the front. Few men who had such cause to believe in themselves did so so naïvely. Sometime in the seventies he had two landscapes going in to the Academy, and there had thronged in to see them the usual crowd of visitors and studio haunters. In those days the visit to the studios was not quite so insincere a function as in these. Fashion was only just beginning to annex the Artist; but Millais was always a prominent figure before the public. He generally avoided these gatherings, but happened on this day to be present. One of the landscapes was a back-water or mill-race, and you saw, across the stream, amongst the trees and underwood, the miller's boy, a dusty figure, busy with his rod and line. The picture was very much admired. The tinsel clink of compliment circulated freely round the room, and Millais took the praise at its value, which was not very high. One lady, very near-sighted, screwing her eyes to see better, contributed her own sentence of praise, ending it with "But why does he ——?" and then abruptly and awkwardly stopped. The artist, deaf to all the adulation, caught a note of sincerity in the unfinished question, and came up to his critic. "What do I what?" he said. The near-sighted lady hesitated. He pressed. "Why have you put a statue in that wood?" she said. Millais took up his brush and gave the miller's boy a scarlet necktie. "And now," he said to the lady, "you may say you made Millais alter one of his pictures." Such a charming, naïve belief had he in his own fame.

HIS BOYISH SIMPLICITY.

For there was this noticeable about the man, that with all his egotism he was very popular. He thought highly of his own work, rated it at its full value, but he was generous in his judgment of the work of others. He was always insisting how much better the young men painted than the old, and always ready to help on a young man who had merit. The fact was there was a boyish simplicity, an absolute honesty, a complete absence of finesse about him, all of which were very captivating as well as very unusual. His heart was on his sleeve, and the heart on his sleeve was a great big, throbbing, human heart. And so he made his impression quite as much by the strength of his nature as by his extraordinary talent. There was so much simplicity about him. He had a picture a few years ago—a landscape with moonlight. "I've got a quotation for it," he said; "'The moon is up, and yet it is not night.' It is in Byron; a lady found it out." And he spoke of the wonderful attribution of that quotation with a kind of triumph.

THE MASTER OF TECHNIQUE.

Beyond all artists practising in England, Millais was the master of technique *par excellence*. It may be that his artless question when a youth—"Art is one thing and nature another, isn't it?"—gives the key to his extreme catholicity on this point. "I tell you what it is," he remarked a few years ago, "men think too much of the technique of Art nowadays, and too little of the spirit. Technique is necessary and fine as being the painter's craft; and the finer it is the better. But it must not be allowed to swamp the spirit. The spirit is more important still, and the public is perfectly right in looking and asking for it." Equally did he objcet to the narrowness of modern "schools" and the petty prejudices of artistic cliques. "It is worse than folly," Millais would say, "for young painters to think that the men they worship are the 'only ones'; or, as many do, that Velasquez is the only Old Master worth looking at. They might as well say, 'there is only one flower, and that is a poppy, or a rose,'"—and then he would enlarge on the necessity of every student and every painter keeping his Art-view large and liberal. Whenever he himself visited the National Gallery, he would first go to examine the Van Eyck and then the wonderful little Bellini—the very antitheses of his own later method. "Painting is quite hard enough," he would explain, "without narrowing one's vision or focussing one's idolatry."

THE HUMANITY OF HIS PICTURES.

His pictures appeal to us sometimes by the mere force of beauty and sometimes by their plain pathos and their noble humanity. "The Huguenot," for example, who refuses to accept from his lady the badge that is to save him at the expense of his honour, is popular just as Colonel Lovelace's famous lines have been popular for more than two centuries, and for precisely the same reason. "The Highlander," again, whose order of release is brought to him by his young wife, is as pathetic and as popular a figure as can well be put upon canvas. "The Black Brunswicker," and "The Gambler's Wife," are in much the same vein of sentiment. "Cinderella," even in its sixpenny reproductions, has delighted children of all ages; a still more recent picture, unhappily lending itself to the purposes of advertisement, has been an isolated thing of beauty on all our hoardings. Certainly no painter of any eminence has been a more general favourite, while preserving his art and his refinement, than Sir John Millais.

HIS GREATEST TWENTY YEARS.

On the whole, the twenty years that followed 1871 may be taken as the period of Millais's greatest work, for, besides these landscapes of somewhat unequal merit, he produced at this time such well-known pictures as "Yes or No?" with its less successful sequel "Yes"; the "Princes in the Tower," and "A Yeoman of the Guard"—remarkable if only for black velvet and dexterous scarlet respectively—"Cinderella," which an illustrated journal soon reproduced and sent to the ends of the World; "Sweetest Eyes were ever Seen," Cinderella's model, apparently, but a year older; and "An Idyll of 1745," in which two or three timid little Scotch lasses listen, after Culloden, to an English soldier-boy who is playing the fife for their amusement. All these, or certainly most of them, have been rendered familiar enough by engravings to justify our earlier remarks as to Millais's popularity. If they pleased the public, so much the better for the public. Unpopularity is neither a criterion of Art nor a moral obligation. But still greater works than these belong to Millais's last twenty years—that is, if portrait painting is the artist's greatest achievement.

A LAST "LOOK ROUND."

There was something very pathetic in the way Millais lingered round the Galleries of the Academy during the last days before it opened, for the first time under his Presidentship. He was in the rooms on the Saturday before the private view, the last of the Members' varnishing days, shaking hands with old friends, and saying, in a hoarse whisper, which told its tale tragically enough, that he was better. He came again on Monday—that was the Outsiders' Varnishing Day. The Galleries were full of painters, young and old, hard at their work, much to do and little time to do it in, when someone said, "Millais is in the next room." Young men and old, they all looked in, mournfully realising it might be the last chance to see the greatest of their brethren. There he was, leaning on the Secretary, and slowly going his round. One young painter, perched upon a ladder, varnishing his canvas, felt his leg touched, but was too busy to turn round. Again he was interrupted—it was the President, who in a scarcely audible whisper, wished to congratulate him on his work. That was Monday. He came again on Tuesday. There was discussion amongst a few of the members about a picture that in the hanging had not got so good a place as it deserved. Take one of my places for it, he said, and he meant it. It was not the first time he had offered to make way, giving up his own position to an outsider. On Saturday, May 2nd, he was there for the last time—to receive the Prince. But now the disease had made rapid advance, and he was not able to take a last walk round the rooms. He loitered behind, and when the Prince heard the cause he insisted on his returning home at once.

"THE PUBLIC WON'T LET ME."

Among the subject pictures painted in the new studio was a single figure of a girl, called "Shelling Peas," afterwards presented to Lord Leighton. While in progress a friend spoke admiringly of the background, which, though only vaguely rubbed in, was sufficiently in tone with the figure and admirably suggestive. "If I were you, Millais," remarked the friend—who was also a limner—"I wouldn't put another touch to that background." "Nor would I if I had my way," said the other artist; "but the public won't let me. They would say that the background was unfinished, or only canvas daubed over." All the same, that sketchy background was never touched again, or very slightly, greatly to the value of the picture as a whole. We forget who sat for "Shelling Peas." But it is pretty generally known that Millais availed himself rather extensively of the services of personal friends for many of his best "fancy" pictures. Many of their names have been mentioned in print, and these include the artist's entire family.

HIS MODELS.

The future Lady Millais did duty as model for the wife in the famous "Order of Release," exhibited in 1852. Miss Ryan (afterwards Mrs. Coventry Patmore) served similarly for "The Angel in the House" (same year), and also for the female figure in "The Huguenot" and for "Ophelia." The Huguenot himself was General Arthur Lempriere, of Jersey, whose family were on intimate terms with the Millais'. The girl in the "Black Brunswicker" was painted in 1860, from Mrs. Perugini, the second daughter of Charles Dickens. For "My First Sermon" (1863) the artist's eldest daughter, Effie (afterwards Mrs. James) sat, and ten years after she stood for "New Laid Eggs" while her sister performed a similar duty for "Forbidden Fruit." Many other notable works of the kind were derived from the artist's children, and only in one case were the sittings remembered with sadness by the parents. This was in respect of the "Boyhood of Raleigh," painted in 1870. The two boys figuring in the composition were portraits of the artist's two sons, and one of them, a pretty, fair-haired lad, never lived to be a man. The three Millais daughters—Effie, Mary and Caroline—sat in a group for the picture of "The Sisters," whilst "Sleeping," "Waking," and "The Minuet," were obtained from the same sources. A friend once remarked that

marriage in Millais' case had proved a highly lucrative investment, as the profits derived from the family posings had from first to last been worth some thousands to the artist. In 1868 Millais had for a sitter a pretty, fair-haired child named Nina Lehmann. She was painted seated gracefully upon a china tub. Some years after the same subject performed much the same duty in a different pose. But her name was then changed to Lady Campbell, and that name was attached to her portrait. The head of the old man in "The North-West Passage" was that of Trelawney, a famous explorer, and the ever popular "Cinderella" was a daughter of Buckstone, the actor.

A Favourite Recreation.

The artist's favourite recreation in town was whist, in which he was considered a proficient, and he was often to be seen in the afternoon, when the day's labours at the easel were over, in the card-room of the Garrick Club, to which place he would walk, if fine, from Palace Gate by way of exercise. His love of whist may have suggested the subject for the artist's most striking portrait group of three young ladies playing the game with a dummy, which, under the title "Hearts are Trumps," became one of the Academy sensations of 1872. "The last occasion of our meeting," writes a friend, "was as recently as February 11th of the present year, shortly after his nomination to the presidential chair of the Royal Academy. Of course I congratulated him upon the approaching honour. But he did not seem to regard it as a subject for much felicitation, and remarked, in explanation, "The duties promise to interfere with my private work, though I intend to ask for half-a-dozen secretaries at least." He spoke then, as he had done for more than a year past, in a husky voice and almost in a whisper, while his deafness in the right ear was so great that in walking on he presently halted, and, taking me by the shoulders in his playful, unceremonious way, placed me on his left side, saying, with a delightful glance, "Now, sir, I can hear you better." Upon my asking presently whether he felt equal to preside at the forthcoming banquet, he said, "Oh, dear me, yes! Why, I was in the chair last year and my voice was as bad as it is now. But they heard me right enough. Still, I rather think there will be no dinner this year on account of poor Leighton's sad death."

His Work in Illustration.

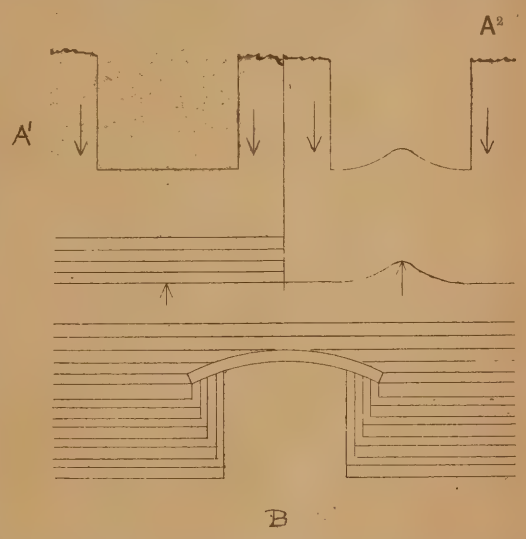
It must not be forgotten that while in his early and early-middle period Millais was painting, and proving a dexterity beyond all previous experience, he was achieving a success not less absolute in the domain of illustration and drawing upon wood. In "Once a Week" and "Cornhill," not to mention other individual works, Millais joined with Sir John Gilbert, Mr. Sandys, Fred. Walker, Pinwell, Mr. Du Maurier, Mr. Holman Hunt, and others in founding the great new school which had, in a measure, been inspired by the wonderful works produced by Menzel for his "Frederick the Great." Inspired only: for the new men were wholly original; and the greatest of them all was Millais. Not only did he head the band of the new emancipated school of wood-draughtsmen (for his draughtsmanship was more brilliant and suggestive than even Walker's), but by the force of his genius and persistent personality he helped to revolutionise the Art and craft of wood-cutting. It was for this reason that he had so deep a love for black-and-white illustration—a thing, generally speaking, unusual in a born colourist—and that he maintained before a Royal Commission that the black-and-white Art, with John Leech as the apostle of it, should be properly represented in the home and included in the ranks of the Royal Academy.

The Rev. C. W. Grove, who recently died at Tewkesbury, was widely known as a most munificent donor to Tewkesbury Abbey. In addition to large pecuniary donations towards the restoration and maintenance of the historic edifice, the fine stained glass west window was put in at his expense, as well as ten windows in the Nave and the east window in the Ambulatory. The large modern Organ and a brass Lectern were also his gifts.

EQUILIBRIATED FOOTINGS OF FENESTRATED WALLS.

The frequency of the occurrence of cracks, fissures, bulges, and distortions in fenestrated walls of buildings is due to an unequal distribution of the loads on the footings underneath the pier portion of the wall, and thus producing an excessive pressure upon and unequal settlement of that part of the foundation soil. In old buildings a central girder frequently ran into a pier between a pair of windows, thus causing the unequal loading which in turn produced a deeper sinking into the soil than the contiguous bay parts of the continuous foundation underneath the fenestral voids. Another common source of cracks, &c., in dwellings is the wide doorway with sidelights, whereby the imposts of the broader opening are more heavily loaded upon the foundations than the portion under the void. It is only the part of the foundation wall underneath the lowest void of the bay portion of the wall that produces direct pressure on the soil underneath the bay. The other wall transoms between the vertical tiers of voids have their weights and external loads transferred to the piers on each side equally. A fenestrated wall thus consists of the piers or vertical continuous solids, and the bay of vertically alternate voids, and solids at the floor levels. Unequal settlements of the continuous foundations must naturally follow this manner of unequal unit loading of compressible soils with its unequal reactions. Hoop-iron bond has been employed for over half a century for the purpose of counteracting the tendency to cracking and distortion of fenestrated walls, as effects of unscientific design of foundations.

Inverted Arches.



The inverted arch is another expedient of more restricted application. It is used under wide openings, and is intended to impart the properties of a reinforcing beam, but it only imparts the compressive resistance on the lower side of the beam arrangement. It fails, however, to afford any reinforcement of tensile strength, and, therefore, does not fulfil its assigned purpose to act as a beam. This pseudo beam, or the ordinary form of masonry underneath the lowest void, Fig. A^1, is supported in the centre and loaded at the ends in the directions of the arrows by the imposts of the piers, which receive their maximum loads by transference from the bays. The support in the centre of the masonry beam is derived from the reaction of the centre, partially loaded, foundation soil. The soil under the bays has an upward reaction equal to the difference between the maximum loaded impost of the pier and of the partially loaded bay. We may, to illustrate this, assume a moderate case of a London house, of a maximum load of three tons per square foot on the pier impost, and of a quarter ton per square foot on the partially loaded bay. The difference of $2\frac{3}{4}$ tons per square foot of upward reaction acts on the bay footing area with a maximum leverage of half the width of the opening. There needs, therefore, be no surprise that cracks and distortions are thus produced in superstructures as are frequently to be seen in districts where the foundation soil is clay or compressible soil. Fig. A^2 is an exaggerated appearance of this upward reaction, showing two reverse semi-eliptic curves joined at the apex.

The Equilibriation.

A fenestrated wall thus partakes of the principle of independent piers with intervening transoms or arches, and, therefore, continuous footings are inimical to equilibrium. The axial loading areas should be central to the distribution of the footing areas. The centre of gravity of all the loading points upon the fenestral piers, as regards their relative weights and positions, is the axis of loading. This axis is, therefore, the centre of the pier footing area, and the footings should be returned symmetrically round this area, with the proportionate projection of offsets. The footings, returned squarely from the front, are shown in Fig. B, which is an isometrical projection as if seen obliquely from above, combining plan and elevation. Since the pier footings are thus returned at the bays the continuous foundation wall must be supported across the bay, from which the footings are thereby removed, by an arch springing from the returns of the pier footings as in Fig. B. This arch may be of one or more rings of brick in depth according to the extent of the span, and if basement floor joists are supported by it, its strength should be adequately increased.

Built-up Footings—Transverse Strength.

In brickwork footings the transverse strength is often deficient, which aggravates unequal settlements, due in the first instance to excessive loading of fenestral piers transferred from the bays. The failure of the footings in such cases, which act as cantilevers, takes the form of opening of the back or inner joints, whereby the footings become split up into two bent levers, or cantilevers. When the footings are four or more bricks (headers) wide subsidiary cracks develope in time in one or other of the cantilevers. The transverse strength of brickwork footings when more than two bricks (headers) in width must be gauged, not by the transverse strength of the single bricks, but by the adhesive strength of the mortar. Brickwork of good hard bricks, carefully laid in good stone-lime mortar, can only be taken at about 40 lbs. per square inch of cross-section as its centre breaking strength. This is equivalent to 720 lbs. (40×18) per square inch of modulus of rupture. In round numbers this would be about 7-8ths

of the modulus of rupture of single sound hard common brick, while it would be about five times that of soft bricks.

A new Free Library is being erected in Antrim Street, Belsize Park, at an estimated cost of £2,300. The building will be one of a series of branches of the Central Institution in Finchley Road, and will occupy an area of 5,200 ft., the site having been purchased by the Vestry from the Ecclesiastical Commissioners for £400.

According to a Paris correspondent historic Malmaison is to be put up for sale by order of the Civil Tribunal of the Seine. The place is in a state of gross neglect, the house itself being practically a ruin. The upset price of the whole property is 101,600 fr. Josephine de Beauharnais, then Madame Bonaparte, bought Malmaison for 160,000 francs. The Empress Josephine died at Malmaison on May 29th, 1814, her body resting in the Parish Church at Rueil close by.

There is some chance of making a beginning with the Dublin Main Drainage Scheme, which was agreed to early in the year. The project is an intercepting sewer. In connection with the proposed works the Corporation have acquired from the Government the Pigeon House Fort, at a cost of £65,000, after payment of which there remains of the loan only £80,000. The contractor, however, is bound to commence at whatever point or points and in such portion or portions as the engineer may direct,

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

THE A. A. TOUR.

BY OUR SPECIAL REPRESENTATIVE, WITH STROLLING SKETCHES BY JOHN BEGG.

WE all know how difficult it is to arrange to find leisure for even a week's sketching tour. When that amount of difficulty is multiplied by twenty-four, or thereabouts (the number of men who represented the Association in Kent and Sussex last week), one arrives at an idea of the importance of this annual event.

Still, however important, it is hard to write about it in an interesting manner. The *motif* of any article describing a town is necessarily identical with the *motif* of the town itself. This, again, must needs depend on two things, the interest of the scene of the town and that of the personality of the tourist. Now, to nearly every reader who is only human, the personal, the human interest is sure to be the more enticing: but when your tourist consists of a company of twenty-four men, your interest becomes divided among twenty-four personalities—becomes in fact twenty-four interests. When we read of Napoleon's wars, it is our sympathy with Napoleon (or his fascination for us) that helps us on, and we do not seek to divide our sympathy among the individuals of his army. How much more charm has the history of an empire, which hinges on the person of the emperor, than that of a commonwealth! It is true our little army carried with it its emperor—the President; but with him also, claiming a share of your sympathy, went three Past-Presidents, a Vice-President, and last (but very far from least) an Honorary Secretary. And the A.A. is a commonwealth in whose little field-force of volunteers for the Autumn manœuvres, everyone, even the President, ranks but as a citizen and a private soldier. So for a *motif* we are constrained to try the interest of the scene of operations, and here again are difficulties. For the scene of operations has been chosen more or less on account of the strategic advantages of the headquarters—the good house of the Castle Hotel, Tunbridge Wells; and while rest and reflection for body were there unvarying in excellence, the food for mind in the surrounding country varied much both in character and quality. I must, therefore, crave your kind indulgence if my account of the town seems to waver in intention between the tourists and the things they saw—of the things they ate and drank you would not care to know. Twenty-four (or thereabouts) good men and true, escaped away, some of them from wives and families and other cares, most of them from Town (where there is care enough)—all from work, found themselves on the morning of Monday, August 10th, about the hour when the T square is wont to be dusted, *en route* by train from Tunbridge Wells to Etchingham, there to begin proceedings (as is ever only fitting) on holy ground.

Etchingham Church is an interesting one of the fourteenth century, and with a plain massive central Tower. It has a very satisfactory plan, and presents a fine lumpy mass externally. This immediately attracted a swarm of our "lightning sketchers," who in turn seemed to attract some thunder clouds—result, a stampede for the shelter of the interior.

We drove off in pelting rain, but this had ceased before we reached Ticehurst, some four miles distant. A quaint village this, but the Church is the chief attraction, partly for the Tower (a western Tower) and the treatment by which it is joined to the Nave by powerful buttresses taking the thrust of the Tower arch, but most of all for the splendid stained glass. We burned to draw this, but the shortness of our time and the necessity of lunch prohibiting such an undertaking we found ourselves without heart to attempt anything else. In one window there is a canopied border, with angels worked in among the canopies, that beats any bit of the kind in glass design I ever saw. The drawing is delightful, the colour exquisite—words cannot describe it, you must go and see it for yourself.

About five miles south-west and a few miles apart are two good Elizabethan Houses, Holmhurst and Bateman's Farm, the latter of which is really very fine. I think I speak quite critically, uninfluenced by recollections of the hospitality of the kind tenant of Bateman's. Even that was forgotten when, on driving into Burwash, we caught a glimpse of the eighteenth century Houses there. The Church is the guide-book attraction of Burwash, but even that proved a star of very minor magnitude compared to Mr. Freeman's House, where we revelled in plaster-work of the best, a staircase and a doorway, if not to rave about, at least to draw and reproduce at the very next opportunity; and very unwillingly you may be sure it was that we answered the call of the secretarial whistle announcing time to drive off to catch our train. Then back to "The Wells" we went to dine, and afterwards to walk the Pantiles, to "take the air" and imagine ourselves back again in the days of the beaux, ere the snuff-box had been ousted by the cigar and the cigarette, and when such a marvel as twenty-four Architects met togther in one spot would scarce have been dreamed of.

On Tuesday we started off in a similar direction, and drew a large circle over the country, visiting Wadhurst, Mayfield, and Groombridge. Wadhurst has a large Church with a timber spire, shingle-hung, and con-

tains a number of interesting cast-iron floor slabs, but our tastes took a picturesque turn, and most of us went for peeps down the village street and bits of the crumbling tile-hung cottages. A short drive took us to the charming village of Mayfield. Here we descended on the "Palace" (now a Nunnery) which St. Dunstan built, they say, and where for centuries the archbishops of Canterbury were wont to dwell. Here the lion is the great Hall which now forms the Nunnery Chapel, built by Archbishop Islip about 1350. Its characteristic feature, shared once by the Guildhall, London, is its open timber roof whose purlins rest on three great stone arches 39 ft. in span. The thrust of these is met by splendid buttresses, between which are segmental arches placed longitudinally over the side windows. The Church of Mayfield repaid a visit, for it has some fine Perpendicular woodwork (bench-ends, choir-screen, Aisle-roof) and a couple of splendid brass twenty-four branch candelabra. There

themselves away from the second tea which here fell to our lot this afternoon, found time to make a few sketches to remember it by. It is a plain enough brick house, *made* first by the charming stone Portico "in the Italian manner," and second by the complete moat that surrounds it, with the stone bridge and gates opposite the Portico. The place breathes of bye-gones, English bye-gones. "An English Home" is the phrase it seems to call up in your mind, and you look at the Italian Portico and the Indian peacocks, and worship them as English too. The place is charming, yet it is hard to say just where the charm comes in, for the house is an ugly one, though redeemed by the Porch; yet without this it would, one feels, still be charming.

We drove on Wednesday to Penshurst and there spent a most enjoyable forenoon. The road soon took us among a sprinkling of modern Houses and Cottages of very decent design, where the bear and ragged staff—the

mention among so much, that may be the silken hangings in the second room, and the Holbein tapestries in the third. What a fine proportion the Gallery shows! What endless "tips" are to be got from the furniture of these rooms; what delicious patterns from the old stuffs of curtains, chairs, cushions! Then what a trial it is to fingers that itch to draw the Great Hall roof, or the tracery of the windows, or the picturesque groupings of turrets, windows, chimneys, all round the exterior and in the courtyard, to know that there are Devey's delightful gardens to be seen, with their tall yew hedges trimly clipped, making innumerable vistas of heavenly sweetness! That in the owner of Penshurst Devey must have found an ideal client was admitted on all hands, and that he would also have found him an apt pupil had he lived was amply proved by a visit to the garden which Lord de L'Isle has added to the Vicarage from his own design. Our punctual Secretary's whistle never sounded more un-

CHIDDINGSTONE: VILLAGE.

are several good houses in the village—of course the well-known "Middle House," dear to lovers of half-timber work, and dear to us for evermore for its owner's most undeserved (and, indeed, most unexpected) hospitality. But best of all is the house opposite, which might be drawn, but cannot be sketched—a Gothic house of stone—made Georgian by removing tracery and substituting sash windows, and by adding a charming porch, steps, and front gate and railings. It may not sound attractive, but it is.

Then a long drive took us north to Groombridge. A drive through some of the finest scenery in East Sussex, on a perfect day, with glorious panoramas opening out now on this side of the hilly road, now on that, along the crest of a ridge, then driving into a valley shady with woods of pine, oak, birch, or brilliant with purple heather. A drive to remember.

Groombridge Place is also something to remember, and those of us who could tear

badge of the Dudleys—mark the possessions of Lord de L'Isle, and call attention to the fact that the good taste which produced these Cottages is that of his lordship. The village of Penshurst is full of material for the sketch-book—the Street, the Forge (modern), the Vicarage, the Church. But here (as at every place we have visited on this excursion) there was so much to see that sketching generally meant a waste of time, so what time we had we mostly spent at Penshurst Place, the lion, of course, of the neighbourhood. After we had given over a few minutes to the vanity of our noble selves, by submitting to a group-photograph at the hands of our honorary amateur photographer, we attacked the House in full force and took it by storm. I will not attempt to rival Murray's Guide by giving any description of this noble pile. Neither will it serve any purpose to dilate on our impressions of it. We wandered through the rooms of the main suite, which Devey so splendidly restored, feasting on the treasures there. If anything can be selected for special

welcome than when it announced that the time had come for us to tear ourselves away from Penshurst, and we went consoling ourselves (the most of us I would be bound) by promising ourselves another and a longer visit in the near future.

The village of Chiddingstone was our next halting place. Here the party broke itself up into two camps, one bent on transferring as much of the Church to paper as could be done in twenty minutes, the other hungering to devour the famous half-timber Houses in the village street. These are singularly perfect as far as their state of preservation is concerned—indeed few better examples are to be found in this quarter of England; so many eager foot-rules toyed lovingly with their scantlings.

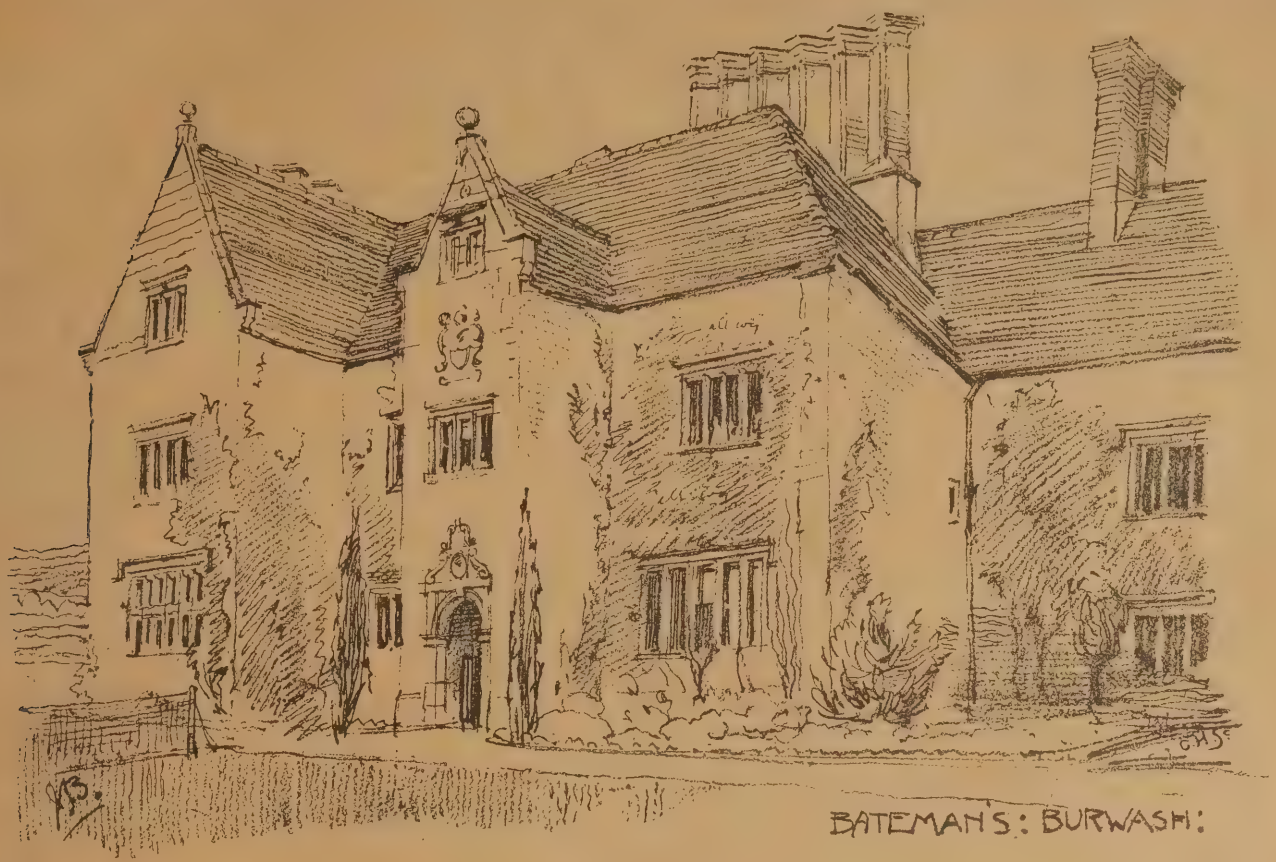
A three-mile drive next took us to Mr. Samuel Morley's House at Leigh—a work of Devey's, where the chief interest lies in the formal garden, and in the masterly way in which the Architect has set his House on the ground. To come here after Penshurst—

from an old to a modern Country House—gave us an object lesson too useful to be missed.

The fourth day was spent in Canterbury. Our modern pilgrims travelled through the heart of Kent amid delightful Kentish scenery. Here and there would come to view, now a home-like farmstead, with its hop-fields and oast-houses; now a quaint village, with its Church rich in warm colouring; now a picturesque windmill. And always the same rich country, and the hedgerows by the railway side straight and full and trim. The pilgrimage was a more rapid one than that of Chaucer's heroes, but his pilgrims could not have been more keen to reach their destination, nor did they beguile the way with tales more pungent or more witty than you may be sure did those of Thursday last.

Under the able guidance of Mr. Clarkson the party was driven first to the Hospital of St. Nicholas, at Harbledown, a Leper-House entering by the noble West Gate. We made mental notes of the scores of "bits" of street Architecture that our fingers itched to draw; we let those fingers have a little relief over the Bridge Hospital and the gateway of St. John's Hospital, and settled down to a more systematic examination of the ancient Monastery of St. Augustine's (once the Cathedral's rival), now connected to a College by the aid of Mr. Butterfield. Here the interest is mainly archæological (though I mean no slight to the Architect just named), and we had an opportunity in the massive ruins of the Church of studying the peculiar features of Norman masonry.

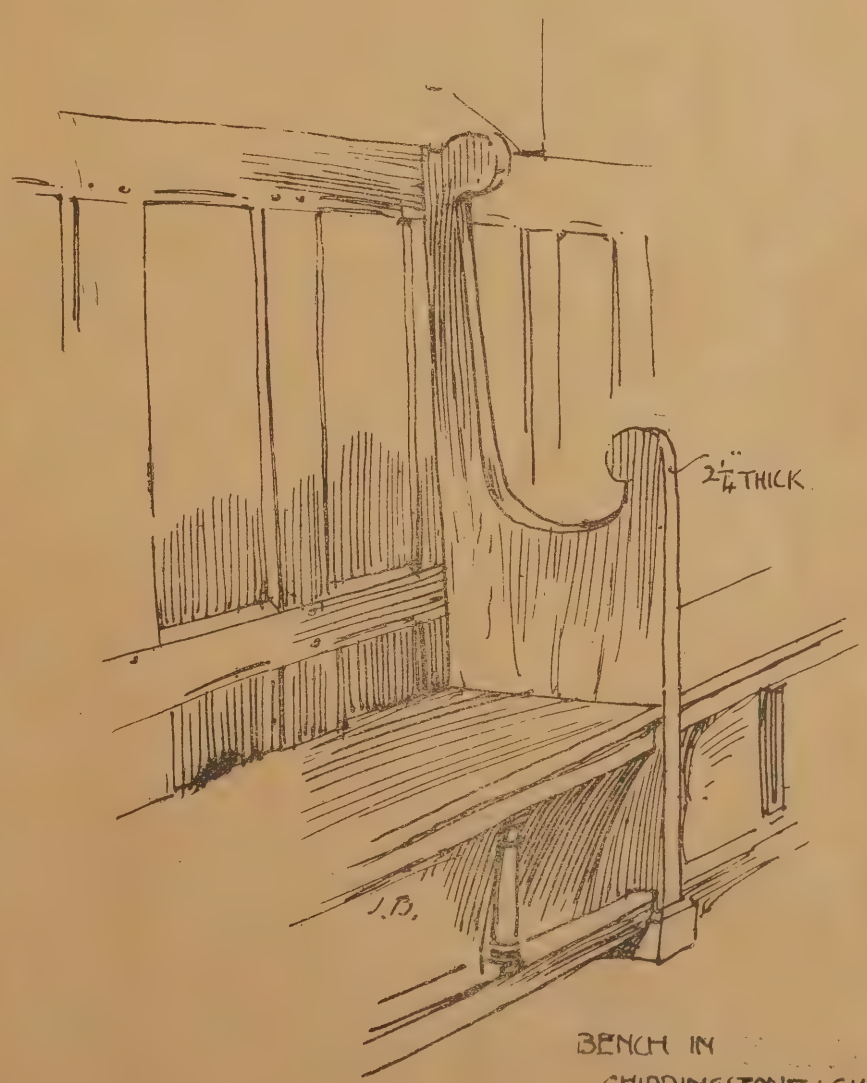
The afternoon was well advanced before Mr. Clarkson handed the party over to the care of the Cathedral vergers. To enumerate the buildings that we had meanwhile been shown would be to trespass on the sphere of the guide book, as it certainly would to give any description of the Cathedral itself. There was time for no more than a walk waiting to be drawn, of object lessons for the student, and of historical interest without end; and here one may find a feast, be he Painter or Architect or Archæologist. We returned to headquarters with empty sketch books, but with full satisfaction of having spent a day as tourists of the highest order—and there is no tourist of a higher order than an Architect at Canterbury.



The last day of the excursion (Friday) dawned wet and miserable, and the party started off with spirits just a little damped. The train took us to Sevenoaks Station, and from here we drove, mackintoshed, to Knole Park. Friday is the regular public day, but to the Association the privilege was extended, by the kindness of Lord Sackville, that we were allowed to swarm all over the house and draw whatever we would. But what an *embarras de richesse* we found ourselves among! The plaster ceilings, the fireplaces, the splendid "Brown Gallery;" then the carpets, the furniture, the pictures! The

FROM HOUSE IN BURWASH VILLAGE.

in Chaucer's time, where there is a quaint Chapel (Norman and Early English), with a sloping floor, and where there are also many fine relics in the Hall. The Chapel interior gives a lesson in the use of colour-decoration. The painting, which can be distinctly traced, is applied all over to an interior that is almost devoid of mouldings—nothing but colour and the proportion of the Chapel. We were called away all too soon, and when we had climbed again into the carriages, and our most greedy sketcher had made his usual narrow escape from being left behind, we were driven into Canterbury along the Pilgrims' Road. One is invited here to realise that this is the view the pilgrims got with their first peep of the Cathedral, but that is a tax on the imagination severe to most, for the town one sees is as a lake to a pond to what they saw, and the Cathedral had then of its three Towers but the central Tower alone.



The most of the day was spent in driving to the chief points of interest in the town, round, conveying to those who had not seen Canterbury before (to their shame there were many such in the party) but a confused idea of its glories. Lanfranc's magnificent Crypt was first visited, where now the Dean and Chapter's excavations show the fine proportions of the massive piers, and where you may see the piers coming boldly down through the vault to carry the later Choir, and the beautiful picture made by the later Crypt under "Becket's Crown." Then we were led to William of Sens' Choir, and saw how his mantle fell on the English William in the Retro-Choir. What an endless field for the student we have here! What stone and woodwork, what bronze and iron! One thirsted to measure the beautiful wood canopy over Bishop Kemp's tomb—to draw the westernmost stalls and their canopies, and the Renaissance Bishop's throne, which modern enlightenment has discarded in favour of one in "Gothic." But I need not further catalogue the things we saw. Canterbury is full of ready-made pictures, only house is a perfect museum of everything that an Architect (in the widest sense of the term) delights in, so that one felt reduced to a state of mere helplessness in the presence of so much magnificence. One was torn by conflicting desires—to see everything and miss nothing, yet to carry away sketch-book memoranda of as much as possible. The exterior is rich in material to the draughtsman's hand, and of the gardens it would be impossible to convey by mere words any adequate impression. There is a delicious formal garden, with a small pond in the centre, all sunk deep in surrounding grassy banks, and all around is the noble park with ancient beech trees, and deer feeding peacefully on the grass at their feet. If we had been delighted with Penshurst we were still more charmed with Knole, and regretted keenly the rain that made it impossible to sketch it; but as we had done at Penshurst, we here comforted ourselves with a resolve to come again soon. As we were leaving the sun struggled once again through the

BATEMAN'S: BURWASH:

clouds, and for the remainder of the day we enjoyed the most perfect weather.

Then Ightham Mote. But first might have been seen the strange spectacle of four-and-twenty men camping right across the public highway, just beyond the village of Seel, merrily but industriously demolishing a sandwich lunch. This over, to the wonderment of the natives, and the debris cleared away, the party drove off once more, and no time was lost in getting to work at the Mote House. Inside there is not much of interest when you have seen the Hall with its stone arch acting as a roof principal (like those in the Hall at Mayfield Palace), and the Drawing Room and it curious old wall hanging of painted paper. But in the quadrangle and round the outside are plenty of pictures for the sketchers, who soon went to work, some with pencil, some with water-colours, for which the rich colour of the brick and stone, tile and timber, and this with the trees reflected in the water of the moat, formed a tempting opportunity. The Elizabethan stables, their half-timbered gables rising over the trees, also made a picturesque group; and when the whistle sounded for the last time on this excursion it was with no small unwillingness that books were shut and camp-stools packed up for the return drive to Tunbridge Wells. With this day the excursion practically ended. That evening the occasion was marked by the usual after-dinner speeches—by a general display of sketches, and criticisms full and free—and then by a "sing-song," such as is dear to the heart of the good fellows who had spent the week together. But, loath to part, the Saturday saw still a goodly number haunting Tunbridge Wells, where the quaint "pantiles" gave material for many a picturesque sketch, and the fine Queen Anne Church, which Thackeray has immortalised in the "Virginians," attracted many to draw the splendid plaster ceiling, and the bits of rich (and useful) detail that this building has in plenty.

BENCH IN CHIDDINGSTONE: CH:

SCARBOROUGH Workhouse is to be enlarged at a cost of £10,000.

A REVOLUTION IN ELECTRICITY.

ONE of the latest, and probably, from what can be gathered, one of the greatest discoveries in the march of industrial inventions, is the apparatus just recently constructed by Dr. W. W. Jacques, electrician to the Bell Telephone Company of Boston, for the production of electricity direct from the consumption of coal. It is claimed for Dr. Jacques's invention that it is capable of converting into electric energy 85 per cent. of the potential energy in the coal put under the furnace. This represents an advance upon present appliances which is simply enormous. The "scientists," of course, are thoroughly well aware that we have not been getting out of present machinery, electrical or other, results adequate to the coal consumed. Heat, as everybody knows, is concentrated energy, and, since upon the basis of the metrio-centrigade measurement, a unit of heat is equivalent to 424 units of "work," it is easy to calculate the amount of "horse-power" which ought to be got from the burning of a ton of coal, provided the heat could be fully utilised. But, to quote a well-informed writer on the subject, "the most improved triple-expansion engines have a thermo-dynamic efficiency not exceeding 19 per cent." Hence, even with the best mechanical appliances at present, four-fifths of the potential energy of the coal is not represented in the results attained. The greater part goes up the chimney shaft and is simply wasted. To produce electricity with steam power as an intermediary necessarily involves further loss from friction, for, whilst the best steam engines only represent 19 per cent., the best dynamos driven by steam power only give 17 per cent. of the energy of the coal consumed; and we are told that "in actual practice 10 per cent. represents a good result." The inevitable consequence has been that in spite of its manifest utility, electricity has remained dear; and though it has to some extent enlarged the field of industrial operations and added to the convenience of life, it has not had an influence upon things equal to steam. If, however, the invention of Dr. Jacques is what it is represented to be, all this is changed. It is manifest that if Dr. Jacques has succeeded in producing eight and a half times as much electric energy for the same consumption of fuel, and with far simpler mechanical appliances, he has rendered electricity at least twice as cheap as steam, and that steam before long will entirely cease to "pay." The appliance by which this is achieved consists of a pot of pure iron, surrounded by a suitable furnace. Into the pot is placed a quantity of caustic soda, and into the soda, which is reduced by the furnace to a state of fusion, is dipped a thick carbon rod, or prism. Beneath the carbon prism, and immersed in the molten caustic soda, is a hollow metal "rose," perforated with numerous holes, and connected by an iron pipe with an air-pump. From the air-pump jets of air are forced into the caustic soda through the rose, the furnace being meanwhile heated to between 400 and 500 degrees centigrade. The electrolyte (the caustic soda), thus impregnated with air, takes up oxygen in excess. The oxygen then attacks the carbon, which is gradually consumed. The result is the formation of large quantities of electricity, which is collected in the iron pot, forming a powerful current, flowing back to the carbon prism as the negative electrode. "The efficiency of 85 to 90 per cent. claimed for the Jacques apparatus is vouched for by distinguished electricians," and it is reported that from a Jacques battery of 100 cells, 12 ins. deep and 1½ ins. in diameter, a current was obtained averaging 90 volts and 16 amperes, and supporting thirty 16-candle power electric lamps for nearly 19 hours. The carbon consumed in the pots weighed eight pounds, the current representing 94 per cent. of the potential energy. In addition there was the coal for the furnace, the amount of which, however, has not been stated. The question that remains in abeyance about the invention is whether or not heat is absolutely necessary to the process. If a high degree of heat proves to be necessary, the percentage of results now claimed may on further investigation have to be considerably reduced. But it seems clear that a means has been discovered of rendering electricity cheaper than steam, and that means, in any event, a great step forward in industry and commerce.

THE A.A. TOUR: AT PENSHURST PLACE: FROM A SKETCH BY JOHN BEGG.

FOR the construction of the Marine Drive and Sea Wall Extension, at Scarborough, the tender of Messrs. B. Cook and Co., Battersea, amounting to the sum of £69,270, has been accepted, subject to certain formal conditions.

THE directors of the Peninsular and Oriental Company have acquired an extensive frontage on the river Thames, with the view, it is reported, of constructing their own wharves and warehouses, thus making themselves independent of Dock Committees, with their burdensome charges and constant disputes. In other words, they are to become their own dock-masters, and provide every accommodation on the river for their own fleet of vessels.

THE movement for the rebuilding of Wombwell Parish Church will have the thorough support of the inhabitants of the little colliery town which lies midway between Barnsley and Mexbro'. The present Church is at once ugly and unpretentious. So ugly, indeed, is it that had it been more assertive it must long ere this have been removed.

THE projected public improvements in the centre of the town of Chapel-en-le-Frith may now be regarded as settled, a communication having been received from the Highway Committee of the Derbyshire County Council, giving its sanction to the same. Some of the oldest property in the town will be demolished, and a new street 30 ft. in width constructed to join the Midland Station Road from the main street.

THE ARCHITECTURE AND BUILDINGS OF CHINA.

UNLIKE other nations, the Architecture of China has retained its own particular character during all times, without any changes and uninfluenced by that of other countries. The origin of building is ascribed to the Emperor Fou-Hi in 368 B.C., but there does not exist any building of that date, probably from their being generally constructed of wood, besides, in the year 246 A.D. all the existing buildings of importance were destroyed by order of the Emperor, so that there should be no record of the power of his predecessors. The type of all Chinese buildings, whether used for residences or as places of religion, is a tent. As the convex form of their roofs shows, they are copies of those made of more pliant materials. Wood is the material generally employed, and that most in use is the nan-mon, which is very hard, and is said to last as long as a thousand years, but stone, marble, bricks, bamboo, and tiles are sometimes used. It is strange that prejudice should exist to such a degree that we find no improvement whatever, either in the constructive or decorative portions of their buildings, and it is almost looked upon as a breach of the laws to depart in any way from their supposed perfection and antiquity. One reason advanced as a hindrance to any innovation in the one style of Architecture is that everyone is subject to the restrictions of public functionaries (who are more or less a type of district surveyor); under their supervision every one is obliged to build according to his rank, and for every house a certain size, as well as details, are fixed. According to these prohibitions the level of the ground floor, the length of the rontage of the building, and the height of the roofs, are in a proportionate scale, from the Emperor to the citizen. The slightness of the construction limits the houses to one story only, and the Palaces resemble a number of tents united. The highest Pagoda is nothing but a succession of tents piled on one another, instead of side by side. Thus the largest towns and the smallest villages remind one of permanent encampments. The most remarkable of the substantial works of the Chinese are the Bridges; that at Loyau is composed of two hundred piers, built with very large stones, which support enormous granite lintels, or stones placed horizontally, crowned by a balustrade. There are numerous Bridges, which by the Chinese themselves are considered to be works of great magnitude and importance. The Temples are generally small and consist of only one chamber, which is the sanctuary of their idols; on the outside is a Gallery. In some instances the interior is spacious; that at Ho Nang, is 590 feet in length and constructed entirely of wood, covered with painted and varnished porcelain. The Pagodas, peculiar to China, vary from six to ten stories in height, diminishing upwards, and the plan is invariably an octagon. The most celebrated is "The Tower of Porcelain," which is 40 feet in diameter and 200 feet high, situate at Nang-King, in the centre is a staircase connecting each stage, which is lighted by windows on four sides; the whole is cased with porcelain. At the entrances of streets, and before many of the principal buildings, are to be seen commemorative buildings and triumphal arches, the better class of which consist of a central and two side openings, the lower part being generally of stone without any mouldings, and the upper part of wood supported on horizontal lintels. Of the great wall much has been written which has perhaps caused a much higher opinion to be formed of the monuments of the Chinese than a careful survey justifies. It extends for 1,500 miles and consists of an earthen mound faced by walls of brick and masonry: its total height is 20 ft. The top forms a platform 15 ft. broad, increasing to 25 ft. at the base of the wall. At intervals of about 200 yards are Towers of 40 ft. square, which diminish to 30 ft. at the top. Commencing to the east of Pekin and extending along the frontiers of the provinces, it was built as a protection against the Tartars, and employed millions of workmen for ten years in its erection. It has now stood nearly sixteen hundred years. From the Architecture as well as the ornamental works, the impression is conveyed to us that, generally speaking, the mechanical skill and imitation are the only faculties that are possessed by the Chinese, as their Arts seem confined to bad copies of the works of Nature, without any feeling of composition or invention.

THE A.A. TOUR: ETCHINGHAM CHURCH: FROM A SKETCH BY JOHN BEGG.

THE contract of Messrs. Rudd and Son, of Grantham, has been accepted at the sum of £1,500 for the requisite alterations to the Grantham old Workhouse to adapt it for a temporary Asylum.

ELECTRIC tramways have been inaugurated in Cairo. The rails and the building works have been furnished by the Compagnie Economique, of Belgium, while the machinery has been supplied by a German company. The length of the rails is 20 miles.

WE are informed that Messrs. Lysaght & Co., iron manufacturers, Wolverhampton and Bristol, have completed arrangements for establishing large works at Newport, Monmouthshire, by leasing 70 acres of land there, and it is expected that the works will be completed in five years' time.

DURING the demolition of a building in Burnett's Close, High Street, Edinburgh, part of a wall, about half a ton in weight, suddenly gave way, and instead of falling towards the outside was precipitated into the interior of the building. The weight of the material caused part of the flooring to collapse, with the result that two of the men—James White and James Finnigan—were thrown down a distance of about thirty or forty feet and severely cut and bruised.

ONE of the historic seats in Leicestershire, the Old Hall at Queniborough, about six miles from Leicester, is announced for sale. It was this quaint old mansion, rich in historic associations, which Prince Rupert made his headquarters in 1642, shortly before the siege of Leicester, and when he was at the head of the whole body of the King's cavalry. The Hall is said to be in much the same condition to-day as it was during the sojourn of the Prince.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
August 19th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."
—JOHN RUSKIN.

A CURIOUS discovery has been made by the workmen engaged upon the restoration of Peterborough Cathedral. Under the southern leg of the parvise or Library, within the west front of the Cathedral, a number of blocks of moulded marble have been found, which, on being put together, make a portion of a huge basin between 20 ft. and 30 ft. in circumference. It has apparently a series of small basins, or hollows, running round it united to each other, but not extending to the centre. It is expected that further fragments will be found which may cast additional light upon its origin. The fragments were cast into the foundations where they were discovered by the fourteenth century builders, A conjecture has been made that it may be the bottom basin of an ancient fountain from the Cloisters which, having become broken, probably from frost, the fractured materials were put into the foundations where they were found.

THE gift of Babylonian antiquities to the Louvre turns out to be less important than was at first supposed, and the circumstances seem to justify the French Ambassador's moderate request and the Sultan's acquiescence in it. During a long sojourn in Irak-Irabi, M. de Sarzec, a French archæologist, discovered and collected a quantity of tablets or tiles, to the number of some 30,000, bearing inscriptions in cuneiform character. The collection cost much time and money, and it was the French Government which provided M. de Sarzec with the funds necessary for his researches. The relics which he found were all sent to the Imperial Museum, of which Hamid Bey is the curator. Last month M. Heuzey, curator of the Museum of the Louvre, came to Constantinople, and begged M. Cambon to ask the Sultan to give him, for that Museum, 30 of these tablets—that is to say, one in every thousand. The Sultan consented, and sent orders to Hamid Bey to hand over the stones to M. Heuzey; but Hamid Bey, who is an enthusiastic archæologist, strongly opposed the surrender of any part of the Babylonian spoil, and for a full fortnight M. Heuzey was unable to obtain delivery of a single tablet. The orders were repeated, but Hamid Bey declared he would never be an accomplice in the spoliation of the Museum of which he had been made the guardian. At length, after receiving reiterated and imperative commands from his Majesty, Hamid Bey placed eight tablets in the hands of M. Heuzey, declaring that if more were required of him he would decline to obey, and would send in his resignation.

MR. F. J. WILLIAMSON has for many years executed commissions in sculpture for the Queen. Born in 1833 in the heart of London (Camden Town), he attended, as a boy, a private School at Hampstead. In a monumental mason's yard in the Euston Road he saw a figure in stone representing "Faith." This caught his youthful attention and fascinated him. He sketched the figure over and over again until he had a fair representation of it, and from thenceforward his aspirations tended Art-wards, and more especially to sculpture. After a time he was brought under the notice of the late John Bell, the sculptor of the Guards' Memorial in Waterloo Place. When he left School, Mr. Bell gave him permission to work in his Studio, but soon after advised him to attend the Modelling Class at Somerset House—at that time the home of the Royal Academy—of which John Bell was the instructor. For several years subsequently Mr. Williamson was in the Studio of Mr. J. Foley, R.A. He was introduced at Claremont by H.R.H. Princess Louise, and was commanded to prepare designs for some memorial sculpture to the Princess Charlotte to be erected in the Mausoleum at Claremont. These were so successful that the completed works were placed in Claremont House instead of the Mausoleum. Since then not a single year has passed without a Royal commission being placed in his hands. The Prince and Princess of Wales are the only two members of the family who have not sat for him. The Queen has specially honoured him in this respect, for rarely has she given other artists more than two sittings for one portrait, while Mr. Williamson has had as many as he deemed necessary. His principal representation of Her Majesty is that which stands in the Examination Hall of the Royal College of Physicians, on the Victoria Embankment, which was proclaimed by the Prince of Wales, when he unveiled it, as "the finest portrait of the Queen ever produced." The bust of Lord Tennyson, which appeared in the Royal Academy in 1894, was executed after the death of the Laureate, and was a special commission from the Queen. A replica was afterwards done for the Corporation of London.

DURING the restoration of the Church at Llanblethian, a Crypt has been discovered under the South Transept, about 17 ft. in length, by about 15 ft. in width. It is approached by a flight of nine steps leading down from the Transept floor. At the bottom of the steps are remains of the iron hooks on which a door once hung. The chamber is lighted by three small openings, which were covered up with earth on the outside, and it is arched with stone from east to west, giving a height of seven feet to the crown of the arch. The whole of this chamber was filled with human bodies, about 250 in number, together with portions of stone coffin lids of thirteenth century character. The bodies have been carefully deposited in one large grave in the churchyard. The Transept, as it was supposed to be, over this Crypt has now proved to be a Side Chapel, for, on the plastering being removed and the old seats cleared away, the outline of an Altar, with a fourteenth century window over, has been brought to light in the east wall, as well as an arched Sepulchral recessed Tomb and a Piscina in the south wall. One side of the Piscina is constructed of a child's stone coffin lid, with an incised cross cut on the top, of thirteenth century character. Mr. C. B. Fowler, of Cardiff, the Architect entrusted with the restoration, knows of no Church in the county where there is a Crypt of this description. The Church, which stands in a commanding position, was at one time of much importance, and no doubt was surrounded by a large village.

NEARLY every ancient Church had its Charnel-house. It was used for depositing the stray bones of the dead which the sexton might happen to throw up in the course of digging fresh graves in the churchyard. It appears that the Charnel-houses and Crypts underneath Churches were among early Christians intended as reminders of the Catacombs—from Cata (downwards), and Kumbe, like the Welsh Cwm, meaning hollow—in which they formerly, in days of persecution, held Divine Services at Rome, in Gaul, &c. One authority states:—"The Charnel-house was generally vaulted in the roof, and was often a building complete in itself, having a Chapel or Chantry, attached to it. In such cases the Charnel-vault was commonly a Crypt under the Chapel, and even in Churches it was not uncommon for the Vault or Crypt to be employed as a Charnel-house." It appears that after the Reformation the Charnel-houses ceased to be treated with the deep reverence of Roman Catholic times. Many of the Reformers, in their excess of zeal, desecrated almost all things which, as symbols, had been associated with piety. The Crypts and Charnel-houses became to the living pits of horror, into which human bones were cast irreverently.

Two very interesting objects recently obtained have just been placed on exhibition in the Egyptian Galleries of the British Museum. The more important of the two is a group of two figures in limestone, representing a High Court official seated on a throne with his wife or sister. The head of both man and woman is ornamented with the usual Egyptian wig, painted a deep black, with eyes and eyebrows of the same colour. The body of the man is painted red and that of the woman yellow, in accordance with the usual Egyptian custom. There are a few incised lines of hieroglyphics giving the names and titles of the two parties, but they are so mutilated as to be almost unreadable. Date about 2333 B.C. The other object is a very large scarab in green jasper, of very elegant workmanship. The underneath part of the beetle is covered with a thin gold plate inscribed with Chap. XXX. of the Book of the Dead. This chapter was a favourite one with the makers of large scarabæi, and is an address to the heart of the deceased, which was weighed in the balance on the day of judgment.

FOR about two years M. Mercié's Memorial Portrait Statue in marble of Meissonier has remained in the garden of the Louvre, surrounded by a wooden hoarding, its base embowered in weeds that are bedded in chips and remnants of stone. At last this fine likeness of the great painter has been cleared of its encumbrances and surrounded with a parterre of flowers. It faces the monument of Raffet.

A HANDSOME Chalice has been given to St. Andrew's Church, Paignton, in memory of Dr. Goodfellow and his wife. It is hexagonal in form standing eight inches high, and is of silver gilt after the Corpus Christi pattern. On the front panel is a raised crucifix of solid gold, with the passion flower and lily set on either side with a sapphire and diamond, and nimbus set with small diamonds. Above the figure is a raised star, in the centre of which is a very fine Brazilian diamond, weighing upwards of 2 carats. On the opposite panel is the Agnus Dei, with nimbus set with small diamonds, and enclosed in a frame of rich tracery. The four intermediate panels are jewelled with amethysts, worked into handsome crosses, with a fleur-de-lis springing from each arm. The knop is pierced and enriched with amethysts.

AT Carlisle the new Girls' Board School in Brook Street was recently opened by the Mayor, Mr. Crowder. In addition to the girls' department there has also been added to the existing Schools a Cookery School with covered playground below, and the infants' department has been enlarged by the addition of a new Class Room and Cloak Room, affording accommodation for 78 more infants. The cost of these additions has been £5,217. The new department has been erected at the Brook Street end of the site purchased a few years ago, and comprises a large Schoolroom divisible into three Class Rooms for 60 children each, flanked on the Edward Street site by two and on the Howe Street site by one Class Room, access to the whole being gained through vestibules, one of which communicates both with the street and playground, and the other with the playground only, a spacious Cloak Room being provided contiguous to each. All the three Class Rooms are capable of seating 60 girls. A new arrangement of screens designed by the Architect and not hitherto adopted will also allow the main portion of the building to be converted in a few seconds into one large Hall for special requirements, educational or otherwise. The School has been built to correspond in appearance with the Boys' and Infants' Schools erected some four or five years ago; and altogether they form a very interesting block from an Architectural point of view, as well as being the embodiment of convenience. The Cloak Rooms, Lavatories, Teachers' Room, &c., are disposed on the playground side of the School-room, so as to have the most commanding elevation next the street. The angular form of the site renders the shape of the two Lobbies irregular, but does not otherwise appreciably affect the plan, which altogether occupies an area of

ver 6,000 superficial feet. Special attention has been given to the arrangements for ventilation and heating, and all the most modern sanitary appliances have been adopted. Mr. T. Taylor Scott has prepared the designs for the whole of the Schools, and the work has been executed under his superintendence by the following contractors:—Builders, Messrs. W. and H. Davidson; joiner, Mr. W. Latimer; slater, Mr. J. Hewitson; plumbers, painters, and glaziers, Messrs. R. M. Hill and Son; plasterers, &c., Messrs. R. M. Ormerod and Son. The furniture, &c., has been supplied by Messrs. Martin and Armstrong, and the heating and ventilating appliances by Messrs. E. H. Shorland and Brother, of Manchester.

THE final revision of the schedule of rents for the Workmen's Dwellings erected by the Plymouth Corporation at Prince Rock has been effected by the Council. As originally proposed the rents were on a somewhat higher scale, the wish being to make the property self-supporting. As now fixed the Corporation will stand to lose £223 per annum when all the dwellings are in occupation. As a matter of theory, the sound thing in Municipal schemes of this kind is to move on commercial lines. To make the buildings self-supporting is the correct ideal. To depart from it is to introduce the element of charity. One of the results of offering houses at less than value may be to attract such a rush of would-be tenants that unless some principle of selection is laid down there will be a risk of getting them filled by people who ought to pay the market price for the accommodation. It must not be forgotten, however, that the scheme is an experimental one; and in all experiments mistakes are apt to be made. The mistake in this case seems to be that a little too much money has been spent on the buildings. If anything, the houses are too substantially built. We should like to have seen small gardens attached, front or back, if not both. Had this been done the Corporation would have set a wholesome example to the speculative builders, who in the east of Plymouth have covered acres of what was open country with a howling waste of masonry, hardly giving room for a bit of green to vary the dreary monotony of stucco, slate, and macadam. As far as the Dwellings are concerned, they are solidly built; first-class material and the best workmanship have been put into them; and, with the single exception that even the higher-priced houses have no entrance passages, they are well and conveniently planned. The committee virtually confess that the buildings are a little too costly, because it is intended that those which remain to be erected on the site shall be put up more economically, so that the moderate rents now decided upon will pay the interest on the outlay. Some of the flats are remarkably cheap. Three rooms on upper floors may be had for three shillings a week.

WITH reference to the new Technical School proposed to be erected on land adjoining the existing public buildings at Bootle, the Borough Engineer and the Secretary to the Technical School recently reported to the Free Library and Museum Committee that the accommodation required would not be obtained for the sum of £15,000 voted by the Council. The Committee thereupon wrote to the Science and Art Department asking their advice and assistance in the matter. It was stated by Alderman Johnson, at a meeting of the Town Council on the 12th inst. that the Committee was most anxious not to exceed the amount which the Council had voted for the new Technical School, and were now making enquiries as to the cost of construction of similar Schools in other towns. On the broader question, as to how they were going to maintain the School when erected, he thought he was right in saying that it would be necessary for the Council to withdraw the £400 they now placed to the credit of the Library Committee for Museum and other purposes, and devote it to the Technical School. It was anticipated that with a good building and proper appliances the number of scholars would largely increase, and that with the amount they received from the excise duties, together with fees and grants from the Science and Art Department, they would be able to pay their way.

FROM Paris comes the news that the Woods and Forests Department is going to sell the ruins of the feudal stronghold of Montlhéry. This was one of the most important keeps in the Middle Ages. It commanded the road from Orleans to Paris, and was, and is still, majestic, both in Architectural character and situation. Montlhéry stands on the edge of the sad-looking but rich tableland of the Beauce, and on one side rises from a steep declivity. Beyond the slope is another plain, through which the Seine meanders. Corbeil and Etampes were practically at the mercy of Montlhéry. Hugues Capet, the Black Prince, Salisbury, Bedford and Louis XI. are associated in French history with this ancient stronghold. Boileau devoted a descriptive verse to it. The State bought Montlhéry in April, 1842, when Gothic Architecture was the rage. It spent about £200 in urgent repairs, on condition that the town at the foot of the Castle was to pay a Caretaker. The townspeople have since laid out a good deal of money, and are ready to take over the ruin and the ground it stands in should the Woods and Forests wish to be done with them. The fee for entrance to the Tower and park is one penny.

IT is said that the Duke of Devonshire is about to make some alterations at Devonshire House, Piccadilly, that will include the removal of the long wall which has hitherto screened his House from the road. Times are altogether changed from 1735, when Devonshire House was built by Kent. This wall with its two massive double gates, stretching from Berkeley to Stratton Streets, has always been a feature of Piccadilly; and although by no means a thing of beauty, it may be permissible to regret its removal and the consequent disappearance of the old-World air that it preserved to this very much modernised thoroughfare. One assumes that a light iron railing will take the place of the blank wall, and that the coach gates will remain, with the four beautiful bronze knockers, fashioned to represent Medusa's heads, that bespeak in some sort the Art treasures within.

THE Report of the Department of Science and Art of the Committee of Council on Education has just been issued in the form of a Blue-book containing, with the appendices, some 450 pages. In the Science Division it is pointed out that in the ten years from 1886 to 1895 the number of Schools has increased from 1,682 to 2,673, of Classes from 5,862 to 9,545, and of Students from 94,838 to 193,404. It is to be noticed that this increase has not been quite continuous, for the numbers for 1893 are higher than those of 1895. In the Art Division we find that 19,898 Elementary Day Schools with 2,192,253 Scholars were taught Drawing and examined. This is an increase of 251 Schools and 68,578 Scholars on the previous year. The grants for Drawing to Elementary Day Schools amounted to £164,494. In 1895 106,051 works executed in the Schools during the session by 23,593 Students were submitted for examination at South Kensington. There were 215 competitors for the 20 Local Scholarships and the 10 Royal Exhibitions. Three of the Local Scholarships and all the Exhibitions are held at the National Art Training School. A separate section deals with other Museums in connection with the Department supported by the State. The section devoted to Technical Education shows that the number of subjects sanctioned since the Acts were passed is 130. The expenditure of the Department in the financial year amounted to £745,470, apportioned as follows:—Expenses of administration, £47,402; direct payments, prizes, &c., to encourage instruction in Science, £156,775, and in Art, £71,939; services common to both divisions, £84,086; Institutions supported or aided by the State through the Department, £80,427; South Kensington and Bethnal Green Museums, £87,586; payments for instruction in Public Elementary Schools and Training Colleges in Drawing, £234,745; grants in aid of local Museums, £494, and in aid of Technical Instruction, £2,016.

Last month's excavations at Thera (Santorin) have brought to light, besides the agora, the remains of two public buildings—viz., the Gymnasium and a Stoa Basiliké. The number of the inscriptions has been increased to more than one hundred. Many of them belong to the Archaic period, and furnish fresh contributions to the history of the earlier Greek alphabet. Several new pieces of sculpture have also been found, but generally not well preserved. Amongst the detached fragments a peculiar importance is attributed to three youths' heads of perfect workmanship. All hope of results from the excavations of this season at Cuma, in Italy, has vanished. That part of the necropolis to which Mr. Stevens's work had been directed was evidently plundered, probably by people of the third to the first century B.C., who in order to bury their dead at a greater depth ruined or destroyed the old Cumæum Tombs.

AT a meeting of the Belfast Corporation Sir William M'Cammond said that 4 per cent. would be fair remuneration for the Architect in competition for the erection of the buildings at Purdysburn, and moved that that percentage be allowed. Mr. Lawther said that after a fair consideration of the circumstances of the case it was decided that the fee should be 3 per cent., and some of the governors thought that 2½ per cent. would be sufficient. Taking into consideration that they were limited to gentlemen belonging to Belfast, it was the feeling of the Board that 3 per cent. would be ample remuneration. He held that as Belfast depended for trade with Great Britain and the World generally that it would be unwise and a bad policy to confine the competition to Belfast. If the fee were raised from 3 to 4 per cent., and the competition confined to the city they would be going a step backwards. It would probably prevent Belfast professional men from getting situations in England and elsewhere. If the conditions of the competition were altered a resolution previously adopted would have to be rescinded and the competition made public. Some Belfast Architects had distinguished themselves by some of the finest buildings in England, and he thought the professional men themselves would rather have a fair competition. It might militate seriously against local rising Architects if it were said in England that no Belfast Architect could compete simply because the Board of Governors of the Asylum had prevented outside talent from competing. The motion was carried.

A LETTER, signed by the members within the district supplied by the East London Water Company, has been sent to the First Lord of the Treasury in regard to the failure of the supply of water by that Company, in which it was stated that the only manner in which its recurrence can be prevented and possible disaster avoided is that the whole supply of water in the metropolis should be in the hands of one authority, and that of a public representative character, so that when scarcity arises in one district it may be met from the supplies of other districts. In his reply Mr. Balfour said that the Government was deeply sensible of the importance of the question to London generally, and to the East End in particular; and that the next Session ought not to pass without a solution of the question being arrived at.

So far as London is concerned the 1896 Art season may be reckoned to be at an end, and on the whole there is small reason for regret that it is over. It has been by no means a satisfactory one, as sales have not been particularly numerous, and Exhibitions have been by no means of high quality. The Academy show was, says the *Globe*, one of the dullest which has been seen for many years in Burlington House. Very few pictures of conspicuous merit were included in it, and faults in hanging made it rather a dreary display. Possibly the provincial Galleries may in the autumn do something to atone for the metropolitan deficiencies; but at present the revival in modern Art, for which everyone has been hoping for some time past, seems as far off as ever. Whether the blame for the present stagnation should be laid upon the artists or upon the public is hard to say, for there are probably faults on both sides; but certainly popular opinion is by no means as well inclined towards modern Art as it was some ten years ago. The only thing that is evident is that there is no lack of buyers for Art work, but they prefer to spend their money upon the productions of deceased artists, and let living men severely alone.

IN New York the new Synagogue will be enriched with two relics of great historical interest. These are two stones, which will be richly mounted on mahogany tables, with a silver-chased plate recounting their story, which to a great extent is that of the first Jewish settlers in New York to gain recognition as a religious body. The stones are bound up with many interesting facts and incidents of that period. In appearance they are dark flint stone, cracked and worn in some places, but carefully held together by a 2 in. iron band which encircles them, and reposing on ancient black mahogany carved tables. They are 3½ ft. in diameter and 10 in. thick, and are said to be the original foundation stones of the first Jewish Synagogue established in New York, in 1729.

THE Dublin National Gallery has just received a very important addition. This is a small picture by Andrea Mantegna, one of the greatest and most original of the Italian painters of the fifteenth century. It is painted *en camaieu, i.e.*, in monochrome on a ground of a different colour. The subject is Judith disposing of the head of Holofernes after his slaughter. The conception being that of a feigned bas-relief, the tent of the Assyrian general is represented merely by its frontal, against a background of red marble. Before the tent the Jewish widow stands, with a short, square-pointed falchion in her right hand, while with the other she deposits the severed head in the sack held open by her "maid," who is apparently an ancient negress. The whole design is of infinite beauty, the drapery, especially, showing Mantegna quite at his best. In execution, too, the picture is most careful and delicate. There is a drawing for it in the Louvre. The subject seems to be one of a series, of which another is in the London National Gallery. This latter represents Delilah shearing the locks of Samson. Mantegna's easel pictures are very scarce. The National Gallery possesses five, a greater number than any other collection, but one of these may possibly be the work of a pupil. The Berlin Museum has two, or possibly three, the Louvre four, the Uffizi, Florence, three; elsewhere they are the greatest of rarities. The series of decorative panels known as the Triumph of Julius Cæsar, which are now the chief treasures of Hampton Court Palace, can hardly be called easel pictures. They were painted for the Palazzo San Sebastiano, at Mantua, and are now in terribly bad condition.

PROFESSOR HERKOMER recently paid a visit to Hwfa Mon, the Archdruid of Wales, and brought for the Archdruid's inspection the articles of the costume which he has designed as being the most becoming and in accordance with the traditional dress of the archdruid. The robe is a graceful and flowing one of pure white crepe, and covers the figure. The sandals are made of white kid of soft texture, and are much longer in the leg than the ordinary boot. The wreath of oak leaves for the headpiece is an instance of Professor Herkomer's work in copper. The leaves and oak are most naturally worked in old copper, which quite imitates the shade of decayed oak leaves. The gold breastplate is the most striking piece of the paraphernalia. It is of pure light gold, shaped in a semicircle with two large studs at each end. Its weight is not much, but it is of solid metal and cost about £70. The material was obtained from the Dublin Museum.

THE American School at Athens has made an important contribution to archæology through the excavations undertaken by it at Corinth, which has hitherto remained topographically unexplored. The finding of the Theatre is an important achievement, as it is the point of departure whence the description of Pausanius may be followed. Some fifty archaic terra-cottas and a figure of a female divinity have been brought to light, and it is believed that some remains which have been last discovered will prove to be those of a temple.

SIMULTANEOUSLY with the improvements at Poets' Corner, a clearance has been effected at the north-east end of Westminster Abbey. The restoration of this part of the building is at length complete, and the space, so long rendered unsightly as a building-yard, has been cleared of sheds and scaffolding, and sown with grass seed. An uninterrupted view of Henry VII.'s Chapel can now, probably for the first time in its history, be obtained from both sides, north and south. An ancient thirteenth century doorway has just been discovered embedded in modern masonry in the north-east angle of the north Transept. The west front, which is in a very decayed condition, has now been taken in hand. The masonry is barely two hundred years old, but it is fretted and corroded in all directions. Hawksmoor's queer pseudo-Gothic Towers are so insecure that the Abbey bells can with safety ring but a wheezy peal on a few Royal anniversaries. Probably some drastic measures will need to be taken with this part of the building before long.

IT cannot be doubted that the exaltation of old masters, in season and out of season, has had something to do with the closing of the modern picture market. The moneyed man has been mis-educated into regarding pictures as being like wine, all the better for many years' keeping, and he has not courage enough to lay down new stuff to mature. If only half the energy were shown in pushing the best work of to-day that has been wasted upon popularising fourth-rate old pictures, better times for contemporary workers would dawn quickly enough. There is, in this connection, a crumb of comfort in the news that the annual old master show at the Academy is in the coming winter to be abandoned in favour of a collection of the works of Lord Leighton. This is a distinct step in the right direction, and we may hope that it will prove successful enough to induce the Academy to modify very definitely its policy with regard to its winter exhibitions.

ON the 29th inst. the members of the Iron and Steel Institute leave London for the North of Spain, where their autumn meeting is to be held, under the presidency of Sir David Dale. For many years past Bilbao has annually produced four-and-a-half million tons of iron ore, the bulk of which is owned by Englishmen and exported to this country, so there can be no doubt that the visit will be an instructive one. At the same time it will enable our ironmasters to judge for themselves as to the truth of the disquieting rumours regarding the approaching exhaustion of this leading source of our iron ore supply. Metallurgically, too, there is much to see, for although the production of steel in Spain has as yet only attained to modest proportions, the steel works are of such recent construction that the designers have been able to profit by the latest English and Belgian inventions. A long list of papers of technical interest will be read and discussed.

PROFESSOR GREGOIRE TOCILESCO, of the University of Bucharest, and chief director of the National Museum, has recently visited Western Europe on a mission for the Roumanian Government to the principal scientific and archæological societies. During the present year he has discovered and excavated another monument which is unique in the ancient world. It is a Mausoleum erected by Trajan to commemorate the soldiers who fell in a battle near the spot, in which the Emperor himself took part. The monument is quadrangular on a platform of five or six steps, and bears plaques covered with inscriptions recording the names of the Roman citizens, the legionaries, and even the peregrines who fell in a battle near the spot. These inscriptions are full of interest, and contain details of the *domus* or of the *domicile* of the Roman soldiers, and of the countries to which the strangers belonged. M. Tocilesco gives a most interesting description of the principal inscriptions, and of the light which they throw on the history of the buried city. He suggests that the great trophy was erected by Trajan at Adamklissi, although the war mainly took place north of the Danube, on account of the Emperor's own presence at the opening battle near that spot, and within the three lines of defence. This battle is indicated in the Trajan column. The Mausoleum appears to have been in the form of a pyros such as seen on the medals of Antoninus Pius and Julia Domna.

REMINISCENCES OF FRENCH PALACES.

BY I. WILLIAMS.

IT is not intended in this article to go deeply into the architectural detail of the buildings, so much having been previously written upon each of the Palaces mentioned that to avoid repetition would be an impossibility—but to give a rough sketch and a few facts of the various objects of interest seen during a series of short visits to the following Palaces:—The Tuileries, the Luxembourg, the Elysée, the Louvre, Versailles, the Trianons, and Fontainebleau. The Tuileries may be considered the principal imperial residence in Paris, and stands upon ground which was once a tile yard. The present edifice was commenced in 1564, and was intended by Philibert Dilorme as the front only. According to his design, there was to have been a centre with colonnades on each side leading to the wings, but the work was stopped before completion. Henry IV. built the large wing towards the Quai, and Louis XIV. the corresponding one on the side of the Rue de Rivoli, also adding the centre and the Porticoes. Louis-Philippe rebuilt and altered considerably that part which is on the right of the centre. Until the time of Napoleon, the Tuileries had been little used as a royal residence as it was exposed on all sides to public thoroughfares. The history of the Tuileries is the history of the Revolution: how the mob on June 18th, 1792, invaded the Palace; how in 1830 it was sacked and the furniture plundered and destroyed; reinstated by Louis-Philippe and broken into again by the mob in the Revolution of 1848, the throne being carried to the Place de la Bastille and burnt, and considerable damage done; afterwards used as a hospital. The façade towards the garden, nearly 1,000 ft. long, was irregular, but picturesque and imposing from its mass. The entrance was under the Pavilion de l'Horloge, or the centre block, and on the right in the north wing were the Chapel, the Theatre, and the Salle du Conseil, which were built on the site of a large hall or theatre. After having been five times captured and sacked by the Paris mob it was reserved for the Insurgents of the Commune, in 1871, to destroy with fire this noble edifice, and the finest specimen of Renaissance Architecture in France. Part of the Pavilion de l'Horloge and the rest of the west front, and the side next the Rue de Rivoli were consumed, but the Pavilion de Flore was only slightly damaged. We next come to

THE LUXEMBOURG PALACE

in the Faubourg St. Germain, on the south side of the Seine, began in 1615, by Marie de Médicis. It was designed by Desbrosses, who is said to have intended to imitate the Palazzo Pitti, at Florence. In this, however, he hopelessly failed, producing a building partly Renaissance and partly Classical, but nevertheless, not unpicturesque. The façade remains nearly as he left it, except that windows have been opened in it. In the beginning of the present century the interior of the Court was altered by Chalgrin, and in the reign of Louis-Philippe, considerable additions were made on the side of the garden, which is very extensive. The Clock Tower, with its allegorical figures, by Pradier, is of the same date. In 1791 it was used as a Prison, and again in 1795 became the Palace of the Directory. After having been utilised as a place of meeting for the Chamber of Peers, under the restoration of Louis-Philippe; for Socialist Meetings in 1848, and other assemblies during the Revolution, it reverted in 1852 into the Palace of the Senate, until the fall of the Second Empire. It was saved from destruction by fire during the Commune by the arrival of the troops at the moment it was being set fire to and is now used as the Prefecture of the Seine. Of the interior there is a handsome Staircase, built by Chalgrin, adorned by statues of the First Empire, which leads to the Guard Room or Salle de Gardes, decorated with Classical statues; the Throne Room, about 180 ft. long, and in excellent proportion, gilded, painted and decorated in gorgeous style; and the Senate Hall, restored in 1859, and semicircular on plan. The Library contains some good modern pictures, the chief of which is the "Elysium of Dante,"

fine work by E. Delacroix. In the apartments Marie de Médicis, which are little altered, e panels, attributed to Poussin and P. de hampaigne, and furniture, have in point of quisite work and lavish gilding rarely been ceeded. The Doric Chapel, completed in 1844, decorated with modern pictures by Gigoux. the south-east corner of the Great Court of e Palace is the Gallery, which dates from 18, and occupies the first floor of the east ing, and contains the best works of living rench painters. The Great Gallery, as it is lled, is well worth a visit. The fresco on the ault is by Callet and the signs of the Zodiac, either side, by Jordaens, and are of the time Marie de Médicis. This room contains the ick of the collection, including works by outure, Corot, Schnetz, Robert Fleury, Meisonier, Rosa Bonheur and Muller. A grand ile of buildings, enclosing a square court,

THE LOUVRE PALACE,

on the right bank of the Seine, between it and he Rue de Rivoli on the west of the Tuileries. The plan of the Castle, which it was originally, said to have been marked out on the pavement in 1868 after traces of the foundation had been laid bare in excavations made by the Municipality. The oldest part of the existing building is clearly the south end of the west ide, designed by Pierre Lescot, who pulled own the old fortress to substitute a Palace in he then so-called Italian style. Henri II. and Catherine de Médicis in turn added to it. Under Louis XIV., at the suggestion of Colbert, Bernini came from Italy to complete the Palace, but his designs were superseded by those of Claude Perrault, a French Architect, who commenced the colonnade of twin Corinthian columns flanking the gateway forming the east ront, "a façade which has not been surpassed n modern times either for elegance or propriety." The river front, also by Perrault, has forty Corinthian half columns. The north ront was begun by Lemercier some years earlier, and it may be that want of money caused the Louvre to remain unfinished. A arge part of it even stood unroofed down to the ime of Napoleon I., who repaired what had fallen into decay and finished the general plan. The embellishments made under the Restoration and by Louis-Philippe have been entirely left n the shade by the work of Napoleon III. The fronts towards the Grand Court—"already the most beautiful of any modern Palace in Europe"—were repaired and restored; the houses which hemmed in the Palace, on the side where the Rue de Rivoli now runs, were cleared away, and the edifice completed by raising the vast pile of building connecting the Louvre with the Tuileries. The constructions were chiefly from the designs of the late M. Visconti. An enormous collection of works of Art occupies nearly the entire range of buildings forming the Louvre Palace, and as a whole is said to be the finest in Europe. On the ground floor are the Sculptures; on the first floor Paintings and Original Drawings; and on the upper floor, Naval and other collections. One should not fail to visit the Salon Carré, restored and decorated by Duban, in which the paintings of the Italian, Flemish, Spanish, and French schools are placed. Here may be seen masterpieces by Correggio, Van Dyk, Holbein, Raphael, Rubens, Titian, Paul Veronese, Giorgione, Murillo, and others too numerous to mention. The Palais de l'Elysée was built in 1718, and is in the Rue du Faubourg St. Honoré. It was enlarged and inhabited by Madame de Pompadour, afterwards the residence of the Duchess de Bourbon and Murat, and Napoleon I. who made considerable improvements. The Emperor Napoleon III., on his election as President, occupied it at one period, but afterwards went to the Tuileries. Architecturally it is not of much note, as compared with either of those mentioned previously. Thirteen miles by rail from Paris is

VERSAILLES,

scarcely known until Louis XIII. built a hunting mansion there. A great part of this building still remains, and forms the central portion of the Palace. History tells us that Louis XIV., finding St. Germain not large enough, determined to build a vast Palace on this unpromising spot, which at that time was a sandy forest, selecting it, according to St. Simon, to show what could be done by Art against Nature. The Palace was begun by Levau, in 1661, and continued under the younger Mansard. The supply of water being insufficient, machinery was erected at Marly for raising it from the Seine, and an aqueduct built to bring a further supply from the Eure, near Pontgoin, but after large sums had been spent, it was abandoned. There is no authentic record of the enormous sums lavished on this building. Louis XV. added the Theatre and a building parallel to the Chapel. In October, 1789, the furniture was burnt or stolen, and the building partially deserted. Napoleon I. and the Restoration scarcely did more than keep it in repair, and it remained unoccupied until Louis-Philippe undertook the task of restoring the Palace and made it a museum for works of Art. Upon the repairs and waterworks and new buildings alone £600,000 was spent at this period. In 1871 the King of Prussia made the Palace his headquarters, and part was used as a hospital. The Palace has a vast open space in front, with two extensive buildings at the junction of three avenues which diverge from it. These were erected by J. H. Mansard, and stabled 1,000 horses. This open space was called the Place d'Armes, and its grille led into a court flanked with Pavilions on right and left. Behind these Pavilions are piles of Offices. In the Royal Court, which is at the back of the statue of Louis XIV., is the old Palace of Louis XIII. It is of red brick, with stone pilasters and marble busts on brackets against the walls, which were added by J. H. Mansard, when he was directed to preserve it during the new construction. These three sides of the Palace surround the Marble Court, so called from its marble pavement, which must have been very beautiful. The interior consists of a centre and two wings, the centre being made up of the old Palace and its additions towards the gardens. The Chapel is 105 ft. long and 79 ft. high, and is a good specimen of the Decorative Architecture of the time. Of the numerous rooms containing sculpture, paintings, and decoration panels by all the well-known artists of the day, we may mention the Grand Gallery of Louis XIV., as it is called, said to be one of the most magnificent rooms in the World, being 239 ft. long, 33 ft. wide, and 23 ft. high, occupying the centre of the Palace, with seventeen windows overlooking the gardens. On the walls are paintings by Lebrun and Mignard. In the south wing was erected a Hall of Meeting, which is semi-circular, in the form of a Greek Theatre, surrounded by Ionic columns and lighted from the roof. The garden front is wholly Mansard's design, and, from its monotony, looks like a street of houses more than anything else. It is 1,362 ft. long, and has 135 windows in each floor. Along the immediate front is a wide terrace adorned with statues, and a broad flight of steps leads down to the garden. After Louis had built the vast Palace of Versailles he decided to erect a smaller Palace, and raised, in 1688, what is now called Le Grand Trianon, which resembles an Italian Palace, the rooms all being on one floor, without basement or attic. Louis-Philippe carried out some repairs at a later period, and built the Chapel. The Petit Trianon was erected in 1766 by Louis XV., and was given to Marie Antoinette by Louis XVI. It has nothing of special Architectural value about it. From the earliest times

FONTAINEBLEAU

was a hunting seat of the Kings of France, being 36 miles from Paris and two miles east of the town of the same name, but it was under Francois I. that the present Palace rose. Large additions were made by Henri IV. The Palace is of vast extent, the interior being very irregular and unimposing. There are five principal Courts. The right wing of the Court of the White Horse was rebuilt by Louis XV., the centre being commenced by Francois I. and carried out by Henri IV., and Louis XIII.; repaired and altered by Louis Philippe. The total dimensions are 151 ft. long by 370 ft. wide. There were once buildings on the fourth side, pulled down in 1810. The Fountain Court is large, with buildings on three sides, erected originally by Serlio, under Francois I., but so often and so extensively altered that it is now impossible to give the exact dates of the buildings. The Oval Court occupies the site of the original Castle of which one turret only remains. The present Court dates from Francois I. and Henri II., whose ciphers may still be seen. The Arcades are also of their time, the Gallery, however, is of Henri IV. The principal entrance to the Palace contains a horseshoe Staircase of Louis XIII.'s date, by means of which access is obtained to the Chapel of St. Trinity, built 1529, decorated under Henri IV. and redecorated under Louis-Philippe. One arch of the old Chapel of St. Louis still remains. The Gallery of Francois I. is 200 ft. long and 19 ft. wide, and was erected in 1530. It is a beautiful specimen of the Renaissance, partly restored by Louis-Philippe, who, however, committed the error of raising the ceiling. The Fresco Gallery, built by Louis-Philippe, is somewhat grotesquely ornamented with painted panels and a series of Sevres porcelain plates. The Throne Room was begun by Charles IX., enlarged by Louis XIV., and altered by Napoleon I. Adjoining rooms were begun by Charles IX., and lead to the Gallery of Diana, nearly 300 feet long, built and painted under Henri IV., but no traces of the original work remain, the whole having been remodelled by Napoleon and Louis XVIII. in the heavy style of their time. The gem of the Palace is without doubt the Gallery of Henri II., built from the designs of Serlio and decorated by Henri II., 100 feet long, 23 feet wide, and one of the most beautiful works of the Renaissance. The ceiling is of walnut picked out with gold and richly panelled; the walls are covered with oak carving, on which are designs in gold, and the panels are painted by Abbate from designs of Primaticcio. The Chapel of St. Saturnin, built in 1534, where the old Chapel of Louis VII. stood, has been remodelled repeatedly. The stained glass windows are fine specimens of the Sèvres work, and are from designs by the Princess Mary of Orleans. Adjoining the Chapel is an immense Dining Hall. The Porte Dorée is a fine specimen of designing by Primaticcio, the outside being gorgeously gilt and carved. The rest of the Palace contains nothing of particular interest. The Gardens were laid out by Le Nôtre. Of the Palaces in other parts of France much could be written did space permit; but these will best form the subject of another article.

AT the re-opening of St. Mary's, Warwick, it was stated that the restoration had taken twelve years to complete.

THE Chester Town Council proposes to raise £100,000 for purchasing property, erecting new buildings, for the electric light installation, new Baths and an Infectious Diseases Hospital.

AT Blairhill, Coatbridge, the new School, erected by the Old Monkland School Board, was recently opened. The School is to accommodate 130 children, and has been erected at a cost of £7,000, or about £10 per scholar.

AT the recent inspection of the Waterworks at Irvine, it was decided to add three filters to those already in use, thus giving an increase in filtering power of nearly 50 per cent. Mr. Wilson, of Messrs. Leslie and Reed, Edinburgh, was instructed to prepare plans for the addition.

A STATUE of Dean Colet, the founder of St. Paul's School, is to be placed in front of that building at West Kensington. It will be executed in bronze by Mr. Hamo Thornycroft, to whom the commission has been given by Mr. Howley Palmer, one of the governors of the School.

A NEW Borough Theatre, erected at West Ham, is to be opened this month. At present the Theatre, which is situated on a prominent site in the High Street, Stratford, next the Stratford Market Railway Station, is in the hands of workmen, but the internal decorations and fittings are rapidly approaching completion. The building has been designed to seat 3,500.

THE erection of a new Mansion House on the Thames Embankment has lately been suggested, but the idea is not at all favourably regarded in the City. The utilitarian argument that the abolition of the ancient Mansion House would facilitate traffic, and that the money obtainable for the site would place a vast sum at the disposal of the Corporation, does not suffice to recommend it to those without whose advocacy the project must continue to be a dream of the up-to-date reformer.

Professional Items.

DUBLIN.—The tender of Messrs. Cotton Bros., Limited, of Portadown, and Clanwilliam place, Dublin, for building a new Lunatic Asylum at Portrane, has been accepted at £167,000, the work to be finished in six years.

NEATH.—New Shops and Business Premises are about to be erected on the site of the old Academy buildings. The contract is let to Messrs. Gustavus Bros., of Swansea, and the Architects are Messrs. Wilson and Moxham, of Swansea.

TRURO.—St. Paul's New Boys' School, erected at a cost of about £2,000, and providing accommodation for 270 boys was recently dedicated by the Bishop of Truro. The Architect was Mr. Douglas, and the contractor Mr. Colliver, of Truro.

HOPE-UNDER-DINMORE.—The newly restored Chancel at Hope-under-Dinmore Parish Church has been re-opened by the Bishop of Hereford. The Chancel, which is of a cruciform design, has been fully restored, entirely at the expense of Mr. J. H. Arkwright. The Architect was Mr. F. R. Kempson, of Hereford.

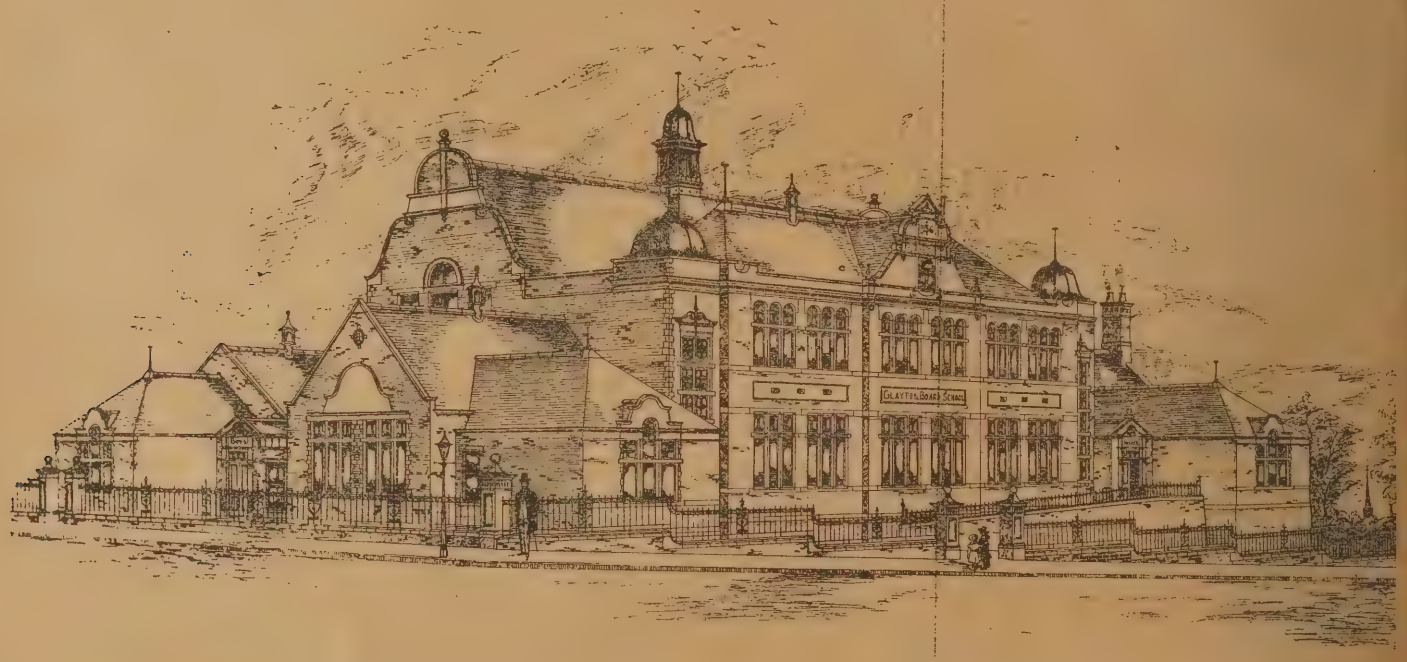
SILVERDALE.—In connection with Trinity Wesleyan Chapel the Foundation Stones for a new Sunday-school were recently laid. The School will adjoin the existing Chapel, and is estimated to cost £400. Mr. W. Wright, of Lancaster, is the Architect. The facing walls will be of Yorkshire shoddies, with dressed Lancaster stone for the corners and window sills, and local limestone rubble for the nteriors.

CAWTHORNE.—The new Wesleyan Chapel and Schools opened at Cawthorne, erected from the designs of Mr. Robert Dixon, are in the Renaissance style, and have cost about £1,400, and will accommodate about 200 worshippers in the Chapel, and a similar number of children in the School. At the same time, a statuette of the Rev. John Wesley, executed in Portland stone by the Mr. S. Swift, sculptor, a native of Cawthorne, now residing in London, was unveiled.

NEWMARKET.—At a recent meeting of the West Suffolk County Council it was stated that the Local Government had decided to comply with the County Council's application for consent to borrow £5,500 for the provision of a new Police Station at Newmarket, except £225 included for Architect's commission and expenses, which was not considered a proper subject for a loan. A resolution was passed that a contract be sealed with Messrs. Kerridge and Shaw for the erection of a Police Station in the sum of £4,749.

HUDDERSFIELD.—Ramsden Street Chapel, which has been closed for some time for decoration and for the installation of the electric light, was recently re-opened. The first part of the work has been done by Mr. J. T. Spratt, of Springwood Street, and the second part by Mr. J. H. Taylor and Co., electrical engineers, Macaulay Street, Huddersfield. The Chapel now presents an improved appearance, a sum of between £200 to £300 having been spent on the renovation of the Chapel and School.

DUNDEE.—A new Catholic Church is to be erected for the Eastern district, having a double frontage to Arthurstone Terrace and Maitland Street, two new thoroughfares at present in course of construction. Accommodation will be provided for 800 persons, with commodious and convenient Presbytery buildings to the north. The building when completed will, it is estimated, cost about £8,000. The work has been placed in the hands of Mr. T. Martin Cappon, Architect, Reform Street, Dundee.



HADFIELD.—Steps are being taken for the enlargement of St. Andrew's Schools, Hadfield, Glossop. The Schools, built 40 years ago, were enlarged in 1878, towards the cost of which Col. Sidebottom, M.P., gave £500. The plans, which have been approved by the Education Department, are for a new Infants' School, to accommodate 138 children, Cloak Room for girls, another for infants, and a Hat Room for boys, with large Class Room over for Sunday School and parochial purposes, new offices, &c. At least £1,000 will be required.

LIVERPOOL.—A special meeting of the donors and subscribers of the Blind School, Hardman Street, was recently held to authorise the committee to use part of the invested funds, if necessary, for the purpose of building a new School. It was resolved that the plans for the erection of the building which had been prepared by Messrs. H. and A. P. Fry, and the cost of which building, when complete, is estimated at about £20,000, be hereby approved, and that the committee be authorised to proceed with the erection of the building in compliance with such plans.

BARROW.—Tottlebank Chapel, which claims the distinction of being the oldest Baptist Chapel in Lancashire, has been overhauled, the rafters renewed, and the roof re-slated, whilst the ceiling above the Gallery has been raised about 3 ft., and the interior has been thoroughly put in order. Throughout the considerable alterations and improvements care was taken that the main Architectural features of the ancient edifice should not be interfered with, and the interestiug building remains in all its main characteristics as in the past. The total cost of the work is estimated at £350.

MORECAMBE.—At a recent meeting of the Morecambe District Council it was resolved to invite tenders for making the Bare Sea Wall and Promenade, both including and excluding the laying of the tram-lines, and subject to the requisite departmental consent to the works being obtained. The Council approved of plans submitted by Mr. F. Edwin Breare, of London, for the erection of a new Hotel on the Calton Gardens Estate (now used as pleasure gardens), at the east end of Morecambe, to be designated the "Grand Hotel." The building is to contain 100 Bedrooms, and the estimated cost is stated to be about £30,000.

SHEFFIELD.—Abbeydale House has been formally opened for Methodist purposes. Abbeydale House, together with a considerable plot of land, was purchased at the very reasonable figure of £2,500. Including the site of the house, the land bought is about an acre and an eighth in extent. The house can be made suitable for all the present requirements of the Society with very little alteration. The mere taking down of a partition dividing the Dining and Drawing Rooms will enable seating accommodation to be found for 300 persons, and there are equally good facilities for holding Class Meetings and conducting Sunday Schoo work.

DESIGN FOR PROPOSED BOARD SCHOOL, CLAYTON: W. R. NUNNS, ARCHITECT, LEEDS.

ABERTILLERY, MON.—On August 10th, the new Schools recently erected in Queen Street were opened. They consist of two separate blocks—the one for boys and girls, and the other for the infants. The Schools are built of blue pennant stone (native), relieved with dressings of Yorkshire stone. The floors are paved with wood blocks, and the Schools are fitted with all modern conveniences. The main room in the Infants' School is large, and divided into two parts by a glass sliding partition. The total accommodation is for 625 children. The contract was carried out by Mr. A. P. Williams, Abertillery, the Architect being Mr. George Rosser, Abercarn.

NEWCASTLLE.—A scheme is on foot for erecting a Winter Garden and Crystal Palace on a site in St. Thomas's Street, facing the Leazes, with side galleries, capable of accommodating upwards of 20,000 persons. In addi-

tion there will be Cloak Rooms, Offices, Refreshment and Smoke Rooms on the same floor. The Orchestra, with Retiring Rooms, is arranged so as to leave the whole of the floor space available for Winter Gardens or Exhibition purposes, or to let off separately for concerts and similar gatherings. Mr. J. W. Taylor, of 31, Westgate Road, is the Architect. The probable cost of the undertaking, including land, is estimated at £50,000.

HARLECH.—Four Memorial Stones of the new Baptist Chapel in course of erection at Harlech were recently laid. The Chapel, which is being erected on the lower side of the main road near the Belle Vue Hotel, will be built of local stone relieved with dressings of Bath stone. The design is of a free Classic treatment. The Chapel will have sitting accommodation for 450 persons, and there will be a Schoolroom underneath. Including the site, the Chapel will cost £1,350 and, it is expected, will be completed in the early spring. The Architect is Mr. J. E. Evans, Barmouth, and the contractors are Messrs. Williams and Adams, of the same place.

BRECHIN.—An arrangement has been come to between the Police Commission and the Parish Council to erect an addition to the present Municipal Buildings, a portion of which will be placed at the disposal of the Parish Council. At a recent meeting of the Police Commission a sketch plan prepared by Mr. M'Millan, Aberdeen, the Architect of the new Municipal Buildings, was laid before the meeting. The plan shows a front elevation to Bank Street, with an Office and Inspector's Room on the ground floor, a three-roomed house to be occupied by one of the burgh constables upstairs, and all the most modern sanitary arrangements. Mr. M'Millan's estimate of the cost of the building was £600. After some discussion, it was resolved to remit the matter to the Committee for consideration.

PLYMOUTH.—After extensive alterations and extensions, necessitating almost complete rebuilding, the Grey Schools, Plymouth, have been formally re-opened. This ancient Foundation School was opened first in 1714, and in 1814 the old building was erected in Hampden Street. After nearly a century's work, the pressure of want of space began to be severely felt, and on his last visit her Majesty's inspector declared that the alterations which were so imperatively necessary must be carried out forthwith. The committee entrusted the drawing of the plans to Messrs. King and Lister, and at a cost of about £1,000 the work now practically completed has been carried out by Messrs. Blackell and Shepherd. A new wing has been added, and the premises made sanitary and well-ventilated, capable of accommodating about 260 children.

PLYMOUTH.—New premises are to be erected in the Military Road for the Millbay Cleaning Works Co., for which they have just accepted the tender of Messrs. Blackhall and Shepherd, King Gardens, Plymouth. The buildings, which have been designed by Mr. H. J. Snell, Architect, Plymouth, will have a frontage of 200 ft., and will run back 220 ft. The very latest electric plant for laundry, dyeing, and cleaning will be laid down by Messrs. New and Mayne, of Westminster, and Messrs. Blackman and Co., of London, will supply the special machinery for drying and ventilating, which include powerful fans that will completely renew the air in which the drying is effected four times every minute. The machinery and electric installation will be of the best kind, and the cost of the whole buildings will be about £14,000.

BEXHILL.—The Memorial Stone of the new Baptist School Chapel, which is in course of erection at the corner of Buckhurst and Clifton Roads, Bexhill, was recently laid. The Chapel which is to be built as a memorial to the late Rev. C. H. Spurgeon, and is being erected by Mr. C. Thomas, of Bexhill, is merely the commencement of a larger scheme, the intention being to erect a larger Chapel on the adjoining plot, which has been purchased for that purpose, and to convert the building now in course of construction into Schools. The present building is to be a Gothic structure with a vestibule in front. It will be 27 feet by 45 feet in dimensions, and will seat a congregation of 250. In addition there will be two Class Rooms —one for girls, the other for boys—with the usual accessories. The building will be constructed entirely of red bricks, with tiled roof.

OLDHAM.—At a special meeting of the Surveyors Committee of the Oldham Corporation, held at the Town Hall for the purpose of appointing a Surveyor for the borough in succession to the late Mr. Andrew Foote, C.E., the following seven selected applicants out of 92 were invited to attend:—William Eckersley, Surveyor for the Chadderton District Council; E. C. Foote, Assistant Surveyor for the Oldham Corporation; Samuel A. Pickering, Borough Surveyor, Colne; W. Wellburn, Borough Surveyor of Middleton; John Witts, Departmental Surveyor of Leeds; J. C. Varley, Contractor, &c., Oldham; and J. H. Mills, Clerk and Surveyor for the Crompton District Council. The final vote lay between Messrs. Eckersley and Pickering. The former received four votes and the latter seven, and on the proposition of Councillor Holt, Mr. Pickering's appointment was put as a substantive resolution and carried unanimously.

MORECAMBE.—The Memorial Stone of the West End Wesleyan Chapel was laid recently by Sir Henry Mitchell. The building will consist of a Nave 30 ft. wide and Aisles 15 ft. wide, with an Arcade on each side having six wood arches. The entrances and staircases to the Galleries will be at each corner of the west end, the Tower at the angle forming a Porch. The Pulpit will be placed at the opposite end, and the Organ and Choir in a Gallery behind. Galleries will also extend along the sides and end. The Schools at the rear of the Chapel are to be divided into an Infant School and Class Rooms, the upper portion being entirely occupied by a large Senior School Room, the staircase to which will also form an additional exit from the Chapel Galleries. The dressings of windows and so forth are to be of Yorkshire stone, and the walls are to be faced outside with parpoints. All the seats and fittings will be of pitch pine. The heating is to be by hot-water pipes, with provision for fresh-air inlets over the coils. Mr. John Edmondson, of Morecambe, is the sole contractor, except for the heating, which will be carried out by Messrs. Seward and Co., of Lancaster.

BRIDGE SOLLARS.—A new Bridge, spanning the river Wye at Bridge Sollars, about six miles from Hereford, has been opened. The Bridge is entirely of iron, resting at either end on stone abutments, and supported in the middle by two pairs of cylindrical columns, the lattice girders and superstructure thus forming three spans. The distance between the abutments is 188 ft., the spans between the cylinders and abutments 61 ft., and the central span 64 ft. The iron columns are 4 ft. 6 in. in diameter, weigh about 15 tons each, are sunk into the bed of the river to the depth of 4 ft. 6 in., and are filled with cement concrete. These are topped with ornamental stone caps, and the whole surmounted by the superstructure in the shape of the roadway and the lattice work sides, the latter being 4 ft. 6 in. deep, weighing in all something like 97 tons. The height of the girders, taking the under side from the bed of the river, is 29 ft., and as the highest known flood was 23 ft. above the bed, there is 6 ft. to spare, thus putting the Bridge well out of the way of the water. The width of the roadway is 15 ft. The joint engineers were Mr. Stephen Williams, County Surveyor for Radnorshire, and Mr. R. L. Bamford, of Hereford. The contractor being Mr. John Preece, of Marden. The cost of the Bridge was something over £3,000.

NEWCASTLE.—The new Baths and Washhouses erected in Gallowgate by the Corporation have been opened for public use. The buildings have been erected from plans furnished by Mr. Gibson Kyle, the English style of Architecture being adopted. The frontage in Gallowgate is 78 feet, and there is a frontage in Strawberry Lane of 213 feet. Ruabon pressed red bricks and stone from the Dunhouse Quarry, near Barnard Castle, have been principally used in the construction. The Baths are entered from Gallowgate, the men's first-class Bath Hall being provided with eight Fire Clay Baths and two Shower Baths. The second class Hall has eight Baths, and room is provided for more if required. There are also women's first and second class baths, and other apartments. In the Wash-houses, which are entered from Strawberry Lane, there are 36 compartments, fitted with all the most modern steam and other appliances. The place throughout is well lighted and ventilated, and seems calculated to meet all the requirements for which the building has been erected. The opening of the new edifice will be followed by the destruction of the old Baths and Wash-houses at the corner of Newgate Street, as they are to be pulled down in order that Gallowgate at that part may be widened. Mr. C. W. King has been the contractor.

DUNDEE.—By authorising the expenditure of £4,000 for the covering in of a part of the Cattle Market, the Dundee Town Council has initiated an improvement which has been advocated for many years. The scheme approved applies to the portion of the Market immediately adjoining Market Street, and extending 60 yards eastward from the western boundary wall, excluding, however, the roadway which enters from Market Street. The area to be covered in measures over 4,000 square yards. The roof, which is to be slated, will be supported by four rows of cast-iron columns, and carried on timber-roof principals. The ridge of the roof will be 28 feet above the ground, while light and ventilation will be supplied by means of rows of roof lights and louvre boards. The new fittings will be of timber and the floor is to be laid with tar macadam. On the north and west the area in question is enclosed by boundary walls, and on the south and east timber cleading will serve the same purpose. The first set of plans provided for the covering in of between 5,000 and 6,000 square yards at an estimated cost of £8,300. The area was reduced, and by adopting tar macadam instead of whinstone paving it was found possible to bring down the cost to £4,850. At a recent meeting of the Markets Committee it was resolved to substitute timber for iron roof principals, and by making several other modifications the estimated cost was reduced to £4,000.

WEDNESBURY.—A Science School was opened on the 12th inst. It fronts Holyhead Road, being situated between the Post Office and the School Board Offices, and thus, with the Municipal Buildings and the Art Gallery, five of the public buildings of the town are in a line. The materials used are red brick with facings, and the inscription "Science School," over the main doorway, in terra cotta; and although the front space is rather circumscribed, an effective appearance has been given to the building. The ground floor is occupied with the Entrance Vestibule; an Exhibition Room, in which it is proposed to exhibit specimens of the manufactures of the town; and a Metallurgical Laboratory, with Furnace Room attached, containing all the latest improvements, and having appended to it a Balance Room, Stores, Lavatories, &c. The rapid fall in the direction of Albert Street at the back has been utilised for Workshops, Stores, and a second entrance under the ground floor. Above the Exhibition Room and Metallurgical Laboratory are placed the Chemical Laboratory, a Lecture Hall, Class Room, Balance Room, Stores, and a Teachers' preparation Class Room. The buildings are of a very substantial character, and all the several parts of the School have been supplied with the best and most modern appliances. The rooms are all large, commodious, well lighted and ventilated, and hot-water pipes and radiators are laid on all over the building. The total cost of the structure and furniture will be upwards of £2,000, towards which the Staffordshire County Council and the South Kensington Department will contribute about one-half. Mr. C. W. D. Joynson, Architect, Wednesbury and Darlaston, furnished the plans and superintended the work of erection, which was carried out by Mr. Thomas Tildesley, Willenhall.

Trade and Craft.

THE STRIKE IN THE LEEDS BUILDING TRADE.

The dispute in the Leeds building trade is now in its sixteenth week. A very large proportion of the bricklayers are said to be tired of the struggle, and quite ready to accept the terms of the masters if the labourers would follow their example. It is said that many of the big contracts on which the bricklayers are engaged on the outskirts of the city are approaching completion, and that as the employers must guarantee a minimum of some months of work for the labourers who are about to be brought in from a distance a difficulty may arise, as the winter, when constant employment is impossible, is approaching. The masters, therefore, are trusting that all the Leeds bricklayers and labourers who are concerned will look well forward, and bear in mind that the imported men must be promised work for a considerable and definite period. The Master Builders' Association denies that any of its members have given the advance, and asserts that nearly all the work now proceeding is being done by non-unionists.

THE COSTLIEST RAILWAY IN SCOTLAND.

The Central Underground Railway, which is the longest underground line in Scotland, although but seven miles in length, was recently opened. It is the costliest railway ever constructed in that country, the expenditure amounting to over £200,000 a mile, and reaching fully £1,500,000 altogether. It runs from Rutherglen, in the east, by way of the districts around Brigdeton and the Glasgow Cross, on to Finnieston and Hillhead and Kelvinside, and terminates at Maryhill. The engineering difficulties encountered in its construction, more particularly under Argyle Street, were of the most trying description. No less than £350,000 were spent in rearranging sewers, and gas, water, and electric light mains, and long stretches of property had to be underpinned by piling owing to the fear of subsidence while the tunnel was being constructed. A unique feature of the line is what is known as a "bell-mouth" arch, under which two tunnels emerge into one large tunnel, all being underground. The signalling at the chief Station—the Central—has been arranged on a novel plan. Owing to the lack of space for a cabin for 50 levers, a small erection takes its place, where a series of short levers work corresponding levers of the ordinary size by hydraulic power in a cabin fully a mile off. The Central Station, although underground and of huge dimensions, requires no artificial light by day, and in the West End the Station at the Botanic Gardens is of a peculiarly ornamental design. It is latticed after the Old English style of Architecture, and topped with gilded minarets. The engineer of the line was Mr. Charles Formans, of Glasgow, who laid the West Highland Railway to Fort William.

AN ARCHITECT'S CHARGES.

At the Stockton County Court, Mr. John Sanderson, Architect, Stockton, sued Mr. Ralph Henderson, of Thornaby, for £2 10s. for professional services rendered. The defendant had a piece of land at the corner of Eldon and Gilmour Streets, Thornaby which in March, 1895, he was trying to utilise. He had had negotiations with the authorities of the Salvation Army, who were probable lessors of a building to be erected on the land. Plaintiff went to see him on March 2nd, and after measuring the site Mr. Henderson gave him instructions as to the size and nature of the building to be erected and its cost. It was not to cost more than £500. Plaintiff arranged to let him have plans in the course of ten days. There was a further arrangement between them that if the negotiations were successfully carried out, plaintiff was to receive £5 per cent. on the cost of the building. If the building was not carried out he was to make a reasonable charge for services rendered. Plaintiff made a plan and approximate estimate of cost, and delivered to defendant in person, and the latter was gratified with them. Plaintiff never heard anything more about it till January last, when he sent in an account for £2 10s. This was not attended to, and in March last plaintiff sent him a letter, the result of which was that defendant and a Mr. Sandford came to see him, and tendered 30s., which he refused to accept in full payment. The 30s. had been paid into Court after the action was entered. A verdict was found for plaintiff for the amount claimed with costs.

UNITED PLUMBERS' ASSOCIATION REPORTS.

From the two last reports of the United Operative Plumbers' Association it would appear that, like a good many societies, some trouble is being experienced on account of the benefits increasing more rapidly than the subscriptions. The superannuation benefits which have recently been introduced appear to have been made retrospective in their character, *i.e.*, that the present old members are to be put on superannuation on attaining the age fixed, although they have paid nothing towards it. This does not appear to be fair dealing. The proper system is that adopted by some societies where a special payment is made for superannuation, and only those who have qualified by paying the requisite number of years can come on the fund. This principle applied to the Plumbers' Association would mean that a considerable number of years would have to elapse before anyone would be entitled to the benefit; but, in the interval, the fund would have been placed on a sound basis. There is, however, another point referred to in the report, and that is their solution of the apprentice difficulty. Like many other skilled trades they had their trouble in this direction, and they have settled it by arranging with the employers to allow one apprentice to a shop which employs one or two men; two apprentices to three or four men; and three to five or six men, with a somewhat more limited scale as the number of men employed gets higher. This is a fair arrangement, and will compare very favourably with that made by some other sections whose action in the past in regard to this matter has been condemned.

SILVER TROPHY FOR INDIA.

A sterling silver shield, 14 inches in diameter, and weighing nearly 300 ounces, has been executed by Messrs. Martin Hall and Co., Sheffield, for India. The central disc is repoussé work in the highest relief. The upper right hand portion is occupied by the figure of a mounted native lancer. On the left hand side, and divided from the mounted man by a group of lance-pennons, are the figures of two dismounted native lancers, standing at "attention." The background is filled in with Indian ferns. The lower part of the body of the shield is a study of Indian palm leaves and ferns, chased, and in the centre appear the regimental colours. The outer ring, or moulding, which surrounds the centre part just described, is arranged in alternate laurel wreaths and panels of oak and lotus leaves, the whole shield being encircled by a massive laurel mount. The groundwork of the shield is oxydised, and all the embossed work gilt, the appearance of the trophy, in its massive oak, glass-fronted case being very striking. The whole of the repoussé work has been executed by Mr. Weston Smith, who received his Art training at the Sheffield School of Art.

THE NOTTINGHAM PLUMBERS' STRIKE.

The dispute in the Nottingham plumbing trade, which has now reached its third week, has undergone a change. This has been occasioned by the action of the other branches in the building trade taking decisive steps to support the strike in the interests of the plumbers. The strike has, therefore, entered upon a new phase, and it is hoped the extension of the dispute may pave the way for a settlement. Since the strike began there has been no desire expressed for the employers and operatives to meet and discuss matters. Both sides appear to be waiting for the other to first make advances. The operatives contend that from the first the Master Plumbers' Association has studiously and purposely ignored their demand. Although the Union officials express a willingness to meet the employers to discuss in detail the causes of the dispute, and as an attempt has been made to employ non-union labour by one large firm, the other branches in the building trade have been appealed to for assistance. The local branch of the Plumbers' Union is affiliated with the Building Trades Council, which represents the whole of the branches of the building trade, and it is this body that has taken action in support of the plumbers. The employment of a non-union plumber at a building in King Street led to several protests being made, but without avail, and in consequence the whole of the plasterers and labourers have ceased work. This had not the desired effect, and in consequence a meeting of the executive committees of each branch of the trade was held at the Clinton Arms, Shakespeare Street, to discuss the situation. There was a large attendance of representatives present, and after a rather protracted meeting it was unanimously decided to give every support possible to the plumbers. As a result of this decision all the joiners employed by the firm on the building ceased work, with the approval of the carpenters' and joiners' executives. Similar action will, it is expected, be taken in other cases if necessary.

HEAVY COMPENSATION.

Mr. William Clarke, of No. 1, Coburg Place, and No. 1, Queen's Road, Bayswater, preferred a claim in the London Sheriff's Court, against the Central London Railway Company for £10,000, as compensation for the compulsory acquirement of his premises by the Company, in connection with the line from the City to Shepherd's Bush. Mr. Freeman, Q.C., who appeared for the Railway Company, stated that a settlement had been arrived at, and a verdict by consent was agreed upon for £6,500.

SOCIETY MEETINGS.

Sheffield Art Society and Sketching Club.—The monthly meeting and exhibition took place on the 13th inst., when about forty pictures were exhibited. Mr. W. Lindley presided. Mr. Lindley showed three large oil paintings executed in his usual sober and truthful style—one an interior of a forge, and two views in Lincolnshire. Mr. W. Hunt was well represented by about fourteen very effective water colors of local bits; two sketches of corn fields showing particularly good and bold work. There were several out-door sketches into which horses had been introduced very effectively by Mr. J. T. Loxton. Sketches of surf and rocks near Flambro' were very delicately and charmingly drawn in water colours by Mr. W. Farnsworth. Mr. W. E. Backhouse had a figure subject "Fisher Girl" and a sketch at Grindleford. Two water colours of "Burbage Moors" were exhibited by Mr. J. Redfern. Mr. C. E. Hall sent two studies of stream and boulders. There was an "evening effect" in oils and two watercolours, "Burbage Moors" and "A Welsh Farmyard," by Mr. J. B. Hinsworth. Several interesting critiques were given on some of the works, a debate following, in which most of the members took part. It was decided to recommence the life class for the winter season on Monday, September 7th.

A DESIGN has been accepted for the proposed Memorial in Chichester Cathedral to the late Bishop Durnford. The Memorial, which will consist of an Altar Tomb, with recumbent effigy, will cost £2,000.

MESSRS. PULLAR, dyers, have contributed £5,000 towards the erection of the new Bridge across the Tay at the foot of South Street, Perth. Altogether £7,000 has been raised. The cost of the bridge is estimated at £12,000.

AN interesting discovery of Roman pottery has been made at Bourn, Lincolnshire. No less than five vases have been unearthed by men engaged in enlarging the gasworks. The vases are each fourteen inches in height, seven inches in diameter at the top and base, the widest circumference being three feet. They are thin, but hard and smooth worked. They were found inverted, embedded in clay about 6 ft. 9 in. below the surface. Four have a pair of ear-shaped handles. It is worthy of note that Eastgate, where the discovery was made was formerly called the Potters' Gate.

A Doomed Church Saved.

The admitted pride in our London City Churches has been too frequently of the kind which "goes before a fall." The proverb would apply literally. And a consuming commerce has been responsible for almost as much demolition as the Great Fire. We are all the more glad, therefore, to note the salvation of St. Mary Woolnoth, and to be able to congratulate the representatives of the widely-ranging influences and interests which have worked to save Hawksmoor's edifice from the spoiler. The habit of attacking these Milestones and Sanctuaries of Religion and History, always a despicable habit, had engendered of late years an impression among Dick, Tom and Harry that "nothing was sacred." A suggestion of their value to the nation, or to the character of this magnificently-traditioned City of London, was inevitably received in certain circles with a snort or a smile. "The utility of the scheme (whatever it happened to be) was too obvious"—ran the catch-phrase. Anything in the way of boring, unsettling, disturbing was hailed as an improvement to London, and we can never forget that this vandal and iconoclastic spirit threatened, at one time, the foundations of St. Paul's. That over-bold and swash-buckler stroke may be regarded as sounding the first note of a growing public distaste for this policy of destruction; a note calling for a Renaissance of reverence. So we see, with growing pleasure, a greater number at Architectural worship, which is only one form of many, yet a good one, since we are taught that there are Sermons in Stones. The reversal of Utility, which, threatening St. Paul's, has had to yield even St. Mary Woolnoth, should be amply encouraging for further effort when needed. The fact is, we cannot spare one of these remaining hostages of bygone days. We are not wholly concerned, even as a professional Journal, with the Architectural merits or demerits of Hawksmoor's work. As to these we agree in the main with the very pertinent letter of "An Architect" which appeared last week in *The Times*. "An Architect" wrote: "The exterior façade is not exactly beautiful, but it is valuable as a very characteristic example of Hawksmoor's strong and defiant originality in Architectural design—a quality not very common in post-Renaissance Architecture." But there can be no question but that the interior, as a small Church for congregational worship, is one of the finest Architectural conceptions of its class in London—or anywhere else for that matter." It is this Church, as a Church, which has been saved. But this is not all. We have more than once pointed out, in emphasizing the attitude of the Institute on the question, that it is more than probable that, for a thousand years, a Church has been associated with this spot. This, if one cares for the Tradition and History of the City at all, should have weighed with some shamefully derelict Church Authorities before they ever permitted a railway company to obtain powers over St. Mary Woolnoth. These railway companies are the giant moles of disturbance, scratching below the surface and throwing up their navvy heaps. They have done their worst, they should have been restrained years ago, but it is not too late to lop off some of their schemes and branches. While a spire stands, however threatened, there is hope. St. Mary Woolnoth seemed utterly lost and yet has been saved, thanks, in varying measures, to Sir Joseph Savory

IN KENT WITH THE A.A.: STROLLING SKETCH BY JOHN BEGG.

and a determined committee; to the R.I.B.A., which was earnestly awake to the issue, and to a number of people who, by writing letters (frequently, it must be admitted, without *raison d'être*), have managed to keep the public warm upon the matter. Finally, giving credit where credit is due, blame must be distributed with equal open-handedness, and the Rev. J. M. S. Brooke, the rector of the doomed Church, comes in for a very comprehensive share. We have long been aware that Mr. Brooke allowed the Church to slip through his fingers into the clutches of the Railway Company, and there can only be bare justice in now making the fact more widely known. A more sorrowful piece of clerical indifference it would be difficult to find.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

ABOUT sixteen members of this Association made their third annual Excursion to Oxford. The first building visited was the new Municipal Offices, and owing to the unavoidable absence of Mr. Hare the party were conducted over the whole of the buildings by Mr. Evans, the Clerk of Works, who took considerable pains to point out and give information respecting all the details of arrangement, construction, and finishing. It was rather reversing the usual order of things at a place like Oxford to give attention to a building in course of construction before taking up the old work, but, owing to the holidays, it was more convenient and also interesting to work, as it were, backwards, and notice afterwards the examples which had to a great extent influenced the character of the design, and see how the Architect had brought up much of his rich detail and finishings to the advancing ideas of the time, and the building is a most interesting sequence to, say Mr. Jackson's Schools, and cannot fail to show to future ages the movement of Architectural thought in the nineteenth century. Christ Church, being adjacent, was examined next, and the rest of the day was spent in a cursory glance at most of the Colleges, under the able guidance of Mr. Cotton, who briefly pointed out the historical and interesting features of each. So far as the sketch-books were concerned, St. John's, Magdalen, Wadham, and New Colleges perhaps received the most attention; at the first-named an old Birmingham man acts as porter, and gave more than usual facilities. The new Church of St. Vincent, by Mr. Bodley, for the Cowley Fathers, shows how dignity and grace may be obtained by studied proportions and mass of wall surface without the aid of costly and elaborate detail; here a plain building of stone and plaster bears upon its surface at every point the hand of a master, and possesses that subtle charm which only the work of artists really has. An interest is given to the roof by being painted by one of the Fathers, who was a former pupil of Mr. Bodley, and who worked under his direction. Iffley Church, too well known to need description, was reached by boat, and also Abingdon, where numberless bits in the town, with views of the Churches, Almshouses, and interesting Market invited the sketcher, but time allowed but a glance before the boat started on its return journey up stream to Oxford. Dinner at head-quarters, the Wilberforce Hotel, in Queen Street, brought all together again before returning to Birmingham at the end of a very enjoyable excursion.

A SPECIAL meeting of the Pontypridd Urban District Council was held last week to consider the various sites available in the town for the proposed County Offices.

MESSRS. JOHN ROUND & SON, LIMITED, Tudor Works, have completed a piece of statuette work in silver, being a Portrait Model of Col. C. E. Freeman. Col. Freeman is represented fully equipped and mounted, and the modelling, chasing, and workmanship have been entirely done at the Tudor Works. The group measures a total height of 17 inches, with a length of 15 inches, and stands upon a highly-polished ebony plinth 4½ inches high, and the total weight of silver is 135 ounces.

DEVONSHIRE HOUSE.

THE WORK OF HUGH MAY AND KENT.

AMONG the great capitals of civilisation there is no more celebrated street than Piccadilly. The origin of its name is still disputed, although it is supposed to date from the time of Charles II., who, when he took his morning's walk in the Green Park, used to buy some cakes, called "pickadils," from an old woman who kept her booth on a spot opposite to the present site of Apsley House. At that time there was no house in Piccadilly to the west of Berkeley Street, with the exception of Berkeley House, which occupied the site upon which Devonshire House now stands. Berkeley House was

BUILT IN 1665 BY HUGH MAY,

for John Lord Berkeley of Stratton. Evelyn says in his "Diary": "I dined at John Lord Berkeley's in his new house, or rather Palace, for I am assured it stood him in neare £30,000. It is very well built, and has many noble roomes, but they are not very convenient, being all roomes of state without clossets. The staircase is of cedar; the furniture princely; the forecourt most noble; so are the Stables; and, above all, the gardens, which are imcomparable by reason of the irregularities of the ground, and of a pretty fish pond. The holly hedges on the terrace I advised the planting of." Twelve years later, we come across another entry in William Evelyn's "Diary"; "June 12, 1684. I went to advise about building two new streets in Berkeley Gardens, reserving Berkeley House and as much garden as its breadth covers. Meantime, I could not but deplore that sweete place, by far the most noble gardens, courts, and stately porticos anywhere about towne, should be so much straightened and turned into tenements. But that magnificent pile and gardens contiguous to it, built by the late Lord Chancellor Clarendon, being all demolished and designed for piazzas and buildings, was some excuse for my Lady Berkeley's resolution of letting out her grounds for so excessive a price as was offered, to wit, neare £1,000 per annum for mere ground rents; to such a mad intemperance has the age come of building in and about a citty already by far too disproportionate to the size of the nation, I having in my time seen it grow almost as large again as it was in my memory." These two new streets in Berkeley Gardens, which Evelyn, the greatest landscape gardener of his day, was invited to lay out, are now Berkeley Street and Berkeley Square. The ground on which they stand was originally called "Hay Hill Farm," and Berkeley House was long regarded as the

FINEST MANSION AT THE WEST END:

When the Princess Anne, afterwards good Queen Anne, was driven from the Cockpit at Whitehall by the odious persecution of her sister, Queen Mary, wife of William III., she took up her abode at Berkeley House, where she and her husband remained as the guests of Lady Berkeley, then a widow, until Queen Mary's death. In 1697 Berkeley House was bought from the executors of Lady Berkeley by William, first Duke of Devonshire, who took so prominent a part in the Revolution of 1688, supporting William III. with all his strength. In 1707 the Duke died in Berkeley House, which was totally destroyed by fire on October 16th, 1733. The fire at Berkeley House was one of the most terrible conflagrations that the West End had seen down to that time. We read in the "Daily Journal" that the Library and a great part of the third Duke's valuable pictures, curios, medals, and sculptures were saved, but that the loss was estimated at considerably more than £30,000. The author of the "New Critical Review of Public Buildings" speaks very highly of the former Devonshire House (Berkeley House) the ruins of which were still standing in 1736, when he wrote. He attributes its destruction to the carelessness of the Duke's servants. He describes it as simple in plan, yet very elegant and quite worthy of the master hand of Inigo Jones, its only fault being the great number of chimneys, which he calls "a heavy Gothic encumbrance to the whole." He laments the loss of a fine statue of Britannia, which, having escaped the flames, was accidentally destroyed by a further act of carelessness. The present Devonshire House, was built about the year 1737, by William, third Duke of Devonshire, on the site of part of the property of Lord Berkeley of Stratton.

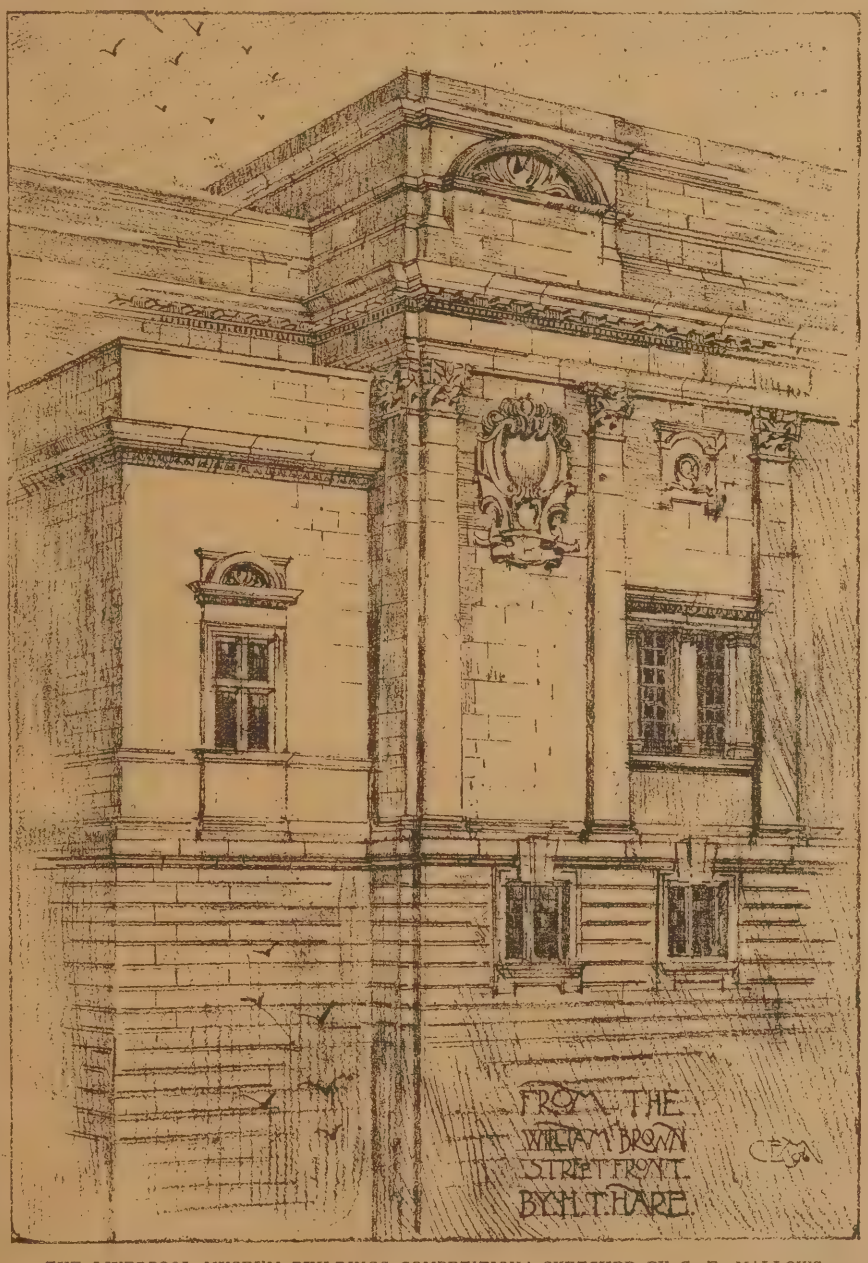
THE DESIGN WAS BY KENT,

and the cost upwards of £20,000. The house recedes a little from the rest of the houses in this street. It has little or nothing in its exterior appearance to recommend it to particular notice, except its ugliness; but its interior is richly stored with some of the finest works of Art in any private collection. The entrance of the house was originally up a double flight of stone steps, arranged as an external staircase in the front, and leading straight into the reception rooms on the first floor; but this arrangement was done away with by the late duke, who made the entrance on the ground level into a Hall of low elevation, beyond which he threw out, on the north or garden side, a semicircular apse, containing a new staircase. The interior staircase on the north side, of marble and alabaster, with rails of solid crystal, was erected by the late duke. The ornamentation of the great staircase, and most of the rooms in the house, is by Mr. Crace. The Picture Galleries are scattered through the long range of rooms which passes all round it on the first floor. It would be impossible to give in this article a complete list of the Art treasures that are to be found here; but we may mention a few of the most important. In the large North Room hang "The Madonna and Child and St. Elizabeth," by Rubens; "The Prince and Princess of Orange," by Jacob Jordaens; and also a portrait, unknown, by Titian. In the Green Room, adjoining, is "Jacob's Dream," by Salvator Rosa; and "Samson and Delilah," by Tintoretto. In the Blue Drawing Room is "Moses in the Bulrushes," by Murillo. A small room on the north side is hung almost entirely with specimens of Van Dyk, including a noble portrait of the late Lord Strafford; and in the same room is Lord Richard Cavendish, by Sir Joshua Reynolds. A list of some of the finest pictures to be seen in this mansion is printed in Dr. Waagen's work on "Art and Artists in England." In the Library here is kept John Philip Kemble's celebrated collection of old English plays, probably the finest in existence. It was made at a cost of £2,000, and was purchased by the sixth duke after the collector's death. The library is very rich also in other departments of Early English literature. The gardens in the rear of the house are mostly laid down in turf, as lawns, and contain some fine elm trees.

ATTENTION has been directed to the state of the paving in Oakley Street, Chelsea, which is the direct route from King's Road to the Park. Along its three hundred yards is some of the worst and oldest wood pavement in London.

AN anonymous donor has just given £1,500 to the Church Army for the purpose of providing and furnishing a Lodging Home for Men adjoining the Society's Labour Home for the Outcast in Holloway. The St. John's Lodging Home in Lisson Grove, which was presented to the Society by one of its central staff, who are all honorary workers, has been filled to its utmost capacity every night since it was opened, nearly three years ago.

THE World's Fair Chicago Medals are all of bronze. They measure 3 in. in diameter, and weigh 6 oz. 10 dwt. (troy weight), against 3 in. in diameter and 8 oz. 18 dwt. (troy), the weight of the Centennial Exhibition medals of 1876, issued at Philadelphia. The one innovation in the new medal is that the names of the respective recipients occur in raised letters upon the face of the actual medal itself. In all former International medals the names have always been simply engraved, generally upon the edge. We have received photographs of the obverse and reverse sides of the Chicago medal, which is, certainly, by no means a good example of the numismatic Art, from Messrs. Harry Hems and Sons, of Exeter. The stagey attitude of Columbus himself on the obverse face, who appears to be throwing himself in despair from a rock into the sea, is ludicrous in the extreme.



TEN THOUSAND YEARS OLD.

PROFESSOR HILPRECHT'S DISCOVERIES.

THE discoveries made by two expeditions that have been and are still working in Babylonia are of general interest. A French expedition has for some time been at work at Telo, and has been remarkably successful. But the American expedition has produced even more remarkable results. At present the head of the expedition is Professor Hilprecht, an American who occupies a foremost place in everything relating to Babylonian archæology. Upon him has devolved the task of classifying and deciphering the enormous number of inscriptions which have been found at Nippur. Professor Hilprecht says that it will be years before the Pennsylvania University will be able to publish all the inscriptions which have been deciphered, but the publication has already begun and gives promise of a rich harvest. The first and most notable result of the excavations is that the history of the Babylonian people as recorded in the cuneiform writing on tablets is carried back at least two thousand two hundred and fifty years further than it had yet been known. In other words, there is now abundant written evidence that the Babylonian people existed and were civilised enough to be able to write at least seven thousand years before Christ. In his judgment the written records probably went back as far as 8,000 years B.C., but he does not intend to print anything which could not be amply borne out by evidence. To have pushed back written history at one stroke by 2,250 years is, however, enough to make a reputation. In reply to an enquiry how it happened that his predecessor had not found the many objects which belong to this early period, he said that Dr. Peters, to whom he attributed great credit for the manner in which he had opened out the great mound at Nippur had worked down to a certain floor or platform which he and others had taken to be the ground level of the ancient city. One of the party, however, suggested that this level should be penetrated, and digging continued until rock or virgin soil was reached. The suggestion was adopted, and it was found that what had been taken for the level of the ancient city was only the level of a comparatively modern city built over the ruins of an older one or a succession of older ones. The excavations above the level or platform had gone through thirty-six feet of débris. They were now continued to a depth of thirty feet below it. The excavations above the platform discovered remains which covered a period of 4,000 years of Babylonian history. Below the platform to the virgin soil was an accumulation of drains, preserved and broken pottery, and various other objects of interest. Twenty-three feet below the platform they came upon the most ancient keystone arch known, an arch which Professor Hilprecht thinks cannot be later than 5000 B.C. Last summer Mr. Haines, who has spent the last three years in continuous work at Nippur, excavated the lower part of the marvellous wall of the city. Its foundations were found to be sixteen feet below the level of the desert; the wall itself was seventeen feet high and forty-five feet wide. Upon the top of this wall was another of unknown height. These walls were built of

BRICKS TWENTY INCHES SQUARE,

probably the largest bricks ever used. The most valuable finds, however, were the inscriptions upon broken vases, bricks, tablets and other objects, and from this it is confidently predicted by Professor Hilprecht that a continuous history of Babylonism will be able to be written. Among the recent finds of the French expedition which has been, and is still, working at Telo, are a number of dated cuneiform tablets of Sargon the First and of his son Naram-Sin. These have now reached Constantinople, and within the last two months have been submitted to the examination of Monsieur Heuzey, director of the Museum of the Louvre, and of Professor Hilprecht, who has been retained by the Turkish Government to decipher and classify the objects found by both expeditions. By this important find all questions as to the mythical character of Sargon is put an end to, and he is shown to have been a real person. The contents of the so-called Oman tablet are definitely decided to be historical and not mythical. One of the new tablets speaks of "the year when Sargon marched against Palestine" (Martu). This was 3800 B.C. Even were no other finds to be made the inscriptions gathered by the two expeditions will add largely to the knowledge possessed of the history and civilisation of Babylonia.

THE LIVERPOOL MUSEUM BUILDINGS COMPETITION: SKETCHED BY C. E. MALLOWS.

WITHOUT ceremony of any kind the great lock on the Sault Ste. Marie Canal, which connects the American lakes, has just been opened. This lock is one of the greatest constructions of its kind in the World, and it has taken seven years to construct. It is 800 ft. in length between the gates, and 1,100 ft. over all; 43 ft. high, 100 ft. wide, and will accommodate boats drawing 21 ft. of water. Its giant centrifugal pumps, driven by compound Westinghouse engines, can fill the lock in thirteen minutes, and empty it in eight minutes.

THE Bethnal Green Vestry has decided to acquire three separate establishments in different parts of the district for the purpose of Baths and Wash-houses, the former to be private, and no provision to be made for swimming. One establishment is to be erected first, as an experiment, to contain thirty baths for men and fifteen for women, together with from thirty to forty stalls for washing.

AFTER a three years' struggle in the Lambeth Vestry as to whether the Electric Light should be provided for the use of the inhabitants of the parish by the Vestry or a private electric lighting company, it has at last been decided as the most economical course to transfer the Vestry's provisional order to Julius Sax and Co., to whom the City of London some time ago entrusted the electric lighting of Smithfield Meat Market. In consideration of this concession 25 arc lights are to be placed, free of charge, at the disposal of the Vestry for the general benefit of the parish.

WHEN the new clock at St. Paul's Cathedral was erected about three years ago the dials had their central parts fitted with white glass for illumination at night. This white glass has been found to make the dials less distinct by day, and also not to be in Architectural harmony with the Cathedral. Instructions have, therefore, been given to the makers of the clock, Messrs. John Smith and Sons, of Derby, to fit in new dark central parts to the dials. It may be mentioned that the total diameter of the dials is about 17 ft., and the central parts are 10 ft. in diameter. When this work is done the dials will have the same appearance they had before the new clock was fixed.

M. DEVIC, an able French engineer, has devised a new sort of Tower, not so high as Eiffel's, but equally curious, for the Exhibition of 1900. He calls it the "Palace of Progress," and proposes to construct it of steel and to ornament it with nickel, aluminium, crystals, and artistic pottery. It will also revolve and be hexagonal in form, the top being surmounted by a Gallic cock. On the different floors or landings, restaurants, theatres, and concerts could be organised. The monument would also be ornamented with clocks, and contain a colossal organ and a chime of bells.

The South Kensington Museum AND THE National Competition.

Important to Students.

TO the Architect and all Art workers the South Kensington Museum is, to all intents and purposes, as a mine of undiscovered wealth, and, for the most part, unexplored. We say that advisedly and quite conscious of all the drawings and studies that have been made there in recent years, but which, nevertheless, have only touched upon the borders of an all but inexhaustible storehouse of Art treasures.

We wonder what proportion of present Architectural Students fully realises the extraordinary advantages the Museum affords? It is not a pleasant reflection, but all the same a fact, that nowadays it is practically left untouched. It is painful to go there at times and notice how the place is neglected, how few students avail themselves of it. So-called Art Students there are—and on students' days in numbers, but we are not concerned here with those who go either to while away the time or to devote a vast amount of misplaced energy and perseverance the reverse of commendable upon the most unfortunate selections of paint which are the reverse of artistic. Of Art Students in reality, we repeat, we see but few, and those that are working do so in a desultory kind of way at small details. There is an entire absence of penetrating and systematic study which was characteristic of student work some years ago. Take, for example, the Division of Measured Drawings in the National Competition in this and the previous year. It compares, making full allowances for the difference of the standard and ages of the students, very unfavourably with that submitted for competition in other places. Both in execution of the work and in the selection of the subject it falls much below its proper standard, more so, perhaps, in the latter because of the utter absence of direction and assistance from the proper quarters. Students are left to shift for themselves as best they may. This is a serious mistake, which we ventured to point out when reviewing the work last year; we suggested at that time it would be a simple matter for the examiners to give, with their criticisms, a list of good subjects in the Museum, in London, and in the Country, together with their reasons, and some useful directions of how to set about the work so as to gain the greatest and most permanent advantages from it.

As there appears to be no sign of the proper people doing this, we propose during the coming winter to undertake the task ourselves for the benefit of Art students generally, and, if we receive proper support, in a detailed and comprehensive way. We wish to warm and freshen up students' enthusiasm in this direction, specially with regard to the Museum, to point out to them the opportunities they are missing by the neglect of this wonderful place, and the immense benefit they would gain by steady and properly directed study within its walls.

There is absolutely no obstacle to work of any kind. There are no difficulties to overcome in the way of sketching orders; you can sketch everything, save the objects on loan, and if you are poor you cannot plead your poverty for there is nothing to pay. Bona-fide Art students are admitted free all the days of the week, and on Mondays, Tuesdays and Saturdays until 10 p.m. There are no fees, there is no trouble; everything is at hand, and the officials always obliging and ready with help. There is no disturbing influence, no dust and stinging worries as in the case of out-door work, no traffic or public to bother, the visitors are so few and far between.

If you are a student, ambitious to have ideas of medals and prizes galore, the Museum will find you all you want. There is no studentship offered, either at the Institute, Academy, or elsewhere, for which you will not find ample material to work from. The only difficulty and danger is in the proper selection of it for the purposes required. It is bewildering in interest and beauty.

If you are intent on winning the Owen Jones or the Pugin, for example, go there and search for your subjects. Not in all the years before you could they be exhausted. Beyond your materials, there are but two things required, and these are rather necessary, namely, ability to draw and a correct sense of selection. We do not propose to tell you how to do the former—no one can; but we can and will, from time to time, give advice and assistance, if desired, on the latter.

With a view of more practical and definite help in this direction, we shall, later on, offer something substantial in the way of money prizes for the best set of sketches in a given subject, and those to whom prizes are not awarded we propose to pay for the use of their drawings in our pages should they be of sufficient merit. In the meantime, we

SKETCHED BY E. A. RICKARDS.

FROM A SKETCH BY C. E. MALLOWS.

advise students to get to work at once. The sketches we shall require are those likely to be of practical service to our readers.

We want to use and explore the treasures of the Museum in a way they have never been used or explored before, and we are going to do it in earnest. Not in a superficial or desultory way—that would be neither fresh nor original, because it has already been done—but in a useful and systematic manner, dealing with the varied Arts in detail.

We want to use and direct in a proper channel the evident abilities of many young students to benefit themselves, and those of our readers in the provinces to whom the Museum is practically closed because it is inaccessible.

There cannot be a class of artists or craftsmen that illustrations from the Galleries fail to interest, because there is no art or craft there unrepresented. There are types and specimens of the Art of all ages, from a grotesque on a Norman capital to the acme of refinement of ornament on a Chippendale chair; from the great and gorgeous tapestries to the delicate and diaphanous embroidery of an empire dress; from a wrought iron standard of the time of the Crusaders to a beaten leaflet of iron by Huntingdon Shaw; from a metal-bound Cathedral coffer of mediæval times to the wooden windows of Peter Paul Pindar's house; from a fourteenth century necklace to a jewelled ring of the time of Beau Brummell.

All that which is most characteristic of the worship, the work, the handicraft, and the service of the old times that are gone, all that is best of the expression of the workman's love and delight in his work, is there. You can name no subject in Architecture, or in the Arts or crafts connected with it, upon which the Museum, either in its Galleries or Libraries, has nothing to say.

The Art Library is one of the finest, if not the finest, in the World, and its collection of prints, engravings, etchings, and so forth, second only to that of the British Museum.

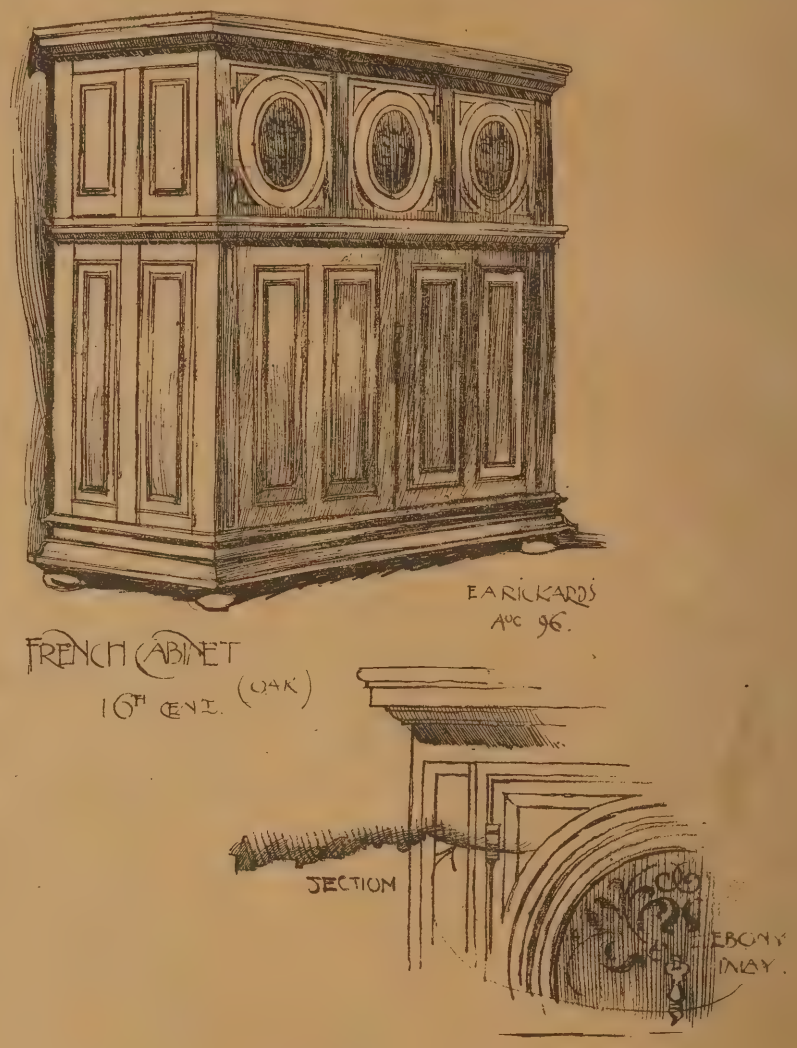
The subject, like the Museum itself, is practically inexhaustible, but we may, perhaps, have said enough to encourage a few workers to go and see for themselves, and later on to let us have the results of their work. The amazing thing is that it should be necessary to write or call attention to such a place at all, but that there is the necessity is easily proven by a visit to the Art Library alone, where seat after seat will be seen empty, and that this is not an exception but a normal state of things several visits will prove. Whether the Library is so big that students lose themselves in it, or half of them are uncertain of its existence, and a quarter

SKETCHED BY E. A. RICKARDS.

indifferent, we cannot say, but we are inclined to the latter opinion. It is certainly not known and used to the extent it should be or anything approaching it.

One engaging quality the Museum has to the lay visitor—and it is only fair and just to put it on record—it shares with the Architectural Room of the Royal Academy the advantage of being a happy and desirable flirting ground, many a foundation of future domestic bliss or misery has doubtless been laid within its walls, and the place loved best is the iron-work Gallery separating the Architectural Courts. It is so nice and dark and mysterious, quite an appropriate place by the way to put delicate ironwork, that we ourselves have, more than once, been the unwilling but interested witnesses of several impromtu love scenes, set with excellent and appropriate back grounds.

The National Competition this year is both encouraging and disappointing. It is encouraging because, compared with the retrospective work in the adjoining Galleries which contain most of the more prominent prize work of the past ten years, it is undoubtedly of a much higher average of merit. It is disappointing because it is not nearly so interesting as last year's show. The Architecture is especially poor, and suffers greatly from the want of some controlling hand in choice of subjects in Design. So long as students are allowed to waste their time, energies and abilities on such impossible subjects as Cathedrals, Town Halls, Triumphal Arches and the like, so long will these competitions continue to yield for the most part unsatisfactory results. Those students who have kept themselves within reasonable bounds, and sent in small sheets of simple subjects, have all, more or less, given interesting and pleasing effects, and it is curious to notice how, even in these, the subject is so much better treated in detail than in mass and general proportion. An exception worthy of remark is the design for Wayside Inn, by E. F. Reynolds (Birmingham), whose charming little drawing for a riverside warehouse our readers will remember we published last year. He wins a silver medal again this year, and for his simplicity and restraint in design and excellent artistic feeling deserves a gold one. We hope to publish some sketches of his work in an early number, perhaps next week. Next in interest we should place the work of George A. Paterson, also a last year's medallist, whose design, a Gallery Front, is good in choice of subject and is worked out in a very interesting and original way. This latter quality, however, is not altogether to be commended in a student of 18. It is, nevertheless, very creditable to him, considering his age. An excellent example is set by Herbert T. Buckland, of the Birmingham Municipal School of Art, who has studied his design for a Cottage Hospital in clay; he gives a photograph of his clay model in the corner of one of his drawings, and it appears to greater advantage there than in the elevation and perspective, which are wanting somewhat in artistic feeling.



The Gold Medal subject is a Triumphal Arch, but the work submitted for it is not in any way to be compared to that of last year. The winner is Peter S. MacLauchlan, of Glasgow, and although his drawings, except the pencil perspective, are careful and very good for so young a student, we much prefer the other set as being more complete. His design, however, for the simpler subject of a Tea Room and Restaurant is excellent, in spite of the overwhelming terminals to the gables. He should cultivate his sense of proportion a little more. The design would have gained much if these terminals had been omitted altogether, and the author—so the Examiners say—would probably have had a silver instead of the bronze medal he now obtains.

We shall return again to consider the rest of the Exhibition next week, but we cannot close now without a reference to the very beautiful work contributed by Miss Florence Steele and Miss Lilian Simpson. The work of the students in Modelling has much distinction and refinement. The tile designs by Miss Simpson are delightful, and Miss Steele's exhibit of a door plate has much grace and character, if it is a little too exuberant.

To return to the Museum again. We publish on another page Mr. Rickards' pencil sketch of a recent addition to the Italian Court. The sculpture should be carefully studied, as it is one of the finest examples of Donatello's work. It is placed close to the Monument to Carlo Marsuppini (by Settignano), and both are from the Church of San Croce.

The cabinet is, perhaps, the best of the French work recently acquired and temporarily housed in the iron erection in the Court. Nothing could be much better in proportion and in detail, and in suitability of both to its purpose. It is a good example of a fine effect produced by very simple means.

The foot of the Crucifix and the exquisitely beautiful figure of Saint John are both in the same court, and should be seen and studied themselves to be properly appreciated. It would be difficult to find anything to equal the figure of Saint John in the history of mediæval sculpture. The chest of drawers is a good specimen of its kind, even if it is a little rococo.

SKETCHED BY E. A. RICKARDS.

A MONUMENT to the late M. Carnot has been unveiled at Châlons-sur-Marne by the French Minister of Public Instruction.

A NEW Railway Mission Hall, in North Station Road, Colchester, which has just been erected at a cost of some £1,050, was opened on Thursday afternoon last.

THE estimated capital expenditure for completion of the extension of the eastern wharves and sheds at Dundee, including additional hydraulic apparatus, is stated at £17.000.

A REREDOS has just been added to Cubert Church. The painting is by the Hon. Mrs. Robartes, and the framework, carving, buttresses, and cornices by Mr. Saunders.

FOR completion of the extension of the Eastern Wharves and Sheds at Dundee, the estimated capital expenditure, including additional hydraulic apparatus, is stated at £17,000.

AT Eauclaire, Wisconsin, a Music Hall which was being repaired, suddenly collapsed, burying a number of workmen. One dead body has been recovered, and fifteen men have been taken out alive, but seriously injured.

WE learn from Brussels that the spire of the Hôtel de Ville, which has presented an unusual aspect for many months past, is now finally enveloped in the scaffolding necessary for repairs, and even the bronze statue of St. Michel, which has overlooked the town for 400 years, is out of sight.

UNDER the direction of Messrs. Jenkins and Marr, Aberdeen, Cairnbulg Castle is being restored by Mr. John Duthie, of Cairnbulg. The scheme of restoration is an important one and will cost a considerable sum. Granite stones are at present being dressed at Corennie Quarry, Tillyfourie, to be used in the external walls, and the endeavour will be made to reproduce the appearance of the structure 300 years ago. In the restoration both the Square and the Round Towers will be preserved, and a new building introduced in place of the ruins between. The remains of the old moat will be converted into an ornamental lake.

ARTISTIC HOARDINGS.

M. PAUL DESJARDINS, so it is said, has a wish to draw out the latest critical faculties of the Parisian lower classes. At present they think too much of that awful mixture vended to them under the engaging title of "little blue," and not enough of High Art. Their time would be infinitely better occupied in visiting collections of the Old Masters, and in comparing, more or less, the archaic merits of Botticelli and Perugino with the fuller flavour of Rubens and Rembrandt. To remedy this defect, M. Desjardins proposes to placard the hoardings and dead walls of the city on the Seine with lithographed reproductions of the famous frescoes of Puvis de Chavannes from the Panthéon—at his own expense. Rightly or wrongly, he entertains the belief that this outlay—considerable as it will prove—cannot fail to elevate the morals of his poorer fellow-citizens. Gazing on the weird and, in some respects, wonderful compositions of Chavannes, the gamin and ouvrier may gradually develop the morals of a modern financier. The Panthéon is but a step from the Salon, and should the experiment prove effective, and the Parisian lower classes gradually grow at once angelic and æsthetic, a few dozen reproductions of the nude—of "La Source," for example, without which no Exhibition of the Salon could be considered complete—would probably finish their artistic education and raise their morals above par. Let our British philanthropists consider whether this French example be worthy of imitation. We possess dead walls and hoardings in plenty, and a large section of the uninstructed public who might be mentally bettered by the daily observation of the works of Sir Edward Burne-Jones, if only that truly great painter would consent to allow his masterpieces to be reproduced

FOR MURAL DECORATION.

The question next arises whether this great Metropolitan improvement should be left entirely to individual philanthropy. Might it not be taken up by the County Council, or by the piano-providing School Board? Surely Mr. Holman Hunt would not object to copies of his more serious efforts being pasted up in all workmen's trains, so that on going and coming from their occupations the horny-handed sons of toil might have their highly impressionable natures lifted above the sordid craving for beer and tobacco into the rarefied regions of the ideal! Not painting alone, but music and poetry might help in the good cause. Meanwhile, and failing an imitation of the French æsthetic philanthropist, we must be content with our hoardings as we find them, hoping for an improvement in the future. Even in the present there is very little cause of complaint. Great artists like the late President of the Royal Academy and Messrs. Herkomer, Luke Fildes, and H. S. Marks, have not, apparently, thought it any degradation to allow their pictures to be used for the adornment of our otherwise dead walls. A quarter of a century ago, when the calling of the

ARTISTIC BILL-STICKER

was just emerging out of its dark ages, the hoardings of the Metropolis did, indeed, for the most part, provide a fearful sight. Bad drawing and vulgar colouring were common. "Posters," however, have gone on improving in merit, until our hoardings are often almost equal in quality to some of the minor picture Exhibitions for which the public are asked to pay a shilling by way of entrance-fee. There is, according to *The Daily Telegraph*, in fact, no more reason why a painter of genius and reputation should not design a poster than should prevent him from decorating the outside of a Palace. The argument that a shower of rain or a rival bill-poster may obliterate his work goes for nothing, because the work itself remains; it is only a single impression that is destroyed. Moreover, it is strange that M. Paul Desjardins should have taken such umbrage at the Parisian placards, which, on the whole, are invested with more artistic merit than our own. Possibly he objects to them because of

A CERTAIN FLAMBOYANT TREATMENT

which cannot be denied; probably for the reason that they present his fair fellow-country-women in a manner which would not necessarily commend them to persons of Puritan ideas. He may fancy that a course of Puvis de Chavannes would correct that tendency to frivolity; and no one who has studied those weird, forbidding Panthéon frescoes will say him nay. However, the artists who draw our posters are gifted with the essentially English quality of restraint, and generally halt well within the limits of propriety. Were it otherwise we too might stand in need of an alternative even in the shape of the pious grotesque. As it is, our street picture galleries are agreeable enough to look upon, and are seldom guilty of the one unpardonable sin—that of artistic ugliness.

By the fall of a crane at the Naval Engineering College, Keyham, a man named Netherton was seriously injured. An extension scheme is being carried out by Shellabear and Sons, of Plymouth, and the crane was only lifting between two and three hundredweight at the time.

MR. EDWIN CLARKE, for many years district surveyor for the parish of Penge, under the Lewisham District Board of Works, died recently at his residence after a very brief illness.

THE death has occurred, at the age of 65, of Mr. Clement J. Casswell, of Horncastle, Lincolnshire. The deceased, who formerly belonged to Spalding, was a member of the Architectural and Archæological Society of Lincoln, Nottingham, and Leicester, and was also a member of the Spalding Gentlemen's Society—the oldest antiquarian institution in the kingdom.

THE Marquis of Bute has signified his intention of contributing £10,000 to the University of South Wales, to be applied for the purposes of technical education in Wales, the sum to be handed over to the authorities as soon as required. The Drapers' Company has also promised £10,000 towards the fund for providing new buildings, and the Government has promised £20,000 on condition that an equal amount is raised by public subscription.

SKETCHED BY C. E. MALLOWS.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
August 26th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."
—JOHN RUSKIN.

A GOOD Art critic story of the late Sir John Millais was told recently by his son, Mr. J. G. Millais. Almost the last work that Sir Edwin Landseer was engaged on was a life-sized picture of Nell Gwynne passing through an archway on a white palfrey. This picture, in which the horse alone was finished, was bought by one of the Rothschild family and given to Sir John Millais to complete. One morning a celebrated Art critic called, and was much impressed with his work. "Ah, to be sure," he said, going up close and examining a deer-hound, which almost breathed, in the foreground of the picture, "how easily one can recognise Landseer's dogs! Wonderful, isn't it?" "Yes, it is wonderful," remarked Sir John, lighting another pipe; "I finished painting that dog yesterday morning, and have done the whole of it myself."

IN the demolition of the Greyhound Inn, in the old-world village of Hendon, a quaint relic is about to disappear. The Greyhound was erected in 1676 on the site of a much older Inn, which was destroyed by fire in that year. The original building, as some assert, was used as a clergy house, but records show that it was a hostelry many years before its destruction by fire. Its connection with the Church, however, did not terminate with the rebuilding in 1676, as in the new lease it was arranged that a room should be put aside for parochial meetings, and as such was used till about twenty years ago. The parish documents are still kept in a safe in this room, and the property is owned by the Charity Commissioners. Apart from these associations perhaps the most curious fact in connection with the place is that it is situated practically in the Churchyard of Hendon Church, and until comparatively recently a bench was actually placed in the Churchyard, a few feet from the path leading to the south-west door of the Church.

TO those unacquainted with it the Jesuit Church in Farm Street well repays a visit. The front façade is an avowed imitation of the Cathedral at Beauvais, and is built in the Decorated Gothic of the fourteenth century. Everything was Gothic in the forties, and both Anglican and Roman Churches were being erected all over the country in this style, as was said at the time, the only difference being that the latter put statues in the niches, whilst the former did not. The Church consisted originally of a somewhat long narrow Nave and Chancel, there being no room for Aisles, as the Nave walls joined the houses on either side. The Altar and Sacrarium were 3 feet lower than their present level, but in 1869 they were raised, with a great gain in dignity of effect. The reredos, it may be noted, was designed by the elder Pugin. Under the sill of the great window (the glass in this is very painful) over the Altar are the Venetian mosaics, given in 1875 by Lady Milford; they represent respectively the Coronation of the Virgin and the Annunciation. On the Gospel side stands the small choir organ (St. Mary's has two organs; that at the west end is a fine Belgian instrument), the console being in the Chapel of St. Ignatius. At the entrance of the Chancel is a life-size figure of the Virgin with a lamp burning before it, and surrounded by candles. On one side of the Chancel is the Chapel of the "Sacred Heart," with a very handsome Altar, the front being entirely covered with hammered brass, the subject being Joseph and his brethren. The whole of the Chapel is exceedingly beautiful, the alabaster on the walls giving a rich appearance. A double Aisle, which was added after the Church was built, runs along the east side of the Nave. It was erected after the designs of Mr. Clutton in 1878. In this are the Chapels of St. Francis Xavier, the Apostle of the East, St. Joseph, and St. Aloysius; each of these contains an elaborate reredos. The "Mary" Chapel is on the right-hand side of the main door. It is dedicated to "Our Lady of Lourdes," and a replica of the celebrated statue of the Virgin, which is in the grotto of that place, stands in the reredos.

IN his report to the Science and Art Department on the examination in Design, Mr. F. J. Shields points out that "in many of the drawings it is very dubious which figure is intended to personify Virtue and which Vice. There is the haziest mental vision of their respective personalities. The students should not confine their aims merely to the acquirement of the language of Art, but should endeavour by solid reading and observation so to cultivate their intellects and imaginations that they shall fervently feel the subject they attempt to pourtray. There are so many of these exercises that are quite without any evidence of emotion—cold and vapid productions." In the subject of Drawing from the Life the examiners regret to say that the standard of former years has not been maintained this year, especially when the female figure has been the subject. They continue urgently to recommend that better-shaped and proportioned models should be set before the students.

CARRIED out under the direction of M. Esquié, the work of restoring the Arc de Triomphe in Paris will occupy a year, and it will be done in such a way that the additions will not be detected. It is not a little odd that this comparatively new Arch—it commemorates the achievements of the armies of the First Republic and the First Empire—should be in a more unsound condition than many of the similar structures erected by the Romans. The truth is that the Arc de Triomphe is built mainly of very porous stone, which absorbs water too readily.

AN interesting story is told of the founder of Morden College, Sir John Morden. He was a Turkey merchant, who traded at Aleppo, and amassed considerable wealth. The story goes that he put the whole of his property into three vessels, which he sent on a trading voyage. He then embarked for London, to await the realisation of his venture. Years went by, and nothing was heard of the ships. Sir John was reduced to poverty, and compelled to take service with a tradesman. One day he heard a gentleman read from a newspaper of an extraordinary event. Three ships richly laden had arrived in London after ten years' absence, long after they had been given up for lost! Sir John hurried to the city, and, of course, found they were his own ships. In his gratitude he vowed that he would build an asylum for decayed merchants, so that none might suffer the hardships he had been reduced to. On the "Great Stone Field" at Blackheath, Sir John erected his College, after the pattern, it is supposed, of Bishop Warren's College for Widows of the Clergy at Bromley. Sir Christopher Wren was the Architect, and Edward Strong, his master-mason, the builder. Morden College to-day is as perfect in structure as when first built. Its fine proportions, the beautiful tint of the red bricks and tiled roofs and the green window shutters, the admirable harmony of the parts and the chasteness of the ornamentation, all combine to make it what it is intended to be, a "haven of rest."

AT Redenhall, which lies a mile east of Harleston, there is an old Church whose Tower took 60 years to build—from 1460 to 1520. This Tower is said to be the finest in Norfolk, but Hoxne, Eye, and some other parishes on the Suffolk side, possess Towers almost if not quite as fine. On the great west door are carvings of a hammer and horseshoe and a shoe and pincers, rebuses, says Blomefield, of Smith and Hammersmith, the probable donors. We think it more likely that the implements commemorate some benefaction of a guild of farriers, or the like, as was suggested by Archdeacon Perowne. At the east end of the North Aisle we come to the Gawdy tortoises which herald the way to the Manor Chapel, in the window of which is a fine series of armorial bearings. The Vestry, entered from the Chancel, has some barred windows which are architecturally interesting, several chests, one with noticeable carvings, and a quaint old plate of the Church dedicated to Bishop Lewis Bagot (1783-1790). Here also are panels of the twelve apostles from the old screen. On the floor of the Chancel was one of the earliest Norfolk brasses, a large figure of William de Newport, rector 1311-1326, and builder of the Chancel. It had a French inscription, given by Blomefield, and was, we believe, destroyed in altering the Church in the earlier part of this century. The brass lectern here is of an exceptional character. It is a two-headed eagle, of great age, and of unascertained meaning.

THE Venus of Milo, the finest relic of Greek Art, is known to everybody, but few have heard of M. Henri Brest, who was the means of securing it for the Louvre. This was as long ago as 1818, yet M. Brest only died the other day, having lived more than a century. Tranquillity, pure air, and simple fare no doubt contributed to his longevity, for M. Brest continued to reside on the island of Milo until his death, remote from all the changes that have troubled the World since 1818. He certainly never saw one of the thousands of casts of the great statue which are to be found in every School of Art and Museum, big and little, in the World, unless, perchance, he had one of his own.

M. JOSEPH THOME, who died a few days ago, was something more than the Cubitt of modern Paris, for the vast building schemes which he realised under the inspiration of Napoleon III. and the guidance of Baron Haussmann, had a political importance as well as an æsthetic result that put them in a different category to the creation of Belgravia. Thome arrived in Paris over sixty years ago as a journeyman plasterer. In Bordeaux he had made acquaintance with Haussmann, who soon recognised in him the vigour and audacity needed for carrying out the Imperial plans. It was in 1855 that he set to work, unhesitatingly buying up whole quarters of the city, opening out boulevards, and lining them with palatial structures. The task in which he himself took the greatest pride was the calling into existence of that magnificent "Quartier de l'Arc de Triomphe," that has no rival in any other capital. Here he laboured on long after the Empire and Baron Haussmann had sunk into dust and ashes, and here he died worth a couple of million sterling, and occupying a sumptuous Mansion in the Avénue d'Iéna. One of his sons carries on the business of contractor.

A NEW plan for draining the Zuyder Zee in Holland is being tried with some success. It will be remembered that on the north-west of this shallow sea there is a broken chain of islands extending in an arc from Texel almost to the mouth of the Elbe. The old plan was to connect these islands by sea-walls, and, having thus shut out the ocean, to drain the Zuyder Zee by means of huge syphons. Naturally the cautious Dutchman has always been terrified by the enormous expense of such an undertaking. The new idea is simplicity itself, namely, not to oppose the tide, but to assist it in the formation of alluvial deposits. For this purpose small rafts, made up of bundles of sticks—fascines would be the military term—and secured by buoys, are let out from the mainland. In the smooth water thus made slime and sand will form deposits round the rafts, and as the deposits accumulate the rafts are to be pushed further and further out till the mainland of Friesland is joined with the islands. The plan is almost childish in its simplicity, but it has been approved by many experts, both Dutch and German.

THE quaint little Church of Staveley-in-Cartmel is following in the wake of the other old Churches of the district, and in a short time much of the interior arrangements will have been swept away. The Church is about 200 years old, and with the exception of being enlarged by the erection of an Aisle 100 years ago it has remained until the present with all the chief characteristics of the little rural eighteenth century Church. The old high, square pews are to be replaced by pews of more modern pattern, the old rubble pillars are to give place to oak uprights, and the roof will be entirely renewed, the interior forming two open roofs, one over the Nave and one over the side Aisle, with an Arcade between. Messrs. Paley and Austin, Lancaster, have charge of the work, which will be commenced as soon as possible. The cost is estimated at £1,000.

IN Dr. E. J. Ball's report to the Department of Science and Art, it is stated the teaching in the Science and Art Classes of the South Western District shows distinct improvement in teaching methods as compared with last year. A large number of the elementary Schools were last year very badly supplied with drawing materials, but the larger portion had since obtained at least those supplies which were most urgently needed. The most important progress that he had to report was a very complete system of Science and Art teaching which had been adopted at Plymouth. At present there was a large Technical School there. This was supported out of the County Borough Technical Grant. The School Board had erected a large higher grade School in the vicinity of the Technical School, and a joint committee of the School Board and municipal authorities had been formed, which will control the teaching at both Schools. A comprehensive scheme of teaching has been adopted, of which the Schools will form part. In the adjoining town of Devonport considerable progress has also been made. Plans for new Municipal Technical Schools had been prepared, and the numbers of individual students attending the classes had increased since last session from under 200 to over 300, and the progress was likely to continue. The large Technical Schools at Bath, too, were nearing completion; and at Cornwall the question of the establishment of a Council School of Agriculture had recently taken definite form. In view of the decadence of the mining industry in Cornwall, the necessity for this School was scarcely open to question, and it might do much to benefit the county. The Mining and Science Schools at Camborne, which were already of an important character, had been very greatly improved during the year by the addition of a new wing, containing large and well-arranged chemical and metallurgical Laboratories.

THE prospectus of the Glasgow School of Art, with local prize scheme, which has undergone considerable revision and improvement has just been issued. The provision made for the advanced work in Life Painting and Design appears to be full and complete, and students receive instruction in life painting at a much earlier period than formerly. Modelling also is included in day and evening classes. Decorative Art is under the care of a special staff of craftsmen, chosen on account of their practical knowledge and skill, and the efforts of the students are directed towards a thorough recognition of the technical needs of the practical art or craft they are studying. The Architectural Department—which section has attained marked success in this year's National Competition as well as in the examinations—issues an inviting programme, the chief item in which is a set of lectures or analyses of Greek Architecture by the director of the Architectural section, Mr. W. J. Anderson. The curriculum for Architect students seems to afford great advantages, as, in addition to the constructional, historical, and other training special to Architects, the resources of the Life and Applied Art Classes of the School are at their disposal.

DURING the excavations of Freiherr Hiller von Gaertringen, on the Greek island of Thera, several sculptures and inscriptions have been found in the Gymnasium; but of particular historical importance is the discovery of a letter written by King Ptolemy Euergetes of Egypt, dated the eighteenth year of his reign (B.C. 229). In this document the King assigns to the mercenaries, comprising the garrison on the island, the revenues of certain specified domains in order that they may be able to defray "the expenses for sacrifices and anointing-oil."

AN arrangement has been come to between the Official Receiver and the County Council, whereby, in consideration of the last-named body giving a sum of £30,000 to the improvement, the Official Receiver undertakes to put back the buildings belonging to the Hotel Cecil 25 ft. By this improvement the width of the Strand in this neighbourhood will be increased from 55 ft. to 80 ft. It may be remembered that the County Council have a scheme for widening the Strand from Charing Cross to Somerset House to this width, and this arrangement is the first step towards the carrying out of the entire scheme. The original intention of the Official Receiver was to place the Hotel buildings only 5 ft. behind the main thoroughfare, but other considerations presented themselves. This improvement has necessitated the purchasing of the entire block of buildings which fronted the entrance, and compensation for the businesses connected therewith. One claim of £60,000 for goodwill is still outstanding, and already the company has paid £200,000 to carry out this vast alteration.

THE collection of rubbings of brasses in the possession of the Society of Antiquaries has, says the "Manchester Guardian," recently been considerably enriched by the gift from Sir Wollaston Franks, the president of the Society, of the fine collection formed by him during the past thirty years, making the series now stored at Burlington House incomparably the finest in existence. The rubbings number many thousands, nearly all of them having been taken from brasses found in England, a few only coming from Flanders, Germany, and elsewhere. The art of engraving monumental brasses seems to have been a form of metalwork almost confined to this country, as comparatively few such brasses are to be met with on the Continent. Sir Wollaston's rich collection of drinking vessels has been deposited on loan in the new Gold Ornament Room at the British Museum. They include a curious set of silver vessels found near Van, in Armenia, a silver bowl found in Lancashire, full of coins of Canute, and several silver bowls, spoons, &c., from Carthage. The extensive collection of Continental china and pottery belonging to the same gentleman will, it is understood, remain for the present on loan at the Bethnal Green Museum.

WITH THE A.A. IN KENT: STROLLING SKETCH BY JOHN BEGG.

SITUATED in Dalhousie Square, Calcutta, next the Hong Kong and Shanghai Bank, the new Standard Life Assurance Buildings are just completed. The buildings were designed by Mr. F. W. Stevens, Architect, of Bombay. The resident clerk of works was Mr. W. G. L. Cotton, and Mr. J. McMinn the general contractor. The works were commenced in February, 1894, so that they have taken something less than two and a half years in completion, a short time comparatively when the magnitude of the buildings and the class of work is considered. The buildings are in two blocks, divided by a *cul-de-sac* lane—Vansittart Row—which is bridged over and surmounted by a fine stone-sculptured pediment, over 30 ft. long by 7 ft. high, in which in the round is a carved representation of the Parable of the Ten Virgins. On the apex above this pediment is a colossal statue of Atlas bearing the World. The extreme height of the building proper is 68 ft., and the Tower at the angle of Wellesley Place and Dalhousie Square 140 ft. The structure consists of three stories. Porebunder stone (a material very much like Bath stone) has been used largely in the construction of the edifice. This stone has long been largely used in the Western Presidency, but it is the first, or almost the first, time it has been employed in Calcutta. The bank premises are paved with marble; the teak counter fittings have brass accessories, the work of Messrs. Weinbridge and Co., of Bombay. The exterior sculpture is by Messrs. Harry Hems and Sons, of Exeter, and the foliage carving by Mr. Rowjee Bhama and his assistants, of Bombay, working from models prepared by Mr. Gomes, of the Bombay School of Art, under the direction of Mr. Stevens, the Architect. The cast-iron work is by Messrs. Burn and Co., of Calcutta.

THE old Clergy House at Alfriston has been handed over by the Ecclesiastical Commissioners to the Council of the National Trust for Places of Historic Interest. The purchase money is the nominal sum of £10 merely, but the Commissioners are now rid of the cost of maintaining the interesting old fabric. It is a very simple and unique building of the fourteenth century, two stories in height, and with a big thatched roof, and the dreadful state of dilapidation in which it is both inside and outside shows how badly the Commissioners have looked after it. It was the humble home of some pre-Reformation clergy, and is probably the only—at least it is the most—complete and perfect of a series of similar homes of the clergy which were scattered over England four or five hundred years ago, and is, therefore, of supreme interest as a relic of the clerical life of those times. The National Trust will put it into order, and have almost raised enough for its restoration.

FEW of the thousands who annually visit the British Museum have any idea of the working or extent of the administrative machinery which is kept going from year to year in order that the collections stored therein may be maintained at their present pre-eminence and added to continually, and that the Museum may not be outstripped by its Continental rivals. Numerically the establishment, excluding the natural history branch, consists of 17 staff officers, 75 assistants and clerks, 128 attendants, and 135 mechanics, masons, electrotypists, firemen, commissionaires, labourers, &c. Although this may seem a large staff, it is inadequate to cope satisfactorily with the immense mass of material that accumulates steadily in the several departments. In the course of last year 34,337 volumes and pamphlets and 70,394 parts of volumes of works in progress were added to the Library, while these figures do not include 926 maps, in 5,795 sheets, and 4,793 pieces of music, each complete in itself, which were acquired during the same period. In the way of books the most remarkable acquisition recently made has been the highly important one of no fewer than 1,014 editions and translations of the "Imitation of Christ," ascribed to Thomas à Kempis, including all those in the celebrated collection of the late Mr. Edmund Waterton, of Walton Hall, Yorkshire. In early English books the most important acquisition is one of the highest interest, being the only known copy of the first edition of a book by Bunyan, "Christian Behaviour; or, The Fruits of True Christianity," printed in London in 1663. This is the third of those of Bunyan's books which were composed in prison, and its existence was unknown until this copy was discovered some years ago in a chest of old books at Cranbrook, in Kent.

THE War Office authorities are about to invite tenders for the construction of an extensive range of buildings at the Plymouth Citadel, to be known as the Men's Married Quarters. This work, which may be regarded as the second stage of the scheme for converting the Citadel into an Artillery Depot, will be commenced at once, and will occupy about eighteen months. The whole block will have a frontage of 800 ft., and the total cost is estimated at about £30,000. It is also proposed to demolish the existing Officers' Mess, and to utilise the site for the erection of additional Men's Quarters, and when the entire scheme is completed the Citadel will, without doubt, contain the finest military buildings in the Western District. The total cost of the whole scheme will not be less than £100,000. The first battalion Welsh Regiment, now quartered in the Citadel, will be transferred to Crownhill Fort Barracks while the work is in hand.

FROM Paris we learn that a destructive fire occurred last week at the Industrial Exhibition of Montpellier. The book department was in a few minutes burnt to embers. It contained a Gallery of rare pictures of men and scenes connected with Montpellier, throughout the history of that old and famous University city. They were lent to the Exhibition by the Municipal Council and private citizens. In the same department was a series of the most interesting documents belonging to the archives of the City and the University. Amongst them are an original plan of the Citadel built by Richelieu, the bull of Pope Urban V. instituting the University of Montpellier in the fourteenth century, a Chinese book printed on silk, documents relating to the Paris Bastille, also the seals of the town, and pictures and parchments. This is an irreparable disaster that will be felt not only at Montpellier, but among the sister Universities of Europe and America. Almost the only thing left of the Exhibition is the Fine Arts Building.

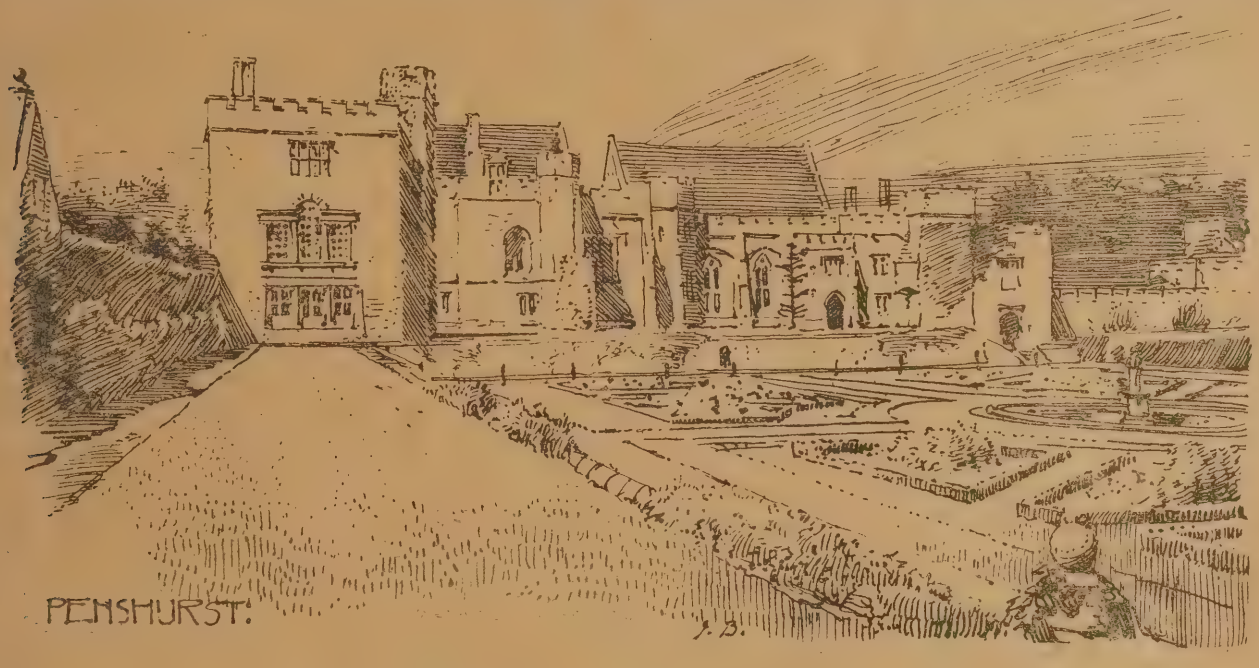
THE Royal Academy has just held its preliminary examination of Art students, candidates for the three years' free education in the best School in England, and taught by the Royal Academicians. The report is not yet complete, for each candidate when the Schools open must do a drawing under supervision to show that his competitive work was entirely his own. It is stated that the young men who offered themselves were much below the standard, and that only a very few will be allowed to enter for the second chance. The girls drawings were the best offered, and show a considerable amount of culture and study. The women's passes were half as many again as those of the men's.

MR. JOHN WILLIAM GRAY, late engineer of the Birmingham Waterworks, died recently at Leamington. When he left school he was articled to Mr. Murray, engineer, who was then engaged in carrying out improvements on the River Wear Harbour. At the end of four years he went to London and obtained an engagement under the New River Company. He subsequently became attached to the East London Waterworks Company, and played a prominent part in many important engineering undertakings. He went to Birmingham in 1865, and obtained the post of engineer to the Birmingham Waterworks Company, and his services were retained when the undertaking was acquired by the Corporation. He made all the preliminary surveys for the scheme for acquiring a water supply for Birmingham from the rivers of Elan and Claerwen, in Radnorshire, a distance of 70 miles, and was to have taken charge of a section of the work; but his health failed, and in the autumn of 1894 he tendered his resignation. This was accepted, and the City Council granted him a retiring pension of £600 a year, his services being available as consulting engineer.

AT CASTLEREA the new Church of St. Patrick was dedicated last week. The edifice is in a suitable position within the town, and occupies an elevated site, fronting St. Patrick Street, and is in the Pointed style of Architecture. The building is cruciform and is divided into Nave, Aisles and Transepts. The Chancel has a traceried five-light window, and a similar window pierces the front gable over the principal entrance. The height of the building to the roof ridge is 65 ft., and its measurements are 160 ft. in length and 61 ft. wide across the Transepts. The walls are of faced ashlar with limestone dressings. The Tower is a campanile, standing at the northern end of the western or principal entrance. It is a square structure and rises to a height of 140 ft. The principal entrance is highly ornate. The Transept gables are flanked by turrets and contain entrance porches. An arcade of six Pointed arches, supported on seven octagonal columns, separates the Aisles from the Nave. The Transept arches are 40 feet high, with a span of 34 feet each. The roof is open work pitch pine. The building is floored with timber with tiled passages and is seated throughout in pitch pine. The High Altar is sculptured and is of Caen stone and coloured marbles, the Altar-piece being in three panels representing the Annunciation. The Altar table is supported on four Connemara marble columns, with richly-carved capitals. The reredos contains a representation of the scene at Calvary, and is flanked by niches containing statues of St. Peter and St. Paul. The side Altars are in the same style as the High Altar, and are dedicated the one to the Sacred Heart and the other to the Blessed Virgin. The cost of the building exceeds £13,000, of which £9,500 was for the structure itself and the remainder for the internal fittings and decorations. The Church, which was designed by the late Bishop of Sligo, in conjunction with the clerk of works, Mr. John Scannell, was built under the supervision of the latter by Mr. John Clarence, of Ballisodare. It will accommodate 1,500 worshippers.

Two pictures have been damaged in the National Portrait Gallery. They are now in the hands of the repairers, and the damage is happily not irremediable. The eyes of Sir Peter Lely's great painting of the Earl of Sandwich are said to have been deliberately scratched with a pin, and the other picture was a painting of Sir William Hamilton by Jervas, and the injury consisted in several long scratches on the robes near the bottom of the picture. Mr. Cust, the Director, in an interview, stated that "the need of additional curators is apparent when you consider that there are only ten men and a policeman to guard 33 rooms, but that matter is in the hands of the Treasury. I think that glazing would settle the matter. If the pictures were covered with glass no one could cause any wanton damage without attracting the attention of the assistants. I am aware that many galleries are provided with railings, but our rooms are unfortunately too small to admit of that precaution. It is a curious thing that the bigger the crowd the less trouble we fear. On Bank Holiday we admitted 2,000 persons without a single complaint from the curators. In crowds people watch one another; but when isolated individuals are wandering through the rooms it is difficult to keep an eye on all."

AN autumn Exhibition of Pictures by the members of the Dublin Sketching Club is now open to the public at No. 9, Merrion Row, Dublin. The Exhibition will remain open during the rest of this month and the whole of September. There are one hundred and seven paintings and sketches in oil and water colours. The unassuming title of the club might mislead people into the supposition that the contents of the room were productions of a more or less hasty character; but the fact is that the majority of the sketches are well finished artistic work. Indeed, one of the pictures, a sea piece by Mr. Alexander Williams, is over four feet long. There is nothing of a very high order in the Exhibition; but on the other hand, many of the pictures are the work of very skilled hands, and possess a goodly amount of merit.



A CAREFULLY written and highly interesting account of Tilty Abbey, appears in the "Essex Review," by Mr. Herbert W. Gibson, of Ongar, who, speaking of the bare walls now constituting all that is left of that old Monastery, laments the peculiar ill-luck of Essex with its archæological remains. "What were once Norman strongholds or religious houses," he says, "are now little more than piles of stones—time has already worked sad havoc, and in another century even the sites of these buildings may hardly be identified." "It is said," Mr. Gibson continues, "to be a most unlucky thing to remove any materials from Tilty Abbey, but the small thefts since the buildings first began to decay must have been continual. According to the local tradition, an underground passage leads from the Abbey to Horeham Hall, some two or three miles away. The entrance, at any rate from the Tilty end, has yet to be found."

SIR R. MURDOCH SMITH, Director of the Edinburgh Museum of Science and Art, states that during the past year the various departments of the Museum have been steadily developed, and the collections enriched by the addition of important specimens, both by purchase and gift. In the department of Scottish geology and mineralogy the work of arranging and labelling the Scottish mineral collection, under the direction of Professor Heddle, has been steadily carried on and is now approaching completion. The most important purchase made in the course of the year was that of a portion (70 specimens) of the Peyre collection of mediæval wood carving and iron work acquired by the Science and Art Department. By the bequest of the late Dr. Hugh Cleghorn, of Stravithie, Fife, formerly Chief Conservator of Forests in India, 907 volumes (besides pamphlets) relating to forestry have been added to the Library. There were also added to the Library by donation and purchase 332 volumes, besides pamphlets. Dr. Ramsay H. Traquair, keeper of the Natural History Collections, in his annual report, states that the chief purchase for the year has been a stuffed specimen of the great auk *(Alca impennis)*. This specimen, in full summer plumage, is one of the finest known, and completes the series of relics of this extinct bird contained in the Edinburgh Museum.

MEMORIAL Stones of a new Welsh Congregational Church in Bank Street, Ponkey, were recently laid. The Chapel is being built of red Ruabon facing bricks and terra cotta, part of the façade being of Cefn freestone. The size of the Chapel will be about forty-eight feet by thirty-six feet, and the Vestry twenty feet by fifteen feet. There will also be a Boiler Room, measuring twelve feet by ten feet. The woodwork will be of pitch-pine. The Chapel will have seating accommodation for about 230, and the estimated cost is £1,045. The Architect is Mr. Gummow, Wrexham, and the builder, Mr. John Davies, Ruabon.

SHEFFIELD, according to some people, is a dirty place where they make knives and forks. The artistic view is not very different. Referring to the recent Arts and Crafts Exhibition, the "Studio" says: "Even during the wildest flights of imagination it would be impossible to write down Sheffield as a city devoted to Art, but to assert that it is void of such an element would be adding blackness to the night and rendering auxiliary aid to those manufacturers who vie with each other in their endeavour to make their city one of eternal darkness. To outward appearance all that was beautiful has foundered in a sea of manufacturing requirements, and all the instruments of production would appear to pour forth their poisonous fumes with a hissing determination to blot the heart out of Nature itself. This is what the stranger must feel on entering Sheffield, and such is the vision carried away to the quarters of the earth and upon which the reputation of the city—as a city—has been built. Certainly the mind which has not sojourned sufficiently long to find how much of beauty is left, may be forgiven for spreading so erroneous a view; but, deep down in the heart of man, there is still the old hereditary love of beauty, of excellence in workmanship and pride in production, which has, and ever will, place them in the foremost rank as Art craftsmen." The meaning of this is a trifle complex, and we do not profess to know to whom the "them" in the last sentence refers. We hope it means Sheffielders. But why will people persist in regarding as a city of eternal night one of the most beautifully-situated towns in England? It is small wonder if Sheffielders retain a love of the beautiful, considering the unequalled opportunities they possess of studying it on every side.

IN reference to the additional accommodation at Liskeard Workhouse, Mr. Gordon Smith, the Architect, reporting to the Local Government Board on the matter, stated that the scheme would need some considerable modification before it could be said to be satisfactory. It was proposed to erect what in effect would be one half (for women) of a new Infirmary and to still keep the present Infirmary for both sexes. This might be feasible as a tentative arrangement, but the new building should be so placed on the garden land when acquired by the Guardians that it could be completed as an adequate Infirmary for both sexes at a later date. In the sketch plans submitted this would hardly be practicable, since the land in question did not extend throughout the whole width of the present Workhouse premises. It would be necessary to move the centre of the future Infirmary more to the south, unless the Guardians were to purchase the land to the west of the Infectious Hospital, as well as the present garden ground rented by the Guardians. If the Guardians would consent to this fundamental alteration, the details of the proposed new building could be easily arranged; indeed, it would be preferable if the Guardians' Architect were to design a complete new Infirmary, of which it might be understood that only one half was to be proceeded with at once. The Guardians should bear in mind that although the Union was undergoing a shrinkage of population, the Infirmaries and Workhouses are generally being more and more made use of by the sick poor, and hence they are being enlarged, rebuilt or otherwise altered in very many Unions, in order to meet the demand made upon that class of Workhouse accommodation. If this suggested modification were adopted, it would be desirable to make the new Wards 24 ft. wide instead of only 20 ft., and the fireplaces (stoves) put in the middle instead of in the side walls, where they occupied valuable bed space; that the Day Room should have means of thorough ventilation; that some accommodation for nurses when off duty be provided away from the Wards (in a second story, perhaps); and that properly fitted up Duty Rooms be provided near the Wards. The matter has been referred back to the Building Committee for its consideration.

WITH THE A.A. IN KENT: STROLLING SKETCH BY JOHN BEGG.

IT is sa'd to be the heart's desire of nearly every literary man and artist, who dreams of building himself a house, to have a Tower for his sanctum. Lady Butler has been able to find a Tower ready made for her purpose—Constable's Tower, Dover. It is a good height above the smoke and fog. A Gallery has been fitted up for her as a studio, and she is busily at work there upon a large new military subject, which may be completed in time to make a sensation at next year's Academy, and to disprove the random assertion Mr. Goschen once made—that the red coat did not lend itself to Art.

THERE has just died at a bathing-place near Christiana the aged sculptor Christopher Borch, who began life as a carpenter, but afterwards studied plaster art in Germany and Paris, and later in Copenhagen. He obtained a stipendium to go to Rome, and finally settled in Christiana. His best known works are the bas-reliefs from the Frithiof legend in Castle Oscarthal, near Christiana, the decorations in the Hall of the University, the "Egg-girl" in the Stockholm Castle, the "Archer" and the "David," belonging to Baron Rothschild in London.

SPANISH ART OF THE SEVENTEENTH CENTURY.

VELASQUEZ AND HIS SUCCESSORS.

THE early style of Velasquez, said Mr. R. E. Fry, B.A., in a recent lecture, marked a new epoch in the history of Art, and formed a connecting link between ancient and modern Art. Velasquez was regarded by artists as permanently modern among the old masters, as the one old master from whom they could learn without in any way sacrificing their spontaneity. Portraiture was an Art which tended to be distorted by the exigencies of the sitter and the recording of fact. The ancient artists constructed their pictures from within, realising in an outward form an internal vision. They could see that there might be two very different attitudes towards a picture in the painter's mind. In the one case, he wanted actually to make a beautiful and delightful thing, just as one might wish to work a beautiful piece of jewellery, and the thing was not only to be beautiful in itself, but it was to carry with it all sorts of beautiful associations; and in that case the artist would bring together in unreal profusion representations of objects that in real life moved one by their beauty, stirred the mind, or interested deeply. In the other case, the artist was passive and receptive and waited until objects were represented to him in a beautiful manner. What he wished to try and show was that Velasquez was one of the first great artists who adopted this latter method. The World, as the ordinary man saw it, was arranged accidentally without regard to fitness. No one, he thought, would be rash enough to maintain that he ever found in Nature that complete subordination to one central idea which was the

ESSENCE OF A WORK OF ART.

Both the ancient and modern artists attempted to harmonise the external world with that internal demand for fitness and purpose. He thought they might regard a work of art as an attempt to harmonise a certain internal demand with the appearance of external nature; to put it shortly, Art was the harmony of the desirable with the actual. The desirable could not impose upon men until it was clothed with actuality; the desirable was the actual made beauty. The modern artist lay in wait to catch Nature in her propitious moods. The indispensable quality of the ancient artist was his invention, his power of conceiving a combination which had never, and perhaps, could never arise in external nature. On the other hand, the necessary quality of the modern artist was not his invention, but the alertness of his perception, his promptitude to seize the significant moment. The Spaniards had learnt this perception in a high degree, while they almost entirely lacked invention. The constructive artist starting with his desirable world was in danger of never giving it sufficient reality to convince the beholder of its possible existence. The one native quality of Spanish Art in the days of Velasquez, in the earlier half of the seventeenth century, was its Zola-like realism. One reason of Velasquez's greatness was his conception that beauty was to be discovered rather than created. In middle life Velasquez attained to that extreme

FREEDOM AND LOOSENESS OF TOUCH

which had distinguished him among painters. This quality of looseness, which was so much admired now by artists that it was aimed at by a conscious effort, was, he thought, in the case of Velasquez rather an inevitable outcome of his firm grasp of the idea of the picture. The real charm in this looseness was its utter unconsciousness. In his later works they saw underlying this a consciousness of structure and purpose which indicated the ease of a complete mastery, and not the uneasy grace of an effected manner. On the whole the development of Velasquez's technique was towards greater simplicity, and in this it corresponded with his gradual change of aim from the second to the third or final style. He was coming back again to his earlier attitude towards Nature, attempting again to depict her as beautiful, instead of deliberately forcing her into well-recognised schemes of beauty.

THIS REVOLUTION

of Velasquez from the old ideas of formal beauty was as complete as Wordsworth's revolt in the last century from poetic propriety. Velasquez could not have achieved triumphs over the ugly in Nature in the technique of his earlier manner. Velasquez painted a whole series of fools, dwarfs and idiots. The impressionist, as contrasted with other forms of Art, depended chiefly on two things: first, the acceptance of the appearance of objects frankly without altering or modifying that appearance, and, secondly, unity of focus. One of the great charms of the final method of Velasquez was in the greater sense of life, and this was a great compensation for the loss of formal beauty. Only by such an impressionist treatment could an artist express the momentariness of the vision, the feeling that after another second all would have changed and gone, and they must enjoy it while it lasted. Velasquez lived intensely in his time, his perception was limited to the actual, and so Velasquez had painted Spain so perfectly that it might almost be said it was superfluous to read Spanish history. He accepted the world of everyday life with its limitations, and gave æsthetic pleasure by distilling beauty out of the actual instead of making actual the beautiful idea.

[Extracts from a lecture before the University Extension Students, Cambridge.]

OVER-BUILT.

THE RESULT OF SPECULATIVE BUILDING.

IN Swansea the speculative builder is not having a very happy time. The town has been over-built and numbers of houses are empty in all parts of the town, and their prospects of tenancy are, to say the least, remote. The result of all this is, that the value of house property is depreciating. Rents are coming down and, possibly, the proportion of rates per pound may rise. This condition of things has been attributed to the large amount of capital that has, during the past few years, been available for building purposes. The opening up of the Town Hill and the Rhyddings estates created a large field for building enterprise; but the enterprise was far more than the immediate commercial prospects of the town justified. The employed became employers, and, if they were not sound, practical men, they often landed the lawyers who advanced the money in little pecuniary losses which greater care might have obviated. It was the custom until recently—and with a few lawyers it is still the custom—to advance money when the building had reached certain stages; the joists, the roof, first coat of plaster, &c. This system was undoubtedly one in which the man without capital—and as often as not this was the speculative builder—was given a loophole to the attainment of wealth through mortgaged avenues. The security to the lawyer was not, at the same time, so good. The builder, once started, found it impossible to stop without going to the wall. The first house had to be completed with money advanced on the second, and so on. The speculative builders increased in numbers. In short, building speculation became a craze, and the town was over-built. And the peculiar part of it is that solicitors, who were advancing this money in the stages referred to, did not seem to appreciate the danger until it had really forced itself upon them. They discovered that the property they already held would not realise much more than its value—if it realised that. However, they seem at last to have awakened to the exigencies of the situation, and there is a movement on their part to restrict advances of money by stipulating that the roof shall be placed before the first advance. Now, as a restriction, this is very effective, for no one but a builder can conceive the difficulty of "getting under cover" in such circumstances. But it undoubtedly entails hardship upon those honest builders who, having started with sufficient capital, have it all invested in property which, in the state of the market, will not realise the original outlay upon it.

THE ROMANS IN BRITAIN.

UNDER this title, Mr. H. E. Malden, M.A., gave a lecture at Cambridge before the University Extension Students. He said they had to consider Roman influence in Britain and the Roman political influence in Europe. Roman influence in England was the remains of an intermittent influence. Roman influence on the Continent of Europe, or in many parts of the Continent of Europe, had not been intermittent at all, but had been continuous from the first time that it began to be applied down almost to the present day. Cæsar's demonstration was probably intended to link the two shores more closely together. The pacification of Gaul by Cæsar would naturally tend to increase trade on the channel coasts. When the Emperor Claudius came it was clear that half the work was done already by the hands of civilisation. They no longer got the violent resistance as was shown in the time of Julius Cæsar. The people were half conquered by the merchants before the soldiers came. The people recognised that they could not sell what they wanted to dispose of without the co-operation of merchants on the opposite side, and they were not prepared to risk growing prosperity upon a desperate stand for political independence. There was very little doubt that the Roman occupation of Britain was a muddled matter. He did not say it was a mistake altogether; the Romans had their reasons for what they did, but it was not well managed. The Romans made a mistake by having no scientific frontier; they should have occupied the coast until they got what they wanted. The Romans tried to make a very unscientific frontier by building walls. The distribution of the Roman forces at an early period showed how dangerous the unconquered Britons were in the minds of the commanders. Yet although the islands were not completely conquered, and although there were many independent natives, the fabric of civilisation seemed to be very well established on the Roman side. He did not suppose London existed when Julius Cæsar made his armed demonstration in Britain because he mentioned nothing of it. London was not the capital of the Roman Britain, and although it came rapidly to the front, it was not so important as it was afterwards. With regard to some of the great cross roads in Britain it was pretty clear they were ancient British roads. They must remember that the physical environments were the same then as now. The climate, he supposed, was rather more severe than now but still the general environment was much the same. They faced it in a more civilised way than our ancestors did in the last century. The Romans did not heat their houses with big fires, the greater part of the heat of which went up the chimneys. Upwards of a hundred Roman houses in Britain had been explored, and all of them were warmed by hot air. Open fireplaces had been found in certain outlying rooms, but the living rooms were always warmed by hot air. Burials always took place outside their towns. In very many of the present arts the Romans must have been far superior to the ordinary Englishman of one hundred years ago. The remains of their villas showed taste in ornamentation, which was considerably beyond the taste to be found in an ordinary Englishman's country house at the present day. Yet this civilisation, as he said, perhaps had a somewhat slighter hold on Britain than it had in some parts of the Roman world. The mere fact that it broke down would help to show that. The Celtic language in Gaul appeared to have been killed by the Church, and ecclesiastical Latin seemed to have been the reason why the Celtic language in Gaul came to an end. Long before the Romans abandoned the government of Britain, Christianity was the established religion of the Roman empire, but no stone inscriptions of a Christian character had been found in Britain. That indicated that the religion of the empire had a very slight hold, and if the religion of the empire had a very slight hold, the system of the empire had not so strong a hold as it should have had. Mr. Malden spoke of the severe taxation on the middle and lower classes, which ultimately broke up the power of the Roman empire.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—When your article on me appeared on the 12th instant I was only able to glance at it, but I read it through afterwards while I was out of town. The paragraph about Lord Leighton, on page 5, does not convey what I meant when I was interviewed. In listening to a long and desultory disquisition on many subjects it is not easy to seize on the exact word used, while the speaker knowing what he means, may express his views so imperfectly that the whole drift of some of his remarks may be misunderstood, besides it must not be forgotten that the disquisition has to be greatly abridged to make it readable. I was pointing out the fastidiousness of Lord Leighton in perfecting his linear compositions, a fastidiousness he shared with G. Mason, Mr. Watts, and perhaps with Walker, and which is greatly valued by foreign artists, and I added, "this, however, is not the English view." In speaking of the brilliance and accomplishments of Lord Leighton, I certainly never had the smallest notion of depreciating my countryman, nor did I use the word "un-English."—Yours, &c.,

GEORGE AITCHISON.

OUR LITHOGRAPHIC PLATES.

THE MORTON HALL, NEWMILNS.

THIS building, which has a frontage of 120 ft. with a depth of 70 ft., will consist of a large Hall, 73 ft. by 43 ft., which, together with a small Gallery at one end, will provide seat accommodation for about 900 people; a commodious Commissioners' Room, with separate Entrance, Retiring Room, &c. The building, as will be seen, is planned lengthways to the street. At one end of the Hall are two Entrance Porches, one being the main entrance from the street and the other at the rear, which also contains stone staircase leading to the Gallery. At the further end of the Hall is a platform large enough to hold about 30 people, with a flight of steps on each side, and convenient doors communicating with the corridor and Retiring Rooms behind the platform. The large Hall is divided by strong buttresses into six bays, each having a stone mullioned window. Two bays in the front are carried up above the eaves with a six-light mullioned window in each and surmounted with gables. The floor of the Hall will be 4 ft. above the street level, and the height is reached by a broad flight of stone steps arranged in the Porch. The building will be set back 14 ft. from the road, with a dwarf wall in front. Along the front runs a deep plinth of rock-faced rubble-work finished with a bold, polished splayed course; above this the masonry will be hammer-dressed, with polished mullions, quoins, and dressings. The roof is to be slated with green slates, contrasting admirably with the red Ballochmyle stone which is to be used throughout. The roof will be surmounted by by a well designed Turret, which, besides acting as a ventilator, successfully breaks the long roof line, and makes an important feature in the grouping. The Main Entrance Porch will be bold and imposing, and somewhat more ornate than the rest of the building. The design is of a free Renaissance style. The interior of the Hall will be lofty, and there will be three entrances, the lobbies of which will be provided with double swing doors. The roof is to be of open timber work, all timbers being exposed and wrought, and the ceiling match-boarded up to the apex. The wide span of the roof necessitates the use of heavy timbers, and the massive woodwork of the roof principals or principal rafters will be conspicuous. At one end of the Hall will be a platform raised above the floor a height of four feet with panelled front and canted corners. At the other end of the Hall will be a Gallery carried across the whole width, having six rows of seats capable of accommodating 150 people. The front of the Gallery will be panelled and divided by pilasters, and richly moulded. The scheme for the heating and ventilating has been carefully considered, and the work of the heating has been entrusted to Messrs. Mackenzie and Moncur, of Edinburgh. The Architect is Mr. Arthur Harrison, of Birmingham, and the building contract is in the hands of Messrs. Matthew Muir and Co., of Kilmarnock.

NEW PREMISES FOR NEWBURY'S LIMITED, BIRMINGHAM.

These buildings have a frontage to the Minories, the Old Square, and the Upper Priory, extending to about 300 feet. They consist of a block of Warehouses, five stories in height. In the basement are Bedstead Warehouses, Packing Rooms, &c.; on the ground floor, General Warehouses; and on the first floor, Show Rooms, Offices, &c.; the second floor is divided into Stock Rooms; on the third floor is the factory, which is approached from the Priory by a fire-proof staircase. Each upper floor is recessed for light to that under. The façade is entirely of terra cotta, relieved with colour and glazed ware. The domes are constructed of granolithic concrete, with glazed ware tiles on top of same. The total cost when fitted will be about £30,000. The Architects are Messrs. Essex, Nicol, and Goodman, of Birmingham.

A NEW TELEPHONE INVENTION.

IN telephony, as at present practised, the amount of space required for the various stations and exchanges, the large staff of attendants that must be employed to carry on the work of these exchanges with efficiency, and the complication of the electrical arrangements necessary to cope with a numerous body of subscribers, constitute a serious practical hindrance. The capacity of a single exchange on the system now worked may be said to be limited to hundreds of subscribers, while one central station capable of dealing directly with 10,000 subscribers and putting any one of them into communication with any other would be all but a physical impossibility, owing to the huge number of contacts and connections, to be numbered perhaps in hundreds of millions, which would be required for its conduct. The Apostoloff Automatic Telephone is a device by which it is claimed that a station of such size is rendered perfectly feasible, because the number of contacts and connections just referred to is so far reduced as to be within workable limits. The requisite connections are no longer to be reckoned in a multiple of the square of the number of telephones connected to the station, but in a multiple of the square root of that number. This result is attained by an ingenious method of grouping at the central station the positive and negative members of each subscriber's circuit, so that each contact, instead of being appropriated to one particular subscriber, is common to a group of, say, one hundred. In the following explanation it will be supposed for the sake of simplicity that the station has only twenty-five telephones working in it, but the principle is precisely the same whether there are twenty-five or 10,000. The twenty-five subscribers are divided into five groups of five. The positive wires from the circuits of the five subscribers that make up each group are connected together electrically, and the resulting five wires brought to a row of five contacts. The negative wires are also connected in fives, but are grouped differently. The first terminals of each group of five are connected by one wire, the second terminals by another, and so on, the five wires being carried to another row of five contacts. It will be seen that by suitably arranging the connection between these two rows of contacts, the circuit of any one of the twenty-five subscribers can be closed, as desired. For instance, if No. 18 were required, a wire connecting the fourth of the positive row of contacts with the third of the negative row would give the desired result, and would not close the circuit of any other subscribers. In the same way 10,000 subscribers would be arranged in 100 groups of 100 each, and if, for example, subscriber 1,795 were wanted, the terminal of the 17th group of the 100 would be connected with the negative terminal representing the 95th member of each group. Thus by the use of 200 terminals any number could with certainty be selected out of 10,000. The co-operation of the two subscribers concerned, and of them only, is necessary to establish communication, and when once that is effected it is impossible for a third subscriber to interfere in any way without the sanction of the two who are speaking. Absolute secrecy is therefore assured.

SUPPOSED TO BE NELL GWYNNE.

IN Birmingham, an interesting discovery has been made by Dr. Boddy, of a picture which there is some reason to believe is a genuine portrait of Nell Gwynne, by Sir Peter Lely. Some seven or eight years ago, while attending a patient in a small tenement in Willis Street, Dr. Boddy noticed on the wall of the living room a tattered and torn picture of the head and bust of a woman. The frame was worm-eaten with age, broken and battered, black with dust and dirt, which completely covered the gold lines originally ornamenting the ebony border, and the canvas, scarcely in any better state of preservation, was very dirty and torn, and several holes testified to the rough usage to which it had been subjected. Still, the picture seemed to be good, in spite of the defects, and Dr. Boddy purchased it for a small amount. He then took it home, and determined that it should be cleaned and restored, and placed in his permanent collection. Time went on, however, and the picture was almost forgotten. The old worm-eaten frame became destroyed or lost, and another was substituted. At length, some months ago, the picture was sent to be cleaned. Mr. Bailey, who was commissioned to undertake the task, at once saw that the painting was more valuable than at first it appeared to be. The work of restoration was somewhat difficult, but it has been successfully accomplished, and now the picture is, to all intents and purposes, as good as when it was painted. There was nothing on the canvas to indicate the name of the painter or the name of the person whose portrait is painted, but circumstances point to its being a genuine portrait of Nell Gwynne, by Sir Peter Lely, or an extremely clever imitation. If genuine, it must have been painted somewhere about the year 1670. Nell Gwynne, the beautiful, merry, light-hearted girl, who rose from the position of an orange-girl in a Theatre to that of an actress, eventually captivated Charles II., and became the mother of a duke and the grandmother of a bishop. During the time she reigned as one of the Court beauties, Sir Peter Lely painted her portrait several times. Cunningham in his "Story of Nell Gwynne," says, "Few heads of her time make a more profitable traffic among dealers. Yet very few are genuine." Criticising Lely as an artist, Pilkington, in his "Dictionary of Painters," says that his pencil was light and free, his colouring lively, the airs of his heads and figures amiable and graceful, the attitudes easy, natural, and well chosen, and of inexhaustible variety." Then he adds, "His draperies have such an agreeable negligence, with broad folds, that his works in that respect, as well as in other peculiarities, are easily distinguishable from all other artists, and they have proved models for imitation. He had, however, a peculiar expression in the eyes of his female figures, a tender languishment, a look of blended sweetness and drowsiness unattempted before his time by any master." In many respects Dr. Boddy's picture fulfils all these conditions, and leads to the belief that the painting is a genuine Lely. The size of the picture is 30 in. by 25 in., and the portrait is in a medallion-designed background.

MR. BALFOUR has consented to lay the memorial stone of the new cottage homes and schools which are being erected near Wilmslow by the Chorlton Guardians at a cost of £60,000.

IT is expected that the new Sewage Works at Darwen will be completed within six months, and it is satisfactory to learn that it is anticipated the original estimate of £35,000 will not be approached by several thousands.

THE Colne Corporation has decided to construct a new Compensation Reservoir, three miles distant from Colne, where there is an ample supply. The cost will entail an outlay of £40,000. Mr. C. Hill, C.E., Manchester, has been appointed engineer.

Professional Items.

UDDINGSTON.—Operations in connection with the erection of the new Public Halls have now begun near the Caledonian Railway Station. The plans, which are by Mr. Alexander Cullen, Architect, Motherwell and Hamilton, show an attractive group. The cost of the building has been set down roughly at £3,000.

BUXTON.—The Foundation Stone of a permanent Church, for the Catholic Apostolic body, was recently laid. The new building is the design of Mr. Brigden, Architect, of Buxton. It is Gothic, with a semicircular Chancel of considerable dimensions. The cost of the building will be about £1,400. The contractor is Mr. Ash, of Fairfield.

GOLBORNE.—The new Catholic School building is to be 34 ft. 6 in. by 24 ft. 6 in., and includes a spacious Cloak Room, and will accommodate about 100. It is to cost about £500; Mr. James Wakefield is the builder, and Messrs. Sinnoth and Powell, of Liverpool, are the Architects. The Foundation Stone was laid last week.

BULWELL.—St. John's Church has just undergone thorough renovation, at an approximate cost of £220. The whole of the interior has been painted and decorated, the Chancel by Mr. G. F. Gascoigne, of Shakespeare Street, Nottingham, and the Nave by Mr. Curtis Wilmot, of Bulwell, both contractors having carried out their respective work in a creditable manner.

RHONDDA.—Mr. Gordon Smith, Architect to the Local Government Board, recently visited the site of the proposed new Workhouse for the Rhondda Valley, which is to be erected on the hillside near Penrhys, and it is stated that Mr. Gordon Smith approved of the place for such an institution, and suggested that the Guardians should purchase more than twenty acres of land in order to provide for several generations to come.

BIRMINGHAM.—At the meeting of the King's Norton Rural District Council, last week, Mr. R. Godfrey, the surveyor, tendered his resignation, which was accepted. It will be remembered that at Birmingham Assizes the authorities had heavy damages recovered against them in connection with a case of sewer gas poisoning, also for fouling a private pool with sewage. Mr. Justice Wills severely condemned the conduct of Mr. Godfrey in the first case, in which £2,500 was recovered.

UDDINGSTON.—At a meeting of Bothwell School Board the Committee reported on the plans of the new School, which the Board decided to erect at Uddingston, and stated that, having reduced the estimated cost by £1,063, the total cost is now estimated at £10,473, and the accommodation being for 1,104, the amount per scholar is £9 3s., exclusive of the janitor's house. Estimates for the work were accepted conditionally on the sanction of the Education Department being obtained.

ABERYSTWYTH.—The inartistic portion of the College known as the old Castle House, is now being taken down, and the site is to be filled with a structure which will be in keeping with the rest of the edifice. The design has been prepared by Mr. Ferguson, of Carlisle, who was associated with the erection of the Ladies' Hotel on Victoria Terrace, and the local Architect is Mr. T. Morgan, Baker Street. The builders are Messrs. Wilcocks, Wolverhampton, and the work will take about twelve months to complete.

MAYFIELD.—The Foundation Stone of a new School attached to the Convent, The Old Palace, Mayfield, was recently laid by the Bishop of Southwark. The School is designed to harmonise with its surroundings, and will accommodate over one hundred boarders. It will be connected with the old building by picturesque bridges. The Architects are Messrs. Pugin and Pugin, of London. The cost of building will be about £12,000. Messrs. L. H. and R. Roberts, of Islington, are the contractors.

MORECAMBE.—It has been decided to extend the Sea Wall and Promenade to Bare, at the corner of Bare Lane, and, providing Government sanction is obtained, it has been resolved to advertise for tenders. The Promenade will then reach from the Battery Inn to Bare, fully three miles, and will form one of the finest marine walks round the British Coast. A monster Hotel is to be built on the Calton Gardens estate, to contain 100 rooms and cost £30,000. A Pavilion is to be erected upon the old Pier.

ST. IVES.—New Waterworks were formally opened last week. A large Reservoir has been erected on Hellesveor Moors, and the water is being pumped from St. Ives Consols Mine by a Merryweather 7-horse power Otto Gas Engine, driven by a friction clutch, the consumption of gas being less than 300 ft. per hour. The water is pumped into the tank at the rate of 6,000 gallons per hour. The Reservoir, built under the superintendence of the borough surveyor (Mr. John Grenfell) is 70 ft. long, 30 ft. wide and 12 ft. deep, and will hold 157,000 gallons.

DUBLIN.—After rebuilding in consequence of the late disastrous fire, the premises of Messrs. Carson Brothers, 7, Grafton Street, have been re-opened. The building is of red brick and Irish cut granite, surmounted by a cupola of carved stone, while the woodwork is polished mahogany. The windows are lofty, measuring some 14 ft. in height. The interior is in American polished pine, and the light at the back is admitted by a glass dome. The work was carried out by Messrs. Farquharson, builders, under the personal supervision of the Architect, Mr. Mitchell, Leinster Street.

BURSLEM.—A handsome Reredos has been erected in the Chancel of St. Paul's Church, Burslem, Staffs., by Mr. J. Green, of King's Heath. The main structure is of oak, relieved by walnut, ebony, pear, olive, and other woods, and is elaborately carved throughout in the 14th century style. This Reredos was exhibited at the Paris Exhibition of 1878, and was the means of securing a Silver Medal for Messrs. Jones and Willis, of Birmingham and London, who constructed the work from the design of the late W. Scott Champion, Architect. A brass tablet on a dove marble slab, commemorating the gift, has also been erected, this also being the work of Messrs. Jones and Willis.

TUNBRIDGE WELLS.—A Drinking Fountain has been erected at the junction of Albion and Quarry Roads, presented by Mr. Gower. The existing Drinking Fountains in the town cannot boast of much Architectural beauty, but this one has been well carried out by Mr. Burslein, the local Sculptor, to the designs of Mr. H. Willard, who is also responsible for many of the buildings in the neighbourhood. The Fountain stands 13 ft. high, and is constructed of Bath stone from the Monk's Park Quarries, in the Renaissance style of Architecture, the columns, keystone and the basin being of polished red Peterhead granite. The keystone bears the following inscription, "Presented to the Corporation by Councillor J. R. Gower, Anno Domini, 1896."

HEREFORD.—At the meeting of the Wellington School Board last week, plans of the proposed alterations and additions to the School, prepared by the Architect, Mr. E. G. Davies, were produced. These comprise a new Infant Room for 54 children, 24 ft. long by 18 ft. wide in the clear, with necessary Cloak Room accommodation, to match existing building, with the exception of large windows in gable and for light. A glass screen is shown dividing off the existing Class Room, and two windows are arranged close to the same to light the Cloak Room. Should this be deemed insufficient a dormer light would be inserted in the roof. The approximate estimate for the alterations, including the removal and rebuilding of the offices, repairing pump and other sundry work, is about £350.

HUNTINGTON, NEAR HEREFORD.—The re-opening of the little Church at Huntington, near Hereford, recently took place. Huntington is a Chapelry of Holmer and the Church is a neat stone building, of modern Architecture. The Vestry, which was a corner in the Nave of the Church partitioned off, has been done away with, thus throwing more room into the body of the Church; and a new Vestry, of stone, has been built at the west end, with storage for coal and other things underneath. The pews have also been restored and ventilated; the font, pulpit, and stove have been removed to more convenient places. New brass lamp pendants have been provided; the walls have been whitened, and the woodwork painted and varnished. The work has been carried out by Mr. Morris, of Portway.

ABERDEEN.—Corgarff Parish Church, which for the past two months has been closed while undergoing repairs and repainting and decorating, was reopened last week. The Church was built about 60 years ago, and is seated for 500 persons. For many years nothing has been done to improve either the exterior or interior of the building. The roof has been entirely reslated, and the outside pointed, and the external wood and iron work repaired and painted. Inside the Church has been entirely remodelled and improved. The ceilings of the Church and passages have been treated in distemper cream colour, while the walls have been oil painted. The general contractors were Messrs. John Mason and Son, Aberdeen. Messrs. Wright and Sons, Aboyne, were the contractors for the slater work, and Messrs. Hendry and Keith, Aberdeen, for the wood work.

DUBLIN.—The work of transforming the Leinster Hall into a Theatre on the lines of the Old Royal will be begun early in September. The corridor walls will be knocked down, and the width of the pit and pit stalls will thus be widened by about fourteen feet. The ground floor will be made to slope from the entrance to the stage in the usual manner. The ceiling will be raised ten feet higher than it is at present, and will be made to take a circular or oval shape. About fifteen feet will be added to the stage depth; the existing balcony will be replaced by a grand dress circle backed with boxes. A commodious second circle and a top gallery will also be provided. The entrance hall will be completely altered, and a new staircase erected. It is hoped that the work will be finished early in December, and that the Theatre will be opened at the beginning of the Christmas season.

SHREWSBURY.—The Hall which is being specially built for the Church Congress at Shrewsbury is now completed, with the exception of the internal fittings, which will be at once proceeded with. It is situated in the Quarry, an open space on the outskirts of the town. The Congress Hall, which has been built from designs by Mr. A. E. Lloyd Oswell, Architect, of Shrewsbury, will accommodate 2,500 persons. There will be two spacious reception rooms—one in the Corn Exchange and the other under the same roof as the Music Hall. The Ecclesiastical and Educational Art Exhibition will be held in a large building now being specially constructed in the Quarry, adjoining the Congress Hall. The loan collection is being organised by the Shropshire Archæological Society and the Powysland Club, while the general trade section will include exhibitors from all parts of England.

SOUTH SHIELDS.—With regard to the proposed extension of the Ingham Infirmary, at a recent meeting of the Governors it was stated that Mr. Grieve's plan provided for 48 extra beds, extra nurses' accommodation, &c., at an estimated cost of something under £5,000. Mr. J. T. Eltringham said he understood that the proposed extension would cost something under £5,000, without Architect's fees, furnishing, &c.; therefore, they would require about £6,000 to carry out the proposed extension in a complete form. With regard to raising the necessary funds, he thought it would not be policy to interfere with the invested funds of the Institution. With 95,000 inhabitants, they should have no difficulty in raising the money to build the new wing; and it would be a disgrace to South Shields if they could not do what was now required of them. In addition to the cost of the extension, there was the cost of maintenance to be considered;

and as their expenses at present were in round figures £2,000, he thought the proposed extension would mean an increase of about 50 per cent. If everyone helped they would be able to raise the necessary amount; but he was sorry to say a great many of the inhabitants of South Shields had not done anything for the support of the Institution.

OLDHAM.—New Bakery, Abattoirs, and other buildings have been erected in Mortar Street, for the Greenacres Equitable Co-operative Society, Limited. The block of buildings to the right as you enter the yard are to be used as Cattle Lairage, Slaughter House, and Cooling Room and they are lined with glazed bricks. The building on the left hand side comprises Lairage, Killing and Cooling Rooms. The Engine and Boiler House are conveniently placed, being central to their work. Adjoining the Boiler House is the Bakery, a large and well lighted room convenient in every way. The Stables are the two upper blocks of buildings and contain 17 stalls. A large Coach House, with sliding doors and a covered shed, completes this range of buildings. The buildings are fitted with electric lights throughout, and Dynamo and Accumulator Rooms are fitted up over the Bakery. The following were the contractors: Excavations, concrete, and brickwork, Messrs. J. and D. Blunn; masonry, Messrs. S. and J. Whitehead; carpenter and joiner, Mr. Booth Smith; plumbing and glazing, Mr. Stanley Bates; slating, Mr. R. C. Fletcher; steel principals, &c., Messrs. Heenan and Froude; concrete floors, Messrs. Homan and Rodgers; general wrought iron work, special rails for hanging and hoisting gear, and ventilator openers, Mr. J. Kershaw; bakery oven and machinery, Messrs. Werner, Pfleiderer and Perkins; lard tanks and cooling machinery, Oldham Boiler Works Company; sundry fittings, Mr. W. Lees. The whole has been caried out from plans, details, and specifications prepared by Mr. Thomas Taylor, Architect, 27, Queen Street, Oldham.

KEYSTONES.

MR. BENJAMIN L. COHEN has given £300 towards the building fund of the Northern Technical Institute at Holloway Road, Islington.

MR. WILLIAM N. M. ORPEN, a designer in the Dublin School of Art, has been awarded a local scholarship by the Science and Art Department.

THE Statue of Bishop Philpott has arrived in Worcester. It will be placed in the north ground of the Cathedral, facing High Street. It is anticipated that the Statue will be unveiled by the Lord Lieutenant of the county.

SOME philanthropic bequests are announced from Berlin. Herr Lothar von Faber died lately in Nuremburg, and has left the municipality 2,000,000 marks (£100,000) for the purpose of beautifying the city. He has also made legacies to his workmen amounting to about 500,000 marks (£25,000).

A LARGE four-storied Factory of the Leicester Cycle Company, Friday Street, Leicester, has been completely gutted by fire, and the flames spread to the adjoining factory of Messrs. Harding and Sons, trimmers. This building was also destroyed. The aggregate loss is believed to amount to over £20,000, but is said to be covered by insurance.

PLANS have been passed for the alteration and extension of Shrewsbury Station, and the work is to be proceeded with at once, and no less a sum than a quarter of a million will be spent. Shrewsbury Station is an imposing structure, the front elevation looking like the front of a fine old manor house rather than a station. Apart from its outward appearance there is nothing to recommend it.

THE Aston District Council proposes to purchase land near Oscott College, at the price of £1,000, for the purposes of a Smallpox Hospital. It was stated as being absolutely necessary that some arrangement should be made for a Smallpox Hospital for the district, but, although the land was to be secured it was not probable that the erection of the new Hospital would be commenced for at least twelve months.

SOCIETY MEETINGS.

The Dundee Institute of Engineers.—Between thirty and forty members of the Dundee Institute of Engineers recently visited the linen damask works of Messrs. John Shields and Co., Perth. The card-cutting room was first visited, and the method of transferring the designs to the cards explained. Passing through the mechanics' and smiths' shop, where several looms and jacquard machines were seen in process of construction, the visitors were conducted through the dressing, winding, pirning, and beaming departments, and had the various processes explained to them. The chief interest was centred in the weaving department, where there are 640 looms, ranging from 28 to 180 inches wide, and about 900 jacquard machines. The quality and class of work as seen in the looms, and which consisted principally of linen damasks, were much admired. Cotton fabrics woven with coloured designs were also seen, and some very beautiful fabrics in coloured silk. A loom weaving Turkish bath towels attracted special attention. The cropping, lapping, calendering, and packing departments were finally visited. The works are driven by three separate steam-engines, one of them being noteworthy as having worked since 1851, and said to be the first engine designed by Mr. J. G. Orchar, Dundee.

The Cambrian Archæological Association.—This Association will celebrate its jubilee this year at Aberystwyth. The meeting will be held on September 7th and four following days. Among the places to be visited during the excursions, perhaps the most attractive will be Strata Florida. The remains of the Cistercian Abbey there will be inspected under the guidance of Mr. Stephen W. Williams, F.S.A., whose exploration of the site under the auspices of the Association a few years ago yielded such valuable results. An opportunity will be afforded on one of the other days of seeing the well-known collection of MSS. in the possession of Mr. Wynne, of Penarth. Mr. J. W. Willis Bund, F.S.A., has promised to read a paper on Llanbadarn Fawr. Mr. Edward Laws, F.S.A., and Mr. Henry Owen, F.S.A., will lay before the Association their report on the archæological survey of Pembrokeshire, with which satisfactory progress has been made during the past year. It is hoped, also, that some decision may be arrived at as to the best means of preserving the great prehistoric Fortress on Treceiri, Carnarvonshire. A full programme of the excursions will be issued shortly by the general secretary, Canon R. Trevor Owen, F.S.A.

Institution of Junior Engineers.—The Institution of Junior Engineers, to the number of 50, held its summer meeting in Scotland, visiting several places where large engineering works were seen.

Sanitary Inspectors' Association.—The annual meeting of the Western Branch of this Association was held at Bristol. Mr. MacMahon was re-elected President for the third year, Mr. Press, of Burnham, was elected Vice-President, and Mr. Moss Flower, Bristol, was unanimously re-elected Hon. Secretary. The election of six members of the Council resulted in the reappointment of the retiring representatives—Messrs. Garland, Barnstaple; Hann, Beaminster; Knowles, Clevedon; Segar, Newton Abbott; Veale, Dartmouth; and Barrons, Tiverton Rural. Mr. Howard, of Wellington, was asked to act as the delegate of the Western Branch at the Leeds Conference, and Mr. Wreford, of Exeter, and Mr. Moss Flower were desired to represent the Branch at the Sanitary Institute Conference at Newcastle-on-Tyne. Mr. D. Cameron, City Surveyor, Exeter, had prepared a paper on "The Reconstruction of Sewers in Narrow Streets and their Cost," and being unable to be present the paper was read by Mr. Press, of Burnham. Papers were also contributed by Mr. Moss Flower, Bristol, on "House Drainage," and by Mr. J. Siddals, Tiverton, on "Some Rural Difficulties," the latter being submitted, in Mr. Siddal's absence, by Mr. Barrons, Tiverton Rural. After the meeting the members visited the City Refuse Destructor and Corporation Electrical Works, and the annual dinner of the Association took place in the evening.

Penzance Natural History and Antiquarian Society.—The members of this Society recently spent a day in the St. Erth, Gwithian, and Gwinear districts. At Trewinnard an old house in the Queen Anne style of Architecture, lying about a mile and a half to the south of St. Erth station, was visited. The present tenants showed the party over the house, and gave them an opportunity of fully inspecting the well-preserved tapestry which covers the walls of one of the rooms. Interest was also shown in a very old family carriage, located in an outhouse. The ruins of an old Chapel, hitherto unnoticed, were pointed out by the vicar of St. Erth, the Rev. C. R. D. Carter. A move was made to St. Erth, where the vicar described the parish Church and traced its historical associations. Several ancient crosses in the churchyard, one of which was remarkably deeply carved, were inspected. Dr. Hugh Montgomerie, the hon. secretary, described the ruins of St. Gothian's Chapel, Gwithian. The parish Church of Gwithian and the stocks were dealt with by the Rev. D. La Touche.

The Aberdeen Ecclesiological Society.—A meeting of this Society was held last week. The first business was a communication, "A raid into Northumberland," by the president, the Rev. Dr. Cooper. Along with a friend, he started on a week's driving tour on Monday, 29th June. Jedburgh was the starting point, and the mention of the Border town gave the lecturer an opportunity of saying a word with regard to the ruins of the ancient Abbey, now preserved, he said, with loving care by the proprietor, the Marquis of Lothian. The Roman camp at High Rochester was briefly described, and Hexham and its Abbey next engaged attention. Passing on, Dr. Cooper sketched briefly some of the salient features of many Churches, new and old, and the little towns passed through, indicating many interesting points by the way. He remarked, for instance, on the remarkable beeches at Wallington, the seat of Sir George Trevelyan, the noble altitude of the trees being fully brought out by the enclosing sunk fence. He touched on Alnwick, and, of course, its historic Castle, second only in England to Windsor itself. He observed that the Castle is kept in excellent order, even the dungeon being illuminated with the electric light. The Society next discussed the arrangements for the annual excursion on the holiday, 28th September. On the suggestion of Mr. Kelly, Architect, supported by Mr. Holmes, it was decided to visit Inchcolm, and probably Dunfermline, in company with the Glasgow Ecclesiological Society.

The Historic Society of Lancashire and Cheshire.—This Society's third excursion of the present season was to Ormskirk Church and the Almonry at Lathom. Arriving at Ormskirk Church, the members were met by Mr. James Bromley, of Lathom, who acted as guide, and a thorough examination of the building was made. The sites of the Chantries were pointed out, and the monuments to the memory of the ancient Earls of Derby described. It is a curious fact that Ormskirk Church has no monument either of the Earl James, who perished at Bolton, and who has always been looked upon by Lancashire people as a martyr or of the Countess (Charlotte de la Tremouille), whose heroic defence of Lathom House against the Parliamentarians is a stirring incident in the history of the Civil War. The registers of Ormskirk, which are in wonderful preservation, and begin in 1557, were produced by the Vicar for the inspection of the members of the Society. The registers contain entries of the deaths of the last prior and several canons of Burscough. The Church plate was also produced for inspection. A drive was then taken to the Almonry in Lathom Park. This charity, founded by one of the Earls of Derby in 1500, and endowed by him, is one of the very few charitable foundations which were not interferred with at the dissolution of the Chantries. Originally intended for a priest and eight bedesmen, the charity now provides for ten poor persons, the stipend of a chaplain, and the education of many children. Proceeding to the Bath Farm, a stop was made for the members to examine the curious open-air bath (supplied by a spring of clear water), which is locally believed to have been the old bath used by the Brethren of Burscough Priory.

Trade and Craft.

THE DUBLIN DISPUTE SETTLED.

The dispute between the master builders and the bricklayers in Dublin was settled on Friday, at a conference presided over by Archbishop Walsh. The men have been granted an increase of ½d. an hour, and the working week has been reduced from 57 to 54 hours, thus bringing bricklayers into uniformity as regards hours with kindred trades. The term for apprenticeship has been increased from six to seven years. This settlement will bring into work an immense number of destitute labourers. The only remaining trades to be conciliated are plasterers and masons.

PARTIAL COLLAPSE OF A VIADUCT.

During Tuesday night and Wednesday morning the arches over the centre pillars of the new Viaduct carrying the Vale of Glamorgan Railway over Porthkerry Park, sank down between 10 and 13 inches, and it was considered unwise by the contractors (Messrs. Pethick Bros.) to allow any traffic over the arches. One of the central pillars has given way somewhat, and considering that the work of construction has taken about two years, this occurrence is regarded as a very serious matter, inasmuch as further delay might be occasioned to the opening of the railway. As far as can be ascertained, it is proposed to entirely renew the centre pillar from the foundation.

VENTILATION OF THE UNDERGROUND RAILWAY.

Analyses have been made of some air taken between King's Cross and Gower Street, which is probably the worst part of the Underground Railway, so far as ventilation is concerned; and the result is very alarming. Dr. Angus Smith has shown that the amount of oxygen in the samples of air taken was only 20.60 per 100 parts by volume. The normal quantity of carbonic gas is 0.037 in 100 parts, but Dr. Angus Smith (from whose analysis we quote) found that in one of the Metropolitan Railway tunnels the carbonic acid gas was 0.388 per cent. This is excessively high, considering that, whenever the carbonic gas in the atmosphere exceeds 0.100 per cent., the air is too much polluted to be breathed with safety to health.

BAD MORTAR.

Charles Edward Woodhead, of 12, Hampden Road, Hornsey, was summoned by the Wood Green District Council for using mortar in the erection of houses in Palace Gates Road which was not compounded as required. A second summons charged defendant with continuing the offence for fourteen days after a written notice had been given him. Robert Henry Harland, an analytical chemist, said he had received samples and analysed them. There was vegetable matter, which was apparent to the naked eye, and a deficiency of lime. Under the bye-law there should be 13.4 per cent. of lime, but the analysis showed only 8.15 per cent. John William Stevens, Architect, said he considered that the mortar was of fair quality. Mr. Taylor, public analyst, said that samples taken by the previous witness were submitted to him. Witness found the proportion of lime to sand and grit was one to four, and to all other matter as one to five. The sample complied fairly with the standard required by the bye-law. The Bench was satisfied that the bye-laws had not been complied with, and imposed a fine of 40s. in each case, with costs.

GLASGOW AND THE ELECTRIC LIGHT EXTENSION.

Upon the subject of Electric Light for Glasgow, the Sub-committee reports that, after visits to the electric lighting works of the Corporations of Manchester and Brighton, the Vestry of St. Mary, Islington, and the City of London Electric Lighting Company, Limited, it recommends that the low-tension continuous current system of distribution should be adhered to by the Corporation in whatever further extensions of the electric lighting systems are hereafter carried out within the municipal area. Now that the maximum pressure allowed with low-tension continuous currents has been raised by the Board of Trade from 250 to 500 volts, the increased latitude will permit of the current being transmitted along the distributing mains to a distance twice as great as was the case under the former regulations. With reference to additional generating stations and mains, which will require to be put down for the proper supply of the whole municipal area, and the particular localities in which such stations could with the greatest advantage and convenience be placed, the Sub-committee is not yet in a position to make any definite proposals.

BUILDING IN ABERDEEN.

Plans of the following new buildings have been approved by the Town Council:—Dwelling-house on the north side of Belgrave Terrace, for Mr. P. Bruce, per Mr. John Rust, Architect; dwelling-house on the south side of Bedford Road, for Mr. James Smith, per Messrs. D. and J. R. M'Millan, Architects; keeper's lodge at the Stewart Park, for the Council, per Mr. John Rust, Architect; cottage on the east side of King Street, for Mr. James Johnston, Clifton Road, per Mr. George H. Jolly, Architect; new showroom at No. 37, Guild Street, for Messrs. Henry Pooley and Son, per Mr. Joseph Leith, builder; two dwelling-houses on the east side of Great Northern Road, for Messrs. James Grant and George Scott, per Mr. William Smith, Architect; two dwelling-houses on the east side of new street at Angusfield, for Mr. George Proctor, per Messrs. Ellis and Wilson, Architects; shop and dwelling-house on the west side of Victoria Road, Torry, for Mr. Charles Strachan, per Messrs. Brown and Watt, Architects; two dwelling-houses with shops, on the north side of Belvidere Place, for Mr. W. D. Buyers; two dwelling-houses on the west side of Ferryhill Road, for Mr. A. Melville; dwelling-house on the west side of Skene Square, for Messrs. Walker and Ross, builders; dwelling-house on the east side of Holburn Street, for Mr. James Jamieson.

A DEFECTIVE PAVEMENT.

At Longton, Judge Jordan had before him a case in which Thomas Breeze, miner, sued Messrs. Battison and Bridgett, plumbers, Longton, for £50 damages for personal injuries sustained by reason of the alleged negligence of the defendants. It was stated that in May last the defendants were engaged in repairing a pavement light in front of a confectioner's shop in Market Street. The squares of glass which had to be let into the iron frame to replace broken ones were found to be a little too large, and had to be reduced in size. While this was being done, the workmen filled up the spaces in the frame with pieces of wood. On the morning of the 8th May Mrs. Breeze was walking over this pavement light, when one of the blocks of wood yielded beneath her foot, and she was thrown down with such violence as to cause the rupture of a blood-vessel. She was confined to her bed for five weeks, and was still suffering from shock and other effects of the fall. For the defence it was contended that the wood blocks were used while the glass was being ground down under the instructions of the agent of the landlord of the property, and, therefore, that the landlord and not the defendants was liable, and that there was no evidence of negligence on the part of the defendants or their workmen. His Honour said that these pavement lights were a most dangerous contrivance, and a nuisance at common law, and if either the tenant or the landlord had been sued, he should have held that they were liable. He gave judgment for the plaintiff for £10 and costs.

IMPORTANT CONTRACT CASE.

A case of considerable importance to builders was heard recently before Judge Yate-Lee at Whitchurch County Court. The action was brought by George Dodd, builder, of Whitchurch, against John Weaver Chinton, solicitor, for the sum of £26 10s., balance of account due on a contract for work done by plaintiff for defendant. With the exception of 10s. the claim was not disputed, but the defendant put in a counter-claim of £50—25 weeks at £2 per week—for alleged breach of contract in respect to the time in which the work was to be completed. His Honour, in giving judgment, remarked that Mr. Chinton had submitted that the penalty of £2 per week for delay in completion was to be taken as liquidated damages, and that was not disputed by plaintiff's counsel. But some extras were ordered beyond the work expressly mentioned in the specification. Mr. Dodd had stated in his evidence that he could not have completed the work, with the extras, within the stipulated time. Mr. Chinton had claimed the £2 per week for which the work was delayed after deducting two weeks, which he maintained was a fair time for doing the extras. Upon the question whether the order for extras prevented a claim for liquidated damages under a contract in the particular form which the parties had entered into, each side relied on the views of certain writers, but no decisions were produced, although the names of several, cited in the text book, were given. He had, however, examined the leading cases on the subject, and, in his opinion, they established that under a building contract, with conditions framed as in the present case, the builder was relieved from his obligations to perform by a stated time when the employer ordered extras. The damages here were not the actual damages suffered, but an artificial sum agreed upon before-hand by the parties for a particular event, and when the event was altered by even a slight amount of extra work, the damages were not liquidated for the new event, and were not necessarily the £2 per week with allowance of time for doing the extras. To him, no question as to a cross action being necessary arose, and, therefore, it must be dismissed.

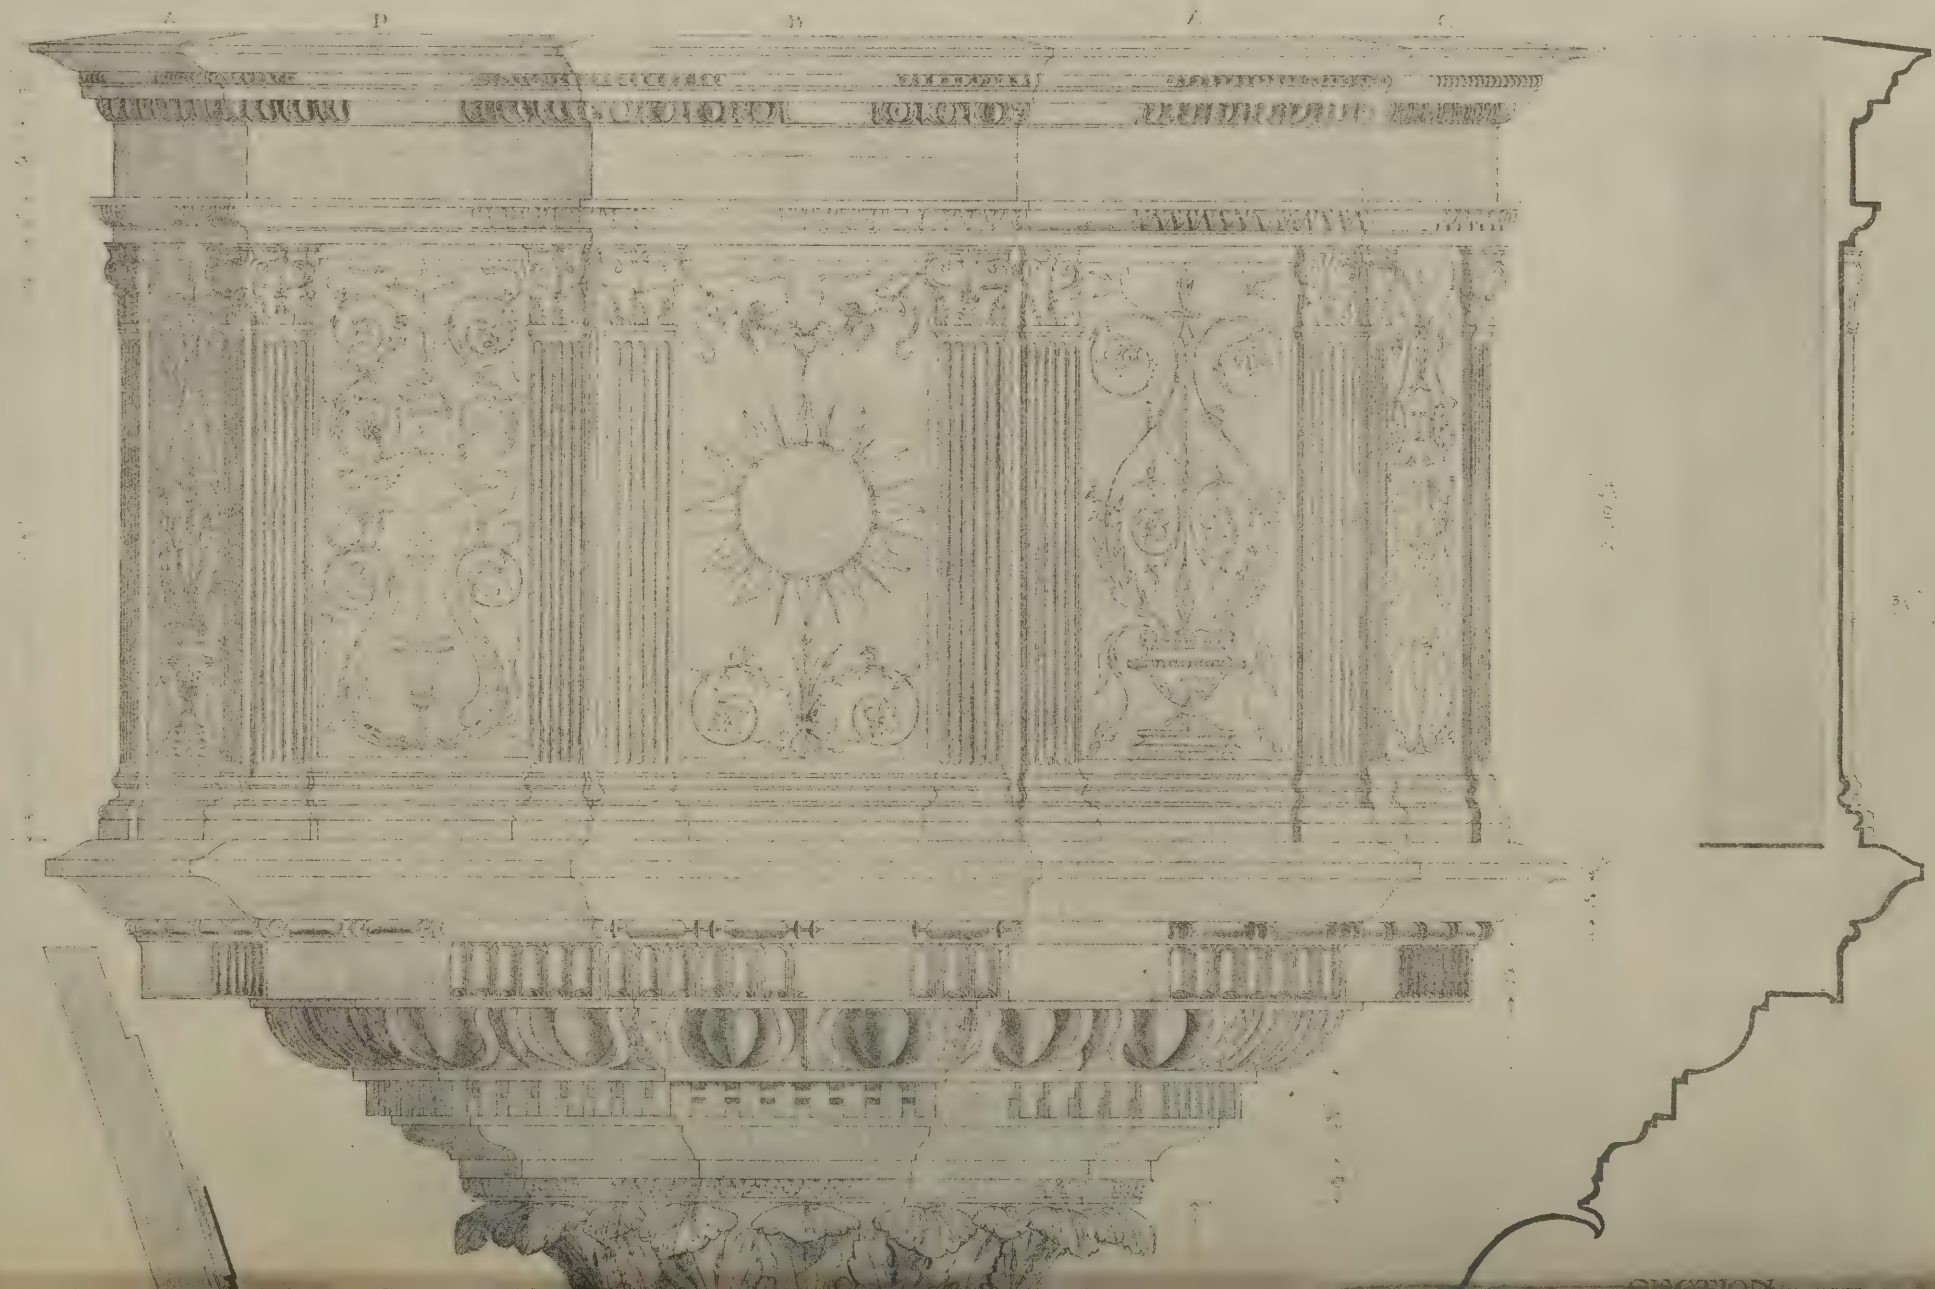
KEYSTONES.

MR. DANIEL J. DIVER, of Forest Road, London, has been appointed Inspector of Nuisances and Surveyor of the Wirksworth Urban District Council.

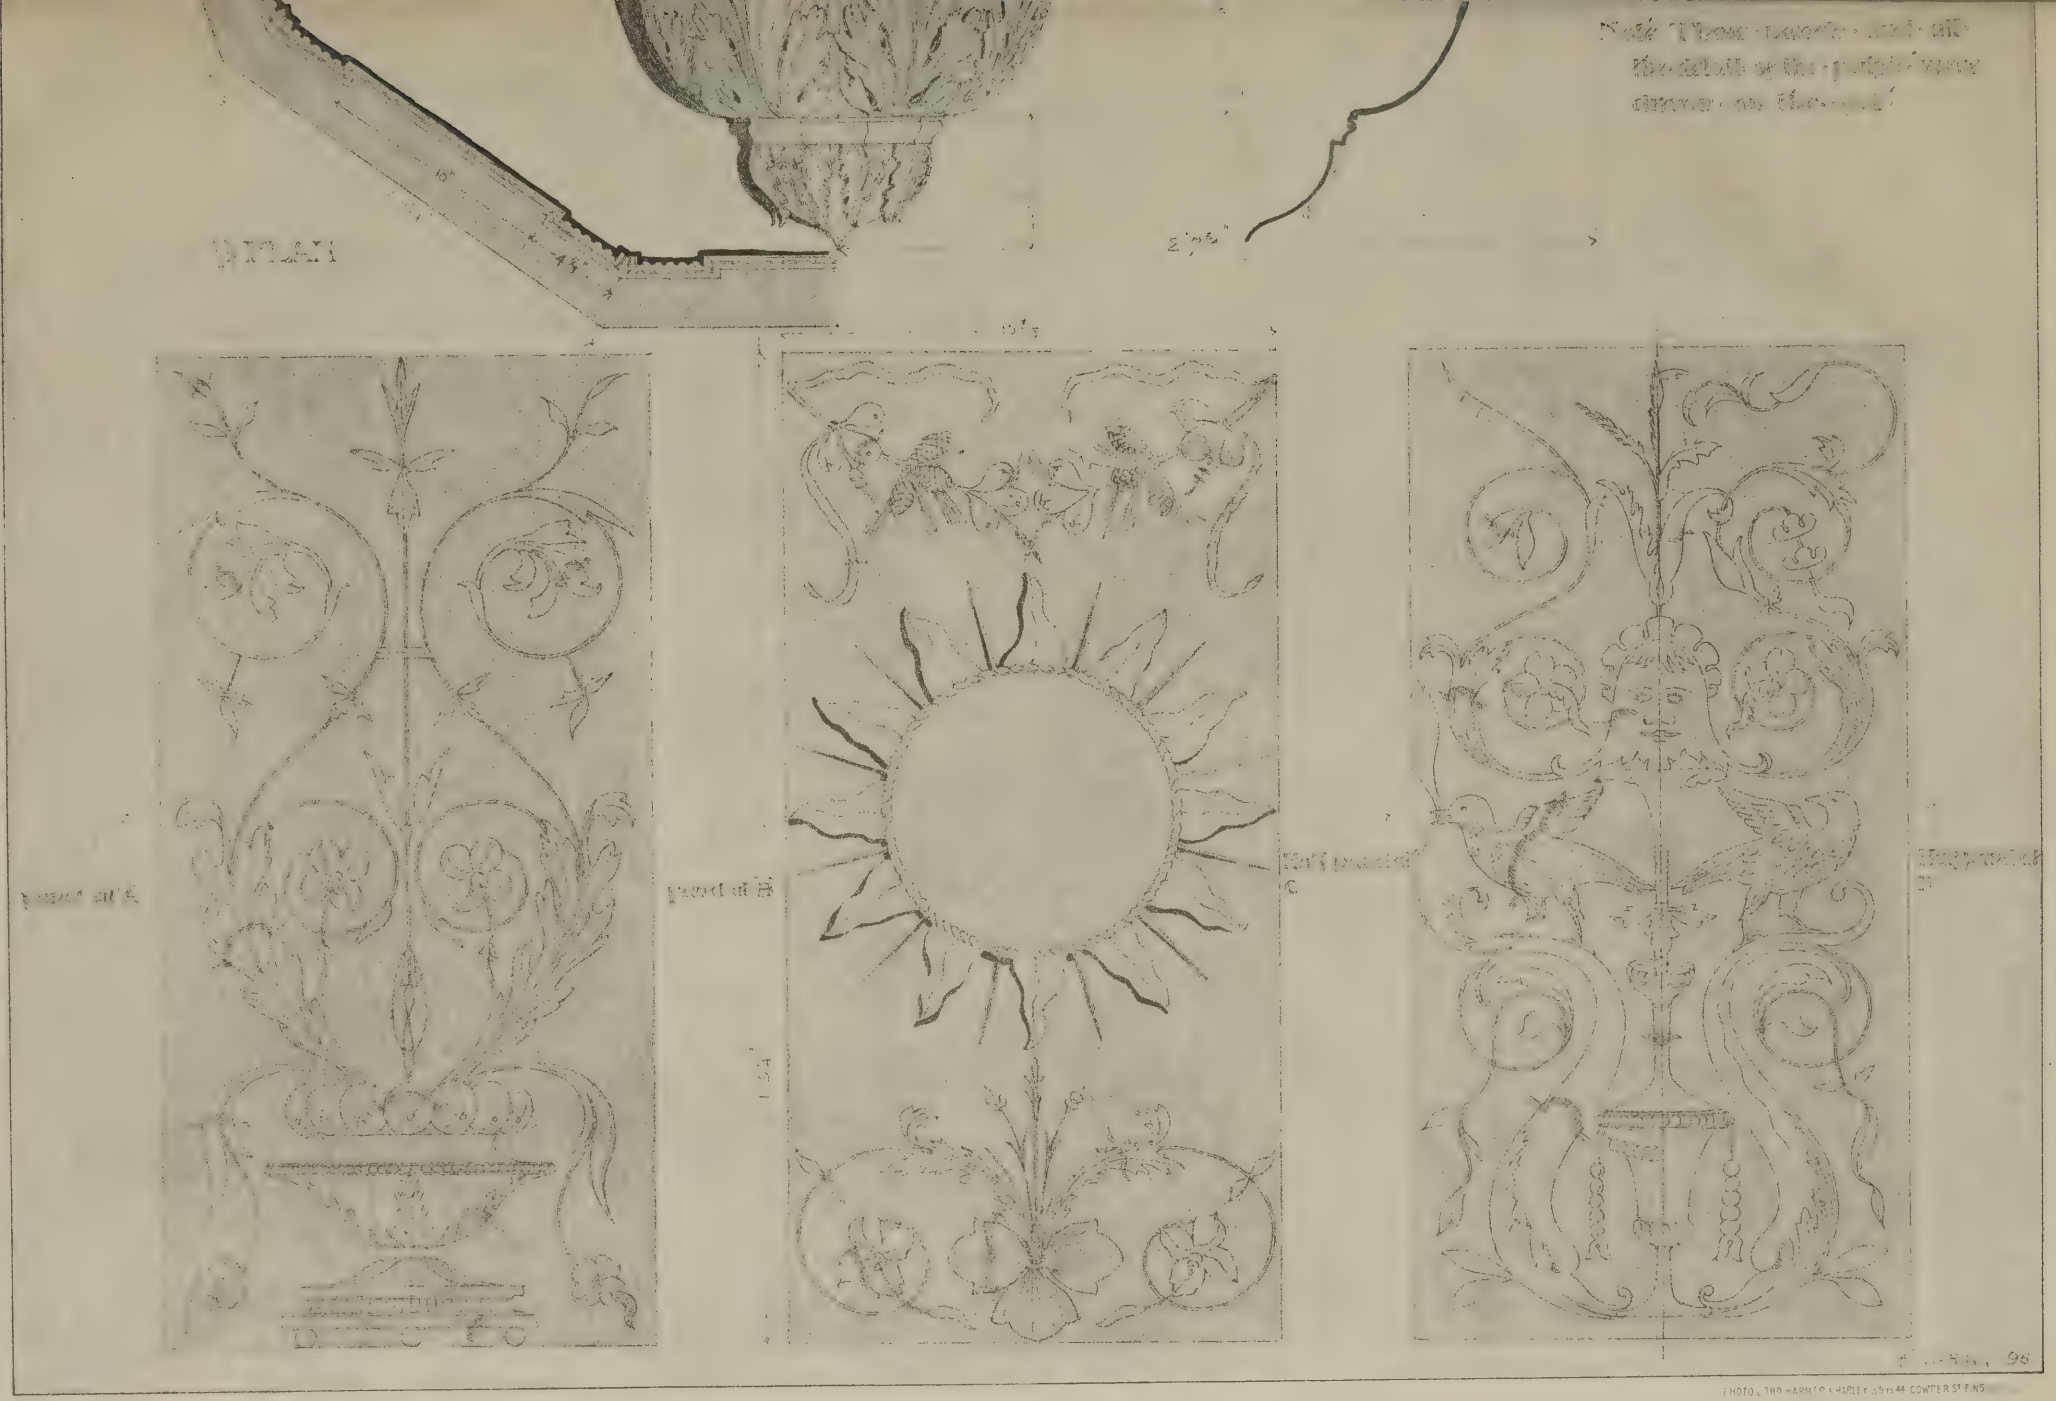
AT Limerick the St. Joseph's Industrial Schools are now complete. The buildings, besides providing additional accommodation, include a Chapel, and have cost something like £6,000.

THE work at the new General Post Office in Victoria Street, Liverpool, is progressing slowly but surely. It is expected, however, that another two years' work will be necessary before the staff can be located in their new quarters.

AN enquiry has been held at the District Council Offices, Elland, by an inspector of the Local Government Board, into the application of the District Council to borrow the sum of £2,100, the major portion of which is to be spent on widening the bridge at Elland over the river Calder. There was no opposition.



THE historical Eccleshall Castle in Staffordshire has been recently sold. The Castle was founded at a very early period; about the year 1200 Bishop Muschamp had a license from King John to make a park here and embattle the walls of the Castle. The place has been for a long time the chief Palace of the Bishops of Lichfield.



ON Thursday afternoon the foundation stone of the Public Baths for Kensal Town—adjoining the Chelsea parochial offices in the Kensal Town Road, was laid by Mr. J. Humphrey, the chairman of the Chelsea Baths Commissioners. There will be two swimming baths, 83 ft. by 30 ft., and 60 ft. by 25 ft. respectively, and 51 private baths. The cost of the undertaking will be about £26,000.

ON Thursday the partial destruction of a bridge by fire, near Willesden Green Station, occurred on the Metropolitan Railway. The line at a short distance from that station crosses an iron bridge on brick supports, and this bridge had been recently shored up with a large number of sleepers. Between eleven and twelve o'clock these sleepers were found to be on fire. An alarm was given, and after about two hours' work the flames were extinguished. The flames, however, had caused the iron girders of the bridge to expand, and the sudden contact of the water caused them to contract and crack. A large gang of workmen was soon at work, and ultimately the bridge was again shored up by new sleepers, and the traffic was resumed at six o'clock in the evening.

A Few Art Figures. Figures are, in themselves, so alien to Art, that a brief consideration of the report of the Department of Science and Art strikes one with a new and somewhat anxious interrogation on the old law of Supply and Demand. The figures bulk so largely, that the temptation exists to use the terms of commerce: "output," "ratio of increase"—and the rest. Are we making widening circles—circles that will ultimately reach the shore?—by this general and frequent diving into the ocean of Art? There is great danger in such depth—of numbers. Since 1886 the tide has been rising; in the decade you will probably be astonished to hear that the number of schools has increased by 991, and the number of students by 98,566. Art, may still be *caviare* to the general, but it is no longer the hugged possession of the Epicurean few. We are very firm in our view that no country in Europe can show such a Revival, such a wide-spread appetite for Art. It is a very wonderful seed-time and the educational sowers have been feverishly eager, but the harvest is not yet. There will be some tares to travel, and, indeed, these are as significant now in every manner of competition as scarlet poppies in shorn ground. But the poppy can be eradicated with difficulty, and so can—by equally arduous means—banality from Art. All can grow the flower now, when all have got the seed—the pained and somewhat piqued expression of the late Laureate in regard, no doubt, to certain of those exquisite tricks of his manner—does not appertain to Art. The profligacy upon stony ground still continues; you cannot grow grapes from thistles. Therefore, the man who would judge dispassionately of the wonderful bound in the Art tendencies of the time must take pessimism for his grain of salt. But with this flavour in his palate he can, nevertheless, feel mightily encouraged by the bulking masses of these students, knowing that some knowledge of Line, and of the Anatomy of Beauty must

FRAGMENTS OF FIFTEENTH CENTURY CARVED OAK WORK: COLLECTED BY MR. H. HEMS, EXETER.

result from so widespread a culture, and that the generation to come compared with that of its grandfathers will be as Grinling Gibbons to a barn door. And this measurement of attainment looked at perspectively, from the right end of Progress, will then seem marvellous. Take on the Science Side of last year, the 2,139 Schools in England and Wales, the 366 in Scotland, and the 168 in Ireland, examined. The number of students who came up for examination from the schools was 108,163—an increase of 8,345 on the previous year. Think of it! Eight thousand! Are reading, writing and arithmetic (one is inclined to ask) making similar progress? Besides these, there were 5,235 self-taught students and, given the germ of genius, these five thousand may number among their ranks that part which is greater than the whole. Now, take the nett 113,598, and you have 52,079 successful in one or more subjects; 22,542 successful for the first time. What is to be found on the Art Side of last year? During the year ending on the 31st of August, 19,898 Elementary Day Schools, with 2,192,253 scholars, were taught drawing and were examined under the regulations of the department; 891 of these Schools were in Scotland, 79 in Ireland, 45 in the Isle of Man, and 18 in Jersey. This was an increase of 251 Schools and of 68,578 scholars as compared with the numbers in the preceding year. In the more advanced work the number of Art Schools and Classes, including 91 Science Schools which take Art subjects, examined in Art in 1895 was 1,883, as against 1,888 (which included 112 Science Schools) in 1894, showing a decrease of 5. The number of students under instruction was 136,324 in 1894, as compared with 136,768 in 1895. Of the latter, 132,390 were of the industrial class. Of the 284 Art Schools and Branch Classes and the 1,478 Art Classes examined last year, 242 Schools and 1,300 Classes were in England and Wales, 25 Schools and 130 Classes in Scotland, and 17 Schools and 48 Classes in Ireland. The number of students who sat for examination was 78,141 in 1895, or 2,209 more than in 1894.

THE Parish Church of Grove, on the borders of Bedfordshire and Buckinghamshire, but situate in the latter county, is said to be the smallest and most curious Church in England. The parish contains under 20 inhabitants, and the Church will comfortably seat a few more than that number. The Church has been restored at a cost of £250.

DAMAGE to the amount of £2,000 was done by a fire which broke out late on Thursday night at Canterbury and entirely demolished the extensive Saw Mills belonging to Mr. H. B. Wilson. Some valuable screen work and other timber in preparation for Kippington Church, Sevenoaks, and Upper Hardres Church, Canterbury, were destroyed.

THE two Royal Saloons which the Queen has used for many years on the journeys from Windsor or Osborne to Ballater, have been practically reconstructed by the London and North-Western Railway Company. The Corridor connecting the two Saloons, one of which was used as a sleeping apartment, and the other as a drawing room, has been removed, and the bodies of the Saloons have been united so as to form one Saloon of uniform width throughout, and 60 ft. in length from buffer to buffer. An entirely new under carriage has been provided, similar in design to those now in use on the latest dining cars on the West Coast route, viz., with two sets of six wheels, on the bogie principle, at each end of the vehicle, which, therefore, runs on twelve wheels.

THE new battleship Victorious has been reported to the Admiralty as ready for the official trials of her machinery, which will be of an exhaustive character. The Victorious, has a displacement of 14,900 tons, and has been engined by Messrs. Hawthorne, Leslie, & Co., of Newcastle-on-Tyne.

MR. SOMERS CLARKE AND THE TEMPLE OF DEIR-EL-BAHARI.

WRITING to the "Times," as honorary secretary of the Society for the Preservation of the Monuments of Ancient Egypt, Mr. E. J. Poynter says: "I venture to forward to you the accompanying statement from Mr. Somers Clarke, F.S.A., concerning the remarkable Temple at Deir-el-Bahari in Egypt—which we append—which has been recently revealed by the excavations conducted at the cost of the Egypt Exploration Fund, my object being to appeal for subscriptions for the work of preservation proposed by him. Mr. Somers Clarke had already made a report on this subject to the committee of the Egypt Exploration Fund, and his recommendations were adopted. From his statement concerning the artistic and archæological value of the remains discovered at Deir-el-Bahari, it is evident that the importance of sheltering them and preserving them from the degradation of time and accident cannot be over-rated. To do this is beyond the resources of the Egypt Exploration Fund, a body which has not only expended large sums of money in laying bare the ruins, but is producing, to a large scale, the illustrations which will ultimately give a record of every part of the structure. It seems to me, therefore, that the attention of the Society for the Preservation of the Monuments of Ancient Egypt may very well be turned towards seconding the efforts of the Egypt Exploration Fund, by taking in hand such works of protection as are deemed necessary, doing this in a way that shall be as inexpensive and permanent as possible. The cost of such a work has been estimated roughly as from £200 to £300, and Mr. Somers Clarke has liberally offered to superintend its construction during the ensuing winter, free of expense to the Society. The work which the Society undertook for the preservation of the

TEMPLES OF KARNAK

has now been successfully completed through the admirable assistance given by the officials of the Irrigation Department at Cairo, at a cost of about £1,250; and will form the subject of a report to be presented at the General Meeting of the Society to be called in the autumn." Mr. Somers Clarke's Report:—"Few, if any, buildings that have been made known to us by research in Egypt exceed in interest, or in the beauty of their sculptures, the great Funerary Temple, built by Queen Hatshepsu, now known as Deir-el-Bahari, and standing on the west bank of the Nile, facing across the river to Karnak. The position of the Temple, standing as it does at the head of a valley and encompassed by cliffs is not a little impressive; and the Architect has adapted his design with great skill to suit the site. The walls are entirely faced with limestone of an ivory colour and of the finest texture. This texture has enabled the sculptors to exercise their skill with the utmost prodigality. The walls are, in fact,

ONE VAST HISTORICAL BOOK,

presenting to us not only the customary religious representations, but also subjects of such remarkable interest as the well known "Expedition to Punt," in which the minutest details are set forth with extraordinary force and observation. To Mariette we owe the first clearing of this Temple on an extended scale. He left, however, as much undone as he had done. Most of the northern part of the Temple area was still buried and unexamined. The Egypt Exploration Fund, under the direction of M. Ed. Naville, has now cleared the site, removing vast mounds of *debris*, and enabling us to see the whole place, with its terraces, colonnades, and sculptures. Unlike a great number of Egyptian Temples, Deir-el-Bahari is not built of large stones. The moderate size of the stones has enabled them to be overthrown with an ease which a more massive style of construction would have rendered difficult; and now that the walls are exposed and that the Temple is annually visited by multitudes of tourists, many of whom are not particularly careful where they walk or what they do,

THE DANGER OF FURTHER DESTRUCTION

has become very serious. Indeed, the remedy must be taken in hand at once. Nor is this the only danger. Placed, as has been already said, at the very head of the valley, and overhung in part by vertical cliffs, many of the now roofless chambers are exposed to the constant fall of small pieces of rock which, attaining a high velocity owing to the distance they traverse, are liable to damage very seriously the sculptured surfaces which they strike. A third reason for protecting the ruins is that the sun, blazing with unabated force upon the wall surfaces, is rapidly bleaching the brilliant colours with which the sculptures have all been originally painted, and which, where but recently exposed, are in perfect preservation. When some thirty years since the sculptures of the "Punt" expedition were revealed and cleared from the mass of *débris* which buried them, the colours were still bright. Now hardly a trace remains. The first part of the Temple to be protected should be that which, lying close under the cliffs, is subject to damage by falling stones. Here vaults of crude brick and of considerable thickness will be turned over the chambers. These vaults, being open towards the south, will admit abundance of light, but will not suffer from the fall of stones from above. In other parts of the Temple modifications of the same system will be adopted, whilst the tops of the walls, very subject to degradation by the boot heels of the tourist, will be encased with brick. The roof of the Hopostyle Hall, now in a state of perfect preservation and glowing with colour, stands in immediate need of external protection both against the not very frequent danger from rain and also against the disintegration caused by the extreme changes of temperature which cause the stone slabs to expand and contract and ultimately to split up. The upper layer of slabs with which the ceiling stones were once covered no longer exist, and the protection they afforded is wanting. What is intended to be done should be taken in hand without delay. Destruction and disintegration are unfortunately always in progress."

AN extensive fire occurred at Charleroi on Thursday morning, causing the total destruction of the electric works owned by the Dulait Company. The damage amounts to 400,000f. covered by insurance.

PART of Cardiff Castle grounds have been recently dug up, bringing to light the foundation of an old Priory called "White Friars," known to have existed some centuries ago. The foundations of the Church are perfect. Further excavations are being made.

AFTER a long delay, the work of constructing a Government Fort on Nell's Point, Barry Island, has been commenced, and it is understood the War Office Department has decided that the structure and its appliances shall be of the most modern and improved description.

THE Paris Municipality is turning the city sewage to a considerable profit. Two years ago it acquired a sandy tract of two thousand acres in the forest of St. Germain. A fifth of the city sewage was turned in the tract which was converted into a sewage farm. The two thousand acres is now rich land.

A TWO-LIGHT ornamental foliated window, with medallion centres, has been inserted in the Free Church, Prestonpans. The window is dedicated to the memory of Mr. Robert Hislop, Castlepark. The window was executed at the studios of Messrs. Ballantine and Gardiner, Edinburgh.

ONTONAGON, in the State of Michigan, was destroyed by fire last week. Scarcely a house out of 500 was left standing, and the plant of the Diamond Match Company, together with 60,000,000 ft. of lumber in their yards, was burned. The loss amounts to nearly 2,000,000 dols.

AMOY, in China, bears the unenviable reputation of being the dirtiest and most unhealthy city in the world. It is exceedingly old. Inscriptions on ancient tombs run back so far as the beginning of the Christian era, and coins discovered in graves date from 1,000 to 500 B.C. During all this period the hillsides of the city have been used as burying grounds. As the population increased, the houses encroached upon the cemetery land until the two became hopelessly mixed. The wells are shallow, and are sunk on the edges of the graveyards, and even among the tombs themselves. The town has no sewers whatever.

MANCHESTER IMPROVEMENTS.

NEW LABOURERS' DWELLINGS.

THE Sanitary Committee of the Manchester Corporation has, says the "Manchester Guardian," prepared a report for presentation to the City Council to-day on the subject of the utilisation of areas that have been cleared of unhealthy dwellings. On the 12th and 17th August the City Surveyor submitted plans of shops with tenements over, fronting Oldham Road, and a Model Lodging House fronting George Leigh Street, proposed to be erected upon this site at an estimated cost of £47,000, and providing accommodation for 741 people of the working class, and these will be recommended to the Council for approval, and the Council further recommended to direct application to be made to the Local Government Board for consent to the necessary variation of the Board's order confirming the Manchester Labourers' Dwellings Scheme, 1890. Plans will also be submitted of a Model Lodging House to be erected upon the Chester Street area for the accommodation of over 278 persons of the working class, at an estimated cost of £19,500, which the Committee also approves of. With regard to area No. 2 Pott Street, the City Surveyor has prepared plans of Tenements and a Lodging House for the accommodation of over 328 persons of the working class, at an estimated cost of £20,000. These plans are likewise to be recommended to the Council for approval. At a further meeting of the Committee, held on the 27th inst., the City Surveyor submitted a report and sketch plans of the proposed buildings. He had, he said, visited Tenement Dwellings and Model Lodging Houses in London, Glasgow, Dublin, and Salford. Of the Oldham Road area he remarked:—"The Oldham Road area (known as Block No. 1) lies between Oldham Road, Cornwall Street, George Leigh Street, and Spittal Street, and is in close proximity to the block of Labourers' Dwellings recently erected by the Corporation, one frontage of which abuts on Spittal Street. The total area of the site is 9,078 yards. It is proposed to improve Cornwall Street, George Leigh Street, and Spittal Street by making them each 18 yards wide, for which purpose 1,580 yards of land will be required. It is also intended to form a new Street 12 yards in width, parallel with Oldham Road, from Cornwall Street to Spittal Street. The proposed

NEW BUILDINGS

will consist of two separate blocks—viz., one block facing Oldham Road, consisting of Shops with Tenement Dwellings over, and absorbing an area of 1,668 superficial yards; the other block, consisting of a Lodging House for men, and occupying an area of 4,774 superficial yards. That fronting Oldham Road and backing on to the new street would contain 14 Shops, with two stories of Tenement Dwellings over, and with basements under each Shop. The Shops have a private side entrance in addition to the ordinary business doors, and there is a Store Room or Office, a water-closet, and dust shoot at the rear. The Tenements are approached by entrances from Oldham Road. A separate entrance and staircase is provided for each group of Tenements. The group consists of four separate Tenements—two of two rooms each and two of three rooms. Each Tenement is complete in itself, having a Living Room, one or two Bedrooms, with Scullery containing sink and boiler, also a water-closet, coal bunker, and ash-shoot. Each Tenement is provided with a balcony at the rear, separated from that of the adjoining building by a brick division wall. A portion of the floor of each balcony is filled in with reflecting prismatic lights.

THE FOLLOWING ADVANTAGES

may be claimed for these Tenements: (1) the sub-division of Tenements into groups by separate staircases; (2) the entrance to all tenements from the front street by well-lighted and well-ventilated stone staircases; (3) a separate balcony, forming a yard to each Tenement; (4) a separate Scullery, obviating the need of a common Laundry; (5) easy means of escape in case of fire or panic; (6) each Tenement is completely isolated, and contains all the accommodation of an ordinary cottage dwelling. In estimating the number of persons to be accommodated in this block of buildings, the same basis has been taken as that upon which the existing buildings (Oldham Road, Block No. 2) were calculated, but the basement and shops have been excluded from this calculation. The tenements consist of seven sets of three-roomed tenements and seven sets of two-roomed tenements on the first floor. The second floor contains a similar number of rooms. The total accommodation provided in this block, upon the basis before mentioned, is 154. The remaining block of buildings on this site consists of a Lodging House, with accommodation for 587 men. This block has a main frontage to George Leigh Street of 263 ft., and frontages to Cornwall Street and Spittal Street of 166 ft. each. The ground floor consists of large rooms for Dining, Smoking and Reading; Superintendent's Rooms and Office, a Shop, lodger's Kitchen, Scullery, &c., with Dormitories fronting Cornwall Street and Spittal Street, and a small Dormitory in the centre. There is a basement under a portion of the building in which Lavatories, lodgers' Lockers, Boiler House, and other offices are provided. The building is three stories; the first and second stories are in every respect similar, therefore a description of one will suffice for both. They each consist of three blocks of Dormitories, 166 ft. long by 23 ft. 6 in. wide, connected in the centre by a building of like character. In designing these buildings special attention has been given to light and ventilation." The estimated cost of these buildings is £47,000. It is proposed to improve Hulme Street and Marsland Street, making them 18 yards and 12 yards in width respectively, also to set back certain portions of the existing frontages in Chester Street and Wilmott Street, making those streets 18 yards in width, and to provide a new 12-yard street leading from Hulme Street to Marsland Street, and abutting on the existing Mill and Cottages on the south-west side, and the new Lodging House on the north-east side.

A NEW LODGING HOUSE FOR MEN

is suggested on the area lying between Hulme Street and Marsland Street; and to set apart land between Marsland Street and Chester Street, having a nett area of 2,112 yards, for the purposes of an open space for recreation. The buildings suggested for a Lodging House provide accommodation for 278 men. The building will be three stories in height, the Dormitories being placed upon the first and second floors. The estimate of the cost is £19,500. As regards the Pott Street area—between Pott Street, Sandford Street, Caroline Street, and Wharf Street, intersected by Beatson Street—it is proposed to improve the surrounding streets, and to erect Tenement Dwellings two stories in height on the land to the north-east side of Beatson Street, providing the accommodation already described in the Tenement Dwellings over the Shops on the Oldham Road site. In addition to providing the minimum area in accordance with the conditions of the Corporation bye-laws, a further space has been set apart between the yards of these Tenements as a recreation ground. The Tenements afford accommodation for 110 persons. It is proposed to erect a Lodging House for females on the area to the south-west of Beatson Street sufficient to accommodate 218 persons. The estimated cost of this building is £20,000. The Committee recommends the Council to approve of the building schemes described in their report, and to adopt resolutions applying to the Local Government Board for their approval of such schemes, and for their sanction to the borrowing of the sum of £60,000 for the erection of the proposed buildings in Oldham Road, Cornwall Street, George Leigh Street, and Spittal Street, and of the sum of £50,000 for the erection of the proposed buildings in Chester Street and Pott Street.

THE number of applications received for the vacant post of Harbour Engineer at Dundee is 86. The final selection will probably be made at the ordinary monthly meeting on October 5th.

A NEW crane, with a lifting capacity of 25 tons, is being erected in the Queen's Dock, Glasgow, by Messrs. Chaplin & Co., Govan. In a few weeks the crane, which will be the most powerful in the dock, will be ready for work.

THE SCOTTISH NATIONAL PORTRAIT GALLERY.

PROPOSED DECORATIONS.

IN December, 1895, Mr. J. R. Findlay offered to present to the Board of Manufactures an additional sum of £10,000 for the purpose of decorating the Scottish National Portrait Gallery Buildings. In making this offer, Mr. Findlay indicated—first, that he desired that certain of the statues for the niches on the façade and at the ends of the building should be provided, exclusive, however, of such statues of historical personages as ought sooner or later to be supplied by representative bodies, or of whom there are existing family representatives; second, that some of the windows in the Hall and Ambulatory might be filled with stained glass, and that mural decorative illustration of Scottish history might also be undertaken; third, that the capitals and brackets in the interior of the building should be suitably carved. The Board accepted Mr. Findlay's gift, and appointed a committee to formulate a scheme. A report of the Architect of the Board, Dr. R. Anderson, having been submitted, the whole subject is now receiving the careful consideration of the Board. The following is what has been decided to be undertaken by the Board in the first instance on the recommendation of the committee:—That four of the statues originally suggested to be placed on the exterior of the buildings should be undertaken without delay by the Board at a cost of about £200 each, and that these statues should consist of George Buchanan, Dunbar the poet, James Watts, and David Hume. That all the carved stonework of the interior in the Hall and Ambulatory, which still remained unfinished, should be gone on with as soon as possible, and selected students of the School of Applied Art should be invited to make designs for this work, and the successful students to receive money awards. That the Ambulatory railings should be treated with some gilding, and that the shields in the centre of each panel should bear the arms of the members of the Board at the time the building was erected. That the dark rooms at the east end on the ground floor of the Museum should be painted with white paint to improve the lighting. Dr. Anderson proposes that the walls of the Staircase should be adorned by the introduction of a number of commemorative panels such as may be seen in the Bargello at Florence and other places in Italy and Spain. In connection with a proposal by the Architect that colour be introduced into the sculpture heraldry on the exterior of the building, the Committee thinks before coming to a decision in this matter that an experiment might be made by means of coloured paper on one or more of the shields to try the effect. With regard to the adornment of the walls and ceilings with decorative painting, the Committee approves of Dr. Anderson's suggestions—that certain artists named by him should be asked to submit sketch designs for historical subjects; that the students of the School of Applied Art should be invited to submit designs for the decorative treatment of the staircase ceilings; that the effect of gesso work should be tried on a small portion of the brickwork of the interior walls, but that no painting or similar decoration should be commenced until all the carved stonework in the Hall and Ambulatory is completed. As regards the stained glass in the windows, the Committee is of opinion that the possible introduction of some stained glass in the windows of the Hall and Staircases should be delayed until the character of the decoration of the Hall and Ambulatory is fixed upon and completed. It may be stated that the statue of Dunbar has been entrusted to Mr. Pittendrigh Macgillivray, and that of David Hume to Mr. C. M'Bride. It is understood that with this £10,000, the total sum expended by Mr. Findlay on the National Portrait Gallery is something like £63,000.

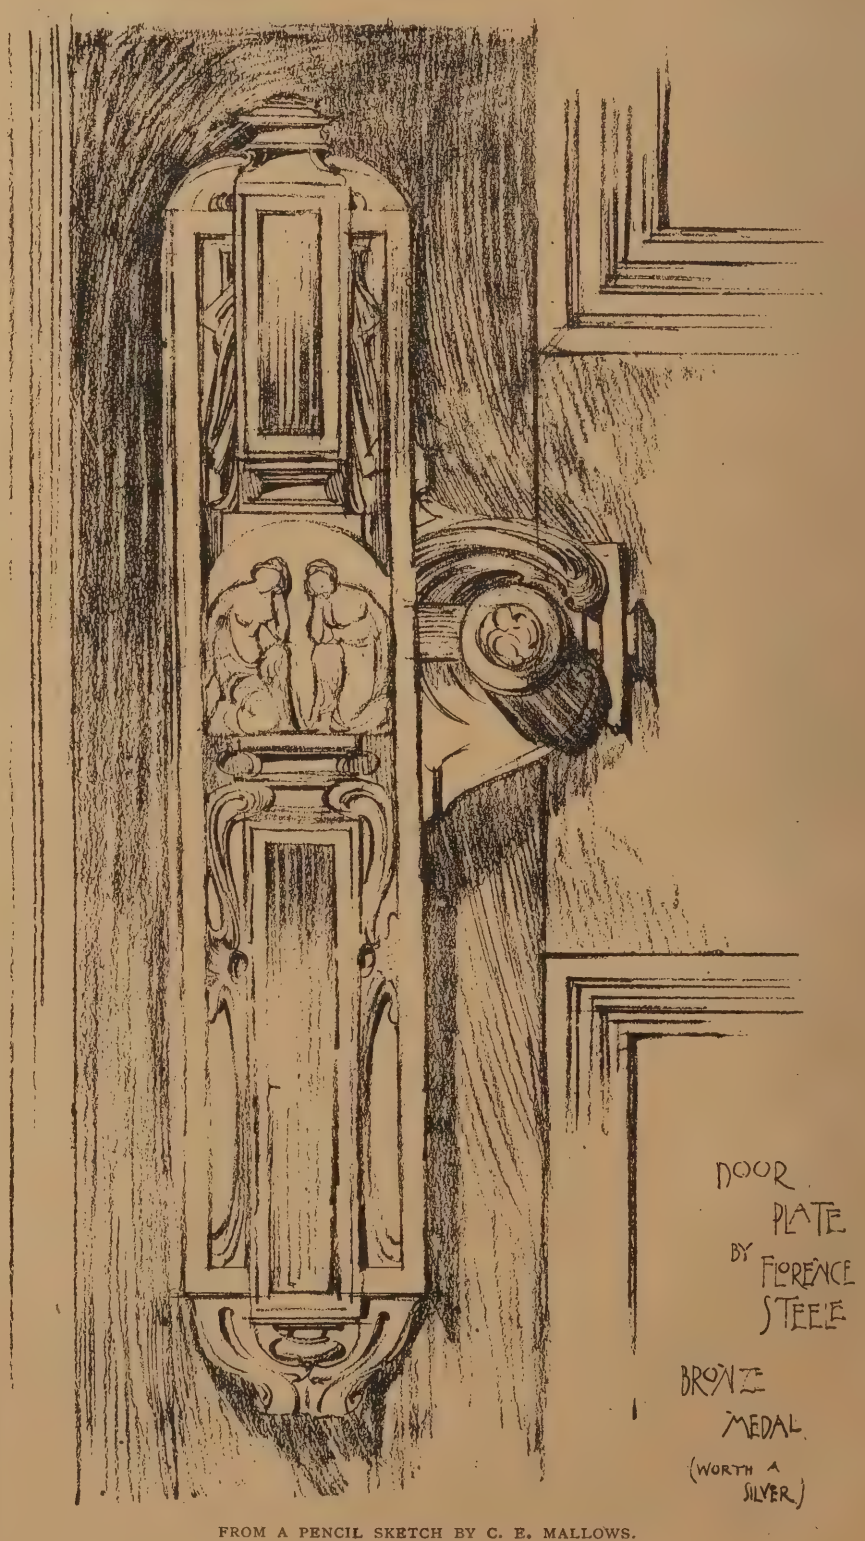
AT Copenhagen the death is announced, at the age of fifty-eight, of M. Julius Lange, Professor of the History of Art at the Copenhagen University. His works on Art have been translated into almost all European languages.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

The South Kensington Museum

AND THE

National Competition.



NOTHING could be much more satisfying than the extraordinary amount of enthusiasm provoked by our article in the previous issue under the above heading. We confess we were not prepared for a tithe of the encouraging support and promise of assistance we have received from different parts of the country, and from all sorts and conditions of Artists. From Architects, from Head Masters of Art Schools and from Students alike, the appreciation of our idea is most gratifying; it testifies at once to the keen interest taken in our proposed treatment of the subject (an interest most pleasantly disappointing to ourselves), and to the now practically assured success of the scheme we have in prospect and which we shadowly suggested last week. It may interest our readers to know that, as a direct result of the article, we have had over two hundred drawings offered us, all more or less relating to the Museum Collection, many of them most beautiful and all serviceable, which we shall use from time to time as the requirements of the scheme dictate.

Amongst the chorus of praise there is but one single note of criticism, and that relates to our reference to the absence of proper control from the authorities. The correspondent, the Head Master of an important provincial Art School, points out that it has been his custom for years past to give all the necessary advice as to study, and also to give a series of lectures on the Museum collections generally. We are very glad to hear it, and hope he has met and will meet with all the encouragement he well deserves. But, although we were well aware at the time of writing of other similar excellent examples, they are in reality only isolated and local ones; they do not in any way affect our main point just mentioned. Good examples in one or two cases here and there, however invaluable to the Students in these particular Schools, cannot, of course, reach the greater mass elsewhere, that can only be effected from South Kensington direct, it was, therefore, to head-quarters, and not to our friends the Art Masters, the criticism was offered.

We preface our remaining notes on the National Competition by saying that the exhibits will be dealt with in a distinctly novel way in our forthcoming Magazine, when the whole subject will be re-discussed and reformed into a controversial feature of the first number. We are now making arrangements by which the drawings illustrating it will be the best obtainable and the reproductions equal to the finest of to-day. Those Students, therefore, whose work is not noticed here, but who have gained distinction in the Competition and are otherwise worthy of special mention, will be duly recognised as just described.

The Gold Medal Design, which as already stated was by a student of seventeen, Peter McLauchlan, Glasgow, is a performance to be placed to his credit, and, as we said last week, is careful and thoughtful as a whole, but not quite equal to that by his competitor, D. Hislop, whose design has dignity of effect if a little unfortunate in some of its proportions. It is fairly-well drawn in pencil and colour, has some refinement, and is well thought out. Mr. McLauchlan scores a point, however, in sending a pencil perspective which this set is lacking, and which may have made the difference in the award. Mr. McLauchlan's pencil sketch is careless and not worthy of the subject, but the composition looks satisfactory in outline as there suggested. His "Tea-Room" design is much better altogether, and has a sensibly-treated front, and the detail is drawn with delicacy and care.

The Sketch Design for a Wayside Inn, by E. F. Reynolds (Birmingham), we wrote of last week, and this week we publish a perspective view drawn from the elevations. He deserves his prize for the simple and unaffected way he has treated his subject. It is cleverly handled, and delightfully rendered in pencil and wash, in which the colour effect is well conveyed. There is a notable absence of striving after effect so apparent in the more ambitious designs. The plan is artistic, and the whole design has the air of olden times. Mr. Reynolds must have had the best of advice in his studies generally, and we fancy we know its source. Birmingham is always fortunate in its teachers, and is probably the best Art School in the country. The other design by Mr. Reynolds is for a Cottage Hospital and is awarded a Bronze Medal. It is not equal to his other exhibit, but is nicely drawn and cleverly treated in parts. His plan, balanced and ingenious, shows rather an elementary knowledge of hospital arrangement.

FROM A PENCIL SKETCH BY C. E. MALLOWS.

SKETCHED BY C. E. MALLOWS.

F. G. Collins, Birmingham, wins a Book Prize for a similar subject. The plan has good points; the position of the wards is right, and the external treatment of that portion is the best of the group, the centre being somewhat tame.

William Haywood, Birmingham, has a National Silver Medal for a sheet of Designs for Church Fittings. They show well-thought-out notions for the subject, and pleasing arrangements of tracery lines. His constructional details would not work out satisfactorily in execution, but the bench ends are well designed, one, at least, takes a very agreeable and sturdy form of outline. The organ screen is much better treated in the detail than in the small scale drawing where it looks a trifle commonplace. The reredos is the most satisfactory part of the set, shows thought, and a desire to be original without eccentricity. It is nicely drawn in pencil, with slight washes rather timidly laid on.

Herbert T. Buckland, Birmingham, has a Silver Medal for an excellent design for a Cottage Hospital, very good in Architectural treatment and ably thought out in detail, although the Wards are not so well arranged as they should be. Non-isolation is a serious defect in Hospital planning. The author shows a photograph in the top left-hand corner of one of his sheets. The effect of this model is quite delightful. We shall publish a sketch of it in our New Magazine.

Mr. Swan's design for a Church has merit, and secures a Book Prize, which is a sufficient reward, the design being wanting in the qualities of refinement and breadth. It is not worthy of the author of the pencil sketches and of the measured drawing of the Skipper House at Ghent, which latter is admirable, and most serviceable for future reference and study.

Roland D. Rawcliffe (South Kensington), obtains a Silver Medal for measured drawings of portions of Rood Loft in Limoges Cathedral, France, and the same award for a design for a Church, which, although it shows some power of design, especially in the west front, and some careful study throughout, is, taken altogether, a little too pretentious, and some of its constructive faults are serious ones. The lettering and general get up of the drawings show lack of artistic sympathy.

on the landing. The external treatment, a simple and effective version of Renaissance, is excellent, and well expresses its purposes. The façade is nicely balanced, but a want of scale is apparent in the proportion of the side wings to the central feature, which latter, however, is excellent. The perspective view is careful and effective, but a knowledge of light and shade would have improved it immensely.

George A. Paterson, Glasgow, wins a Book Prize for a very artistic design, both in drawing and work. The subject, a Gallery Front and Screen, is treated in a fresh, reserved, and original manner, with slight German feeling thoughout. The colours are satisfactory, with the exception of the shadows, which are hard and unsympathetic. It is, however, excellent as a whole, and shows great promise in a student of 18. The effect of the design would be better explained by a perspective, in which we can imagine a nice effect of light and shade.

A Bronze Medal is given to Miss Alice B. Giles, Lambeth, for her delightful design "The Pied Piper of Hamelin." There is evident so much charming fancy, sense of colour and of line, combined with genuine decorative effect, that we think her design deserved something very much better than a bronze medal, in spite of the unfortunate perspective and the curious Architecture of the Bridge. This is such a lively and bright sort of plate that we returned to it again and again with pleasure.

Thomas C. Overnell, South Kensington, shows some good designs for programme covers and book decoration which well deserve the Bronze Medal awarded.

The Silver Medal given for the same subject (by George Montague Ellwood), is

SKETCHED BY C. E. MALLOWS.

Albert Bradshaw, Nottingham, well deserves his Bronze Medal for a good design for a Public Library. His plan is well arranged generally, the Lending Library and Reading Room being placed conveniently on the ground floor and well lighted. The Reference Library, Book Store, Ladies' Room, &c., are planned over and fairly well considered, although some waste space occurs

better drawn, and shows a good deal of invention and a faculty for placing and balancing blacks which is very satisfactory. Some portions, however, have a a tendency to be hard and mechanical.

Florence M. Homewood wins a Bronze Medal for a fanciful and well-drawn illustration to Longfellow's Golden Legend. It illustrates the verses referring to Lucifer's

attempt to tear down the Cross of Strasburg, and the idea is well suggested and carried out.

Florence M. Homewood has a Book Prize for some good designs for tailpieces.

H. M. Brooks' wins a National Bronze Medal for some careful drawings in which the Architecture should have been carefully studied.

Ethel Dobbin, Nottingham, wins Bronze Medal for the "Heart of the Rose Unopen," which is gracefully and delicately drawn.

"The History of Modern Painting" has a very good cover design by John E. Hardy, for which he obtains a Book Prize. The decorated arrangement of line is good, but we hope he will have an opportunity of re-arranging the date and volume number, which are stiff in position, and destroy the repose of the whole design seriously.

inadequately rewarded with a Book Prize for her charming invitation card, bright alike in fancy and in colour, and Celia A. Levetus, Birmingham, has the same prize for some excellent illustrations, apparently for children's tales.

In the Class of Colour Design the work of Henry Edgar Crockett wins distinction and a National Silver Medal for a set of four really beautiful colour sketches, on brown paper. The subjects are: "The Sleeping Beauty," "St. George and the Dragon" (2), and "A Pastoral." Of these, we like the slightly and effectively drawn "Pastoral" the best. It is quite gay with movement, colour, and life, and the figures are most daintily and delicately suggested. All these subjects are for long and narrow horizontal panels.

The upright panel, by Henry A. Payne, Birmingham, called "Song," is a very harmonious arrangement of colour and excellently well drawn. We believe it is intended for the decoration of the Birmingham Town Hall, and is presumably a study for the subject.

SECTION

A DOOR KNOCKER BY ELEANOR MERCER.

SKETCHED BY C. E. MALLOWS.

The "Toilers of the Sea," and "Don Quixote," by Alfred Jones, are masterly in arrangement, drawing, and design, and easily first amongst them all. Nothing could be much better than the simplicity of *technique* and of handling; they are very able drawings and show promise of considerable power.

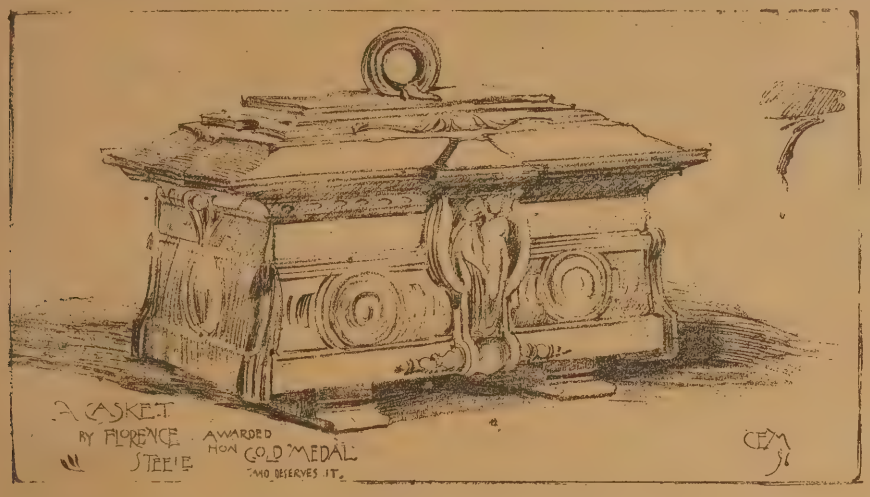
Miss Winifred Smith, of Birmingham, who gained the Gold Medal last year, is this year

A Silver Medal award is also given to Joseph Ogden, of South Kensington, for an able ornamental design, able, that is, so far as the figure and decoration is concerned, but the Architecture is poor and weak.

A Bronze Medal is given to Catherine Whitworth, of Leicester, for a design for an Embroidered Altar Cloth, which shows a capital combination of colours and pliant decorative arrangement, but the figures are out of proportion.

AN IDEAL PRESIDENT.

IN a letter to the "Times" upon the Royal Academy and Craftsmanship, the writer, referring to the necessary qualifications of a President of the Royal Academy, says "that sufficient stress is not laid on the advantage to be derived from the possession of a wide sympathy for artistic crafts as well as for painting, sculpture, and Architecture. The work of the sculptor-goldsmith has found its way into the Winter Exhibitions at Burlington House and has been appreciated by the public. In the recent Academy Exhibition Mr. Gilbert's St. George, the enamels of Mr. Fisher and of Nelson and Edith Dawson, and the silver work of Gustave Natorp, F. Lutiger, and others have added greatly to the attractiveness of the Lecture Room. The admission of certain crafts to the Academy Exhibition has been tried on an experimental scale and has proved successful. With a President in touch with the Crafts as well as with the Arts it is probable that the experiment would be tried on a larger scale, to the great advantage, not only of the Academy Exhibitions, but also of the artistic industries of the country. It is needless to point out how great a relief would be given to the monotony of succeeding vistas of paintings in the Academy Exhibitions by a few cases devoted to craftsmanship. The advantage to artistic industries would be two-fold. Manufacturers and craftsmen would be encouraged to produce objects of intrinsic beauty—not necessarily for sale. The Academy, by selecting and exhibiting objects of merit, would gradually educate the public taste and develop a demand for good craftsmanship rather than for novelty and smartness. At the present time the very existence of craftsmanship is threatened. Apprenticeship is virtually dead, and workshop tradition is dead. To make matters worse, an interested cry is being raised, and was heard at the recent Congress of International Workers, to the effect that young persons must not be employed in industries until they are 16, and consequently too old to learn a craft. Technical education has been suggested as a substitute for apprenticeship and workshop training. Technical Institutes and Polytechnics are being founded in considerable numbers and at great expense, under an erroneous belief that if young persons devote a few hours to art and technological classes they can be transformed into artists and craftsmen. Art and technical classes cannot create artists and craftsmen, but they do produce a large body of disappointed amateurs, for whom there is no demand and no work. If the Academy can grasp the fact that the Art of the nation is not confined to Painting, Sculpture, and Architecture, and will recognise that her crafts have some small claim for sympathy and consideration, it will do more for the encouragement and development of craftsmanship than the most elaborate system of technical education."



Two very large express locomotives have been turned out of the Gateshead Works of the North-Eastern Railway, from designs by Mr. Wilson Worsdell, the locomotive superintendent, which are specially notable from the fact that the driving wheels are the largest coupled ones in the World.

ANOTHER addition has been made to the objects of interest in the city of York. Five pieces of artillery, captured by the British forces during the recent Burmese expedition, were recently sent from Portsmouth, being a present to the city from the War Office. They comprise three muzzle-loading and two breech-loading guns, the respective weights of the former being as follows:—1 cwt. 1 qr. 18 lb., 1 cwt. 7 lb., and 3 qr. 26 lb. The breech-loaders weigh 6 cwt. 13 lb., and 6 cwt. 7 lb. The pieces are culverins, one measuring over 6 ft. in length, and they are of a type used in bygone days in naval warfare.

BELFAST CATHEDRAL.

EXHIBITION OF THE DESIGNS.

IT is generally known that the site chosen for the new Cathedral is to be that occupied at present by the Parish Church of St. Anne's, in Donegall Street, on which formerly stood the Linen Hall of Belfast, in what was then known as Linenhall Street. The drawings which are now on exhibition in the Free Library are by Messrs. Thomas Drew, and W. H. Lynd. The first instalment of the contemplated operations will represent an expenditure of £30,000. There is no doubt that a complete Cathedral should consist of three great divisions—viz., Arcade, Triforium, and Clerestory; and that its parts should be Nave and Aisles, Choir and Aisles, Transepts, and one or more Towers. The general aspect, according to the design, is simple and unaffected; ornament is sparingly used, and the dominating feature is the Central Tower and Spire, to which the other portions lead up the eye, producing a very effective composition. The drawings show the ground plan; the transverse section through the Nave looking east; a perspective of the interior also looking east; and there is in addition a perspective from the west end showing the Tower over the intersection of the Nave and Transepts. The former two are Geometrical, and are well executed in Indian ink, the section being also tinted. There will be no high Choir Screen, the Architects having decided upon a simple septum similar to that in the

FROM A PENCIL SKETCH BY C. E. MALLOWS.

CATHEDRAL AT FLORENCE.

The edifice comprises a Nave and Aisles, about 70 feet in width by about 125 feet in length, to the Screen of the Choir. On each side extend Transepts with Aisles, the width of the Cathedral at this point being 130 feet internally. The Choir is seated with stalls, affording accommodation for the diocesan clergy and the choristers. Above the Choir will be a lofty lantern, forming the lower portion of the Tower. The Pulpit and Lectern occupy respectively positions at the bases of the great piers of the Tower facing the Nave. It is on the south pier, at the east end of the Choir, that the Bishop's Throne is placed. The Chancel extends about 50 feet, having at the back of the Altar an Ambulatory, thus affording complete access around the walls of the interior of the Cathedral. The organ is located on the east side of the north Transept. The front Porch, which is deeply recessed about 14 feet, with angle columns at each side, has a central division at the doorway. The west front is flanked on either side by octagonal Turrets, terminating in steeply-pitched stone roofs. On the north side is placed the Baptistery, which is about 15 feet square, approached by a moulded archway in the north Aisle. On the corresponding side in the south Aisle is the Galilee Porch, which should form a striking feature in the composition. It has a deeply-recessed doorway, liberally groined ceiling, and arcaded walls. At the angle of the Nave and south Transept is a groined passage to the Vestries and Chapter House, which are not included in the work to be carried out at present. From the section we gather that the Aisles will be groined in stone. The Nave will also have a similar ceiling, and for the purpose of resisting the thrust caused by the great weight thrown by stone-groining massive buttresses are placed on each pier, with flying buttresses above. The roofs are of steep pitch, and will probably be covered with lead and have ornamental parapets, with gutters behind. The Nave will be of fine proportions, the height from the floor to the top of the groining being 63 ft. The Chancel arch is of equilateral form, resting on responds with carved caps and richly moulded zones and bases. Of eight lights, at least 40 ft. high, the east window consists. The height is filled in with tracery of Geometrical design. In the Choir four rows of stalls are arranged at each side. The platform of the Altar is elevated six steps above the pavement of the Nave. The Screen at the back of the Altar, and immediately under the great east window will be richly arcaded and filled with tracery. Behind the Altar is placed a bas-relief of the picture representing "The Last Supper." A feature of the exterior of the Cathedral is the large and well-proportioned Tower rising in the form of one of the early Perpendicular Towers associated with some of the old English structures. The belfry windows in the Belfast Cathedral are to be of great height, with large louvres. At the four corners of the Tower rise octagonal Turrets, terminating at a considerable height above the parapet in richly crocketted steeples. A wheel-window fills the space immediately above the doorway of the West Front, which is of Geometrical design, and surmounted by a narrow Gallery, behind which is some arcading. The gable terminates at a height of over 100 feet with a carved Celtic cross. As to the flanking Towers, they rise a few feet higher, with steep octagonal stone roofs. On the site of the old Rectory in Donegall Street, at the corner of Talbot Street, is shown a building of ecclesiastical appearance, we presume a Chapter House, to which it is connected with a passage. There is to be a Crypt, which will add to the dryness of the entire building, as it is well known that foundations are wet in this portion of Belfast. Lighting will be by means of traceried windows.

A GRANITE monument to Mr. Hugh Brown, the Queen's late Highland attendant, has been erected over his grave in Crathie Churchyard. The inscription at the base of the monument is as follows: "In loving memory of Hugh Brown, Highland attendant to Queen Victoria for seven years. Eighth brother of John Brown, the Queen's personal attendant. Died at East Lodge, Balmoral, March the 29th, 1896, aged 57 years."

AT Stromness the Harbour Commissioners have purchased what is known as Murray's Pier at the price of £1,000, and they are negotiating for the purchase of the Warehouse Pier and stores, the object being to dredge, deepen, and otherwise improve the harbour. The plan includes a roadway along the beach from Murray's Pier to the north end of the harbour. The improvement works, exclusive of the price of the Piers, are estimated at £12,500.

COMPULSORY LABOUR INSURANCE.

IN Switzerland a curious experiment is being tried with a system of insurance against want of employment. In this country we have such voluntary means of insurance as are provided by Trades Unions, Friendly Societies, and Savings Banks. In Switzerland, where Trade Unionism has not flourished, they are trying what can be done by legislative measures, optional or compulsory. There is a compulsory system already established in the town of St. Gall which has a population of between 20,000 and 30,000. An Industrial Insurance Fund is managed by the Municipal Council. All male wage-earners resident in St. Gall whose average earnings do not exceed 3s. 11½d. daily, are bound to belong to the fund and pay premiums graduated according to the amount of their wages. The better paid workers can join or not as they please. Apprentices and labourers under age in receipt of less than 1s. 7d. daily, are exempted, and persons already belonging to a voluntary insurance organisation are not compelled to join. But, with the exceptions thus indicated, the scheme is compulsory on all the male wage-earners who receive 3s. 11½d. or less per day. Having paid the premiums, the workman when out of employment is entitled to relief for a period of not more than sixty days in any one year. If he is out of work through his own fault, or by a strike, or if, being able-bodied, he declines to take work suited to his position and capacities when it is offered to him, then the relief is withheld. Otherwise he gets a fixed payment, higher or lower according to the class of premium he has contributed. The number of persons insured up to June of the present year has been 4,200. According to this scheme the danger of actual destitution through ordinary failure of employment in St. Gall ought to be reduced to a minimum or extinguished altogether. Yet it is stated that the working classes of St. Gall have not taken kindly to the scheme, and that compliance with the law now is understood to be not cheerful but grudging. We are not told whether their objections are to the practical working of the compulsory principle, or to such details as the limitations on the amount of relief. But when we learn that non-payment of premiums is punishable with fines or even imprisonment, we may hazard the guess that some of the St. Gall workmen find this concrete form of Socialism rather irksome. As to the benefits of the scheme, while the relief is considerably less than the wage, yet the working classes get a good deal more out of the fund than they put into it, the balance, of course, representing the contribution of the community. The revenue from the premiums is stated to be small as compared with the calls made upon it, more especially in winter, and the fund therefore has to rely to some extent on auxiliary sources of income, of which the chief is a municipal grant-in-aid. There could be no objection to such a grant, assuming the scheme to be properly administered. In Glasgow the public willingly subscribed a considerable sum to meet the exceptional distress of last year, and a regular grant would simply take the place of such exceptional voluntary contributions whether from the public or the Common Good. A scheme which really settled the problem of distress through want of employment would be hailed with general thankfulness.

AT Liverpool, the Masonic Arms Hotel, Lark Lane, with two small shops adjoining, was recently sold by auction for £28,200. The property is freehold, but as the reserve price was only £12,500, it is an instance of the fictitious value placed upon licensed property.

BARONESS BURDETT-COUTTS recently laid the memorial stone of a new School connected with the Westminster Baptist Chapel, Romney Street. The Church itself was built in 1828, but the Sunday School work has been carried on under difficulties in the Gallery of the Chapel, which cost £1,600 to erect. The Church cost £3,600. The new edifice, which is estimated to accommodate 250 children, will cost £1,000.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
September 2nd, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."
—JOHN RUSKIN.

THE old inn which Mr. Ruskin mentions so tenderly in the pages of "Praeterita"—the Old King's Head at Croydon—will shortly be pulled down. It stands facing the open space of Market Street, and until recently under the shadow of the hideous old Town Hall that has just given way to the new municipal palace of this go-ahead borough. The Old King's Head is quite a humble building, although of a respectable age, and somewhat dignified by reason of its dormer windows and deep-eaved roof. A succession of occupiers during the last fifty years have done something to vulgarise it by converting its front into the likeness of an ordinary public-house, and by the addition of great sign-boards.

A CURIOUS discovery was made by some workmen while making excavations at the rear of the Rose public-house, in the Old Bailey, almost immediately opposite Newgate Prison. A few feet of earth had been removed when a bricked waterway some 8 ft. deep by about 6 ft. wide, with an arched roof, was revealed. The stone of which the walls and roof are built are most roughly put together, and are evidently of great age. It is inferred that the opening is part of a long disused conduit which at one time ran into the Fleet River. There is an inlet at one side, through which water entered from another conduit. The existence of other buildings precludes the possibility of tracing the conduit to its end, but there is little doubt that it is part of one of those curious underground waterways, of which there formerly existed many in this part of London.

EXTENSIVE structural alterations have within the past few weeks been in progress in the Offices connected with the Mansion House Justice Room, the object being to secure increased accommodation and to facilitate the transaction of the business. The works, which are being carried out under the supervision of the City Surveyor's Department, Guildhall, are fast approaching completion. The principal feature in the alterations is the providing of a new room, situated in the basement of the Mansion House, for the taking of affidavits, declarations, and other documents, to which the signature of the Lord Mayor or an Alderman is required. The old Affidavit Room has been converted into an Office for exclusive use in connection with the ordinary business of the Justice Room. The alterations will add greatly to the convenience of the public and of the officials of the Court.

MOTOR carriages as at present designed are very far from perfect. The vibration reminds one of the earlier days of the torpedo boat. Added to this, most of the cars leave behind them a fume of burnt oil which would almost suffice to trace their course by the sense of smell alone. Until these and other defects have been surmounted, the motor car is little likely to become a popular favourite, though no doubt the very great concessions made by Parliament will do much to stimulate inventors. In particular, the placing of the limit of speed as high as fourteen miles an hour went further than the most sanguine had dared to hope, considering that motor-driven tramcars are limited by the Board of Trade to a speed of eight miles per hour. It is true that the speed in question is only permitted in the case of cars not exceeding three tons in weight, but, even so, it is very much too high, except, perhaps, for the very lightest motor tricycles.

M E. REVIERE, the well-known anthropologist, has discovered, in the Department of the Dordogne, a new and important prehistoric cave, the walls of which are covered with drawings of animals. The caves of the Dordogne have for some years been noted for their relics of a very early race of men. In that part of France the river valleys are cut rather deeply into a limestone plateau, and their precipitous walls are often pierced by caves. These were occupied as dwellings by a primæval race. It was their habit to throw the bones from their food upon the floor, where they still lie, mixed with fragments of rock. In this refuse on the floor, which is often cemented by a calcareous deposit into a solid mass, many relics of that prehistoric race have been found. Among them are numerous weapons of stone, most commonly of flint. Besides these are needles and prickers, arrow-heads and barbed harpoons, of bone. Pieces of antlers, of bone and of ivory, are carved into different forms and ornamented with sculpturing; patterns and figures also are occasionally scratched on bits of stone. The special interest of M. Revière's discovery is that he has found some kind of incised ornamentation upon the actual walls of a cave. Both the objects depicted and the material employed throw considerable light upon the condition of Western Europe at this early age. The antlers of reindeer are commonly used for tools and ornaments, and the bones of this animal abound in the *débris* on the floors. Obviously, it must then have been as common in Perigord as it now is in the extreme north of Asia or America. But the most interesting sketch of all is a fairly accurate and rather spirited outline of a mammoth, scratched on a piece of a tusk—these figures sometimes are actually sculptured as if to form the handles of knives or of tools of some kind, but in other cases, as in the last-named, they are incised on the flat or curved surface of a bone or of an antler.

AN interesting letter from Mr. Saml. E. Lees upon the subject of wood paving appears in a daily contemporary. He says:—"It has surprised me that the London authorities should have adopted the use of soft wood for their thoroughfares. As Mr. S. McSweeney says, 'there are blocks down in Sydney sixteen years' (they have been down seventeen years) 'with ¾-in. joints, that taken up and relaid with close joints will last for the next twenty years or longer.' That is true, and had they been laid with close joints originally the work of taking up and relaying would not require to be done for the next four or five years, the grouting between the wide joints causing the edges to fray and work off. These woods used in Sydney cover over sixteen miles of road, some of which are 100 ft. wide, and they consist of iron-bark, black-butt, tallow-wood, red gum, and other hard woods. In the cases of wide joints (which are now abolished), during my term of office as Mayor of Sydney—1895—there were many sections taken up, and they were reduced in depth by cutting an inch off the worn surface, and relaid closely. The wood is sound, sanitary, and as good as at first—with a promise of a twenty or a twenty-five years' life added. These operations were done very cheaply, as the concrete foundations are sound, and the cutting by machinery and retarring of blocks, together with the labour of relaying, are done by contract. Australia could supply all the hard wood required for wood paving, builders' girders, railway sleepers, joists, or any other purpose. The paving blocks will stand cutting down more than once."

AN Exhibition of the Royal Cornwall Polytechnic Society was opened last week in the Polytechnic Hall, Falmouth. In the Oil Painting department there is an absence of figure work, and it is equally a matter for regret that some of the better known artists have not sent a few examples of their work. Very few examples of amateur work have been sent in, and the Black and White work is also somewhat disappointing. The Ornamental Art department is well sustained. A variety of work comes from Charles A. Eva, of Penzance, including modelled design for a door knocker, in cast and pierced brass, carved stone boss, oak-string course, panel, Flemish Renaissance, set of designed borders, &c. Gertrude Cox sends a piano back and satin panel for wall decoration. From Barbara E. Hext, the committee has received door of a grandfather's clock in oak; while M. A. Anderton sends an excellent carved spinning chair and chip table. Towering above the other exhibits is a massive limewood mirror frame, which will be admitted a bold piece of work. This comes from Rashleigh and Pinwell, of Plymouth. Miss E. D. Cooper again exhibits some choice bits of carving, including five panels. Modelled designs for tiles come from Walter M. Barnes, and a marble bas relief, "Cupid Singing," from F. Massey. The Industrial Class at Newlyn is responsible for eight items, ranging from a repoussé casket to a tea tray and inkstand. So far as Mechanics are concerned, they fall numerically below the average, but there are several items of importance, notably those sent by Cox and Co., of Falmouth, the Expanded Metal Company, Limited, E. T. Newton and Sons, C. Lindley and Co., and W. Brenton. Electricity is but badly represented. The Expanded Metal Company have a stand showing samples of stiff lattice, worked out of a single sheet of metal, to a coal dresser or ore beater.

IT is with much regret that we record the death of Mr. William Dyer, the well-known picture-restorer, which occurred recently at his house in Camden Road. Mr. Dyer, who was seventy-four years of age, had for the last fifteen years had charge of the pictures in the National Gallery, as well as those in many of the best private collections. In early life he worked for the late Mr. Farrer, the Bond Street dealer, but afterwards had a business of his own, first in Orchard Street and afterwards in Mount Street. Of the many important pictures which he cleaned, it is enough to mention two—Sebastiano del Piombo's "Raising of Lazarus" and Holbein's "Ambassadors," and in both these cases, as in very many others, the delicate operation was accomplished with great skill and caution.

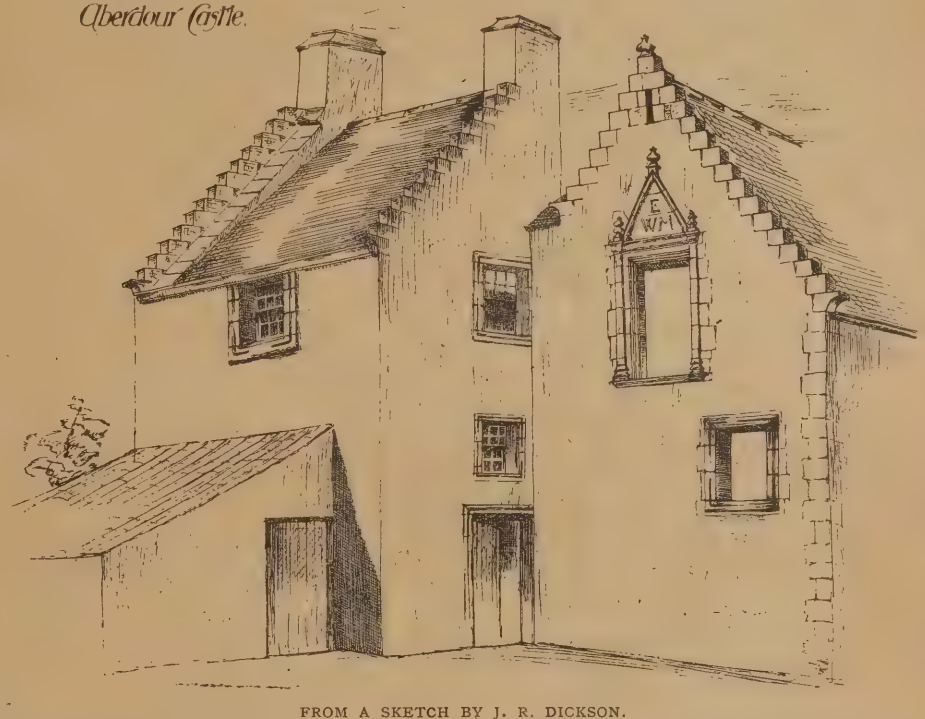
THE Duke of Norfolk has purchased a site for £13,000 on which it is proposed to erect a Roman Catholic College at Oxford. It is about three acres in extent, and is within a short distance of Mansfield and Manchester Colleges, the Racquet Courts standing upon it at the present time. This College will be in addition to, and quite distinct from, the Hall under the auspices of the Jesuit Order. The Hall marks the first instance of a return on the part of the religious orders to their former connection with Oxford, and the proposed new College will hold a corresponding position in regard to the action of Roman Catholics in general in regard to the University. Considerable agitation with reference to the question has been carried on for some years among the Catholic laity. It is stated that before the commencement of the Michaelmas term the Catholic bishops intend issuing a joint letter of instruction with reference to the recently-granted permission. One of the provisoes is the appointment of a chaplain for each University.

SIR JOHN MILLAIS' house is said to be one of the most beautiful in modern London. A few years ago the wealthy artists entered into a noble rivalry in house building and decoration. Lord Leighton's Art Palace, like Sir John Millais' and some others, were the topics of their day, but Leighton contrived to put more Art into the scheme of his mansion, and Sir John Millais, being a family man, went necessarily into more domestic details. But each home was very beautiful. Sir John's Entrance Hall was a dream of beauty in decoration, in mosaic floorings, columns, marble dados, and marble staircase. Mr. Alma Tadema, Mr. Hubert Herkomer, Mr. Goodall and Mr. Poynter have all lovely town houses, in which the artistic mind of the occupant is seen in the construction and embellishment. The late P.R.A. also maintained a lovely establishment at Dunkeld. He was for many reasons fond of Perthshire.

CONSIDERABLE interest has been aroused in Hampstead by the proposal to convert the well-known chalybeate well in Well Walk into an ordinary drinking-fountain. The well, together with six acres of common land, then part of Hampstead Heath, was granted to the poor of Hampstead in 1698 by the Countess of Gainsborough. In the last century the water had a reputation for medicinal value higher than any other spring in England, and through that and other wells in the neighbourhood Hampstead became a famous "watering place." Its popularity gradually declined, and though the old Assembly Room in connection with the wells is still standing as a private house, the Pump Room, after being used successively as a Chapel, Drill Room, and a School, has been pulled down. The spring has, however, up to now, still provided a certain amount of water of some medicinal value, and it has been accessible to the public through a fountain erected in Well Walk, Hampstead. The supply has gradually diminished, almost to vanishing point, and it is proposed now by the trustees of the charity to lay on a supply of ordinary water, at a cost of about £30, and cut off the supply from the spring. It is, however, alleged that the spring has simply been diverted (probably into the sewers), and that this is the sole reason for the failure of the supply. An attempt to save the well from the proposed alteration is being made, and the Hampstead Vestry is considering the advisability of taking action in the matter.

IN Paris the British Embassy has been installed since 1815 in the Mansion 39 Faubourg Saint Honoré. It was bought by the Duke of Wellington upon his arrival in Paris for the British Government, and it had belonged to the Princess Pauline Borghese, whose property it was at the accession of the First Empire. The Mansion—Palace is a better name—was bought for £24,000; it is worth to-day, perhaps, £160,000. L'Hotel Borghese was, in 1814, situated in what was called in those days "le quartier des Maréchaux"—a fact that is accounted for by the names of the tenants of the surrounding residences. Suchet's house was at No. 31, Faubourg St. Honoré, and Joseph Bonaparte had lived there in 1800. Marmont lived at No. 45 of the same street, in the Mansion built by the Marquis de Brunoy; at No. 47 dwelt General Beurnonville; Marshal Sebastiani had his "hotel" at No. 51. Moncey lived in 1812 at No. 73; Sérurier lived just by, at No. 8, of the Rue Boissy d'Anglais, and Junot was his neighbour. The Emperor of Austria stopped in the Hotel Borghese during the occupation of the Allies for a time in 1814. It is, together with the Palace of the Elysée, the oldest building of the Faubourg, and there was a house there, as may be seen on Delagrive's map of 1728, when the rest of the neighbourhood appears to have been nothing but a park. It is famous for its splendid salons and its vast "Galerie du Trone," and was constructed at the end of last century upon the plans of the great Architect, Mazin, for the Duc de Charost. Under the Empire "l'hotel de Charost" fell to the younger sister of Napoleon, the Princess Borghese, who furnished it according to the taste of the time. Its decorative features have not suffered displacement; it presents a perfect type of the First-Empire style, and it has acquired an inestimable value from the circumstance. It also possesses marvellous mantelpieces and fireplaces, of which the bronze-work, admirably embossed, reproduces the Imperial emblems. The interior of the house best deserves attention. The Vestibule is a vast apartment, with walls panelled in marble, and leading at its farther extremity to a monumental staircase. The whole of the frontage towards the Champs Elysées is taken up by three symmetrical and similar salons, and they are supported to right and left by two long galleries, which run the length of the wings of the house. The one leads to the Salle à Manger, the other to the Ball Room. These twin corridors, panelled with marble, open upon a verandah which encloses a sort of courtyard that one has to traverse in order to reach the garden.

THE last words of Professor Middleton concerning the South Kensington Museum appear in the annual report of the Science and Art Department, which has been issued during the last few days. It is rather pathetic to find, in view of the generally admitted difficulties which he had to contend against, that his last official utterance was practically a lament over the national parsimony and a protest against the manner in which his hands were tied. He wrote that he could not "refrain from again urging the necessity of more space for the proper exhibition of the Museum collections generally;" and he expressed the opinion that these collections "are much too crowded at present, and so cannot possibly be seen to advantage." What is the use of a Museum which is so limited in space that its contents "cannot possibly be seen to advantage" it would be hard to say; and it would be even more difficult to explain on what principle a really eminent man was engaged to direct that Museum if it was an essential part of the official policy to consistently disregard both his opinions and his advice.



AT Leicester last week, Colonel Hasted, on behalf of the Local Government Board, held an enquiry into two fresh applications of the Corporation. One arose from the proposed exchange of land in the Victoria Park Road. The other to enable the Corporation to borrow £15,500 in order to construct the proposed Newark Road Bridge. On neither point was there the slightest opposition, and it may accordingly be assumed that the requisite sanction will be conceded in due time. In the course of his explanation, the Town Clerk made the announcement that the Corporation had no intention to pull down the Old Newarke Gateway, and would accordingly make their roadway round it.

MR. C. B. FOWLER has made further interesting discoveries, while excavating for the laying of a drain around the Tower of Lanblethian Church. An effigy tomb was removed from inside the Church, and made to act as a foundation to support the south-west Tower buttress, when the Tower was added on to the Church about the latter end of the fifteenth century. The sepulchral slab is of Sutton stone, 4 ft. 10 in. in length, and 1 ft. 9 in. in width, of thirteenth century character, very similar to the tomb in the Church at Llantrithyd, viz., a civilian recumbent, with hands folded in prayer, at the feet of a greyhound. No doubt this tomb formed a portion of the recessed arch which was recently brought to light in the south wall of the South Chapel over the Crypt, where the 300 bodies were found as described in a recent issue. About a foot below this tomb is the base of a stone Altar. The tomb has been removed and placed in the arched recess—no doubt its original position previous to the time when it was wantonly removed and built into the Tower foundations. It has not suffered much from being buried for over four centuries and supporting many tons weight.

A MUSEUM of costumes is about to be opened in Berlin, with a view of showing theatrical managers how to avoid anachronisms of dress on the stage. In the present state of theatrical enterprise, and—in justice it must be added—of the public taste and intelligence, the danger in this country is rather in the direction of a too cramping exactitude than in any archæological looseness or inaccuracy. With us, for many years past, no theatrical production of importance in which the time or clime has been other than our own has taken place without the avowed assistance of experts of the first eminence. The names of Godwin, Lewis Wingfield, Seymour Lucas, and Alma Tadema are guarantees of the reverence with which detail of the kind has been watched. Indeed, if any inaccuracy or inconsistency is detected in a modern play, it is generally safe to assume that it has been allowed to remain for the sake of the artistic effectiveness of the scene.

IT is not everyone who admires Lord Grimthorpe and his weakness for restoration. Thus a contemporary:—"I have not seen Lord Grimthorpe's plans of restoration in connection with the famous old Church of St. Michael's at St. Albans, but I think every archæologist will regret that the historic Tower of the Church has been pulled down to make way for a new edifice. Lord Grimthorpe is the restorer of St. Albans Abbey and many other Church edifices, and his enthusiasm as a restorer has led him to spend a large sum of money on his whim. On this part of his labours I need not speak; but it is nothing short of vandalism to pull down this old Tower. The Church is 1000 years old, and is older than any part of St. Albans Abbey. The Tower was a fine, characteristic, square structure, and it stands upon the foundations of a previous building which was unquestionably laid by Roman hands. In the opinion of some archæologists, these foundations were the remains of a Roman Temple which, in time, became converted into a Christian Church. That, however, is a matter of mere speculation, though it would be quite in keeping with the spirit of the times to extinguish the memory of the old Temple by the erection of a Temple of the new faith over it. The Church is, of course, associated with all the history of St. Albans, and as a massive piece of Saxon work, so solidly and well put together that the fabric has not needed the hand of many restorers since Saxon times."

Aberdour Castle.

FROM A SKETCH BY J. R. DICKSON.

THE Queen has granted Bushey House to the Duke and Duchess of York, who were offered the Stud House, in the Home Park, Hampton Court, after the death of Sir George Maude. Bushey has good gardens and grounds, and the house is comfortable and well-arranged in the old-fashioned style, and not too large. George III. granted Bushey to his son, the Duke of Clarence, who made the place his principal residence until he came to the throne in 1830. It was then given to the Duke of Sussex, but it was taken away again from him, being wanted as a dower-house for Queen Adelaide. From 1837 Bushey was occupied by the Queen Dowager, and when she died, in 1849, it was granted by the Queen to the Duc and Duchesse de Némours. The Duc d'Alençon keeps the place until the middle of October, when extensive repairs and alterations are to be carried out by the Office of Works.

AN interesting relic of an old Scottish saint, St. Fillan, and his time, has just been rescued from the privacy of a private collection and placed in a position where it may be seen and reverenced by a larger public. This is the old holy water font of the ancient Chapel of Dundurn or St. Fillan's, which stood to the west of the Saint's own hill—Dun Fillan—in a field on the south side of the Earn, not far from where it issues from the Loch. Of the old Chapel and its appendages, built by the Saint, nothing is now known to exist save this round stone basin. On the site of the Saint's Chapel another was built three hundred years ago, and for generations the holy water font lay upon the sill of one of the windows. When this second Chapel was unroofed several years ago, the stone basin was taken charge of by Col. Stewart, of Ardvorlich, who has now handed over the old stone basin to the Parish Church authorities, and it is to be used as a baptismal font. The stone, which is 13 in. in diameter by 7 in. deep, is a roughly hewn piece of whin, shaped like a large curling stone. On the top is a cup which is 6 in. across by about 3 to 4 in. in depth. The basin has been set on a wrought iron pedestal, the gift of Mr. Duncan Macara, The Oaks, St. Fillans. The pedestal has a heavy base, a pillared plinth with spirals, and, for holding the stone, a bracketted top, adorned with oak leaves, thistles, and wild roses.

THE Board of Works Department has discovered serious dilapidations in the ornamental stonework upon the façade of Somerset House. It appears that the well-known coat-of-arms which tops the frontage to the Strand, together with the four huge figures in Caen stone that decorate the building, have been found to be rapidly crumbling to pieces. Some very dangerous indications of this decay have been afforded within the past few days. The coat-of-arms and some of the figures were found to be shedding portions of their ornamental work, much to the danger of foot passengers. Great fear was entertained of a complete collapse, and to provide against this danger a number of workmen have started at scaffolding the front entrance of the structure. The intention is to remove the decaying ornamental figures, and supply their places with new and more substantial designs.

LAST year a well-known English Art critic was awaiting his audience of the Duke of Aosta. He had been ushered into a rather gloomy ante-room in the Pitti Palace, and his eyes wandered from the dim contents of one frame to another. Suddenly his attention was arrested. The loss of a beautiful work by Botticelli has long been deplored. "Sky'd" in that ante-room the stranger perceived a time-stained canvas. He climbed on a chair and gently rubbed the bottom of the picture with a handkerchief. He had only cleaned a tiny patch when he recognised that he had come upon the gem, prized by the Medici, the lost Botticelli! The dust of centuries proved to be a veil which peeled off easily, disclosing, in perfect preservation, the renowned "Triumph of Virtue." Some authorities say mere light, cruel time, possible accidents, and the ruthless restorer must, before this date, have caused the deterioration of the picture had it not worn its friendly mask of secular dirt. As it is, "La Pallade" is in its pristine freshness—is actually fresher than any work of the Master! When the Englishman was summoned to the presence of the Duke, he imparted the joyful news of his discovery. Since then the picture, resting on crowned chairs has been the only canvas in a cabinet in the Royal suite of rooms in the Pitti Palace.

IN the Crypt of St. Paul's Cathedral, the last resting-place of so many of our great painters, there is to be seen a Memorial which is interesting as an unconventional but thoroughly successful essay in stone and metals by Mr. Alfred Gilbert, R.A. It is fixed next Frampton's Memorial to Frank Holl, R.A., in a recess close to the spot where Lord Leighton and Sir J. E. Millais lie buried. So dark is the place that its existence seems in danger of being overlooked. The Memorial is to Randolph Caldecott, who died out in Florida in 1886. A figure of a child, about 3 ft. high, standing in quaint mediæval dress with close cap, holds in her hands a small medallion, on which it is intended to affix a portrait of Caldecott. Aluminium has been used for the figure, and the face, hair, hands and feet have been coloured with pigments. The Architectural framing is of bronze and stone—dark and very effective. Caldecott was born at Chester in 1846, and the inscription describes him as "an artist whose sweet and dainty grace has not been in its kind surpassed: whose humour was as quaint as it was inexhaustible." The Memorial to Frank Holl is a great contrast, but is none the less successful. The celebrated portrait painter died in 1888 at the age of forty-three, in the heyday of his career. "How short the life, how great the work," is the brief but significant epitaph.

WHEN Henri Rochefort planned the erection of a workmen's Glass Works at Carmaux, to help the glass workers, he received an anonymous gift of 100,000 francs. The donor was Mme. Dimbourg, who has recently died at Boulogne, aged 72. She was a curious old lady, wildly generous, yet careful to miserliness; sending her gift to the Glass Works anonymously, and then complaining when her name was omitted from the stone bearing a list of subscribers. She lived in an unpretentious house, furnished in the plainest fashion; hoarded up every scrap of paper and bit of rag she found, yet helped all whose want came to her ears. She sent 1,000 francs here, 3,000 there, whilst her own servants could scarcely get enough to eat, and their wages were extremely small. The money for the Glass Works was sent in a small linen bag, comparatively worthless, which no one thought of returning to her. She sent a servant to claim it, however, and was greatly annoyed it had not been sent back.

OWING to the heavy rains which have fallen in the Swansea Valley this week, and the consequent increase of water in the Morriston Canal, the enormous pressure resulted in a most damaging accident at the new sewerage works promoted by Messrs. Thomas, Watkins, and Jenkins, near Tir Penry. Sewerage pipes are being laid down from the river up to the town, and, in order to reach Tir Penry from the Old Bridge, it was necessary to work under the Morriston Canal. Considerable trouble was experienced owing to the sandy condition of the soil, which allowed a continuous flow of water to run into the works. The water had been successfully dammed, when a flood of water washed down into the tunnel and drowned the workings. Forcing its way out at a distance of 20 yards, the road leading down to the Old Bridge was soon changed into a river, the water running into the houses on either side several feet deep. This continued for several hours, the force of the water enlarging the outlet hourly, until at last the canal bank and its foundation near the spot were entirely swept away. With such an enormous aperture the water in the canal was getting low, and the bottom of the canal became visible. There being no water in the canal, all the large tin-plate works—five in number—in the neighbourhood have stopped. The bridge crossing the canal near where the accident took place was in great danger of collapsing, the earth surrounding the foundation having been washed away, with a couple of feet of the wall.

THE East London Trades, Industries, and Arts Exhibition has been such an unqualified success that the promoters have decided to depart from their original plan and allow it to remain open until November. Opened by his Royal Highness the Prince of Wales, at the People's Palace, on June 6th, it has been so popular in the densely crowded district of the East-end that nearly a quarter of a million of people have already passed the turnstiles. A nominal charge of a few pence is made for admission, and in addition to the interesting features which the Exhibition itself presents, such as the manufacture of sweetmeats, weaving, brushmaking, and operations in connection with other industries, an excellent and varied programme of amusements is provided. Associated with the industrial side of the Exhibition is the work of the students in the many polytechnics and technical institutes, and it has been the practice to hold a weekly reception by the members connected with the societies and trades who have combined to make the movement a success.

IN the absence of Mr. A. Vaughan Stevens and his family on a holiday, their mansion at Harpenden has been completely destroyed by fire. Strenuous efforts were made to extinguish the flames, which were first seen in the upper part of the premises, and were principally confined to the skirting in the passages and bedrooms, behind which ran the electric wires. All attempts to get the fire under control were futile, and a large number of people then directed their energies towards saving the valuable furniture. In a comparatively short space of time the mansion was stripped of a portion of its contents, the men working until it was impossible for them to again enter the building. Owing to an insufficient supply of water the fire engines could not render much assistance, and the building was burnt out. The damage is estimated at from £12,000 to £15,000. The cause of the fire is supposed to be the fusing of the electric-light wires. A complete installation was put in at very considerable cost when the mansion was built a few years ago.

WITH a view to the ultimate adoption of a system of lighting their trains by electricity, the Caledonian Railway Company has had an experimental train fitted up, and a trial was recently made on the new Underground Central Railway at Glasgow. The train consists of seven six-wheeled carriages—two first-class, three third, and two third brakes. The system now being experimented with is that of Messrs. J. Stone & Co. It is stated to be an entirely new departure, and the patentees claim to have succeeded in producing a system which makes the installation of each carriage complete and self-contained. Each vehicle carries its own generating plant, the motion of the carriage producing the electricity, and storing it in an accumulator, which automatically comes into action when the train slackens speed or stops at stations. The dynamo, which is driven by means of a light strap or belt direct from a pulley on the axle, is suspended from the underframe of the carriage in such a manner that absolutely none of the vibration of the axle is transmitted to it. However the speed of the axle may vary, the dynamo always runs at a uniform rate, and always produces the same amount of electricity. A mechanical governor automatically connects the dynamo to a small accumulator when the train is in motion, and the lamps then take their current direct from the accumulator, which has a storage of fully seven hours. Each carriage is provided with a switch so arranged that the light can be fully or partially on, or altogether cut off.

STILL another statue of a foreigner is destined to adorn the streets of Paris, viz., that of Washington. The cost of the statue has already been provided for by the Washington Statue Association, composed exclusively of women. The well-known American sculptor, Mr. Daniel French, has just left for Paris to see the proposed site—at the intersection of Boulevard Hausmann and Rue Washington—and he will then return to America, one of the stipulations concerning the statue, which is a gift of the association to the city of Paris, being that the work shall be exclusively American. Paris is one of the few cities in the World which erect statues to the great men of other nationalities.

THE large extensions in progress at the Gas and Electricity Works in Cotton Street, Aberdeen, are proceeding rapidly towards completion. The more important part of the extensions is probably that which is being carried out at the Electricity Station, where the premises are being enlarged to more than twice their former size. A space of ground immediately to the north of the existing buildings has been taken in, measuring about 58 ft. by 36 ft., and on this space are being erected a new Engine and Dynamo Room, Boiler House, Offices and Stores. The Engine and Dynamo Room, which is on the ground floor, fronts Cotton Street, and, along with the present room, accommodation will be provided for machinery to generate a 3,000 h.-p. current of electricity. The first floor of the extension will be used for Offices, Stores, and Testing Room. Entrance to the whole block will be provided by a large and handsome arched doorway in the middle of the building. The total cost of the extensions is estimated at £3,700. An important addition is to be made in the plant, comprising a 300 h.-p. engine and dynamo of the direct couple type, which is being constructed by Crompton and Co, Chelmsford and London, at a cost of £2,660; and two new 600 h.-p. boilers with feeder, water heating apparatus, and pumps, which are to be supplied by M'Kinnon and Co., Aberdeen, at a cost of £3,000. At the Gas Works the Retort House has been the scene of a very radical change. The present Offices and Dwelling Houses occupied by certain of the employes at the Works are also undergoing considerable alteration and extension. On the east side of the main entrance to the Works stands the Timekeeper's Office and Store Rooms and on the top of these are being built two additional floors. On the first floor are the Manager's Room, which is a large apartment, the Outdoor Assistant's Office, and a Drawing and Writing Office; while the second floor is to be set apart for a Testing Room, Book Stores, &c. On the west side of the gateway an additional floor has been placed on the Workmen's Dwelling House, and alongside, a two-story house for the assistant superintendent is now in process of construction. The total cost of the extension of the offices and dwelling houses will amount to about £2,000.

AT Douglas last week the opening of the new Central Promenade and Cable Tramway took place. This last section of the Promenade, which now stretches along the whole margin of Douglas Bay, and has been called the Central Promenade, reaches from the site of the iron pier (now removed) to the Queen's Promenade, a distance of 1,000 yards. The foreshore has been enclosed to form the promenade, but such enclosure does not in the slightest degree interfere with the bathing ground. The carriage and footways provided are over 100 ft. in width. The sea wall is built of concrete, and is of substantial character and handsome appearance. The whole work was constructed at a cost of £8,000 for the Douglas Town Council, under the supervision of Mr. T. G. Taylor, C.E., borough surveyor. The completion of the work has rendered it possible to drive along the sea coast from Laxey to Port Soderick, a distance of almost 14 miles. The Upper Douglas Cable Tramway, which has been promoted by the Isle of Man Tramways and Electric Power Company, Limited, to the north end of the town, has been constructed by Messrs. Dick, Kerr and Co., Limited, of London. The route is one mile and a half in length, and a double line is laid for the whole distance. The gauge is three feet. The power used is steam, and it is supplied from a convenient station by two Lancashire boilers with Galloway tubes, the water being passed through one of Green's economisers, where, from 60 degrees Fahr., it is raised to about 300 degrees before passing into the boilers, thus effecting a considerable economy. The engines, like the boilers, are in duplicate. They are of the horizontal high-pressure non-condensing type, and are fitted with Dr. Proell's automatic expansion gear and governor. The cars are of the bogie pattern, and were built by Messrs. George F. Milnes and Co., of Birkenhead. They are built to carry 32 passengers. The cable is 3¼ inches in circumference, of steel wire, laid on a hemp core with six strands of 13 wires each, seven round six on the "Lang" lay principle. The cables are each 20 tons in weight.

AFTER promoting a Bill for the purchase of the Highgate Cable Tramway for £2,000, the London County Council was forced to withdraw it as the Court of Chancery sanctioned the sale to a private individual for £2,500. The London County Council would have paid £2,600, only the Court thought that some time must elapse before Parliament sanctioned the proposal, and a speedy sale was best for the creditors. The matter has been in the Court for three years, and the line has not been worked for two years and a half. The Board of Trade now require that in addition to the £2,500 paid for the line—and a like sum will be needed to put it in repair—a capital of £10,000 shall be raised, and there is little chance of a new company being formed with such a capital as this to work a bankrupt concern. The London County Council had intended putting the line in thorough order, and the North Metropolitan Tramways Company would have leased it and run a service of cars from the top of Highgate Hill to the City.

THERE exists in Athens an Archæological Society, says the *Manchester Guardian*, which has been doing interesting and important work during the last ten years, though its very name is almost unknown beyond the confines of Greece. The Society of Christian Archæology was founded in 1885, and already it has more than justified the hopes of its promoters, not only in the collection of many memorials of early Christian Art, but in saving from destruction more than a few interesting old Churches. When the independence of Greece was secured measures for preserving the antiquities of the country were at once adopted, but by "antiquities" only the memorials of Classic times were understood; and so far from any effort being made to prevent the destruction of old Churches, as many as seventy of these venerable buildings are said to have been demolished in order to supply materials for the construction of the new Athens Cathedral in 1840. It was well known, however, that in different parts of the country there were many gems of early Byzantine Architecture, one of which is among the most curious and interesting ecclesiastical architectural monuments in Athens. One of the objects of the new Society was to establish a Museum of Christian Art, and this already contains a remarkably interesting collection of old pictures, mosaics, croziers, seals, vestments, &c. A library has also been formed, and a number of ancient documents has been secured by the Committee. But the direct work of collecting is only one branch of the Society's operations, and by its action the preservation of the remaining old Christian Churches is now virtually assured.

Artizans', Labourers and General Dwellings Estate at Hornsey.—Terrace of Fifth Class Houses.

ROWLAND PLUMBE, F.R.I.B.A., ARCHITECT.

DISCOVERY OF AN OLD WELL.

IN the course of excavations which are being made in Shoreditch in connection with the electric lighting installation which the Vestry of that district are about to establish, a singular discovery was recently made. Whilst at work in a deep cutting one of the navvies struck his pick through a yielding substance. A large quantity of earth and rotten wood fell with the blow, and the man himself nearly followed the rubbish. An old well was disclosed which, on measurements being taken, was found to be 20 ft. deep, and a yard in diameter, and to contain 7 ft. of water. There were found in the well the elmwood barrel and suction pipe of a pump. Although unmistakably of very ancient date the brickwork was remarkably clean and perfect, compact and mortared towards the top but loose towards the bottom to allow the water to percolate into the well. The well was under the pathway, in the High Street, two or three yards from the entrance to the Standard Theatre, close to the end of Holywell Lane, and in the district known as the Holywell Liberty. It is not improbable that the well gave its name to the spot and was connected with the Benedictine Priory which formerly existed there. An old map bearing the date 1745 and entitled "An actual survey of the parish of St. Leonard in Shoreditch, Middlesex," has the following reference to a spot close to the present site of the Standard Theatre: "Here are the remains of a Priory founded for black nuns of the Order of St. Benedict, the time when and by whom authors are not agreed. Divers lands and possessions were given them by Galfrid and William de Melichas, and divers others which were confirmed to them by King Richard I., April 11, 1195." Unfortunately a conflict of authority prevented the officials more directly concerned with the works for the electric light installation from pumping the newly-discovered well dry, and effecting a careful examination of this relic of a bygone age. The Works Department of the Vestry, who are carrying out the excavation, decided to fill in the well so that there might be no delay in their work.

SENSATIONAL PICTURES.

THE one Gallery that had the courage to open during the summer months is the Continental. But as if its managers realised that some special attraction must be offered to warrant such daring, they have searched the Salons of Paris for sensations, that an exhibition of "Startling Pictures" should be the result. In London, the pictures that startle are not the technical experiments and fireworks that challenge attention and talk at the Champ de Mars and the Salon des Indépendants. Audacity or outrage must be in the subject; and it blood flows plentifully on the canvas, if a grim incident or gruesome anecdote is treated with the utmost realism, then the work is thought to be characteristically French. In a word, the pictures that startle on this side of the Channel are mainly those that on the other are passed by as the huge *machines* yearly produced to cover the walls of the old Salon. Before going to the Continental Gallery, we knew that it was in the Champs Elysées the "Startling Pictures" had been sought. Nor when we did go were we surprised to find M. Tattegrain's gigantic "Bouches Inutiles" the special feature. Of the other pictures, the most conspicuous belong to the same class, though none is so large and horrible. M. Laucadère's "L'Arène" is a painted version, one might say, of "The Sign of the Cross," in which the painter has neglected the moral, perhaps, but has not hesitated to give the disagreeable details which Mr. Wilson Barrett amiably leaves to our imagination. M. Jean Verber's "L'Homme aux Poupées," apparently intended to appeal by its puzzle, to which we doubt if he himself could give the solution, is the work of a man who ought to do better things, though we hardly agree with M. Henri Rochefort—quoted in the catalogue—that one might think bits of stuff here and there had been painted by Eugène Delacroix. We can fancy the outburst of indignation in the *Journal* had Delacroix lived to read this. There is a M. H. E. Delacroix represented, who, however, does small honour to the name by his foolish, glaring "La Poésie Guerrière," a sort of military allegory, for which M. Detaille, a few years since, set the modern fashion. But it is useless to go further through the list. Enough has been said to explain the character of the collection. Those who care more for Art than for sensation still have a refuge, even at this dead season, in Trafalgar Square. It is only for the lover of "Startling Pictures" that the Continental Gallery caters, as its managers have the frankness to announce.

AN ARTISTIC MANSION.

STAFFORD House came into possession of the Sutherland family in 1842, and since that date they have spent upwards of a quarter of a million on the building and its decorations. Of the kings, queens, princes, statesmen and celebrities of all shades of opinion and of all countries who have been received and entertained at this Mansion, it would be impossible to give any idea. Queen Victoria, in the early part of her reign, was not an infrequent visitor; and it was on the occasion of one of these visits that the then youthful Queen made the remark which speaks volumes as to the beauty of the interior of the Mansion, and the artistic nature of its contents: "I have come from my house to your palace." Rogers, too, the well-known banker and poet, once said that he had visited nearly every Palace in Europe, and had never seen anything he liked so well as Stafford House, adding that it was to him a fairy Palace, and the Duchess was the good fairy. With regard to the interior, the entire construction of the Hall is in the form of a square. The walls, floor, and staircase are all of marble; the staircase—which is a double one—being supported on either side by Caryatides; the balcony is supported by marble columns. The furniture of the Hall has choicely carved gold frames and upholstery of silk and velvet, with floral designs of many colours. The lamps of ormolu and crystal are of remarkable size, and there are eight smaller ones on pedestals, the upper portions of which are of

WROUGHT GOLD.

There are some beautiful busts also to be seen in alabaster and white marble; on either side of the staircase the Queen and Prince Consort respectively, and that of Ferdinand de Lesseps. Then there are four marble statues, and some granite pedestals carrying bronze figures, which support baskets of the same for flowers; also a mosaic table on mahogany stand with gilded legs, and a bronze equestrian group which was presented to the late Duke for his work on the railway from Helmsdale to Wick and Thurso, County Caithness. The State Drawing Room is a "truly regal apartment," while the Duchess's Boudoir is "extremely elegant in appearance, containing amongst other Art treasures a splendid Correggio; in the ceiling may also be observed some rare painted frescoes. The floor is covered in tapestry; the walls are hung with green velvet, the furniture—which has finely carved frames—is some of it in green velvet brocade, and some in cream with floral designs. On the large antique couches much beautiful Indian drapery is seen. A large white marble-topped table is supported with a massive carved gold base and tripod figures. Stafford House contains one of the finest private collections of paintings, including pictures by Rubens, Murillo, Vandyke, and Titians. At the end of the Picture Gallery is the State Banqueting Hall of fine proportions. The ceiling of the Library is lavishly decorated in white and gold, doors and window recesses painted and ornamented in character. The carved frames of the furniture are some in white and gold, and some in gold only, with upholstery of green brocade of a lighter shade than the walls. White and gold cabinet cases contain the books; and these cases are placed in every available space round the room. On the top of these bookcases may be seen marble busts and Sèvres china. It is lighted with electricity, diffused from a bronze chandelier. In recesses on either side of the fireplace are some costly miniatures; the fireplace itself has an alabaster mantel with ormolu decorations. On the mantel stands a Parisian timepiece of bronze and platinum, on either side of which are Chelsea vases and ormolu candelabra.

DUBLIN ART INDUSTRIES EXHIBITION.

THE number of exhibits in the Art Industries Exhibition, held in connection with the Horse Show, is 769, as compared with 516 last year, showing the large increase of 253. There is quite a remarkable increase in the proportion of exhibitors of artistic work in leather, the number being three times that of last year. The specimens are good, some of the raised work being excellent in design and execution. These exhibits are mainly the production of private workers. Two Convents send in work, that of the Sisters of Mercy, Kinsale, and that of the Poor Clares, Kenmare. The work which was executed by pupils of these Schools, is of a useful character, including album cover, letter and card cases. The private exhibitors have not so well combined the useful with the ornamental. The result shows the value of the training in the Convent Schools, which enables the pupil to produce forms which are not merely artistic but are useful as well, and will thus command a price in the market. Sir Edward Sullivan shows in this section eight reproductions of antique book bindings with inlayings and enamelling.

THE ARTISTIC METAL WORK

is represented by 39 specimens. There are, in addition, 21 designs. Last year the exhibits numbered 41, while there were only 12 designs. The curious feature about the section is the decline in the number of wrought iron exhibits. The class for this work was established only last year, and was very successful then, but for some reason the interest in it has not been maintained. There has been a steady increase in the number of artistic metal workers competing at the Show since the Art Industries Exhibition. In 1893 the number was 9, in 1894 it was 11, last year it rose to 20, and now the number is 22. A gratifying feature is that the work has improved year by year. At the start there was much over-elaboration, and though the tendency is not yet wholly subdued there is still a marked improvement, which shows that the Exhibition has been of value in educating workers into a taste for simple Art forms. There is still some room for improvement. It is strange that in this work there is no attempt to reproduce the old Celtic designs in metals, which are the finest, perhaps, in existence, and would come with all the charm of freshness in these days of exaggerated and oftentimes incongruous forms.

THE WOOD CARVING

is, after the laces and embroideries, the most important feature in the Exhibition. There is a tendency in this class of work to attempt the production of ideal conceptions rather than articles of utility. This was the case when the Exhibition was first opened, when many exhibits were admitted that possessed little merit. The large number of really good things that have been sent in since then have crushed aside the unworthy specimens to which wood is unsuited, that were in the beginning allowed to crowd the cases. These forms were often grotesque, and the attempts at high Art resulted in the most inartistic productions. The exhibits are in the main good and useful things. The workmanship is excellent, in many of them, and the designs are good. The number of exhibits is 215 as compared with 208 last year. There are in addition 19 exhibits of designs for wood carving; the number of exhibitors in the section is 115, last year there were 98. Only one Convent, that of the Sisters of Mercy, Kinsale, has an affiliated wood-carving class. The Society would do well to get others to join the movement. The Art needlework is another important section of the show. There is an increase in the number of exhibitors, but the exhibits that they have sent in are not so numerous as last year, but show, on the whole, a satisfactory state of things, for there is a tendency to produce quality rather than quantity.

AT Moscow a fire recently occurred in the Rumjamzeff Museum. The Panin Hall, which contained the Public Library, was destroyed with the books, and the adjacent Rumjanzeff and Dolgoruky Galleries, where many valuable collections are exhibited, were damaged by water.

A MINISTRY OF HEALTH.

SANITARY INSPECTORS' CONFERENCE IN LEEDS.

AT the Conference of the Sanitary Inspectors' Association in the Council Chamber of the Leeds Town Hall, in the absence, through indisposition, of Sir Benjamin Waud Richardson, M.D. (president), Mr. T. Pridgin Teale, F.R.S., read the President's address, in which Dr. Richardson said that some twenty years ago he raised the question whether we ought not to have established in our country a

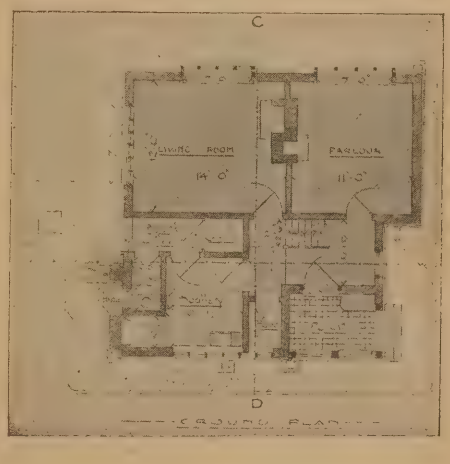
DETACHED COTTAGE, EPPING, ESSEX. : J. W. RHODES, ARCHITECT.

Minister of Health. It was by modification of, and additions to, the Registrar-General's Department, as it now existed, that the new official and governmental institution for which he pleaded should be established. The department would be no longer for mere registration, but would include all that related to health. Correctly re-named it would be a Ministry of Health or a State Department of Health. The construction and duties of the Ministry of Health would lead to several divisions of labour. In addition to the duty of collecting the registration of births, deaths and marriages, the Ministry of Health would collect the registration of disease throughout the kingdom. A complete system of registration would be established, and the returns supplied by it would include not only the diseases affecting human kind but the diseases affecting animals and plants in every locality. Above all, the Minister of Health would collate the leading facts connected with the work of the various sanitary officers of the kingdom, and condense them annually into a form that would serve as a permanent history of the results of sanitary progress. To this end each local authority would send to him, at stated times, and always once annually, the report of its medical officer on the health of the whole district under its charge; a report systematically arranged for ready reference, and for after-arrangement for the central department. To the Ministry of Health would naturally be referred the sanitary arrangements of prisons and of the establishments of police; and, lastly, to a Ministry of Health there would, of necessity, be attached a direction having reference to the sanitary construction of all the public works that would be carried out by the Government at its instance and expense. At first sight it would occur to most minds that, following the usual precedent, the Minister should be a Minister of State, changing, or liable to change, with every Government, and holding his office as a Chancellor of the Exchequer or other Minister of the Crown now holds his official appointment. The impression, however, in his mind was that such a mode of appointment would not be for the best interests of the country, nor for the best interests of the science of preserving health. The Health Minister would differ from other Ministers of the Crown in almost every particular. He could only carry out the duties of his office after a special training for the performance of them. To leave his duties to the chiefs of departments would be to ignore them altogether, and to let the most useful parts of the office go by default, perhaps at times when the union of the different parts of the official work in one mind and in one direction was most imperative.

Mr. George Darley read a paper prepared by Dr. Spottiswoode Cameron and himself on "The working cost in Leeds of destroying refuse by heat." He said that in Leeds there were now four destructors, but his figures only related to three of them — Armley Road, Beckett Street, and Kidacre Street— which had been working pretty steadily, although not up to their full possibilities, during the three years ending 25th March last. During that period 181,645 tons of refuse had been burnt. The working cost, exclusive of land, plant, and superintendence of refuse removal, had been £14,773, giving a rate of 19·52d. per ton of refuse destroyed. The cost of the erection of the three sets of buildings and additions had been £24,266, the interest upon which at 4 per cent. was £2,912, or nearly 3·85d. per ton. The cost of land for the destructors was £7,999. The total cost per ton of refuse destroyed had been 24·64d. Papers were also read by Mr. R. W. Evans on "Public Health Law"; Mr. Joseph Lindley, Batley, on "How Dwelling-houses are sometimes Unhealthy"; Mr. R. W. Cass, Pudsey, on "Drainage of Buildings."

THE new Pier for Herne Bay is to extend three-quarters of a mile into the sea, so as to be available for steamers at all times of the tide. The engineer for the work is Mr. Ewing Matheson, and the cost of the Pier is to be £35,000.

STEPS are about to be taken towards providing a new Vestry for the ancient Church at Bakewell, in which is the famous Dorothy Vernon Chapel. This Chapel for some years has been used as a Vestry, and an attempt is now being made to obtain sufficient money with which to build a Vestry on the north side.



SOMERSBY Old Hall, Lincolnshire, where Alfred Tennyson was born on August 6th, 1809, is advertised to be let or sold. It was here that a great part of the earlier and more beautiful of the Laureate's work was conceived and executed. It would be a great pity if anything happened to prevent the preservation of so interesting a place.

THERE was successfully launched from the yard of the Cail Engineering Works at St. Denis, on Wednesday, a steamer which marks a new departure in shipbuilding, the innovation consisting of a series of rollers on which the vessel proper is carried. Four engines, developing altogether 200 horse-power, simultaneously drive the propeller and give a rotary movement to the rollers. It is intimated that a speed of 25 knots an hour will be attained.

BALLOCHMYLE QUARRY has just produced two splendid fossils, which are described as the grandest examples of crystallisation that have ever been found in Ayrshire. While one is only sixteen inches by nine inches, the other is four feet in height by two in width. The larger one is tree-like in form, the stem in slenderness resembling a palm. From it the branchlets and twigs spring, gracefully bending downward towards their tips. Around its root it is further adorned by crystallisations of shrub-like growth occupying about a foot of the base. Mr. Bain, lessee of the quarries, is to present the fossil to Kilmarnock Museum.

AN EARLY NORMAN CHURCH.

THOUGH the documentary history of New Shoreham Church is singularly scanty, its Architectural history, as Mr. Edmund Sharpe pointed out in his valuable monograph on the building, read before the Archæological Institute in 1853, is remarkably precise and well defined. A great portion of the original building has disappeared, for the fragmentary ruin of the south-western corner of the Nave is still standing detached by a long space from the present western wall, and this fragment was obviously included in the original Church. This must have been built during the later Norman period before 1145 (the earliest mention of the Church is in 1151). The present western portion of the Church, including the Transepts, is of the Norman period, though apparently about 1180, and probably it was terminated eastward by three eastern Apses and a Choir without Aisles, all of small dimensions. These were removed during the Transitional period (1145-1190), and the very handsome and spacious Choir with north and south Aisles, which is now the principal portion of the Church, was built in their place. The upper part of the central Tower is of the same date. To the Lancet period (1190-1245) belong the Choir, the Triforium, the Clerestory, and the exterior flying buttresses. Some of the windows in the Choir and Transepts belong to the Rectilinear or Perpendicular period, 1360-1550. Such, in the briefest possible summary, appears to be the Architectural history of the Church. It was probably founded by Philip de Braose, the second Lord of Bramber, about the year 1100. Connected with the Priory of Sele, subsequent alterations were made, it may be supposed, by successive Lords de Braose. That no material additions were executed after the thirteenth century was probably due to the decay of Shoreham as a port. Coming to the present day, and omitting mention of various internal works of restoration carried out in 1877 and subsequently, extensive and thorough repairs to the Tower are now in progress under the direction of Mr. B. Engel, Architect, and Mr. Thompson, builder. This absolutely necessary restoration has been taken up by the Vicar and a committee. Not content with restoring the

DETACHED COTTAGE, EPPING, ESSEX: J. W. RHODES, ARCHITECT.

Tower, they have taken in hand the re-casting of their bells. Nos. 2 and 4 of the old peal, cast by Lester and Pack in 1767, were inscribed "Our voices shall with joyful sound, make hills and villages echo round." Some of the influential subscribers to the works now in progress are anxious to take the present opportunity of rebuilding the Nave. While the plant is on the spot, they argue, this project may be carried out much more cheaply than in the future, when there are no such appliances at hand. It is said that £8,000 more is wanted— a large sum, but surely obtainable by widely spread and well directed appeals. The Church ranks second in interest in Sussex to the Cathedral itself, coupled perhaps with Boxgrove Priory.

Professional Items.

CADOXTON-BARRY.—The new Baptist Chapel building will cost about £1,550, and will accommodate about 600 people. The Foundation Stones have already been laid. The Architect is Mr. Williams, of Messrs. Bruton and Williams, of Cardiff, and the contractor Mr. J. Griffiths, Barry Docks. The cost is estimated at about £1,600.

SOUTH NORMANTON.—A new School building has been commenced, the contractors being Mr. Geo. Page for the brickwork and masonry, and Mr. Geo. Smedley for the woodwork. It is proposed that the memorial stones should be laid early this month. The site for the new building cost £100, and the cost of the erection will be about £500.

GOLDTHORPE.—Memorial stones have been laid of a Branch Stores in connection with the Doncaster Co-operative Society at Goldthorpe Lane Ends. The building was commenced last April, and is expected to be completed during November. It is situate on the Doncaster and Barnsley road. The cost is to be about £2,165, including two houses. Messrs. Athron & Beck, of Doncaster, are the Architects, and Messrs. Arnold and Son, of Doncaster, the builders.

WARRINGTON.—The extensive grounds of the Winwick Hall Estate, near Warrington, the site of the proposed new County Asylum, are now in the hands of the contractors for the preliminary works necessary before the erection of the Asylum can be commenced. The Architects for the Asylum are Messrs. Henry Crisp and Oatley, and W. S. Skinner, of Bristol, and it is expected that the main contract will be given out next spring.

NORTHAMPTON.—Plans have been accepted in a limited competition (open to three members of the profession) for the Rose and Punchbowl Hotel in this town. The old house is to be pulled down for the improvement that is contemplated being made by the Corporation, viz., the widening of Marefair. The new building which is to cost about £2,000, will be built of red brick with stone facings. The Architect is Mr. H. Norman, of Swan Yard Chambers.

WEST BROMWICH.—Last week the new Theatre Royal, which has been erected in Walsall Street, West Bromwich, on the site of the building which was destroyed by fire in September, 1895, was opened. The Theatre, which has been built and fitted up upon the most modern plan, will cost, when completed, between £6,000 and £7,000. The contractors are Messrs. Bradley & Lloyd, of Wolverhampton, and the decorations have been carried out by Messrs. A. R. Dean & Co., Birmingham. The Architects are Messrs. Owen & Ward.

LEEDS.—The Markets Committee of the Leeds Corporation has accepted the tender of Messrs. H. Braithwaite and Co., of Swinegate, Leeds, for roofing in the open square of the Kirkgate Market, subject to the approval of the Council. The amount of the tender was £8,218, and the work is to be finished within twelve months of its acceptance by the Council. In order to give immediate relief to the stallholders, it is proposed to divide the work into three parts, and it is expected that the first portion will be finished and ready for occupation in about four months.

BIRMINGHAM.—A Reredos has been unveiled in St. John's Church, Sparkhill, by Mr. C. A. Smith-Ryland, in memory of Miss Ryland. It is the work of Messrs. Jones and Willis, the Architects being Messrs. Martin and Chamberlain. The Reredos, of which so far as the central portion has been erected—leaving the sedilia to be added—is of Caen stone, divided into four Gothic-headed panels by clustered polished alabaster columns, with moulded stone bases and moulded and enriched caps. The panelling is of alabaster, and is surmounted by three crocketted gablets, having sunk moulded and enriched panels, the central ornament being the monogram "I. H. S." On the plinth of the Reredos is an inscription.

KILMADOCK.—The Parish Church has been reopened after undergoing very considerable alterations. The fine old Church, with its massive Tower, was built in 1820. The formation of the interior has never been altered since the present structure was built seventy-six years ago. The Church has accordingly been reseated in the basement, a new system of lighting by electricity introduced, and a new organ built. The wood used is yellow pine, with a dark graining over all, the Pulpit being of solid oak. The contractors were:—Joiners, Hutchison and Grant, Glasgow, and Reid and Hutchison, Doune; painters, W. Carson and Sons, Stirling; plasterer, John M'Laren, Dunblane. The Architect was Mr. John Honeyman, Glasgow.

BOTHWELL.—At a recent meeting of the heritors of Bothwell, held in the Parish Church, to take into consideration the question of the restoration of the old Church, Dr. Pagan submitted plans which had been prepared by Dr. Rowland Anderson. They included the lowering of the roof of the Sacristy to its original height, restoring the stone mullions on the east and south windows, replacing the broken off stone carvings connected with the sedilia and piscina, lowering the ground round the Church and the floor to its original level, repairing the walls and roof, heating, furnishing and slating the Church. He stated that the estimates which had been taken for the restoration of the work amounted to £1,700. After consideration it was agreed to approve of the plans and to appoint a committee to carry them out, on condition that the amount required be subscribed or guaranteed.

LEIGH.—The Leigh District Council has obtained the sanction of the Local Government Board to the borrowing of £33,548 for an improvement scheme by which Market Street, one of the principal thoroughfares of the town, which at present is a narrow and irregularly constructed street, varying from 18 ft. to 46 ft. wide, will be made a uniform width of 52 ft. A large block of buildings, in which old-established businesses are at present carried on, is to be demolished, and for the destruction of these buildings heavy compensation is claimed. Important improvements are also to be effected in Bradshawgate and Chapel Street, Leigh, and in view of the growing importance of the town, the provision of a new fever hospital is being rapidly pushed forward. An extensive sewerage scheme is also being carried out for the district at a cost of between £40,000 and £50,000.

LLANWRTYD WELLS.—The new Church dedicated to St. James, was recently opened. The Church has been chiefly built by local workmen, in the early Geometrical style, consisting of a Nave, 58 ft. long by 25 ft. wide, with a Porch, 8 ft. by 7 ft. at the western extremity of the south side. The Chancel, including the Choir, is 26 ft. long by 19 ft. 6 in. wide, with a Vestry on the north side, 14 ft. by 10 ft. There are chairs for 226 worshippers. The walls are built of local pebblestone in flint work; the roof is covered with Portmadoc blue slates and Ruabon red ridgings and crosses, with a bell cot mounting the western gable; the contractor for these was Mr. William Thomas. The dressings are of Grinshill red sandstone; the contractor for this work was Mr. Thomas Barker. The roof is open timbered, and the contractors for the carpenter and joiners' work were Messrs. Samuel Williams and Son. The encaustic tiles for floors were supplied by Messrs. Mansfield Brothers, Church Gresley. The windows are glazed with cathedral tinted glass, by Mr. Samuel Evans, Birmingham. The painting is by Mr. John Graham. The whole has been carried out from the designs and under the superintendence of Mr. David Jenkins, Architect, Llandilo.

PORTSMOUTH.—Portsmouth can boast of possessing the second largest School in England. It is known as the Drayton Road Board School, and was opened last week. The front elevation faces west, and there is a Tower at the southern end over the staircase leading to the girls' department. The boys and girls' School are in one block, the girls occupying the first and the boys the ground floor. The Schools are erected on the Central Hall system, with five Class Rooms on either side of the large Hall, which measures 80 ft. by 40 ft. The entrances are by quadrangles at the north and south sides, there being two in each quadrangle. The girls' School (including a Central Hall) is reached by two fireproof staircases at the back. Mezzanine floors are provided, which serve as book stores and Lavatories. The Teachers' Rooms are at the end of the corridors. There is also a large infant School. There are three large playgrounds, that for the boys being at the west front, the girls in the centre, and the infants at the back. The boys' and girls' Schools will accommodate 1,200, and the infants' 850. The plans were prepared by Mr. A. H. Bone, Portsmouth, and the work was carried out under his supervision. Mr. Cockerel was the contractor.

BISHOPBRIGGS.—A new public School, which has been built by the Cadder School Board, was opened last week. It occupies a site a little off the public road, two or three minutes' walk from the railway station to the north. The old Stirling School, built and endowed by Mr. Stirling, of Keir and Cadder, stands between it and the public road, but is now being demolished, and with its removal will disappear a somewhat interesting local feature. The new buildings are estimated to cost about £4,500. To the front there are two gables with a Tower in the centre. The entrance to the School is at the base of the Tower, and leads directly into a large Central Hall. Then, to the right off the Tower, there are two rooms for the teachers. The Central Hall is surrounded by the Class Rooms, which are seven in number, and capable of giving accommodation for 420 scholars. In each gable there are two light windows with mullions and arched heads. The gables are finished with an enriched bargeboard, under which is a tracery quatrefoil opening. Behind the School, a new residence is being erected for the headmaster, at a cost of about £750. The Architect is Mr. David Sturrock, of Bath Street, and the principal contractors are, for the mason work, Mr. John Marshall, and for the joiner work, Messrs. Kemp and Sons, Bishopbriggs.

HUDDERSFIELD.—Corner Stones of a new Wesleyan Chapel and Sunday School, which is in the course of erection at Thornton Lodge, were recently laid. When the new building is completed, it will accommodate about 200 persons, with a School Room and two Class Rooms underneath, and the cost is expected to be about £700. It will consist of a basement to contain hot water apparatus and Store Room. The first floor will consist of two Class Rooms, School Room, and Lobby. The top floor will contain a large Upper Room, which will be used as a Chapel. The room will be 17 ft. in height, with open stained pitchpine roof, and will be ventilated by eight inlet ventilators and three outlet ventilators into air flues. All the rooms will be lighted by gas from pendants suspended from the ceiling. The front elevation will be of pitch-faced Elland Edge stone, and the ashlar heads, sills, and trusses will be moulded and wrought. The contractors for the various works were:—Masons, Messrs. William Mallinson and Sons, Lockwood; joiners, Messrs. J. Blakeley and Sons, Netherton; plumbers, Messrs. Crossley and Bould, Marsh; slaters, Messrs. J. Longbottom and Sons, Lockwood; plasterers, Messrs. Jas. Wilkinson and Sons, Meltham; painting, Mr. R. Heaton, Paddock; and heating apparatus, Messrs. Milan and Sons, Lockwood.

OLDHAM.—The new building in Union Street which has been erected by the Methodist New Connexion body for School purposes, was recently opened by Miss Smith, of Holyrood. The style of the building is Queen Anne, and is carried out in red Ruabon, terra cotta, and fancy bricks. The ground floor has a large spacious entrance, with Vestibule (leading direct to the School Room), from which is a staircase leading to the upper Class Rooms. The large room, which is in the centre, is 51 ft. by 42 ft., and there are three Class Rooms on the other

side, and an additional staircase leading to the upper Class Rooms on that side of the School; there are also Lavatories. The upper floor has ten Class Rooms, five on each side. The School Room, including the Gallery, will accommodate 750 persons. In the basement is a Gymnasium, together with a spacious Kitchen, and a hoist communicating direct with the School. The whole contract, exclusive of heating, was let to Mr. William Lees, of Oldham, the sub-contractors being as follows:—Terra cotta and facing bricks, the Ruabon Brick and Terra Cotta Company; excavating, draining, and brickwork, Messrs. S. and J. Smethurst; stonework, S. Smethurst; carpenters and joiners' work, Wm. Lees; slating, R. Fletcher; plastering, James Hall; plumbing and glazing, John Kershaw; painting and varnishing, E. Edmondson; heating, Mr. W. F. Spencer; electric lighting, Messrs. Charlesworth and Co.; tiling, Messrs. Williams and Co.; and wrought ironwork, Messrs. Cunliffe and Dean. The work has been carried out from the designs of, and under the superintendence of, Mr. J. W. Firth, Architect, of Oldham. The total cost is about £4,500.

GREENBANK.—The new Elementary Schools were opened last week by Sir Charles W. Dilke. They have been erected by the St. George School Board to accommodate some 940 scholars (girls, boys and infants) at a cost of £9,400, from plans prepared by Mr. F. Bligh Bond, Architect, of Bristol. The Schools stand on a long and narrow site, and the ground floor extends for a length of nearly 300 ft., with a frontage for the whole distance to St. Leonard's Road. The Infants' School, of one floor only, occupies the upper or south end, and contains a School Room for 100, and four Class Rooms for 50 children each. The senior department joins this on the north, and is divided into a ground floor for boys and a first floor for girls, each having separate entrances. Both these departments contain a Central Hall, 50 ft. by 36 ft.; three Class Rooms, 25 ft. by 22 ft., holding 50 each; and two, 25 ft. square, holding 60. There is also abundant accommodation for teachers, and a thoroughly satisfactory sanitary system for all departments. A Caretaker's House occupies a corner of the site. A system of ventilation and heating combined has, for the first time, been adopted by the St. George Board in this building, and has been installed by the patentees, the Blackman Warm Air Heating Co. The building is erected of local pennant stone, with Bath stone dressings, and is slated with "Sedan" green slates. Internally the rooms are lofty, airy and well lit, and the Central Halls, especially that on the upper floor, are remarkable for their size and good appearance. Into the large upper School Room has been fitted a seventeenth century carved stone chimneypiece, removed from the old house at Barton Hill—now known to have been the manor house of "Tilly's Court"—on the demolition of that building for the site of the new Board Schools erected there (also designed by Mr. Bligh Bond). It appears that on the destruction of the house, the chimneypiece was preserved by the then owner, Sir Joseph Weston, who had it removed to Clifton; upon his decease it was sold by Lady Weston. The chimneypiece bears the date 1658.

BIRMINGHAM.—To facilitate the work of the Upper Highgate Street Mission, Mr. Cadbury has undertaken the provision of a complete suite of rooms. For this purpose two-thirds of an acre of land have been acquired, having frontages on the Moseley Road, opposite the new Board Schools and Oughton Street. The main entrance to the buildings will be in the Moseley Road, but the large Hall for meetings will be in the rear, with an entrance in Oughton Street, and it will be capable of providing sitting accommodation for 2,000 persons. Arrangements, however, will be provided for dividing the room so as to be equally suitable for small meetings. Underneath this room will be a spacious and well-equipped Gymnasium, which will also be available for meetings. On the Moseley Road side there will be a spacious Crush Lobby and large Coffee and Reading Rooms. A glass-covered Verandah will also be provided, and there are also to be provided Ornamental Gardens and Shrubbery. In addition there are to be fifteen small Class Rooms and a Lecture Hall, 33 ft. by 66 ft., a well-equipped House for the manager, and an Office for the secretary. Mr. Cadbury further proposes to build thirty-three Almshouses for old people at Bournville, and the designs for these, as well as the Institute in Moseley Road, have been prepared by Mr. Ewen Harper. The Almshouses will be built with ground floors only, in thoughtful consideration of the aged limbs of the inmates. Each house will contain a good Living Room, with bay window, a Bedroom, Scullery, and Coal House; each will have a separate yard, while the entrance to each Lodge will have a Porch, with comfortable rustic seat. The outer doors will be of oak, and the whole of the fittings of the neatest and most substantial character. The Almshouses will be arranged in two quadrangles, divided up with paths to form ornamental gardens, laid with turf. In the centre of the building is to be a wide carriage entrance, and above a Clock Tower with Time-piece, facing four ways. On one side of the carriage entrance will be the Matron's Residence, and on the other a commodious Hall. The gables are formed of half-timber of solid oak; the buildings themselves are to be constructed of the best bricks, with stone or terra-cotta dressings.

OSSETT.—The site on which it is proposed to build the Town Hall covers an area of about 3,620 yards, and was originally bought by the Local Board for a similar purpose in 1877. The scheme, however, fell through, as the Local Government Board declined to sanction plans for the erection by a Local Board of a structure which it was proposed should contain a large Assembly Hall in addition to Public Offices. The plans for the building have been prepared by Messrs. Holtom and Fox, Architects, of Dewsbury, who estimate the cost of erecting and furnishing at £11,000. Fronting to Bank Street, the Town Hall will be a neat structure. The elevations are to be in the Classic style of Architecture, with square and circular headed windows; the front and return elevations to be in ashlar, and the remainder in pitch-faced delph stone. At the front there will be a rustic basement with columns and pediment over, and with extensions on either side for the staircases to the larger Hall. Two stories in height, the ground floor (above the basement) will be elevated some four or five feet above the ground level, and will comprise the Municipal Offices, Borough Court and a Council Chamber. Above will be a large Assembly Hall, with a spacious Gallery and Balcony. The principal entrance to the Municipal Offices will be in Bank Street, approached by a short flight of steps. On the right side are to be the Town Clerk's Private Office, General Office, Strong Room, Rates Office, Mayor's Room and Council Chamber; on the left the Surveyor's Room, Borough Court, Magistrate's Retiring Room, Waiting Room, and Committee Room. The whole of these rooms are to be 13 feet high, with the exception of the Council Chamber and Court, which will be 16 feet. The entrances to the large Assembly Hall are to be in the wings on either side of the main building. Over 100 feet long and 54 feet wide, there will be seating accommodation in the area of the Hall for 860 persons, whilst in the Balcony and Gallery there is to be accommodation for another 300. The platform will be large enough to accommodate a band and chorus of 150. Ante Rooms for performers are also to be provided. In the basement will be Offices for the Water Inspector and the Weights and Measures Inspector; also three other Offices or Store Rooms, a prisoners' Waiting Room and Police Room, as well as Kitchen, Heating Chamber, and Coal Cellars.

THE Freemasons of Kent have decided to present a window to Canterbury Cathedral, at a cost of £600.

A DISCOVERY has been made in the commune of Pitthem, near Bruges, of an ancient cemetery, dating from the time of the early Franks. Two graves have already disclosed skeletons of warriors who had been buried with emblems of mourning, as was the custom during the time of Clovis and his successors. Being the first discovery of the kind north of the Meuse, it proves beyond doubt the existence of Germanic tribes in Flanders.

Views and Reviews.

ST. BARTHOLOMEW THE GREAT, WEST SMITHFIELD.

MR. FREEMAN DOVASTON has issued a small illustrated pamphlet telling the unique interest and beauty of the venerable Norman Church of St. Bartholomew the Great, in Smithfield. For the notes—excellently done, by the way—we are indebted to Mr. E. A. Webb, one of the honorary secretaries to the Restoration Committee. Such a work as this was greatly to be desired. An awakened interest in Architectural glories, of which the loving care bestowed upon this fane is a fitting sign, has spread far beyond professional limits. Even the Londoner—most apathetic of beings—has felt the charm. The ancient courts of St. Bartholomew have echoed, of late, with unfamiliar footsteps, and men have wandered in from near and far to gaze upon this noble work of the forgotten great, and, perhaps, to be the gladder for its beauty. The illustrations comprise a series of fourteen half-tones; charming in their subjects, they are no less worthily executed. Visitors to the Church will find this little book to be a genial companion, less garrulous withal than the ordinary animated *cicerone*, but none the less pleasant and informing on that score. For others, to whom—through scantiness of leisure or bar of distance—St. Bartholomew's can be no more than a name, Mr. Dovaston's work will serve to reveal some of the manifold beauties of one of England's most famous Churches.

"Views of the Ancient Priory Church of St. Bartholomew the Great, West Smithfield, London, with Notes by E. A. Webb." 1s. London: Freeman Dovaston, 5, George Street, Euston Road, N.W. 1896.

CHRIST'S HOSPITAL.

WE have here a delightful publication for all—and how many they are!—who hold in grateful remembrance the pious foundation of the boy-king, Edward VI. It is a little album of sixteen views, setting forth in manifold aspects the features of London's noblest charity. The publisher has not seen fit to furnish any accompanying letterpress. The illustrations are left to tell their own tale—and a very charming tale it is. Had the story found verbal utterance, perhaps something might have been said of the wordy war that has been waged about these quiet buildings in recent days. It is entirely well that Mr. Dovaston should have added the venerable School to his series of publications. In a little while its place will know it no more, and London will be the poorer by the loss of one of its most treasured inheritances. We may be allowed to feast our eyes upon mammonite piles of modern masonry, but these Tudor chronicles in stone that taught our fathers of beauty in Art, of charity in life, will have passed from sight into a vague remembrance.

"Views of Christ's Hospital." Freeman Dovaston. 1s. London: C. Taylor, 23, Warwick Lane, E.C. 1896.

A TRADING company has offered £3,500 for an unfinished picture of Millais'—one that was on the easel at the time of his death. The picture would, no doubt, be of immense value for advertising purposes, but it is understood that Sir John Millais' family have declined to sell it.

IT is stated that the Acetylene Illuminating Company, of Queen Victoria Street, have concluded arrangements with the British Aluminium Company, who are already located at the Falls of Foyers, by which they will be able to erect works of several thousand horse power for the manufacture of calcium carbide, using water power.

THE plans for the new School for the Blind that is to be erected in Church Road, Wavertree, Liverpool, were recently submitted to the Improvement Committee of the Corporation, and will probably be sanctioned at the next meeting of the Council. The proposed building will be of large dimensions. The grounds will abut on Fir Lane, and as a consequent matter the Council will be asked to consider the question of widening that thoroughfare.

A NEW CHURCH IN LIMERICK.

AT Nenagh, near Limerick, within the grounds of the ancient Manor of the Butlers, and beside the old Norman Castle, which still looks down on the valley of Ormond, the new Church of St. Mary of the Rosary was dedicated last week. Mr. W. Doolin, M.A., Architect, Dublin, to whom the execution of the work has been entrusted, was the winner of the limited competition. The second prize of 50 guineas being awarded to Mr. George C. Ashlin (late Pugin and Ashlin), Architect, also of Dublin. Mr. John Sisk, builder, of Cork, has carried out the work. In the report submitted with the competition drawings the Architect states, as regards style, the English Gothic of the 13th century, as exhibited in some of the great collegiate Churches of Yorkshire—perhaps the most perfect development of Pointed Architecture in its severest simplicity—has been adopted with such legitimate introduction of foreign and modern elements as practical considerations dictated. The Gothic of the Lancet, or early English period, found a lasting home in Ireland, admirably adapted as it was to the building stone, as well as to the climate. The pious missionaries who, under St. Gall, St. Albert and St. Finnian, evangelized Lombardy, the Rhine Provinces, and Franconia, from their Alma Mater in the Benedictine Abbey of St. Gall, did not confine their labours to foreign lands; their influence triumphed abroad, hence there is what antiquarians are pleased to call the "Byzantine Influence in Irish Art." These "Episcopic Vagantes" ("Rapparus and Vagrant Friars," as they were called later on), were not without their influence on Architecture in Ireland; nor yet is it too much to assert that Irish features can be seen and the traditions of Cashel and Killaloe plainly recognised in the chevroned recesses of many a sculptured doorway in the valley of the Rhine or the plains of Lombardy. With this the designer's apology for some features of his Church, for which he fails to find a local precedent; it must still be admitted the Church realises a style adapted to the Irish limestone in which it is built; the slates are Irish slates; the glass, or nearly all of it, is Irish made. The leading dimensions of the various parts are as follows:—Total length (internally), 171 ft. 3 in.; total length of Nave to Chancel arch, 132 ft.; width between Aisle walls, 61 ft. 3 in.; width between centres of arcade columns of Nave, 32 ft.; width of Aisles, 16 ft. 3 in.; length of Chancel, 39 ft. 3 in.; width of Chancel, 26 ft. 6 in.; width across Transepts, 87 ft. The spire is about 199 ft. high from ground line to base of vane, the eave of Aisle 21 ft. over ground; the Clerestory is 44 ft. over ground. The height to eave of Nave from ground line is 45 ft. 6 in.; the height to ridge of Nave is 75 ft.; the height to eave of Transepts, 38 ft.; the height to ridge of Transepts, 62 ft.; the height to eave of Chancel, 40 ft.; the height to ridge of Chancel, 66 ft. The Church is heated by Messrs. Musgrave, of Belfast, on a combined system of hot air at the entrance and high pressure hot water at the Chancel. So far the decoration within is confined to stained glass, the "Rosary Window" containing a full representation of the Fifteen Mysteries, the work of Messrs. Early, Camden Street Works, Dublin.

SOCIETY MEETINGS.

Northern Architectural Association.—An excursion visit was made to Darlington by the members of this Association on the 22nd August. The party was met at Bank Top Station by Mr. G. G. Hoskins, F.R.I.B.A., a past-president of the Association, and after some time spent at St. Cuthbert's Church and the Free Public Library, inspections were made of buildings now being carried out in accordance with the designs of Mr. Hoskins, comprising the new offices for the Darlington Guardians, the Technical College, and some new business premises, the terra cotta used in all these buildings being greatly approved of, both for its excellent quality and the truth with which the Architect's detail drawings are being adhered to. The visit concluded with an inspection of the recently-erected King's Head Hotel.

Trade and Craft.

A YEAR'S BUILDING IN LEEDS.

Mr. Hainsworth, the Inspector of Buildings to the Leeds Corporation, has just presented a summary of the work carried out in his department during the year ending on the 25th of March last. The 2,242 houses shown upon 406 plans approved include 12 Villas, 42 semi-detached Villas, 518 through houses, and 1,670 back-to-back houses. The 40 miscellaneous plans were for a Church, 2 additions to Churches, 4 Chapels, an addition to Chapel, 2 Mission Rooms, 5 Schools, 12 additions to Schools, a Home for Blind, Deaf, and Dumb Children, with Class Rooms, Workshops, and Swimming Bath, an addition to the Blind Institute, an addition to the Leeds General Infirmary, 2 Banks, an Arcade, an addition to Arcade, a Club, an addition to Club, 3 Hotels and Public-Houses (rebuilding), and a task labour yard. During the year 1,681 houses have been completed and certified for occupation, including 17 Villas, 6 semi-detached Villas, 429 through houses, and 1,229 back-to-back houses. During the year 918 miscellaneous buildings were completed and certified, among which were a Church, a Chapel, 3 Mission Rooms, a Synagogue, 7 Schools, 12 additions to Schools, 2 additions to Homes for Waifs and Strays, a Clergy House, a Bank, 2 Corporation Baths, and 3 Hotels and Public-houses (rebuilding).

RECONSTRUCTION OF EGLINTON IRONWORKS.

Extensive alterations have been carried out at the Eglinton Ironworks, Kilwinning, comprising the construction of three new iron furnaces and ammonia works. The three furnaces and stoves (which latter are Ford & Montcur's patent) were lighted for the first time last week. Two of the furnaces will be devoted to the manufacture of ordinary iron, while with the third hematite iron will be turned out. Only three of the old furnaces of the Neilson pattern are now standing, and two of these have been in blast till about ten days ago. Little or no flame will be emitted by the new furnaces.

DECLINE OF ABERDEEN GRANITE TRADE.

Professor Dove Wilson, who was appointed arbiter in connection with the request by the monumental stonecutters of Aberdeen for an increase of 1d. per hour in the rate of wages, has submitted his report. He is unable to come to the conclusion that present circumstances warrant the raising of the wages. In his report the Professor makes the following important statement:—"The trade at present seems to me not to be in a thriving condition. It is largely an export trade, and the export to the Australian colonies is practically stopped, and the once very important trade with America has greatly diminished, and threatens to be extinguished altogether. Accordingly the numbers both of the employers and employed are decreasing, and there is a considerable number of unemployed men in the trade. To increase the wages would have the effect of further handicapping the employers in competing with home and American firms."

MESSRS. HENRY CONOLLY AND CO.

Messrs. Henry Conolly & Co., of London, have forwarded to us a revised and enlarged edition of their Illustrated Catalogue of Goods used in the Building Trades. The volume is a large quarto of 193 pp., arranged with an eye to economy of time and exactness of reference. The illustrations of articles manufactured and sold by Messrs. Conolly number several thousands, ranging from the latest thing in gas-burners to the most elaborate of fitted baths. The volume is further adorned by a number of whole-page representations of the Firm's workshops and showrooms. A full and apparently accurate index is appended, and the whole production is business-like and sufficing. Messrs. Conolly have added to their Catalogue a feature of practical value to the Trade, being a series of tables setting forth the "weight and capacity of water," the degree of pressure at different heads, the weights of iron piping under the rules of the L.C.C., weights of lead pipe and zinc sheeting, together with the approximate weight of wrought iron gas tubing of varying bore. These details, with others of similar value, tend to make this Catalogue something more than the usual trade compilation—indeed, a work of reliable reference on such matters as are connected with Messrs. Conolly's wide range of manufactured goods.

PRICES IN THE IRON TRADE.

There has recently appeared on the Manchester Exchange a representative of one of the largest firms of American ironfounders, who is offering iron at lower prices than those quoted by English founders, while guaranteeing it to be equal in quality. It is further stated that the Americans are not pushing surplus stocks, but are prepared to make and deliver iron here in competition with the English iron, so long as they ship it at ballast rates in cotton-laden ships coming to Manchester.

KEYSTONES.

The new Conservatory in Sefton Park, Liverpool, which has been presented to the city of by Mr. H. Yates-Thompson, at a cost of £10,000, will be opened probably in the first week in October.

THE old National Schools of St. James's, Accrington, have at last been sold to a contractor for £20, and half of the site has been disposed of privately for £2,100. The trustees originally wanted £6,400 for the site and block. The Schools were built near the commencement of the present century.

A new County School is likely to be built very shortly at Llangollen. Llangollen School stands in an important district, and a worthy and suitable building will be a great acquisition to the neighbourhood. At a recent special meeting of the Managers it was announced that of the £4,200 required, virtually £2,600 had been secured.

IT has now been decided to defer until the end of the year the formal dedication of the Battenberg Memorial Chapel in Whippingham Parish Church. There was never any expectation that the sarcophagus would be ready this autumn, but it was strongly desired that the Chapel itself should be appropriated to its new use without loss of time.

AT Bristol operations have been commenced at the Haymarket, the workmen of the Corporation being employed in removing the boundary walls and railings. It is proposed to continue the road from Union Street across the Haymarket, widening the thoroughfare leading to Bond Street, and doing away with the awkward corner at the end of the Haymarket.

AN International Art Exhibition has been held this year in the German capital to celebrate the second centenary of the existence of the Academy of Arts. Among the British artists who sent in work the sculptor, Mr. F. Onslow Ford, R.A., received a large gold medal, while small gold medals were awarded to Mr. Gotch, of Newlyn; Messrs. G. W. Joy and Waterlow and Mrs. Laura Alma Tadema, of London.

A stained glass window has been erected in St. Catherine's Church, Ventnor, in memory of Kenneth Sinclair Coghill, who fell in the battle of Krugersdorp. The window was subscribed for as a mark of sympathy with Dr. and Mrs. Coghill on the loss of their son, whose death was much lamented at Ventnor, and as a record of his bravery and self-devotion, to which many of Dr. Jameson's officers and troopers have borne testimony.

THE Blackwall Tunnel is rapidly approaching completion, and it is now practically certain that in the course of the next few weeks the actual work of boring will have been completed. Even then, however, much will remain to be done, and it is not likely that, under the most favourable circumstances, the opening ceremony can take place before the latter end of July. Her Majesty, as has been stated, is being approached on the subject, but it is generally considered at Spring Gardens that, as was the case at the opening of the Tower Bridge, the Queen will delegate the duty of inaugurating London's latest engineering triumph to the Prince of Wales, who will represent Her Majesty.

Why not an Architectural Congress?

An Architectural Congress on broad and salient lines would serve to create lay interests, might even arouse lay enthusiasms, for Architecture. The Lay Mind, content with its inefficient and impurely conventional suburban or town dwelling, has not yet disassociated Architecture from the drier, reverent bones of Archæology. If you open the question of a Frieze, even in a company of sufficient culture, you will find at once the Classic Note assumed with a pedantic or an ignorant reference to the Elgin Marbles. It has never yet struck the lay dinner-table that the finest branch of Art is worth the toss of a chicken bone in discussion. Architecture is regarded as a gloomy subject, one never to be dissevered from the hod-carrier, the ladder, mortar-mills and a *soupçon* of "*drains* about the house?"—with an elevated nose in interrogation. The statement, savouring, at first acquaintance, of exaggeration, may be tested. The more than average man, well read, of a comfortable library, some knowledge of Painting (and the Capitals of Europe), will enquire immediately you show him, with a somewhat pathetic pride, over your house, designed by yourself: "Gravel soil? good drainage of course; one can depend upon *that*; yes, very charming view." The Public Mind never gets much above the foundations; when it soars we hear of the Bijou Family Residence, or the Cottage *Ornée*. It is not a lofty flight, and, to the professional mind, more than ordinarily disastrous, but the Public Mind manages to make a nest therein, calling it "Home," not omitting to take in an Art Annual. The Archæological Aspect of Architecture—estimable in itself, highly interesting, engrossing upon occasions, we fully admit—has been responsible for this alien public attitude to an Art which appeals, beyond all other Arts, once its sedater and sweeter tones are caught and carried onward in that Harmony of Home of which Architecture and Design are the dual composers. The public persists in taking a North View; we suggest that the Congress might turn attention to that "sunny aspect" which is ever demanded by the Public Mind in the choice of a dwelling. Yet it is one of the grosser and grotesquer of anomalies that the "sunny aspect" of the House is freely admitted in every three-line advertisement, but the brilliant Dawn of the Art itself, creative of Houses, nay, surely, of *Homes*, is more slowly recognised, more frigidly received. The British Nation is indeed in the Temperature Zone. The other week we had the opportunity to admire some very excellent and, indeed, original craftsmanship, the "very things" one would have thought, in the acquisitive parlance of shop buying, for the monied Outer World. But "lords and ladies, nay, and duchesses, have seen them and exclaimed over them, delighted over them, described them: how *sweet! how* original! how daring, how Burne-Jonesy, but—they have not bought! Those little things you see have lain in that cabinet five years—five years of enthusiasm beginning in rapture and ending in retirement." The incident springs to gables, to doorways, to mouldings, to the shapes of rooms, up till quite recent years, to weather-tilings. It has been the Spirit of I Dare Not waiting upon I Would. By slow and imbibing degrees, taking much false intoxicant and poison on the way, the Public Mind is gaining courage; it has found out the Beauty of half-tones, of self-tints, of natural colour; of the straight-speaking welcome of many directly Applied things; no longer is it necessary, in the interests of public modesty, for every internal brick and stone to wear clothes? Now that Architecture is recognised as living and human in its touch, in its tenderness, flesh and blood in its individuality and expression, the Public Mind would like the better acquaintance of a Classic and long-invited guest. But the Public Mind likes its "Association Meeting," its "Conversazione," tinctured with Art or Science, and we suggest an Architectural Congress as the first step to the ampler mutual recognition seemingly possible in these more willing days of Domestic Art.

HOUSE AT BEDFORD PARK: C. F. A. VOYSEY, ARCHITECT.

DECLINE OF THE GLASS TRADE.

AT present only about one-tenth of the glass used in this country for ordinary purposes is of British manufacture. While Continental glass firms are pouring their productions into England, the English trade is languishing, and in the last quarterly issue of the "Flint Glassmakers' Magazine," the organ of the National Flint Glassmakers' Society of Great Britain and Ireland, it is stated that the payments to the unemployed for the previous quarter were upwards of £700. This is at the rate of £2,800 a year for out-of-work allowance to the members of a society numbering only a little over 2,000. The men's own organ says:—"If we are to go on in this standstill fashion it will only be a question of a few years and we shall see more than one-third of the trade on the superannuation list." That there is something very much amiss in the trade is admitted both by masters and men. The former have no doubt about the cause, and say that the English trade can never be recovered while the present conditions imposed by the men's society are in force. The prestige of the best class of English finished glass is fully maintained, and it has held its own in the market. But much of this glass is glass for the luxurious and wealthy, and is not the class of manufacture which goes in bulk into consumption—namely, what is generally termed hotel glass, and such as is used for ordinary table purposes. For this the demand is very great and constant, and it seems to be directly owing to the action of the men's society that all but a fraction of this trade has been lost to the home producer and has passed into the hands of Belgians, Germans, and Swedes. The French make a better class of work, but are not competitors in the English market for the trade in hotel glass. One well-known glass works on the Rhine employs more men than the whole of the members of the Flint Glass-makers' Society of Great Britain and Ireland number. Yet if a reasonable working system were adopted in the English trade there is no reason why a thousand glass-workers might not be employed in England where now there are only a hundred. The society men, as a matter of fact, have for many years been masters of the situation, and are unreasonable in the maintenance of the system under which the English glass trade has been dwindling away. In 1858 there was a great struggle which cost their society upwards of £50,000, and it ended in an agreement as to the apprenticeship system, which has since greatly fettered the trade and helped to prevent its development. Instead of development, indeed, there has been continual shrinkage and contraction, and one glass house after another, not only in the principal seat of the industry, but in a number of districts, has gone out of existence. Hence it is that the men's executive are now lamenting the large number of unemployed members on their books. If English glass manufacturers had a free hand in the matter of the arrangements with glassmakers, and the men would agree to put in more hours' work, the employers, while still paying good wages, would be enabled to compete with the foreigners. As it is, glasshouse after glasshouse is being shut up, a limited number of men get very high wages, a large number get none at all, and are receiving unemployed pay from their union. The foreign producer is thriving while the English firms engaged in this industry are becoming fewer and fewer in number. Yet, even under the present trying conditions, one class of hotel glass can be made (by the aid of new methods) at a price to compete with the foreign article, and if the men would consent to work a "turn" of nine instead of six hours, it is said the trade that has drifted into the hands of the foreigner might be recaptured.

Messrs. RAKE & COGSWELL have prepared the designs and are superintending the extension of Mr. J. Bulpitts' premises, at Portsmouth.

AT a recent meeting of the Leeds City Council, the proposal to spend £15,000 upon the improvement of Wood Street was adopted.

A NEW Peal of Bells has been placed in Monaghan Cathedral. The bells were cast by Messrs. Gillett and Johnston, of Croydon.

A VISIT TO HELMSLEY AND RIEVAULX ABBEY.

WITHIN a radius of a very few miles from the railway station at Helmsley are the remains of the great Abbeys of Rievaulx and of Byland, the Priories of Newburgh and of Rosedale, the site of that of Keldholme, the interesting Church of Pickering, with its mediæval wall paintings; that of Kirkdale, with its Runic inscriptions; and that of Lastingham, with its Saxon remains and its memories of the great missionary bishop, Cedda; the military works of Ampleforth (of pre-Roman date), the Roman Camp of Helmsley, and the great Norman Castle which now overlooks the older fortification, the Castle of Gilling, reminiscent of the Fairfaxes, and of Pickering Castle and Slingsby Castle, not to mention places of so modern an interest as the Church and house of Laurence Sterne, at Coxwold, and the birthplace of Roger Dodsworth, the antiquary, at West Newton Grange. The members of the Bradford Antiquarian Society, to the number of about forty-five, recently held an excursion in this district. On arrival at Helmsley a visit was paid to Duncombe House, the residence of the Earl of Feversham, and some of the chief treasures of the mansion were inspected. The House which was

BUILT BY SIR JOHN VANBRUGH

in the middle of the last century, was burned down a few years ago, but it has since been admirably rebuilt, and its collection of paintings and marbles is of much importance. Many of the paintings are at present on exhibition at York, but the visitors had an opportunity of seeing the famous antique statue called, from a resemblance to that in the Uffizi at Florence, "The Dog of Alcibiades," and attributed to the famous Greek sculptor Myron. From Duncombe House the party drove to Rievaulx Abbey, a visit first being paid to the fine terrace on the hillside overlooking the Abbey ruins. The terrace has been described by a competent critic as "one of the finest in England." Mr. J. Norton Dickons, the President, in a short address, pointed out the chief Architectural and archæological features of the building, and said that absolutely no worthy Architectural description of the building had ever been published. Before this could be done exploration of the masses of ruins which now cover much of the site would have to be carried out. Eight or ten years ago the Rev. Canon J. C. Atkinson, when editing for the Surtees Society the charters of Rievaulx Abbey, hinted that such systematic excavations as were made, with results of extraordinary interest, at Fountains were about to be undertaken at Rievaulx. Nothing, however, has since been done, though there ought to be no difficulty in regard to funds. It is said that the shillings paid by visitors to view the Abbey exceed £100 a year, and if Lord Feversham could be induced to devote for a few years the comparatively insignificant contribution to his income to the purposes of the

EXPLORATION OF THE RUINS,

under skilled supervision, the interest of the site would be vastly increased, and the beauty of the spot need not be in the least impaired. It is a little surprising also that no good history of the Abbey has ever been written, though the materials are abundant. In some respects also the history of the institution is one of striking interest. When William the Conqueror marched through Helmsley on his way back from the Tees, he left enduring marks of his wrath over the fair face of Yorkshire, and many centuries passed before they were obliterated. There is no doubt that to Walter Espec the Augustinians owed the foundation of the Priory of Kirkham, and that he provided a home for the body of monks sent into Yorkshire by St. Bernard from the famous Monastery of Clairvaux, in Champaign. The Monastery which was settled at Rievaulx in 1131, beside being the earliest in Yorkshire, was also a most fruitful progenitor of monastic houses. For long it seems to have interested itself in missions to Scotland, and the beautiful Abbey of Melrose, the premier Cistercian Monastery in Scotland, and half a dozen others in Scotland and the Lake Country of England, are numbered among the direct heirs of the religious zeal of the colleagues of St. Bernard who laboured in the wilds of Ryedale. Terrible destruction was wrought to the lovely buildings at the dissolution of the Abbey, and the ruins now consist mainly of the Choir and Transepts of the Church, and the Fratry or Dining Hall of the monks. The Choir, however, does not seem to have been part of the original structure, but was probably added about 1240, it being a particularly lovely specimen of the Early English style. One curious feature notable in the arrangement is the fact that the main axis of the Church does not, as is the rule in England, run east and west. The circumstance is partly due, no doubt, to the fact that the nature of the ground, hemmed in between the hillside and the river, made the usual arrangement inconvenient, and partly also due to the foreign traditions of the original inmates, who were perhaps also the builders, of the Abbey, for the orientation of Churches was not so strongly insisted upon on the Continent as it has always been in England.

THE GLASGOW SCHOOL OF ART.

THE position gained by this School at the examinations and competitions of the Science and Art Department for the year 1896 is highly creditable. Eighty-nine prizes have been received in the national competition as against 74 last year, and 865 passes were made at the advanced local examinations as against 650 passes made last year. The passes in the examinations include the largest number of excellent and first-class ever yet made by the School. The National Competition results are: 1 gold medal, 5 silver medals, 12 bronze medals, 21 national books, 1 Owen Jones medal and prize, 18 prizes for sets of works, and 31 free studentships—making a total of 89 awards, being an increase of 15 on the number attained to last year. For Architectural design the gold medal, 1 silver medal, 6 bronze medals, 8 national books, and 6 prizes for sets of works were gained. For life studies, drawn and painted—1 silver medal, 1 bronze medal, 5 national books, and 2 prizes for sets of works. For design as applied to manufacturers—1 silver medal, 1 Owen Jones medal and prize, 4 bronze medals, 5 national books, and 7 prizes for sets of works. For painting still life and and from the cast—1 silver medal, 1 bronze medal, 2 national books, aud 2 prizes for sets of works. For modelling the figure—1 silver medal, 1 national book, and 1 prize for set of works. The Director of the Architectural section is Mr. W. J. Anderson, and we know of no School doing better work than this one.

THE use of Motor Cars in connection with street scavenging was recently under discussion by the Dover Town Council, and the arguments in favour of horseless vehicles were so strong that the Council decided to delay the erection of extensive Stabling accommodation on land they have purchased for a scavenging depot pending further information.

WHILE alterations were being carried out at the Empire Cycle Riding School, Tavistock Place, Russell Square, London, a small wooden box containing a large collection of gold and silver coins of the reign of Charles II., was found buried in mould under the flooring. The unearthed coins are of considerable value, and in a good state of preservation.

ALTERATIONS in High Street, Sheffield, have necessitated the removal of an old building in Mulberry Street, which, nearly a century and a half ago, was used as the Preaching Room of the Wesleyan Methodists of Sheffield. The Mulberry Street Preaching House was opened in 1757, and was then only two stories high, and the Preaching Room was about 12 yards by 10 yards in size, without a gallery, and the walls were unplastered and whitewashed. For a number of years the Methodists worshipped there, having the building twice enlarged during their occupancy of it, and having a Gallery built. It had no Architectural pretensions, being somewhat barrack-like in its appearance, standing about half way up Mulberry Street on the east side, without a single feature to attract attention to it.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

MEN WHO BUILD.

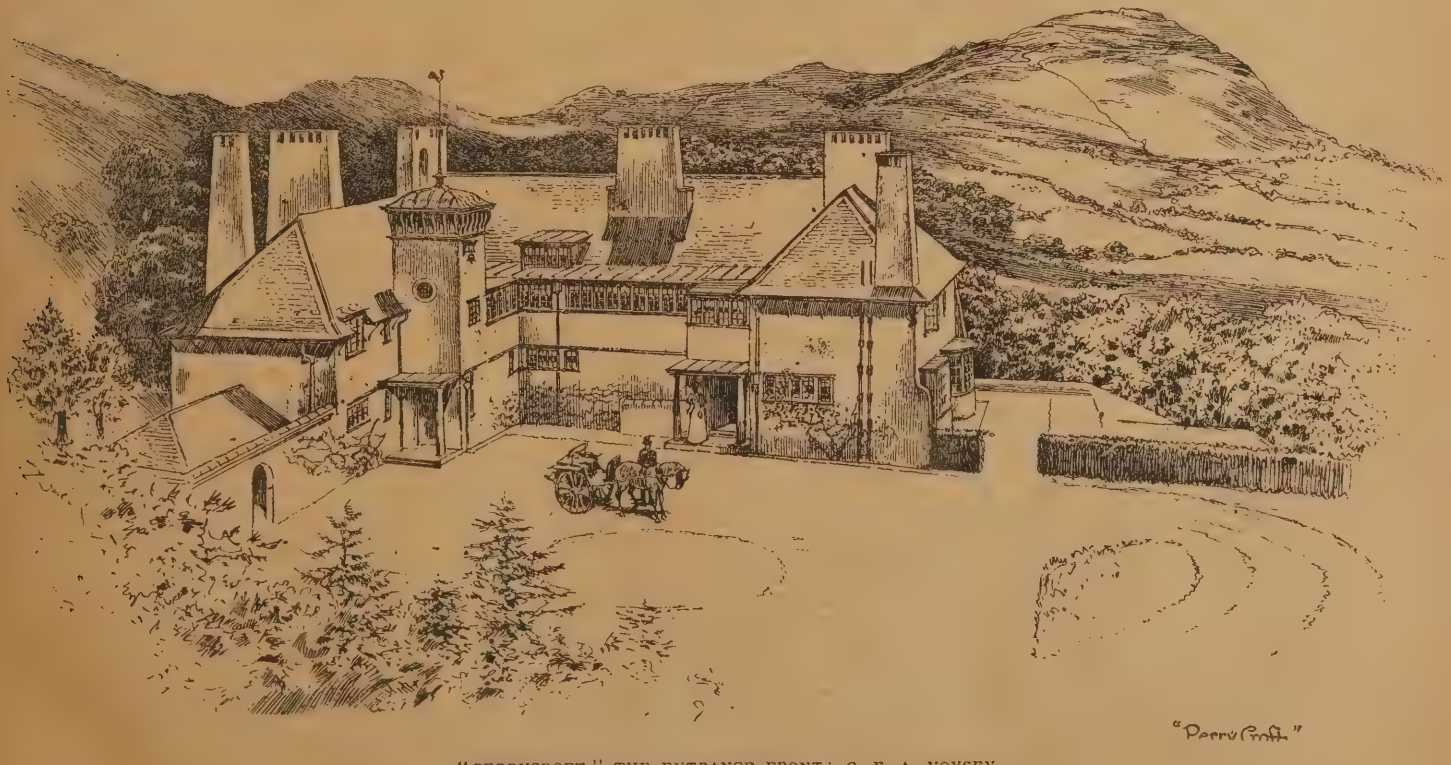
No. 45.

MR. CHARLES F. ANNESLEY VOYSEY.

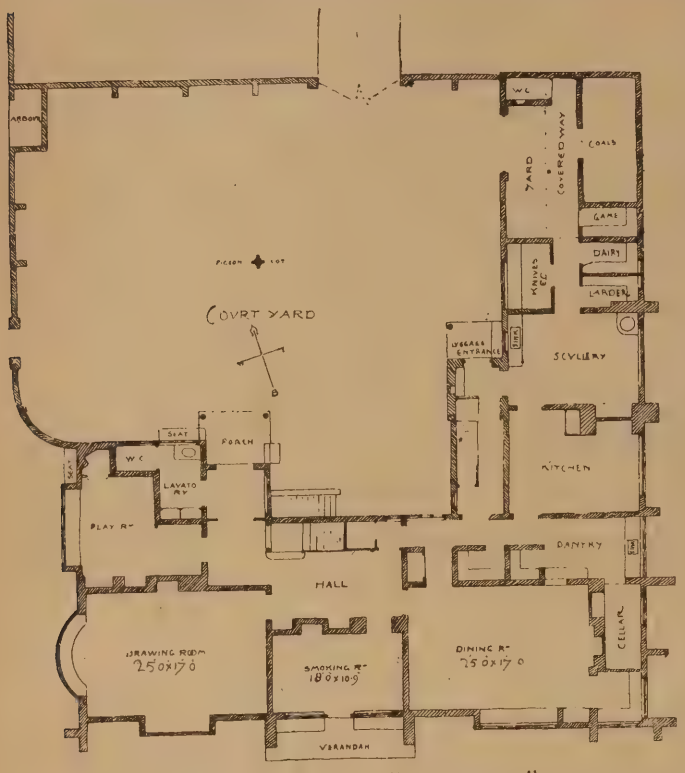
PROGRESS in Art has always been traceable to the appearance of certain independent men, who, despising the glacier movements of the Schools, and refusing to sacrifice their individuality to any tradition, however venerable, have struck out their own line, harked back to first principles, and endeavoured to construct (or delete) their own theories of the harmonious and the beautiful. The principle holds good throughout the history of Art, from the time when Giotto first broke through the Byzantine tradition, that held Art hidebound to inflexible laws, and ventured to make pictures that were distinct in themselves, representing actual scenes, to the days which have seen the appearance of men like Constable, Millet, Corot, Monet, or Whistler. These artistic Nonconformists have been the salt of Art. Appearing irregularly, sometimes singly, sometimes in groups, their common characteristics have always been their sturdy individuality, their lofty ideals and marked originality, to which oftentimes genius may be added, for it is not always enough recognised that to be an original artist one need not necessarily be a genius, but simply a person of high ideals and independence sufficiently strong to refuse to palter with one's artistic conscience.

The Renaissance of Decorative Art that has taken place in England during the last twenty years, we owe to a group of artists and craftsmen working independently, each for his own ideals, and according to his own lights, yet with common objects and sympathies, and the subject of this paper, Mr. C. F. A. Voysey, has borne a high and honourable part in this great work, both as an Architect and as a Designer of wall papers, fabrics, and furniture.

When one thinks of it, there is cause for not a little patriotic pride in the English Renaissance. As a purely national product it has succeeded in establishing a European movement of a genuine and far-reaching kind, which is more than can be said for



English pictorial Art, at least, since the days of Constable. Quite recently, in Paris, I was struck by the attention and the respect paid to the English Decorators, the spirit of whose work, so far removed in its severity and dignity from the luxuriance and redundance one associates with French taste, nevertheless seems to meet with the keenest appreciation in the French Capital, and by no means least as regards the productions of Mr. Voysey himself. We have in this, at least, evolved a movement that is individual and distinctive, founded upon principles that command universal respect.



Another sign of the times worth mentioning is the change in the relative positions occupied by the workers in different branches of Art. Why the painter of easel pictures—and those only of a special kind—has so long occupied the position of "King of the Arts" it is difficult to explain. The fact that this is all changing is a token that better days for English Art generally are in store. From his lofty eminence the *genre* painter has looked with contempt upon Architecture, Mother of all the Arts, and Decoration, prime handmaid to Architecture. Now we all want to be decorative artists, and, without belittling the painter, it is only right that other branches of Art, equally important to his, should take the position to which they are entitled.

In describing a recent conversation with Mr. Voysey, upon his aims and achievements, I will abandon, so far as possible, the tiresome and artificial question-and-answer method of the formal interviewer, and endeavour to give the substance of his remarks in a coherent form.

Mr. Voysey resides in a quiet road in St. John's Wood. As the house is not his own, it is the interior rather than the exterior that bears the stamp of being inhabited by an artist and craftsman. He looks forward to the time when he will be able to build his own house. The marked features of all his work are its independence and originality. He guards these precious qualities jealously, and, to use his own words, "Never will design to please anybody but myself." He tries even to prevent those sub-conscious cerebral processes by which a designer becomes influenced, unknowingly, by the work of others, by rigidly excluding from his house all designs that are not his own. Although it is by his Decoration that he is best known to the public, Mr. Voysey is, first and foremost, an Architect. He considers everything inside the house within the Architect's province, from fittings and furniture to the very tooth brushes. He holds the loftiest views as to the dignity of the Profession, and believes that the less a client understands of the work in hand and inter-

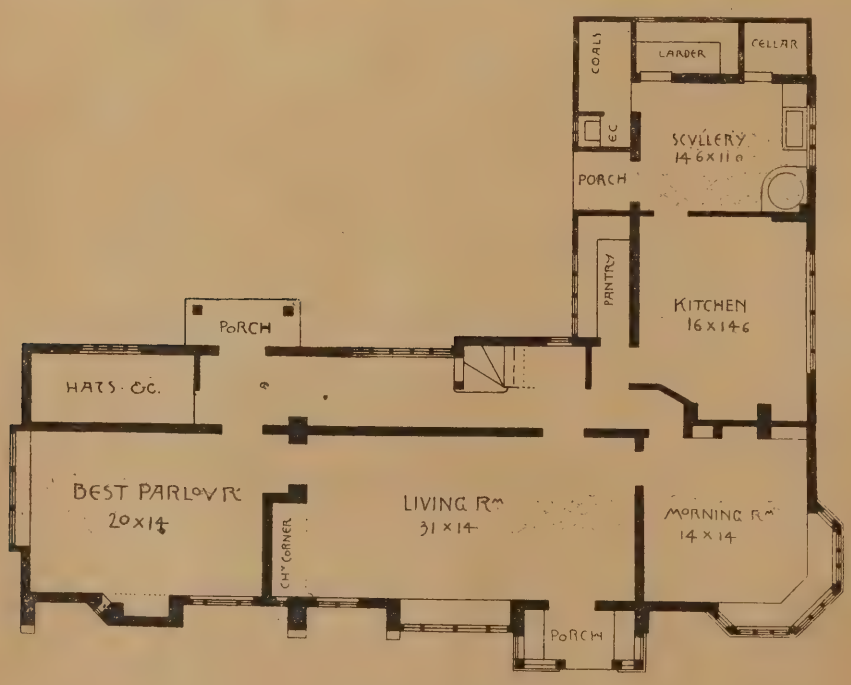
"PERRYCROFT," THE ENTRANCE FRONT: C. F. A. VOYSEY.

GROUND FLOOR PLAN OF "PERRYCROFT."

no Style. The first principles of Design, he holds, are the conditions and the requirements of the work to be executed—in England, the climatic conditions of the country and the national requirements of the home-life that is peculiar to it.

Although the greater part of Mr. Voysey's Architectural work so far has consisted of small residential villas and country houses, such as are here illustrated, he does not wish these to be considered in any way as his particular *line*. He has simply executed them because he was commissioned to do so, and is equally prepared to devote his attention to any branch of Architecture that may be required of him. It is refreshing to find in his work that he mostly avoids the red bricks and red tiles that for so long have been considered "the thing" in our fashionable suburbs. He finds that he can obtain effects at once more dignified and harmonious with white rough-cast and green slates. Slates, he says, have many advantages over tiles: they are more durable, are less liable to injury from hurricanes or storms, and make a better roofing; and these are points that true Craftsmen cannot afford to sacrifice for effect—especially effect that is not really either tasteful or desirable. Of course, Mr. Voysey does not employ the common Bangor slates, but the green slates, which are just as easy to obtain.

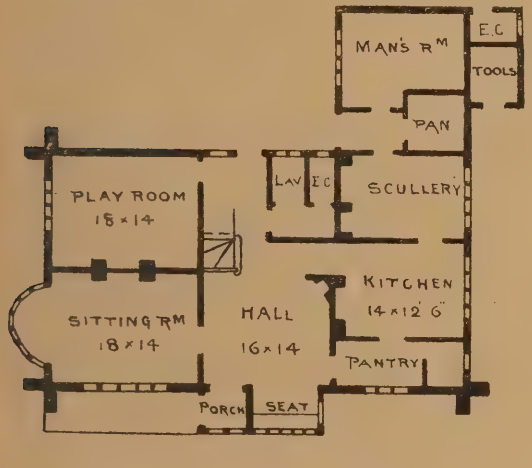
The fact that Mr. Voysey has designed many cheap houses will make his work more interesting to the numerous people with good taste yet limited means, than if he had been occupied with huge mansions or public buildings. Several of the houses here illustrated have been built for quite small sums, as for instance, the "White House," Bedford Park, which, exclusive of the wing recently added, cost £500 only. For this house, by the way, Mr. Voysey has been more praised and abused than for any of his houses, and, possibly from that cause, he is inclined to feel for it rather more than the usual regret of an author for his creation. It certainly requires some hardihood to erect a "White House" in a neighbourhood wholly given up to the bondage of red bricks and tiles.



On the question of cheapness in building, Mr. Voysey has much that is very interesting to say. The great thing is to get people with limited means to understand that Art is really economical, and that a badly built house is never cheap. No one can afford to dispense with good materials. Mr. Voysey can design cheap houses, but the cheapness is not obtained by insufficient foundations and scamped materials, but by regulating the proportion of Art and obtaining stateliness and simplicity instead of elaboration. Mr. Voysey's mind is prolific of ideas, each of his houses is a special creation in itself, adapted to its site and surroundings with the utmost care and study, guided by consummate taste. He showed me another clever contrivance for opening windows that he has just invented for one of his houses, but as that is not yet patented, I am not at liberty to describe it here.

Mr. Voysey is a self-made man. All that he has done has been through his own unaided efforts. He claims lineal descent from the Wesleys', and perhaps inherits somewhat of their strongly marked individuality. But he confesses freely that the struggle has been a hard one, that he almost starved when he first tried to make his living by Design. The manufacturers wanted the usual trade designs, Mr. Voysey would not consent to make them, and it took years before his work made its way. The only assistance that he

feres with the Architect the better. "If a man goes to a doctor," he says, "he should have faith in that doctor. Similarly, an Architect should be an autocrat, and lead his client along gently in the path he thinks to be best." Mr. Voysey does not profess to design in any particular Style. But, after mature consideration, designs his building in a manner that best suits all the conditions as to situation and requirements of the house to be constructed. Formerly a man would either be all Gothic or all Classic, and could not be both; Mr. Voysey ties himself to



AT CASTLEMORTON, WORCESTERSHIRE—FRONT ELEVATION: C. F. A. VOYSEY.

PLAN OF CASTLEMORTON.

has received has been indirect, but he is none the less grateful on that account. More than once, in the course of our conversation, he expressed his gratitude to Mr. William Morris, the pioneer of the English Decorative Renaissance. "It is he," he said, "who prepared the public mind and educated it, and who has done for me what I might not have been able to do for myself, made it possible for me to live."

As Mr. Voysey, is perhaps, best known by his wall-papers, those who read this will naturally expect to hear his views upon the subject of the best covering for our walls, and I cannot do better than quote his opinion from one of his lectures upon the aims and conditions of the modern decorator, for he has lectured more than once upon the subject, though he hates lecturing as an agony. "Do not think that I place wall-papers first," he says, "wooden panelling, whether polished or hand-stained, is best of all; next to that comes painted panelling, but as papers wear better than the plain wall, we must permit them to exist on this ground. If, however, the room be a well-proportioned one and the furniture good, even if pictures are absent, the need for wall-papers is not apparent on æsthetic grounds; but in such a case the frieze may be treated with a pattern, either printed or stencilled, not too engrossing, but yet sufficiently important." Elsewhere he says "a wall-paper should be always sufficiently a pattern, the repeat of which is recognised as one of its chief characteristics, rather than

PLAN OF HOUSE AT FRENSHAM.

a pattern disguising the repeat, and presenting in detail interwoven pretty bits, known in the trade as 'all-over' patterns." Mr. Voysey's decorative creed he has summed up as follows: "Simplicity in decoration is one of the most essential qualities, without which no true richness is possible. To know where to stop and what not to do, is a long way on the road to being a great decorator." How he carries this out may be seen from the specimens of wall-papers and furniture here reproduced. In simplicity and Classic restraint lie their greatest charm. As he himself says: "Simplicity requires perfection in all its details, while elaboration is easy in comparison with it. Take what Art you may, and you will find only the greatest masters can be simple, or dare to be simple."

Space forbids my dwelling at greater length upon the special qualities of this branch of Mr. Voysey's work, but it is the less necessary, in that it has been exhaustively treated of elsewhere ("Studio" for May). He has introduced many new motives into wall paper design, and has suffered the inevitable penalty of success, extensive imitation.

To those who wish to decorate their homes on true principles, Mr. Voysey says, "Don't ape anybody else, and, above all, don't listen to the charming ladies who write those columns, of mingled pretentiousness and triviality called 'Decorative Home Notes,' for the weekly papers. All prescriptions for Art arrangements are poison. If a man's home expresses himself and his own taste, it will be interesting at least. What is wanted is a little more *honesty*, not mock Art, less over-decoration, and less trash in our rooms."

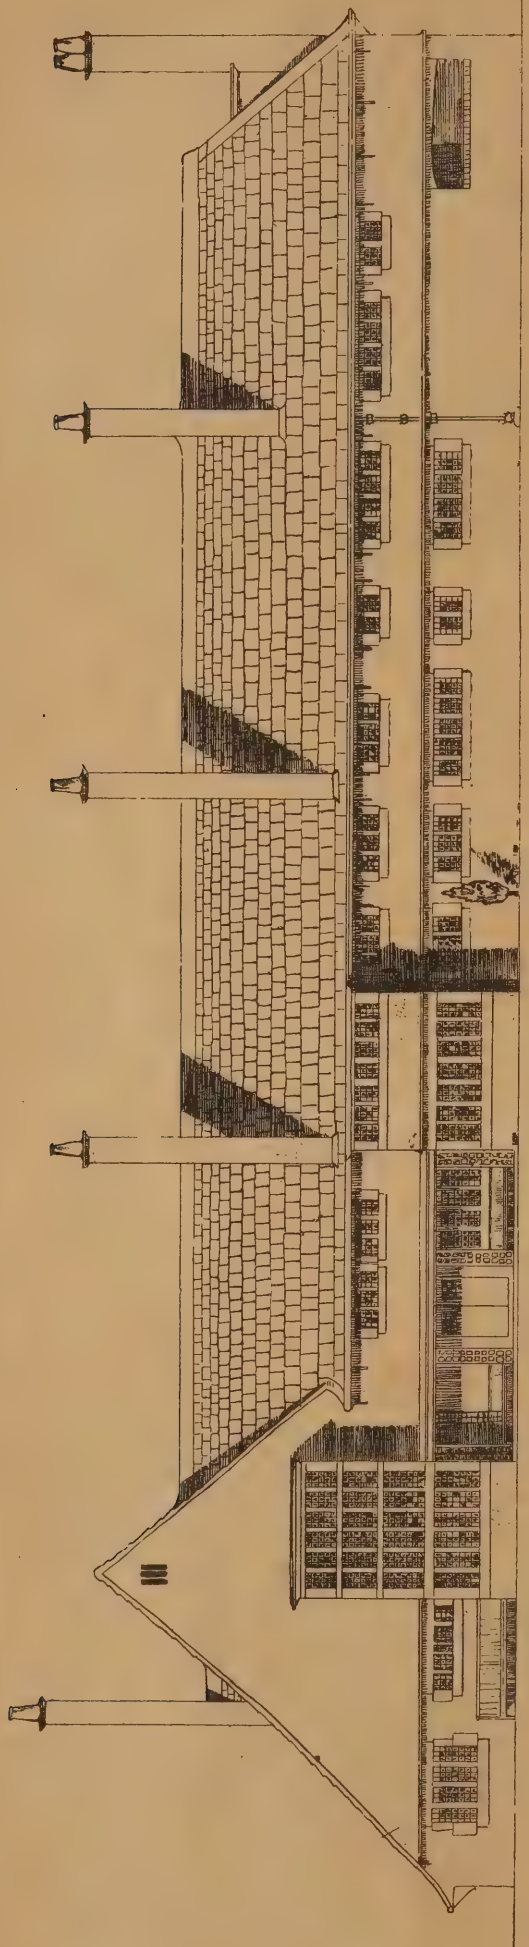
I will conclude with a few biographical details about the subject of the foregoing remarks. He was born in 1857, and was educated at Dulwich College and elsewhere. His grandfather was an Architect.

In 1874 he was articled for five years to Mr. J. P. Siddon, and about fifteen years ago he commenced on his own account. As I have already said, Mr. Voysey has struggled all his life against great odds, but to-day he is able to feel—to use a famous phrase—that "the flowing tide is with him."

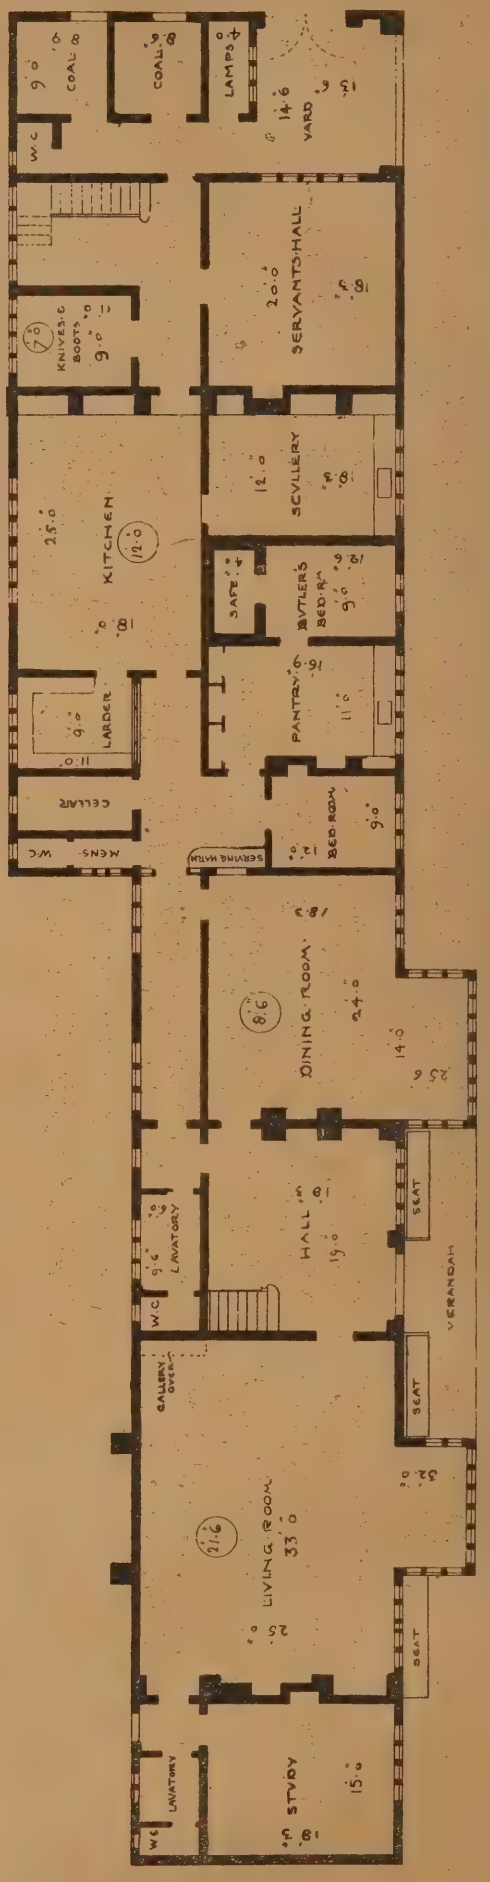
If it be true that harmonious and æsthetic surroundings conduce to the living of gracious and convenient lives, workers like Mr. Voysey may be entitled almost to claim a moral mission.

HOUSE AT FRENSHAM, SURREY: C. F. A. VOYSEY, ARCHITECT. FROM A PHOTOGRAPH BY MR. LEONARD CROSSE.

GLASGOW TECHNICAL COLLEGE.



THE results of the Science and Art Department examinations in the Architectural Classes of Glasgow Technical College, in which the students attending these classes were examined, have recently been received. They show that all the students who were examined in Architecture have passed, two of whom—William M'Clelland and Thomas A. Moodie—pass excellent, seven others pass first-class, and six second-class. Two students have passed in the first-class in Architectural Design. In the National Competition James C. Walker has received a bronze medal for a design of a modern Cathedral, and Charles E. Monro a prize for his set of works which include measured drawings of parts of Glasgow Cathedral. In the Advanced Examination in Building Construction 56 students were presented, and while all have passed, no fewer than 29 take the first-class certificate. In the Elementary stage 53 pass in the old first-class standard and 13 pass "fair." In the Carpentry and Joinery Examination, Richard Wilson takes a first-class in the Honours Grade, and James S. Boyd a first-class in the Ordinary Grade, while fourteen others pass in this subject. In Brickwork and Masonry, James Anderson and James Smail take first-class and seven others pass. The large increase of students in attendance at these classes has necessitated the appointment of four additional assistants and the re-arrangement of the work of the three assistants previously engaged, whereby Mr. James Lochhead, A.R.I.B.A., now devotes his whole attention to the post of Instructor in the Architectural Studio, with Mr. W. K. Anderson as assistant. Mr. Thomas A. Moodie is Instructor in the Designing of Buildings Class in the Honours Building Construction Course. Mr. Thomas S. Fraser is Senior Assistant in the Advanced Building Class, with Mr. James M'Kissack as Junior Assistant; while Messrs. John Robb and James C. Walker are Joint Assistants in the Elementary Building Class. As hitherto, Professor Gourlay will have sole charge of the Day Classes in Architecture, and deliver all the Lectures to the Evening Classes, as well as tutorially teach the Architecture and Honours Building Classes.



HALL OF HOUSE AT FRENSHAM. FROM A PHOTOGRAPH BY MR. LEONARD CROSSE.

DURING the absence of the Czar, English workmen are carrying out some renovating and re-furnishing operations at the Winter Palace in St. Petersburg.

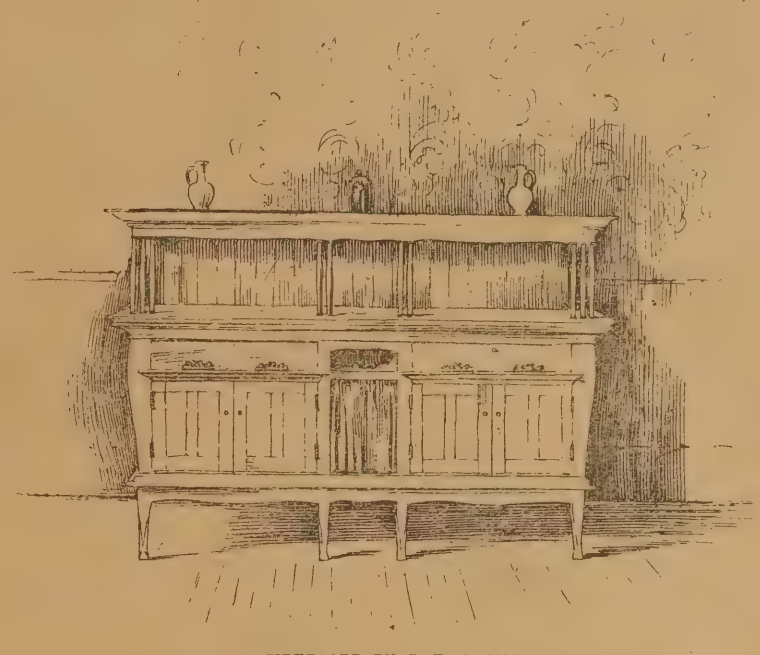
THE Panels in the Judges' Lodgings at Leeds, which were painted by the late President of the Royal Academy, when he was only 18 years of age, are to be removed and placed in the Corporation Art Gallery. As he was only a student at the time, Millais did not append his signature to the work, but there is no doubt as to their authenticity.

PROPOSED HOUSE, SURREY: C. F. A. VOYSEY, ARCHITECT.

GROUND FLOOR PLAN.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
September 9th, 1896.



"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."
—JOHN RUSKIN.

CONSIDERABLE dissatisfaction is felt in Dublin that the Board of Control should have given the contract for the erection of the Portrane Buildings to a northern firm, although the tender of a Dublin firm was the lowest. True, the difference was not great. Messrs. H. & J. Martin offered to do the work for £166,666, and Messrs. Collen Bros. for £167,000. "Having regard to all the facts and circumstances, and to the terms under which the revised estimates were invited, the Board felt bound to give the contract" to the latter. The "binding" circumstances are not manifest from the letter of the Board's Secretary. It is felt, and justly may be, that the firm whose members, officials, and men will have to contribute their quota to the construction and maintenance of the Asylum should have had the preference even if the prices were equal.

UPON the subject of the West Front of Westminster Abbey, a correspondent writes:—"In a note recently you speak of 'Hawksmoor's queer pseudo-Gothic Towers'; but should not the 'credit,' or, as you put it, 'discredit,' of this work go to Wren? I have heard the remark, more than once, that 'Wren added to the Western Towers of Westminster Abbey with considerable success, considering that he hated Gothic,' and personally I agree with this remark. The upper windows of these Towers show that the designer had not caught the spirit of Perpendicular work, but, perhaps, he did not want to. Why should he, living in the eighteenth century, try to design as they did in the fifteenth? I like these Towers very much better for being able to say when they were added to by simply looking at them, instead of being puzzled as to what is genuine Perpendicular work in the West Front."

SIMULTANEOUSLY with the opening of the "Brook Hospital," Shooters Hill, under the auspices of the Metropolitan Asylums Board, a discussion took place at the meeting of the City Guardians on the alleged extravagance committed in the building of this particular institution. One critic declared that "there was scarcely a royal palace on the Continent of Europe that afforded an example of such lavish and costly appointments as this Hospital." The building had cost £500,000, and now 325 officers and servants had been engaged to wait upon 450 patients. The Rev. R. H. Hadden, a former member of the Asylums Board, ventured to plead on its behalf that it did a most praiseworthy and excellent work; but the City Guardians embodied in a resolution an emphatic protest against the extravagant expenditure referred to, and carried it by a large majority.

IT appears that the House built by Samuel Richardson, the printer and novelist, in Salisbury Square, is not in course of demolition, as the House in Salisbury Square which is being pulled down is No. 11, whereas Richardson lived at No. 12, which was acquired some years ago by Messrs. Lloyd. The House built by Richardson had a passage connected with it which communicated with Fleet Street, and that right of way Messrs. Lloyd have enjoyed for several years—since, indeed, No. 12 was acquired by them. The House which is being pulled down has recently been purchased by the firm in question. It was formerly owned by Mr. Deputy Obbard. Richardson lived in Salisbury Square, and after his death, in 1761, was buried in a vault in the church of St. Bride, hard by. Through the instrumentality of the late Mr. Joshua Butterworth, a brass tablet was put in the Church, setting forth the facts that in a vault close by the remains of Samuel Richardson were deposited, that he was born in 1689, was master of the Stationers' Company in 1754, and died on July 4th, 1761. This tablet was put up in 1889, the bi-centenary of the novelist's birth.

SIDEBOARD BY C F. A. VOYSEY.

THIS autumn the Belgian Government, in conjunction with the Chamber of Commerce authorities at Ostend, will commence work upon a very extensive and important system of Docks, which are estimated to cost three millions sterling, and which will entirely sweep away the present unsightly quays which form the old Harbour. According to the official plans, the Docks will extend inland between one and two miles. All the houses along the line of the canal which the Docks will follow have been purchased by the Government, and considerably over 100 have already been demolished. Spacious Warehouses, on the model of those at Antwerp, with promenades on the top, are to be erected on the quays, round which the railway system is to be carried; and powerful hydraulic cranes will be placed at intervals round the quays. Dry Docks are to be constructed on the north-east side of the port on the principle of those at Tilbury. The old Dock now in front of the Railway Station is to be filled in, and a park and ornamental gardens will be laid out in its place. A further improvement as part of this scheme, which will quite alter the appearance of the old portion of the town of Ostend, is the construction of a boulevard in a direct line from the Railway Station to the Kursaal, which will involve the demolition of one or two hundred more houses. The Docks will be completed in five years.

THE large blocks of Artisans' Dwellings erected by the Manchester, Sheffield, and Lincolnshire Railway Company near the site of their great London terminus, which we illustrated in our issue of August 5th, are now nearly completed. Situated at the junction of Grove Road, Grove End Road, and St. John's Wood Road, they cover an area of not less than four and a half acres, and will cost, from first to last, a sum of £250,000. They are in six blocks of about 375 feet long each, and are five stories in height, being built of yellow stock bricks with red brick facings. The roofs are finished off with flat asphalted spaces, for use as drying grounds. An item of engineering interest is found in the arduous work which went towards building the extremely heavy retaining wall, bordering Regent's Canal for a length of 550 feet. Constructed of concrete, it is 35 feet high, and broadly based on an 11 feet foundation. Accommodation will be provided in these buildings for 2,690 persons displaced by the Lisson Grove and Princess Street clearances, and a new Lisson Grove will thus be formed in the near future amid the groves and secluded villas of St. John's Wood. The Architect is Mr. Alex. R. Stenning.

A NEW submarine Boat on Poukalov's system is approaching completion at Cronstadt, and will soon be put to its trials. The boat is to be driven by electricity, supplied by accumulators sufficient to last for a two hours' run, and is to have a speed of ten knots an hour. It is adapted for travelling along the surface of the water and for submerging itself to a depth of not more than seven feet by the aid of horizontal rudders. Its use is to approach sufficiently near to the enemy's vessels effectively to launch the torpedoes which it carries without on either side. The boat is 19 feet in length, and one ton in weight, and is therefore adapted for being carried by large war vessels. Its mechanism is said to be so simple that a man may easily drive it single-handed without any special training.

THE Autumn Exhibition of Paintings and Drawings in the Galleries of the Birmingham Royal Society of Artists was opened last week. The arrangement of the hanging follows pretty much the accustomed lines, but, owing to the unusual number of large canvases, it has been found impracticable to maintain the reformed procedure instituted a few years ago of placing the water-colours in the Long Room. They are now relegated to their old abiding place in the North Room. A slight but very agreeable alteration has been made in the arrangement of the little Octagon Room. With these exceptions, the order is the same as for many years past. In point of the total of exhibited works, there are rather fewer than usual, by reason of the fact that the number of large paintings and drawings is much higher than ordinarily, and the wall-space at the disposal of the hanging committee is not elastic. What is more important than mere numbers is that the quality of the Exhibition as a whole is superior to that of any show we can recall in recent years. Mr. Jonathan Pratt and his colleagues have secured the loan of an unusually large number of pictures which have been in the Royal Academy, the New Gallery, and other Metropolitan Exhibitions, and among these are several that hold high rank among the "pictures of the year."

MUCH attention is now being directed to the serious condition of the Aberdeen Graving Dock, and there seems to be a very general impression that the only remedy for the unsatisfactory state of matters is the construction of an entirely new Dock. In the report now being drawn up by the Harbour Engineer, it is made clear that some very drastic steps will have to be taken by the Harbour Board without delay. In all directions the Dock has given way. The bottom is in many parts practically without foundation at all, and a few taps of a hammer in almost any part at once indicates the loose condition of the concrete below. When boring was tried, the boring had only proceeded five inches when water came bubbling out, and the instrument was found to be among exceedingly loose material. Then the sides in the interior of the Dock are giving way, as can be seen at a glance, and they are giving way along the whole length of the Dock. On the north side the superstructure, from a distance of about a couple of feet above the bottom level, has been bulged bodily forward, and the large concrete guard step at the bottom has been bulged both upward and outward. The stairs at the east end give very evident signs of the upheaval which is going on, particularly the stair at the south-east corner. The south side of the Dock consists of a comparatively narrow Quay between the Dock and the Albert Basin, and this is the most dangerous portion of the entire works. At the other side of the Quay, facing the Albert Basin, the superstructure towards the east end has been bulged outwards towards the Basin for a distance of 3 ft. 6 in. Piling has been resorted to, and iron stays have been put in, but these appear to have been of little effect in checking the disintegration which is evidently in progress. The Harbour Board will be asked to contemplate a large expenditure merely for a temporary repair, and the question is whether it would be better to spend, say £30,000 to £40,000 in putting it into such a state as may render it safe for some years, or spend £70,000 in providing a new Dock entirely.

THE new Harbour at Hastings, now in progress at Rock-a-Nore, consists of the construction of two breakwaters, the eastern being a concrete extension for 610 ft. of the existing No. 2 groyne, and the western and larger one (a total length of 1,750 ft.) being a curved arm running outward from a point just eastward of the Fish Market. These breakwaters will enclose a high water area of about 26 acres. The Harbour has a depth of 14 ft. at low water, spring tides, at the entrance, and of from 10 ft. to 12 ft at the landing Quays. Each breakwater will be lighted with a special light, and will be provided with a solid parapet on the seaward side 7 ft. high, and will have a line of railway along its entire length. There will be three wooden Pier Quays forming extensions of the breakwaters, and here Sheds will eventually be erected. The work is expected to occupy two years, Messrs. Punchard, McTaggart, Lowther & Co., of London, being the contractors. Their engineer is Mr. W. Kidd, Mr. A. E. Carey is the chief engineer of the Commissioners, and the resident engineer is Mr. T. W. Barber.

FROM the designs of Mr. Marden Mowbray, of Oxford, a Screen has been erected in the Bower Chapel of the parish Church, High Wycombe. The Screen is of oak, and was originally erected in the finely-moulded Early English arch on the north side of the Church. There was formerly also a Screen dividing the south Aisle from the Bower Chapel, but of a plainer design than that on the north side, consisting of five arches, the central one being a little lower and wider than the other four. These Screens were broken down in 1863, and laid by as lumber. Very little new wood was necessary in the restoration of the Screen, and very few alterations have been introduced in the design. In order, however, to lighten its character, the plain woodwork between the arches in the upper portion has been pierced, and a similar treatment has been extended to the panels in the lower part. It is a question if this latter alteration is an improvement upon the original design, as it has a tendency to lessen the weight and solidity of the base of the Screen, where those qualities are most needed. Some carved finials have been added to the dividing uprights between the arches. On the eastern side, facing inwards towards the Bower Chapel, there is the following inscription, in old English characters, some of the letters being slightly mutilated:—"Pray ye for the Soulys of Rychard Redehode, Agnes his wyfe, ther son Willm and Johan hys Wyffe, the whyche . . . . p. clos. . . . 1468." This is the original inscription, except the date, the figures of which have been substituted for the Roman numerals formerly on the Screen, but now lost.

ST. MARGARET'S, Westminster, was built within the precincts of the Abbey in 1064 by Edward the Confessor, to serve as a Parish Church for the inhabitants of the Palace. The Saxon building erected by the Confessor was pulled down in 1140. The Nave was rebuilt by the merchants of the Wool Staple in conjunction with the Westminster parishioners, the Chancel being erected at the cost of the Abbot of Westminster. The south Aisle was added during the reign of Edward IV., by Lady Billing. Whilst the south Aisle was being built the rest of the Church was "modernised" into its present style of Gothic, viz., Perpendicular. St. Margaret's, viewed from the exterior, is not impressive. It is dwarfed by the Abbey, and one looks at the two as being specimens of "dignity and impudence," but once get inside the Parish Church and all such a comparison is forgotten. There are no Transepts, just a Nave, Aisles, and quasi-Chancel, on the north side of which stands the organ in what was once the Lady Chapel. The Altar is well raised, and is backed by a Reredos, the centre portion being filled by a carving in lemon wood, evidently Italian work of the middle of the last century, representing the supper at Emmaus. Almost all the windows are filled with stained glass, mostly modern. The subjects, however, in many cases are more suited for Christmas numbers than as aids to the devotions of those who worship in the Church. Thus, in the "Gurney" window in the north Aisle, we have two winged angels holding up a scroll representing the earliest form of a motor car. In another window, also in the north Aisle, underneath a reproduction of Botticelli's "Nativity"—the original is in the National Gallery—is a representation of two very modern-looking figures in fancy dress—one in mauve and the other in heliotrope. The Queen's Jubilee window, too, in the south Aisle is, perhaps, one of the most awful specimens of stained glass in existence. But the magnificent east window atones for them all. This exquisite piece of stained glass was made, according to some authorities, at Gonda, in Holland, and was intended as a gift to Henry VII. for the Chapel at Westminster that he was building; according to others, however, it was a wedding present from Ferdinand of Spain, and was ordered to commemorate the marriage of Prince Arthur, the elder brother of Henry VIII. and Catherine of Arragon. The central light represents the Crucifixion, the Saviour on the Cross being flanked by the two thieves. This window took five years in the making. When it was finished, Arthur was dead, and Henry VIII. refused to place it in the Abbey, as he hated to be reminded that he had married his brother's widow. The window was, therefore, sent to Waltham Abbey. At the time of the dissolution of the monasteries the Abbot, Robert Fulham, sent it to his private Chapel at New Hall, Boreham, in Essex. It afterwards passed into the hands of General Monk, who buried it during the time of the Commonwealth to save it from the Puritans. It was subsequently sold in 1759 to St. Margaret's for four hundred guineas.

SPEAKING of the way in which Michael Angelo worked, Vasari says:—"I have seen Michael Angelo make more chips of marble fly about in a quarter of an hour than three of the strongest young sculptors would in as many hours, a thing almost incredible to anyone who has not witnessed it. He went to work with such impetuosity and fury of manner that I feared almost every minute to see the block split in pieces. It seemed as if, inflamed by the great idea that inspired him, this great man attacked with a species of fury the marble in which his statue lay concealed." One instance of such frenzy of labour came when Michael Angelo was a boy but fourteen years old. He had carved a faun, one of those strange woodland creatures, half goat, half man, of which the Romans are so fond, with fresh faces, tossing hair, sprouting horns, and goat's legs. Lorenzo de Medici saw the work, and was amazed at its delicacy and the richness of fancy displayed; but he began bantering the young sculptor in the easy, gracious fashion of a great prince. "Look you," said he, "these wonderful masters are not always young as you would have it; they get wrinkled brows, they are unsteady on their legs, they lose their teeth." He indicated, as he spoke, the beautiful row of teeth which adorned the smiling lips of the creature, and passed on. Then occurred a scene full of passion and pathos, and eminently characteristic of Michael Angelo. As the curtain closed upon the prince the young sculptor flew upon his faun, mallet in hand. Round about the jaw and brow he made tell-tale lines. He puckered the eyes with crow's feet, and, last of all, he placed his chisel against the creature's upper jaw, and smote a tooth away, by that one act giving the face an indescribable look of age. Lorenzo was amazed at the marvellous transformation. It was an effective introduction to the power of the young artist, and he took him into his household and brought him up with his own children.

In Derbyshire, midway between Rowsley and Bakewell, lies the village of Youlgreave, which is worth a visit if only to see the grand old Church, whose massive Perpendicular Tower rises up amidst the trees and forms a landmark for miles around. The stone of which it is built has been turned a rich yellow brown by the fury of many a tempest, and the shattered windows of the Belfry seem to gaze with a protecting care over the village which lies below. The Church has many points of interest within as well as without: the Norman and pointed arches, the massive pillars, with their curiously carved capitals, the ancient Tombs and Monuments, and, most of all, the extraordinary Font of Norman origin, with a stoup—possibly a receptacle for holy water—attached to it. This Font is sculptured in red sandstone, and looks as if the curious dragon which straggles around it had begun but yesterday his impossible task of swallowing the stoup. An interesting story is attached to this ancient piece of workmanship. It is said that at the restoration of a village Church near by, the Font was turned out and its place usurped by a new one, which the execrable taste of the eighteenth century considered of more value and beauty. The old one was removed to the Vicarage garden, there to be exposed to the violence of wind and weather. But the Youlgreave people, possibly possessed of more knowledge and taste than their neighbours, appropriated it, and placed it in their own Church, where it now stands. Opposite the south entrance of the building is a curious old sun-dial which is said to be composed of an ancient Font. In the Church are two interesting monuments. One, in white marble, is an Altar tomb, with coats of arms displayed on its sides. It is now placed in the Chancel, and bears a recumbent effigy of Thomas Cockayne, who died in 1488, mortally wounded in a duel. The other, a Crusader sculptured in stone, is much more ancient—probably of the twelfth or thirteenth century. In the north Aisle is another interesting piece of carving in white marble. It must have been originally intended for an Altar-piece, and was, as the inscription testifies, erected by a certain Robert Gilbert in memory of his wife. It represents the Virgin crowned, bearing the Child, while on the right is Robert Gilbert, with seven sons, and on the left his wife, with ten daughters. It is impossible to leave the Church without remarking the beautiful Burne-Jones window at the east end. The centre light represents "Rex Omnipotens," holding the world in the left hand, on which the right confers a blessing. The side lights show the four Evangelists, with their several emblems, each so beautiful as to make a picture in itself, yet none detracting a whit from the all-pervading tender dignity of the central figure.

IT is very much to be regretted, from the point of view of the artist and of the lover of the picturesque, that there is no public authority which would have power to prevent the desecration of beautiful scenery. Some such restraining force is greatly wanted just now at Christchurch, in Hampshire, where the famous view of the old Priory Church from the river has been hopelessly ruined by the erection of a Boathouse, which aggressively occupies a position in the immediate foreground of what used to be an almost perfect picture. This new erection is not only itself in the worst possible style of makeshift Architecture, but has been placed so as to conceal from one side the beautiful old Place Mill, a venerable building which has for centuries harmonised with the Church behind it.

ONE is glad to see scaffolding, for the purpose of considerable repairs to roof and walls, surrounding the old house in the Marylebone Road, at the corner of High Street, where Dickens spent ten of the busiest and most productive years of his life—from 1840 to 1850 — for this means a new lease of life to a building full of interesting associations. Whilst living in this roomy dwelling with its double bow front (with occasional intervals at Broadstairs) he wrote "Bleak House," "The Old Curiosity Shop," "Barnaby Rudge," "Martin Chuzzlewit," "Dombey and Son," "David Copperfield," the "Christmas Books," and "American Notes." In the garden, surrounded by a high brick wall, and on the window-sill of the novelist's study, his pet raven hopped about and kept up a ceaseless chatter to the accompaniment of the dull roar of the traffic. Here it was that Longfellow made a stay, and Forster, Maclise and Tom Hood were constant visitors.

HENRY WOODYER, who helped to restore the older Architecture of the land after the recent wave of Italian work, and whose death was recently recorded, was born at Guildford in 1816, and educated at Eton, and Merton College, Oxford, where he took his B.A. degree. About the time he left Oxford he made the acquaintance of the late Dean of Lincoln, William James Butler, then curate at Puttenham, near Guildford. Perhaps it was owing to his influence as a member of the Cambridge Architectural Society that Mr. Woodyer—then without any settled plans of life—turned his attention to Architecture, and went to work for a few months in the well-known chambers of Mr. Butterfield, in Adam Street, Adelphi. His first independent work was a new Church at Wyke, in the parish of Worklesdon, Surrey. His practice was for the most part of a more private character than that of his contemporaries. One of his earlier works was the Sisters' House at Clewer, with Orphanage, St. John's School and Hospital, culminating in the beautiful Chapel of the Sisterhood. Out of this grew buildings for the Sisterhoods at Ditchingham and Horbury, and the Hospital at Eastbourne. Churches built or restored by him may be found in many parts of the country, amongst which may be mentioned the Church at Highnam, near Gloucester, with its fine spire, built by Mr. Gambier Parry; new Churches also at Reading, Wokingham, the College and Chapel built by Sir Frederick Ouseley, near Tenbury; others near Southampton and Portsmouth; the Sailors' Chapel at St. Raphael, and Almshouses, Bristol; and many others all built on the type of old English Gothic. But, perhaps,

HANOVER CHAPEL, REGENT STREET.

Mr. Woodyer's work was best shown in his restorations of old Churches and in that most difficult work of adding to and enlarging them. Among the many restored and enlarged Churches may be mentioned the fine old parish Church at Newbury, the Church at Mells, Somersetshire, Ask in Surrey, Mitchell Dean in the County of Gloucester, Beaconsfield, Bucks; St. Helen's, Abingdon, with its five Aisles, and Churches in Surrey and Sussex. Of domestic work mention should be made of the renovation of the Hall of Eton College, additional Schools there, the School at Cranleigh, Surrey, and he also was Architect for many Parsonages, as well as Country Houses and parish Schools. Mr. Woodyer never entered into any competitions for any building, public or private, having as much work as he cared to undertake from private clients.

THE meeting of the British Association at Liverpool next month promises to be unusually successful. St. George's Hall, where the Reception Room and Offices will be situated, has been repainted and decorated at great cost. A very interesting excursion to the Isle of Man has been arranged. The excursion will extend over five days—from Thursday, September 24th, to Monday, September 28th, inclusive. The party will be divided into four sections—archæologists, geologists, zoologists, and botanists—and will be conducted by competent leaders over those parts of the island which offer special attractions for scientific study.

ANOTHER big scheme, involving the expenditure of at least £40,000, is before Torquay Town Council. Never was there a Corporation more vigorous in new and costly schemes. It was only last week that it received the Local Government Board's sanction to the expenditure of £23,000 on electric lighting works. The new scheme involves the purchase of the Dartmoor Valley in which the town's reservoirs are situated, as well as the adjoining Trenchford Valley; the removal of all the farms and dwellings from the drainage area, and the stopping of all cultivation of the soil. It is beyond dispute that the town's water supply must be increased. According to Mr. Hawksley's showing, the population supplied from the present reservoirs is 3,000 in excess of the number which they are capable of serving at the present rate of consumption. This has not been felt because the stream in the Trenchford Valley has been used to augment the reservoir supply; but those who know the Trenchford Valley best, like least the use of its water under existing conditions.

A FEW days ago a man named Matthew Donnelly, who lives in Duleek, Belfast, and occupies a garden on the site of the Old Abbey of Duleek, near Drogheda, made an extraordinary discovery. While digging in his garden he uncovered a large flagstone, over which a deposit of earth, about 3 ft. in depth, had accumulated. With the assistance of three men, the large flagstone was raised, when a cavity was revealed beneath about 10 ft. in depth and 4 ft. in width, in which lay the skeletons of a man and a horse. The human skeleton appeared to be over 6 ft. in length. No weapons, armour, or clothing of any kind were found. The sides of the cavity are built of masonry.

HANOVER Chapel, the front entrance of which we illustrate on this page, is no more. It was built from the designs of Professor Cockerell, R.A., some sixty years ago, and the Portico was the best example of revived Greek Architecture in England.

MR. J. L. PEARSON, R.A., has recently made a further report upon the West Front of the Cathedral to the Dean of Peterborough, in which he says:—I have again had an opportunity of inspecting the West Front, and under more favourable circumstances than before, for since my previous visit the whole of the upper surface of the groining has been freed from the very considerable accumulation of rubbish and dirt which covered it; the pockets of the groining have also been cleaned out. This work, I regret to say, has disclosed a state of things I had not fully realised, inasmuch as the under surface of the groining does not show how large and deep the fractures really are, nor how much it is separated from the walls, and although I had realised the fact that the filling in was not well put together, yet I had not supposed it to be so badly built as it is now found to be. The removal of the rubbish has also exposed the walling over the arches which before could not be got at, and which are found to be composed of small thin rubble stones with no mortar to hold them together, and as this condition of things extends through its whole thickness up to the dressings which form the outside surface, I think you will understand that, unless the whole is taken out and rebuilt, it would scarcely be safe to rely upon bolts keeping it in its place. The gap, to which I before alluded, which exists between the inside part of the wall and the outer part, can now be clearly seen, and anything more alarming I can scarcely imagine. Since my former visit more scaffolding has been put up to the north gable, and this enabled me to examine it more closely, and I regret to say I found it very much worse than I had believed it to be when looking at it from a lower level; it is indeed surprising how it stands in its present condition. I therefore feel bound, but with great reluctance, to suggest that this gable should be taken down and rebuilt, numbering or marking each stone of the outer surface that the whole or nearly the whole shall be replaced without alteration. The taking down of this gable will enable the great arch below to be properly rebuilt and bonded and partly straightened, and the spandrels also to be properly rebuilt with large bedded stones; it will then be possible to add the bolts I have before recommended, so that they shall have the supporting power I intended them to have, for with the walls in their present condition they would be of little or no use. The other two gables, walls, &c., are much in the same condition, and should, I think, be treated in the same manner.

IN section one of the Congress of the Sanitary Institute held at the College of Medicine, Newcastle-on-Tyne, Professor Corfield, in his inaugural address, said that, having been a teacher of hygeine in a Metropolitan Medical School for more than a quarter of a century, he thought he might say something of the progress made in the teaching of public health. All the great ancient teachers of medicine showed by their treatises that they attached the highest importance to the study of the methods for the prevention of disease, but even their treatises had not anything like the influences upon the world's history that the works of Moses had had. Moses had handed down to us the practice and teaching of the ancient Egyptians on the methods for preventing the spread of infectious diseases and preserving the health of the community. Having referred to the Roman engineers and the Greek gymnasia, remarking that there seemed to be a danger nowadays in our Public Schools of athletics being considered of more importance than mental exercises, he referred historically to the work of John Howard, the Frenchman Parent Duchaklet, Dr. Snow, Sir William Jenner, Sir Edwin Chadwick, Sir Benjamin Richardson, Dr. Edmund Parkes, and many others. He said that among our great teachers we must not forget to include Edward Jenner. Having regard to the Parkes Museum and the work of the Medical Schools, he insisted upon the absolute necessity of the proper qualification of the examiners who were to examine medical men and sanitary inspectors in hygeine. He also outlined the work to be accomplished by congresses, but said that by far the most important work was that which was done in the Class Room, the Laboratory, and out of doors, or should he say in the courts and alleys of our great towns? It was in these places that an accurate practical knowledge of public health work in its various branches could only be acquired. The acquisition of such knowledge was a labour of years, and required the devotion of a lifetime. Dr. Henry W. Newton (chairman of the sanitary committee of the Newcastle Corporation) and Mr. P. G. Griffith (Cheltenham) read papers on the vaccination and smallpox subject, and the discussion which followed was unanimously in favour of vaccination. Dr. Arthur Newsholme (medical officer for health at Brighton) read a paper which went to show that oysters and mussels taken from the banks near sewage outflow are a means of communicating disease. In the sanitary inspectors' section, a resolution supporting the Superannuation Bill of the Sanitary Inspectors' Association was adopted. Mr. Thomas Cass (Hull) urged that more attention should be paid to the drainage of factories. In the medical officers' section a discussion on the submerged tenth elicited general remarks on the importance of dealing with the young. Dr. Sims Woodhead urged the rigid registration and frequent inspection of milk supplies by both medical officers and veterinary surgeons. Dr. Wynter Blyth (medical officer of health for St. Marylebone) delivered a lecture on the isolation of infectious sick in Hospitals. He said that the provision of due hospital accommodation in a district was a duty and a necessity.

FOR the purpose of erecting Lodging Houses and Model Dwellings in groups of single Tenements, the Corporation of Manchester has decided to borrow £110,000. The new dwellings are to be situated in different parts of the city, and, in addition to erecting the buildings, the scheme involves the destruction of a great deal of insanitary property. The destruction of insanitary property has been taken in hand by various Corporations since they were empowered by the Legislature to undertake work of this character. But in this case the Manchester Corporation is going beyond mere demolition, accompanied, as it usually is, by the re-sale of the property, and intends to erect the Lodging Houses and Model Dwellings itself. The housing of the labouring population is a perplexing problem in two sorts of areas widely different from each other—the agricultural village and the big city. In the agricultural village the cottages cost but little, the sites on which they are built still less, but the wages of labour are so low that even these cottages cannot, when new and in good condition, command a rent sufficient to yield anything like a fair return for the outlay. It will be interesting to see if the Manchester authorities can succeed, where other people have failed, in confining their houses when built to those for whom they are intended.

A CORRESPONDENT writes:—"The suggestion referred to in a recent number of your Journal, that the Zuider Sea might practically be enclosed and dried up by joining the six islands that run in a continuous north-east arc from the mainland at the Helder for over 100 miles to near the German shore, is not really feasible. The Islands in question are Texel (the largest), Vlieland, Terschelling, Ameland, Schiermonnikoog, and Rottummoroog, the latter little more than a sandbank, upon which one family only lives. I happen this summer to have spent my holiday upon and amongst this interesting group of Islands, and there is certainly no actual intention in Holland to attempt to make a uniting bank of any kind between them. Indeed, to those familiar with the surroundings, the idea seems, on the face of it, practically impossible. Nieuwe Diep, the Chatham or Woolwich of Holland, is on the eastern side of the Helder, which town it joins. The sea across to Texel is several miles wide, and over it the Dutch fleet constantly steam. If the passage way was blocked, Nieuwe Diep, with its Arsenal, would be ruined. Further, Schiermonnikoog (a name derived from the old Friesian words "schier" (grey) and "monniken" (monks), freely translated meaning "The Isle of the Grey Monks," and pronounced Skim-monna-co), is fully ten miles from Ameland, its nearest neighbour, over which distance a strong sea runs. And, so far from any blocking or joining of the Islands being anticipated, Count von Berndorff, the German millionaire who now owns the whole Island, is just about starting his scheme for building a fashionable Watering place at that end of Schiermonnikoog nearest to Ameland. He means it to be a rival to Schevenuigen to the south, and Heligoland in the north. For this undertaking Mr. Georg Thielen, of Hamburgh, is the Architect, and Mr. R. Jürgens, also of Hamburgh, the Consulting Engineer."

THE members of the Iron and Steel Institute, who are holding their annual meeting at the Provincial College, Bilbao, have elected Mr. E. P. Martin, of Dowlais, as president of the Institute for the next two years. Included in the programme was the reading and discussion of a paper by Señor don Pablo de Alzola, C.E., the director of the Altos Hornos Company of Bilbao, which was of exceptional interest, inasmuch as it advocated protection for Spanish iron and steel industries:—Mr. William Gill, M.I.C.E. (of Bilbao), read an interesting paper on "The Iron Ore Indstries of Biscay and Santander," in which he dealt with the present condition and future prospects of those mining districts. He said the total quantity of iron ore shipped in 1895 from the Bilbay River was 4,214,000 tons, of which 3,122,000 tons went to British ports, and the exports of this and the adjoining districts—now rapidly developing—would probably reach 6,000,000 tons. The approximate output of the district from the commencement of modern mining operations in 1860 to the end of 1895 was about 68,000,000 tons, and it was roughly computed that about half that quantity yet remained unworked. The total number of persons employed in the mines during 1895 was 8,734 men, 62 women, and 209 boys. The hours varied with the time of the year, but there was an almost universal system of allotting to each gang of workmen so many waggons of ore and rubbish per day, and on the task being completed they could go home, or do more work, which was paid for as overtime. Feast days were numerous, and what with these and bad weather the number of effective working days in the year were about 285. Accidents were not frequent, and were principally caused by waggons running over the men or by falls of rock. The lodging, clothing, nutrition, and hygienic surroundings of the workmen fell far short of what they should be, but compared with other provinces of Spain their lot was enviable. Consequently there was a constant influx of outside labour far exceeding the work available, and in the winter time there was much distress among the people. Labour troubles, though rare, were not unknown, thanks chiefly to Socialistic agitators. One of the most interesting features of the Bilbao district was the variety of haulage systems employed for the conveyance of the ore to the railways. The haulage by bullock carts since 1881 had gradually died out, and the ore was now brought from the mines by railways, inclined planes, endless chains, or wire rope-ways worked automatically, or by steam-power. Improvements were now being made which would place Bilbao in the first rank as a commercial port and harbour of refuge. Professor Wadding, of Berlin (the Bessemer Gold Medallist), followed with a paper on "The Roasting of Iron Ores with the view to their Magnetic Concentration." Excursions were made into the Basque country and to the Oak of Guermeir, where Spanish Sovereigns knelt and swore to uphold the liberties of Basques, the castle of the ex-Empress Eugenie, a Basque festival at a watering-place; and also to the Visenyan Iron and Steel Works and the Iberian Tin-plate Works. Other papers read were: Mr. H. D. Hibbard (New Jersey) on "Sand on Pig-iron, and its Avoidance," Mr. T. W. Hogg, of Newburn Steel Works, Newcastle-on-Tyne, on what he termed "The Missing Carbon; Mr. W. Colquhoun, of Liverpool, on "A New Water-cooled Hot-blast Valve."

EXCAVATIONS are being undertaken at Furness Abbey with a view of definitely ascertaining the extent of the original buildings and the ground plan. A start has been made with the work, but some time will elapse before there is anything to show progress made.

ANCIENT ARCHITECTURE.

THE CAVE TEMPLES OF INDIA.

BY I. WILLIAMS.

TO Mr. James Fergusson we are almost entirely indebted for the earlier history of India, and for a mass of information collected during visits to the principal Caves and Temples in different parts of this vast empire. An impression has generally prevailed that the Cave Temples of India are of a date anterior to any existing remains of antiquity, and that the Arts of Persia and Egypt proceeded from India, whereas it has been clearly proved that Egypt had ceased to be a nation before the earliest of the Cave Temples were excavated. The inference that the Persians derived their forms of Architecture and ornaments from those of the Temples of India has been founded on the similarity of the capitals and columns of Persepolis to some of the Hindoo Temples, which it has been supposed were built in an older style than prevailed at the time of their erection. The ancient Monuments of India are of two kinds, the excavated and the structural, the one being cut out of the rocks, while the others are erected of different materials in the usual manner. The former are the most ancient, and were made by the Buddhists, a sect whose earliest existence cannot be dated prior to the sixth century before the Christian era. It is extremely doubtful whether they ever built Temples, as no trace of these buildings now exist, nor is any description of them to be found in the works of native or foreign writers. Mr. Fergusson considers that there is no cave anterior to the middle of the third century B.C. The Caves consist of three classes; the first of these are the Vihara or

MONASTERY CAVES,

the earliest of which are natural caverns slightly improved by Art; those which followed had a verandah opening into the cells for the abode of the priests, but without sanctuaries or images of any kind. The simplest form of these consists of one square cell with a porch, sometimes nearly 30 ft. in length; in others the verandah opened into a square Hall, on three sides of which cells are placed. Another sub-division of the Vihara Caves consists in the enlargement of the Hall, and the consequent necessity of the use of pillars. In these, besides the cells, there was a deep recess, in which the statue of Buddha was placed. The Caves at Ajunta are the finest, though good specimens may be seen at Ellora and Salsette. The Buddhist Chaitya Caves form the second class, and must be considered as the Temples or Churches, and one of them is attached to every set of Caves in the west of India; the plan of them is exactly the same, though the details and sculpture vary with the age in which they were erected. The Cave of Karli is the most perfect, and believed to be the oldest in India. It has been supposed that they were copies of the interiors of structural buildings, though no traces of such buildings exist in India, Ceylon, or beyond the Ganges. There is an external porch in all these Caves, and an internal Gallery over the entrance. The centre part of the Temple is surrounded by circular or octagonal pillars that divide it from the Aisles, and are carried round the semicircular part at the farthest end; the whole bears a strong resemblance to the arrangement of the Early Norman Churches. The Nave is twice its width, and is roofed by a waggon vault; the roof of the Aisles is generally flat. In the centre stands the Daghopa, in part of which there is always a sculptured niche containing a figure of Buddha. The third class consists of

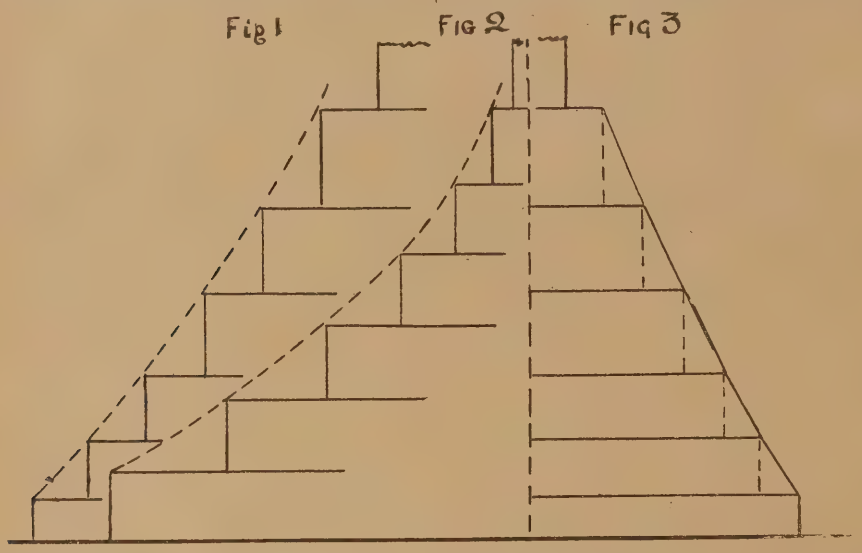
BRAHMINICAL CAVES.

Which mostly have a great resemblance to the Vihara, though the arrangement of the pillars and the position of the sanctuary are in no instance the same. The walls are nearly always covered with sculpture, while those of the Vihara are mostly decorated with painting and inscriptions. The finest specimens are at Elephanta and Ellora; others are to be found at Salsette. The excavated Temple at Elephanta is 130 ft. long by 110 ft. wide and 14½ in height. The ceiling is flat and supported by four rows of columns, connected by a simple architrave. The columns are 9 ft. high, standing on pedestals; they are reeded and have projecting capitals of semi-circular form, from which spring the brackets of the ceiling. Against the walls are sculptured colossal human figures in high relief, which differ from each other by a variety of symbols. Of these very interesting monuments there are large numbers: at Kannari there are nearly 100, consisting of three stories, cut out of the face of the rock. In many of the Caves at Ajunta, which are 150 ft. above the ravine in which they are situated, there are remains of painting and inscriptions. The form of the arch was unknown in a structural form to the Buddhists, but was nearly always adopted in the Chaitya Temples, while in the Brahminical Caves the ceilings are invariably flat. There is another curious class of excavations cut out of the rock and which seem to be imitations of structural Brahminical Temples. They are of one block of stone, though executed in a way to convey the impression that they are erected of jointed masonry. These Temples have the appearance of standing in pits, as all the surrounding parts have been cut away, and the present level of the ground is, of course, higher than the Temples. The Kylas at Ellora, which is one of the most modern specimens of excavation in India, is, according to Mr. J. B. Seeley, 401 ft. long by 247 ft. wide, and is at the north-east angle 104 ft. deep. Round the sides of this area is a Cloister, supported on square pillars, which are covered with subjects from the Indian mythology. The centre part is occupied with the Entrance Pavilion, the Chapel of Nandi, and the grand Temple and Sanctuary. The approach to it is by a bridge, from which you descend to the Chapel by nine steps, and, passing on over another bridge, you arrive at staircases on each side, which lead to the Inner Court, the Temple, and Cloisters. On each side of the bridge are gigantic figures of elephants, and, beyond, are two carved pillars. Truly this is

A WONDERFUL MONUMENT,

and impresses all who see it, not on account of its height, its forms, the regularity of its lines, or the profuse number of ornaments with which it is covered, but by its great peculiarity of situation, which conveys the feeling of its originating from superhuman efforts. It would be a difficult matter to trace the history of the constructive buildings of Hindoostan. There is no characteristic which can be produced with certainty of all the styles of Architecture, except that their history is written in decay. The absence of the arch in all construction of every age is general, and the principle was quite unknown. The upper parts of the buildings were supported on square pillars, and from all sides of their capitals brackets projected equal to their width, and leaving generally a space equal to three diameters between their greatest projection, thus leaving only one-half of the whole length of the architrave unsupported; but when a greater space was required, a succession of projecting brackets placed above each other was adopted, sometimes meeting in the centre, thus having the effect of a horizontal arch. One of the oldest structural Monuments is that of Bobaneswar, built about the middle of the seventh century, and in a style of Art for which it is very difficult to find explanatory terms, the details being so far removed from all the ordinary forms of Architecture. In plan, the Indian Temples or Pagodas are square, the only light admitted is by the door, and darkness seems to have been considered necessary to the sacredness of the building. Of the Hindoo Temples, the largest is that at Chillambaram, which is enclosed in a rectangular space of 1,332 ft. in length by 936 in width, by walls 30 ft. in height. Here is a variety of Temples more curious than beautiful, connected by extensive colonnades and porticoes. Pyramids stand over the entrances of the outer enclosures, and consist of several floors. The Bunds or dams are among the interesting works of the Hindoos. These are made to intercept the course of small rivers and thus form an artificial lake for purposes of irrigation. On these dams, which are constructed of stone, Palaces and Temples are placed and between them broad flights of steps lead down to the water. Nothing can be more erroneous than to compare the Architecture of India with that of Egypt, or even with Classic styles to which there is no resemblance whatever. The Indian styles, whatever their defects may be, have, at least, the merit of being original.

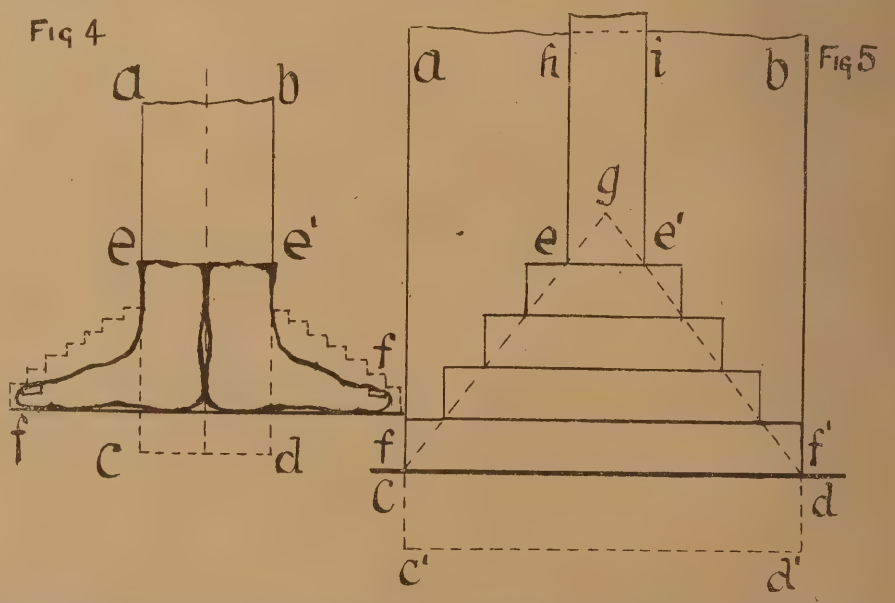
A RELIC OF EARLY IRELAND.



SITUATED upon the estate of the Herbert family, near the lakes of Killarney, the grey stones of the stately Muckross Abbey speak mournfully and sternly of the past. The history of these ruins dates back to the days of 1140; at least, this was the original site of an Abbey erected by the Cistercians, a community of monks noted for the massiveness of their buildings, of which many vestiges are found. In 1192 the Abbey was destroyed by fire. In the year 1340 Muckross, the ruins of which remain, was reared on the site of the original building by the famous McCarthys, Princes of Desmond. This Abbey was long known as Irelaugh, which means the Building by the Lake. The Franciscans were established here upon the rebuilding of the Abbey. The place was repaired in 1602, and again in 1626. It is kept from falling into greater decay by the care of the landlord, who has a man employed to scrape away the gathering moss and root out the weeds from the heavy stones of the floors and walls. The portion occupied by the Church is about 100 ft. by 24 ft., grey with the discoloration of age and storm, and adorned by moss and trailing vines. A stone marks the place where once stood the High Altar in the Chapel of the Monastery. At its rear was a lengthy window, the opening of which is still there. The window was of Gothic style, and at the very foot of the Altar was the tomb of McCarthy Mor. At the right hand side of the Altar was the seat occupied by the bishop, and at the left still may be seen the small opening in the ancient wall where the sacred vessels were emptied of water. The stone gutter still remains where years ago the water trickled into the earth. The ponderous doorways of stone, the arched windows and the chimney places are well preserved. That portion of the Abbey which has undergone the least change consists of four corridors supported by massive stone arches facing outward to a court which is perfectly square, the corridors framing it about. The floor of this court is merely of earth, beaten down by the tread of ages. At the angle of two-line of corridors which were used as a walk by the monks, is a double niche in the wall. According to tradition two large statues once filled these arched cavities, one being a representation of the Mother of God, as the symbol of truth and purity. Before this statue persons who were supposed to be wrongly accused of crime were accustomed to kneel and assert their innocence. On one occasion, it is said that a man guilty of murder casting himself upon his knees before the image declared his innocence of the deed. As he pronounced the words he fell forward dead. So terrible was the impression produced thereby upon the monks, that to avoid further perjury and sacrilege they bore off the statue and buried it at night beyond the Abbey walls; yet where the form of stone was hidden has not yet been revealed. The niches are empty. The Abbey is surrounded by an extensive cemetery, and on one side of the Church is a Vault known in the neighbourhood as the "Monks' Vault," it is a small compartment set in the outer wall of the Church and closed across by iron doors with immense hinges.

IT is stated that plans have been prepared for the erection by a Birmingham syndicate of 763 houses upon 23 acres of land situate in Red Lane, Coventry. Three streets will lead from Red Lane, and the whole of the houses will be easy of access from Red Lane. The houses are to be generally of 12 ft. frontage, and will have a depth of not less than 80 ft. These houses it is intended to let at 3s. to 4s. rental. A better class of house will be set back 6 ft. from the road, and will be provided with parlour, kitchen, pantry, scullery, and three bedrooms. The cost of making the streets will be about £9,000, and the total cost of the scheme £186,000.

FOOTINGS.



THEIR NECESSITY AND IMPORTANCE.

THE subject of Footings is not one of a light or airy nature; on the contrary, it is, or should be in practice, of a solid and substantial character. Footings possess no pleasing forms, nor are they invested with lines of beauty. Neither have Footings any attractions for the general reader, though they have an interest for the engineer and the builder. We bestow no ornamentation upon them, for they are hid in the ground. They never see the daylight, and may be submerged in damp or waterlogged soil, or founded on bed-rock, far below the surface of the ground. Nevertheless, Footings are a most important consideration in building construction, notwithstanding that the scientific principles involved in their functions are often, we know, greatly ignored. All building and engineering structures which must have substantial foundations, generally have to resort to the expedient of Footings. The Metropolis, as we know it, would have been a commercial impossibility without introducing the expedient of Footings in foundations of large buildings and structures for Warehouses, Factories, Mills, and other purposes. Indeed, we may say our commercial eminence has, in a sense, been founded upon "Footings." Footings, in the eyes of a builder, rightly are to a building what the foot is, in a restricted sense, to the human body. They obviously serve to distribute the weight over an enlarged surface. But the effectual performance of this service depends upon their being designed in accordance with scientific principles, and constructed with a due regard to the mechanical laws involved. Footings possess the further function, obviously, of decreasing the unit intensity of pressure of the base upon the soil. But do builders invariably do justice to this important principle? If so, why make all the courses with the same projections and heights, when the unit intensity of pressure decreases at each course downwards. The unit pressure is, of course, lightened in the inverse ratio that the area of the offsets is increased at the levels of the successive courses. We may be permitted to give a simple illustration, to readily show the typical operation of this function. If we have, for instance, a brick pier of a cross section of 2 ft. square, and say 10 ft. high, carrying a load of 16 tons, or 4 tons per square foot of section, which may be considered a safe load for a certain description of brickwork, though an overload for some soils. We know that if such a loaded pier is placed upon the London clay of ordinary foundation levels, it will sink very considerably, and unequal settlement of variably loaded adjacent parts cause cracks, bulges, and ruptures of the superstructure. Indeed, the consistency of the clay may be such that the Footings will continue to sink slowly for several years, until an equilibrium of the forces actuated by the load, and a reaction of the soil, is brought about. But if the area of the bottom of the pier be doubled, while its weight remains the same, the unit intensity of the pressure on the soil is just half, or 2 tons per square foot. This latter unit load most of the London clay, under ordinary conditions, will bear safely without appreciable or inconvenient subsidence. Here, then, it may be observed, if the same projection for the same height of the courses is sufficient for the intensity of the 4-ton unit level, it must be more than sufficient at the lower unit, or 2-ton level. The projection of the latter course could, for the corresponding strength, afford to be double, or inversely as the unit pressure. Or if the projections remained regular, the thickness of the course could be reduced in the ratio of the reciprocal of the square root of 2, *i.e.*, $\sqrt{2} = 1{\cdot}414$ of which the reciprocal is $\frac{71}{100}$; in other words, the thickness of the bottom course could be over one-fourth less than that of the top course. If, on the other hand, the ratio of the unit pressure at the bottom Footing course to that of the top course were one-third, the projection of the bottom course could be three times that of the top course. Or, again, the thickness of the bottom course could be the reciprocal of the square root of 3 (1·732), *i.e.*, $\frac{58}{100}$, or a reduction of $\frac{4}{10}$ in the thickness. In either case there would be a considerable economy in dimension stone; for instance, where employed in foundations of an extensive character. In many cases where we see a saving might thus readily be effected, no attempt is apparently made to economise—and why? Footings, as usually constructed by official rule-of-thumb methods, are, we know, gradually enlarged by a regular succession of equal offsets of the same thickness. This method, however, as we have said, is not scientific, though in brickwork it is practically convenient. In brickwork each offset consists of the successive courses being set back a quarter brick, say 2¼ inches. The offsets thus form parallel vertical and horizontal surfaces longitudinally on both sides of the wall, whether solid or fenestrated, alike. Curves occur only in plan where it is to correspond with circular work in the superstructure. The broadening or enlargement of the base by means of Footings obviously imparts another important property, that of lateral stability or steadiness, to prevent leaning or toppling over from wind pressure, or side thrust from any other force. Footings appear a simple affair, and are frequently so treated, or mistreated, as resulting cracks, fissures, bulges, &c., in superstructures, so frequently observable, even in good buildings, too often betray.

IDEAL FOOTINGS.

The perfect type of Footings should increase the strength and thickness of each offset in proportion to the increase of the unit pressure, so that the strength of the offset shall have a constant ratio to the pressure it sustains. We find the nearest general practical approach to this method is followed in the steel and concrete foundations of the modern tall steel frame or "cage" buildings of Chicago, New York, &c. In these concrete-embedded steel I beam Footings, which are laid in regular layers, each layer crosses the next one above it at right angles. In each layer the extreme bottom fibre of the beams are given the same unit tensile strain. This is accomplished by giving the upper layer of beams greater depth than the lower one, in proportion to the number and length of the beams in the respective layers. Considerable saving of the steel is thus effected. As steel has a much higher transverse strength than stone, it provides a larger Footing base with much less height, and structural weight of Footings upon the soil than is possible with stone. If we assume, as an illustration of this principle, a case in which landings, or large dimension stone, is used for each course of Footings, we may disregard the appropriate dimensions for the unit loads here used. Suppose, then, the load at the foot of the wall or column is 6 tons per square foot, and that it is required to reduce it to 1 ton per square foot upon the soil. Further, assume that the base plate of the column is sufficiently strong to carry the entire load upon a limited breadth of its perimeter. This condition obviates the necessity for making the entire length of the beam of sufficient transverse strength for a centre total load. A much less expensive method, however, of treating the problem is that of making the base plate strong enough for the entire load, so that only the cantilever of the length of the projection has to be considered. This method can be carried out in two ways, depending upon the governing conditions of rectangular beams and cantilevers, viz., that their moment of resistance varies directly as the breadth and the square of their depth, and inversely as their length or projection. Hence the projections may be all alike, and the heights or thicknesses of the courses varied directly as the squares in succession, as

in Fig. 1. Or, on the other hand, the thicknesses of the courses may be all alike, and only the successive projections varied inversely as in Fig. 2. In either case, the profile of the offset arises, gives nearly the same character of curve, which is of the logarithmic class. The approximate curves are shown in dotted lines. If the Footings were of concrete they could be constructed of trapezoidal blocks, as in Fig. 3. The construction of Fig. 1 depending on the square of the depths of the offsets, and representing approximately the ideal form of Footings, can be derived by the resolution of the equation $W = \frac{bd^2}{l}$ which expresses the above relative conditions of transverse strength. Then resolving for the depth, d, $d^2 = \frac{Wl}{b}$ therefore $d = \frac{\sqrt{W.l}}{d}$. Then take the square roots of the comparative unit loads W, on the successive offsets, and expressing the resultant relative heights in the nearest one-fourths of unity, the following table of the relative heights corresponding to the unit loads on the successive offsets, is the data for Fig. 1.

Tons.			Heights.
6.	$\sqrt{6}$	= 2·449 =	10
5.	$\sqrt{5}$	= 2·236 =	9
4.	$\sqrt{4}$	= 2·000 =	8
3.	$\sqrt{3}$	= 1·732 =	7
2.	$\sqrt{2}$	= 1·414 =	6
1.	$\sqrt{1}$	= 1·000 =	4

Again, if the heights of the offsets be alike, and only the projection, l, is varied, as in fig. 2, then resolving the above equation for l, we get $l = \frac{bd^2}{W}$ *i.e.*, the projection l is inversely as the load W. Hence, if we assume a projection sufficient for 6 tons of unit load as $\frac{1}{8}$ part of the length of the unit projection for the ton, the following will be the several projections corresponding to the successive offset unit loads, viz.:—

Loads.	Projections.
6 tons.	$\frac{1}{8}$ of unit for 1 ton.
5 ,,	$\frac{1}{5}$,, ,,
4 ,,	$\frac{1}{4}$,, ,,
3 ,,	$\frac{1}{3}$,, ,,
2 ,,	$\frac{1}{2}$,, ,,
1 ,,	1 ,, ,,

DEVELOPMENT OF FOOTINGS.

The prototype of Footings is readily seen in the human foot. The idea may be conceived from Fig. 4, which consists of a pair of feet placed together, heel to heel, in profile. If a rectangular figure a b c d be superposed, the footless shank is shown, which has a much less breadth of base than the combined feet. The development will appear by superposing a regular stepped series of Footing offsets, ef, e'f'. From this ideal development we can pass on to a practical one, Fig. 5, in which a b c d is a rectangular profile of a masonry pillar. Assuming that a less cross section of masonry will support the imposed weight, we accordingly reduce the breadth of the section to, say, one-fifth, and continue it down and out to the full width of base by off-setting Footings ef, e'f', to obtain the same width f'f. The weight of the massive rectangle of masonry, we assume, caused it to sink by overloading the foundation soil down, say, to c'd'. But by lightening the imposed unit load upon the soil by the amount due to the surplus masonry, a h e f, on one side, and by i b e' f' on the other side, we have obtained equilibrium of the reaction of the soil with the lightened unit load at the level of c d. We have only here shown two dimensions in the figures, *i.e.*, height and breadth, but in reality it is evident there is a third dimension, length, in order to represent weight in the assumed solidity of the masonry. In practical designing the mind must always conceive of the design in three dimensions, its height, breadth, and length, and accordingly visually represent them by plans and sections accompanying the elevation. In computing the weight of masonry a unit length of one foot is usually adopted for the solidity, thus making a cubic foot for each one foot of the two dimensions. The calculations are thereby much facilitated in working out the structural weights of the several parts.

PUBLIC BUILDINGS MAINTAINED BY GOVERNMENT.

A PARLIAMENTARY paper was recently issued giving the following list of those buildings in the United Kingdom of which the Architectural structure and fabric are maintained by Her Majesty's Office of Works, and, being of considerable interest, we publish it in full. The list is signed by the Hon. Reginald B. Brett, Secretary to the Office of Public Works and Buildings:—

Royal Palaces: Buckingham Palace (with Royal Mews), St. James's Palace, Kensington Palace, Marlborough House, Windsor Castle (with Adelaide Lodge and Frogmore House), Hampton Court Palace, Hampton Court Stud House; White Lodge, Richmond Park; Kew Palace and buildings on Kew Green, Kew Observatory; Pembroke Lodge, Thatched House, and East Sheen Cottage, Richmond Park; Bushy House, Upper Lodge, The Cottage, Hawthorn Lodge, and other houses in Bushy Park; the Banqueting House, the Wilderness House, the Pavilion, and other houses at Hampton Court; Holyrood Palace, Linlithgow Palace (ruin), Dunfermline Palace (ruin), St. Andrew's Castle (ruin), Carisbrooke Castle, Edinburgh Castle (Banqueting Hall, Argyll Tower, and St. Margaret's Chapel).

Ecclesiastical Buildings: Chapter House at Westminster Abbey; Glasgow Cathedral; General Assembly Hall, Edinburgh; Elgin Cathedral (ruin), Fortrose Cathedral (ruin), St. Andrew's Cathedral (ruin), Arbroath Abbey (ruin), Dunfermline Abbey (ruin), Dundrennan Abbey (ruin), Haddington Abbey (ruin).

Parks and Gardens: Rangers' and Superintendents' Lodges in various Royal parks; Albert Memorial, Kensington Gardens; Marble Arch and Hyde Park Corner entrance, Hyde Park; Wellington Arch, Green Park; various other buildings.

Houses of Parliament, Westminster Hall, Stables of the Speaker at Millbank.

The General Post Office and other Post Offices in Great Britain; the Custom House, Lower Thames Street, and other Customs' buildings in Great Britain; the Inland Revenue Offices in Great Britain, the County Court buildings in England, the Metropolitan Police Courts, the Sheriff Court Houses in Scotland (partially), the District Probate Registries in England; the Bankruptcy Offices, Carey Street, London, and Provincial Bankruptcy Offices; the Offices of the Surveys of the United Kingdom at Southampton, and District Survey Offices in Great Britain; Menai Suspension Bridge. Ancient Monuments of a structural character (all ruins), viz.: Pictish Towers, Glenelg, Inverness-shire; and Mousa, Shetland; and Carloway, Rossshire; Burgh of Clickanim, Shetland; Edin's Hall, Cockburn Law, Berwickshire; Ancient Chapel, Isle of Whithorn.

Other Public Buildings in London: Admiralty Offices, Agricultural Department, Bethnal Green Museum, Board of Trade, British Museum, Burlington House; Charity Commission, Whitehall; Chelsea Hospital; Civil Service Commission, Cannon Row; Colonial Office, Council Office, Education Office, Foreign Office, Geological Museum, Home Office, Irish Office; Land Registry, Lincoln's Inn Fields; Land Revenue Record Office, 6, Whitehall; Local Government Board; Local Government Board (Animal Vaccine Station, Lamb's Conduit Street); Lunacy Commission, Whitehall Place; Military School, Chelsea (Duke of York's Royal); Mint, Royal; National Debt Office, Old Jewry; National Gallery, National Portrait Gallery, Natural History Museum, Patent Office, Paymaster-General's Office; Public Works Loan Office, Bank Buildings, E.C.; Public Record Office Buildings; Royal Courts of Justice; Scottish Office, Whitehall; Somerset House, South Kensington Museum, Stationery Office; Standards Department, 7, Old Palace Yard, and adjoining Tower; Tower of London (excluding Barracks), Trafalgar Square and the statues thereon, Treasury Chambers, Treasury official residences, University of London; War Office, Pall Mall; War Office, Winchester House, St. James's Square; War Office, Horse Guards, Whitehall; War Office, Queen Anne's Gate, &c.; Waterworks, Orange Street, Trafalgar Square; Whitehall Banqueting House; Woods, Office of; Works, Office of; various minor offices, various public statues.

Other Public Buildings in Edinburgh: Parliament House and Courts of Law and Exchequer Chambers, General Register House, Royal Observatory, Local Government Board and other public offices, Science and Art Museum.

AN ANCIENT FONT.

IN THE CATHEDRAL CHURCH OF ST. NICHOLAS, NEWCASTLE.

WITH its exquisitely beautiful cover, the ancient Font of the Cathedral Church of St. Nicholas may well rank amongst the many ancient historic Fonts to be found in this country. Of the exact date of the Font itself we are not certain, but in all probability it is of the same date as the Tower underneath which it stands, and which is generally supposed to have been built about 1450. A recent writer ascribes the date of the Tower as early as 1435, but it is more likely of the former date. The Font and its pedestal are of polished marble. The design, although plain, is quaint. The shape is an octagon, each side being slightly hollowed. The sides have shields, on six of which are carved the arms of Robert Rhodes, on the seventh the arms of Agnes, his wife, and on the eighth are the two coats quarterly. The cover is of later date than the Font, probably half a century later. It is a beautiful piece of work, light and graceful, rich in detail, and is of a very pleasing design. Although there is no record to tell us who gave to St. Nicholas its Font, we think there can be no doubt but that it came from the munificent hand of Robert Rhodes, and whose arms the Font bears. The Font, although originally placed underneath the Tower, where it now stands (which is the Baptistery proper), does not seem to have always remained in this position, for a writer in the early part of this century says that it was then "standing in the north-west corner of the Chancel." It was probably removed there, because at that time service was held in the Chancel only. We learn from another writer, who wrote in 1827, that the Font was placed in the north Aisle, and was then "disused." That it was again restored to its original position at the west end of the Church we know, and at no distant date from 1827; and that it was then in "use" and not "disused." Only for a time, however, did it remain, for at the restoration of the Church, which began in 1873, it was taken down and removed to the west end of the north Aisle, where it remained until the year 1886; when improvements were then being carried out at the west end of the Cathedral, it was once more restored to its ancient position underneath the Tower. The Font would seem to have shared the fate of many of the monuments in past years, and to have had frequent coats of paint applied to it; and it is due to the renovating hand of the marble mason that we now see the Font with its polished surface, assuming its original appearance. In re-erecting the Font in 1886, another step was added, raising it higher, and greatly improving its appearance. Chains were also placed round the Font, and the cover, instead of being made a fixture, was made to move up or down.

THE Sunderland Guardians have decided to erect a new Water Tower, which will enable them to supply the Workhouse with water.

THE Blackburn Corporation is about to apply to the Local Government Board for power to borrow £25,000 to increase the present electric plant, and has suggested to the Tramways Company that the time is opportune for considering the advisability of substituting electricity for horses as the motive power on certain sections in the borough.

IN connection with Liverpool College, Huyton Hall, with its grounds, containing about 11,000 square yards, contiguous to Huyton Railway Station, has been purchased for the purpose of converting it into a School for Girls. Plans are being prepared to erect Class Rooms, Gymnasium, &c., in addition to the Mansion itself, to cost £1,500.

Professional Items.

PLYMOUTH.—A new iron Church, built at Peverell Park-road, Mutley, was recently opened. The building, which is a substantial erection and well lighted, has been erected by Mr. C. L Duke, of Plymouth, from plans prepared by Mr. R. H. Worth.

LINLITHGOW.—A new Stained-Glass Window is to be placed in St. Michael's Church. It is proposed to construct the memorial in St. Catherine's Aisle, which contains a window of great Architectural beauty in the Flamboyant style. This will be the third memorial window erected in the Church.

STRANRAER.—The Parish Church of Inch, three miles from Stranraer, has been re-opened. The old Church was almost wholly destroyed by fire, and in the erection of the new structure only the walls have been used. The Architect was Mr. Hamilton More Nesbitt, Edinburgh, and the cost will exceed £2,500.

EDINBURGH.—About twelve sets of competitive plans have been received for the Reconstruction of North Bridge Street. An assessor has not yet been chosen to assist the Council in coming to a decision as to which plans shall be awarded the premiums, but a meeting of the Committee is shortly to be held for this purpose. In our opinion it is better to appoint the assessor before advertising for plans.

CORK.—At the opening of the new Court House by the Lord Lieutenant of Ireland, it was stated that the Portico, described by Lord Macaulay as worthy of Palladio, was uninjured by the flames and remains unaltered, while the interior of the building has been reconstructed by Mr. W. H. Hill, whose plans were adopted after keen competition. Mr. Samuel Hill was the contractor.

MORECAMBE.—In connection with the alterations to the Winter Gardens, it is intended to convert the present Hall into a Ball Room and Promenade, and to clear out the present Baths and build, upon their site and the adjoining land, a fine new Pavilion or Concert Hall. Plans (in competition) are being prepared by Messrs. Maxwell and Tuke, and Messrs. Magnall and Littlewood, both of Manchester, the latter firm being the Architects for the new west end Pier and Pavilion.

PUDSEY.—Tenders have been let for the erection of the new Baptist Chapel. The design has been prepared by Messrs. Hodgson and Farrer, Architects, Bradford and Pudsey. and the cost is estimated at about £2,500. The works have been let to the following tradesmen: builder, Wm. Hutton, Pudsey; joiner, A. Whitham, Pudsey; painter, J. Shuttleworth, Pudsey; slater, A. Thompson. Stanningley; plasterer, Hill and Houghton, Pudsey; plumber, J. Scarth, Pudsey.

ST. BREAGE.—The Bishop of Truro recently dedicated the new Church School at St. Breage. Last year the Education Department condemned the existing building and required the managers to erect a new large School Room and Class Room and to convert the old room into an infant department. There is a commodious School Room and Class Room, with boys' and girls' Cloak Rooms. Mr. W. J. Jenkins prepared the plans, and Messrs. White and Thomas, of Crowan, were the contractors.

PETERCULTER.—Craigton School was opened last week. The School is externally a neat structure and internally admirably adapted for its purpose. There is an extensive playground round the School. Plans of the proposed new Schoolhouse at Craigton, prepared by Messrs. Ellis and Wilson, Architects of the School have been submitted to the School Board. The plans show a house estimated to cost from £800 to £850, and at a recent meeting it was decided that the Architects should take in offers for the necessary works.

ATHERTON.—A scheme for the erection of a new Primitive Methodist Chapel, in Alma Street, took a practical form when the Memorial Stones of a suite of Vestries were laid. It is expected that in the course of a few months steps will be taken to complete the scheme by the erection of a Chapel in front of the Vestries on land adjoining the present School-Chapel. The new building is to accommodate 500 people, and is estimated to cost £2,000. The contract has been let to Messrs. R. Rathbone & Sons, of Atherton.

THORNTON.—A Church is about to be built in the Station Road of red stone and pressed bricks, the roofs being covered with green slates. The building has been designed in the later period of Gothic Architecture, and the picturesquely treated bell turret, corbelled out from angle buttress, is effective and rather novel. There is accommodation for about 500 persons, but it is only proposed to build Nave with 250 sittings, the Transepts being left out in the meantime. The Architect is Mr. Wm. Williamson, jun., Kirkcaldy.

NORTH SHIELDS.—At the monthly meeting of the Tynemouth School Board it was decided that the plans for a new School in Coach Lane, prepared by the Architects, Messrs. Marshall and Dick, be approved and forwarded to the Education Department for sanction, and that the School furniture required be arranged for by the Board; also that the building be of brick, with stone sparingly used, and terra cotta where thought desirable, and to be heated by low pressure steam and open fires. The building proposed to be erected will provide accommodation for 510 children.

BRISTOL.—A new public Library has been erected at St. Philip's from plans prepared by Mr. W. V. Gough. The building operations were commenced by Mr. E. Walters, the contractor, last year, and the Library has now been completed, with the exception of a portion of its internal fittings. The front elevation is artistic. Within, the principal feature is a spacious and lofty Hall, which will provide accommodation for a very large number of readers. In the centre newspaper stands will be placed, while another portion of the Hall is set apart for a table for magazines and reviews.

MORECAMBE.—The plans for a large Hotel to cost £50,000 have been prepared by Messrs. Maxwell and Tuke, of Manchester. The Hotel will have Lawn Tennis and Bowling Grounds in connection; the area of land occupied by Hotel and Grounds being 12,850 yards. On the lower ground floor there will be Kitchen, Larder, Wine Cellars, eight Bedrooms, Smoke Room, Billiard Room, and Lavatories. On the upper ground floor, a Dining Room, Reading Room, Lounge, &c., and altogether about nine Private Sitting Rooms, and 89 Bedrooms for guests.

BELFAST.—Woodvale Hall, Cambrai Street, which has been erected by the Belfast Central Mission, was recently opened. The new building, which is constructed of corrugated iron with brick front and wooden interior, occupies a site at the Shankhill Road end of Cambrai Street. It is 90 feet in length and 60 feet wide, has an elevated platform, and affords sitting accommodation for about 1,000 persons. It is lofty, well lighted and ventilated, and is built much in the same style as the Grosvenor Hall, without balconies. The building was erected by Mr. Andrew Logan, builder, from the plans of Mr. Andrew Dobson.

LEEDS.—The new Roman Catholic Church, in Burley Road, is practically an extension of the Church and School which were built on the site some four years ago at a cost of about £4,000. It was originally intended that the building first erected should be entirely devoted to School work, and that a separate building, to be used as a Church, should be erected. This plan, however, was abandoned, as it was deemed more advantageous to extend the existing Church and School, and this work is at present being carried out from designs by Mr. J. Kelly, Architect, Leeds, at a a cost of £2,500, the Church being known as that of the Sacred Heart.

SHIREOAKS.—The alterations at the Church of St. Luke, which have been going on for the past few weeks, are now completed, and consist of new Choir Vestry, which has been formed by removing the Organ from the base of the Church to a Chamber over where it originally stood. A new Doorway has also been made from the new Vestry, leading into the Church. Some new Choir Stalls have also been erected, and also Priests' Stalls. A new Chancel Step has also been put down. The work has been carried out by Messrs. Bowman & Sons, Stamford. The Organ has been rebuilt and thoroughly renovated by Messrs. Forster & Andrews.

WOLVERHAMPTON.—We understand that the General Purposes Committee has decided to recommend the Board of Guardians to purchase the Perry Hall Estate at Wednesfield for the new Workhouse. It is stated that the price asked for the estate is not much more than £6,500. The area is 181 acres, while the house and buildings are estimated to be of the value of £1,000. Should this scheme be adopted, it is believed that the cost of erecting a Workhouse would amount to nearly £100,000, inclusive of the cost of the land. Several other sites have been considered by the Committee, including the Moat House property, also situated at Wednesfield.

AUSTERFIELD.—St. Helen's Church, which was built more than 700 years ago, by John de Builli, who was the son of one of William the Conqueror's more trusted followers, is sadly in need of restoration. The Church consists of a Nave and Chancel, divided by a Norman arch. The windows, one of which contains some very ancient fragments of stained glass, are insertions of a later age. The old south doorway of the Porch is a very curious and excellent specimen of the early Norman period. It is flanked on each side by two pillars, supporting an arch, with a zigzag moulding, typical of early Norman Architecture, whilst on the tympanum is a rude figure of a dragon. Mr. Hodgson Fowler, Architect, of Durham, whilst pursuing his investigations, preparatory of advising upon the restoration, made a most interesting discovery. He found, built up and hidden in the north wall, five beautiful pillars, supporting three Norman arches. It is intended to restore these arches and pillars to their original use. The Church is in a sad state of decay, and Mr. Fowler's estimate for the whole work, including oak pews and pulpit, is £1,550.

LIVERPOOL.—In consequence of the need for further accommodation for the School for the Blind, Liverpool, the committee of the Institution has decided to remove the Children's School to Wavertree. The site selected at Wavertree, adjoining the Parish Church, and abutting on the Holt Recreation Ground, consists of three and a half acres, and has been purchased, together with Wavertree Hall, which stood upon it, for £5,000. The buildings for the School have been designed by Messrs. H. and A. B. Fry, Architects, Liverpool. The old Hall will be removed, and the Schools placed somewhat higher up on the slope of the hill so as to have a south-west aspect. They form three sides of a square, and comprise Dining Hall, Music Room, a suite of modern Class Rooms with intercommunication, Dormitories, a Sick Ward with isolation Baths, including a plunge, and the necessary domestic offices, with residence for the master and accommodation for servants. The Gymnasium, which is to form one of the wings of the building, will be added after the rest of the structure has been completed. The buildings will be of red brick, plain but picturesque. They are now being proceeded with, the contract having been let to Messrs. Morrison, of Wavertree. In all, including cost of the site, the sum needed to carry out the scheme is £25,000.

TORQUAY.—The new Church of Holy Trinity, Torquay, is fast approaching completion, and will be consecrated by the Bishop of Exeter to-morrow. The site cost £1,000; the Church, with new roads, cost £9,000. The new Church has been erected on a portion of the Apsley House grounds, close by the old building, which

was opened in 1831. It has an imposing exterior appearance, and a lofty Tower and spire; but there is nothing elaborate in its construction. The general effect is good, but the details are of the simplest character. In is built in the Early English style of local limestone, with Bath stone dressings, and consists of Nave, north and south Aisles, Transepts and Chancel, with Organ Chamber on one side and Vestry on the other. The Tower stands at the north-west corner of the Nave, and with the spire rises to a height of 162 feet. The columns and arches of the Nave are of Bath stone, and the caps of the columns are left in block for future carving. The roof principals of the Nave, the Chancel and the Transept, are carried on Bath stone corbels with Petitor marble columns. The Chancel arch is richly moulded, and springs from Bath stone corbels, with Ashburton marble columns. There are two steps to the Chancel, and they are of Ashburton marble, while the Chancel will be paved with red tiles. Inside, the walls are plastered. The Aisles have wood-block floors, but the floor under the seats is of ordinary boards on joists. In addition to the main entrance under the Tower, there are three other entrances. The seating, which is entirely new, is of pitchpine, and will be stained and varnished. The windows are glazed with cathedral glass. The Church will be heated by hot water on the high pressure system, and be lit by incandescent gas burners. Inside the Church is 130 feet long by 53 feet broad in the Nave. The total length of the Nave is 101 feet. Seating accommodation is provided for about 700 persons. Messrs. Vanstone and Mumford are the builders, and Mr. E. W. Meredith, the clerk of works.

PERTH.—Important additions have been made to Sharp's Educational Institution. The additions, which give an increase of fully two-thirds to the original floor space, are situated behind the original building, between it and the east boundary of the ground. Behind the centre block of the original building there is a large Class Room, measuring 53 ft. by 30 ft., lighted from the roof. The two side wings of the old building have been extended eastwards to the boundary, and situated to the north and south of these are long one-story wings. The accommodation provided in these buildings is, in the south wing, a physical Laboratory, and a Workshop and Lecture Room in connection. The shop is fitted for the accommodation of twenty-four students at the benches. The Lecture Room is fitted with benches for the preparation of the necessary working drawings. The large Class Room can be divided, when required, into two rooms. The ground floor of the north high wing contains the modern languages Class Room, access to which is obtained from the large Class Room. The north low wing is the Gymnasium, which is the only part which is not completed. The whole of the low buildings are roofed over with light steel rafters, and are open up to the ridge. The Chemical Laboratory, with Store and Preparation Rooms and Lecture Room behind, is situated on the first floor of the south high wing. The Lecture Room is immediately behind the Preparation Room, and connected with it and the Laboratory. The Art Department, containing elementary Drawing Room, Antique and Life Room, Modelling Room, and Master's Private Room is on the first floor of north high wing. The contractors for the work were Messrs. J. and C. Hay, builders, Dundee; Messrs. Hay and Son, joiners, Perth; Mr. Peacock, plumber, Dundee; and Mr. M'Ritchie, plasterer, Dundee. The fittings were erected by Mr. Thomas M'Aulay, Dundee, and the heating has been executed by Messrs. Walker and Son, Newcastle-on-Tyne. The whole of the work has been designed by Mr. J. Murray Robertson, Architect, Dundee.

PERTH.—Extensive improvements are being carried out at Perth Academy. An adjoining property to the north of the present School has been acquired by the School Board. This property has been altered so as to form on the ground floor two Preparatory Class Rooms. The entrance door will form an extra entrance, and it, along with the windows, has been remodelled to harmonise with the front of the School. On the first floor there is a large Preparatory Class Room with a Gallery. This room can be divided by a movable glass partition fitted in the centre so as to form two Class Rooms if necessary. On the second floor there are three Class Rooms to be used chiefly for teaching music, and at the landing of the Staircase on this floor is the female teachers' private room. All these rooms are provided with fireplaces, and the floors are laid with wood-block flooring. On the newly acquired ground behind the property and next Barossa Street, a two-story building is erected. On the ground floor is a Luncheon Room 31 ft. by 25 ft., lighted by three windows from the street and reached by a passage from the Girl's Court, which leads also to the Cookery Class Room. Off this room is a Store and Scullery provided with two sinks and all the necessary fitments and fittings. On the first floor is the room for teaching drawing, lighted from the north side of the roof by four large roof lights. Off this room is a Gallery for models, also lighted from the roof by a large roof light. This building is to the north of the present writing and drawing Class Rooms. The former will be converted into additional workshops, with benches for 40 scholars. The remainder of this floor is occupied as an antique Drawing Room, which adjoins and enters from the new Drawing Room. The principal rooms are ventilated by tobin tubes and large ventilators in roof. The whole of the older building has been repaired and repainted. The contractors are:—Messrs. Fraser and Morton, builders, Perth; Messrs. Leith and Lumsden, joiners, Perth; Messrs. Frew and Son, plumbers, Perth; Mr. M'Ritchie, plasterer, Duudee; Messrs. R. Dow and Son, painters, Perth. Mr. William Watson is clerk of works, and the Architect is Mr. George P. K. Young, 42, Tay Street.

EDINBURGH —A new Church is to be erected at Fountain Hall-road to hold 600 people. Of the Early English style of Architecture, it will have three entrances in the front elevation, two of which will be by porches at the side of the main entrance, while the three two-light lancet windows in front will be flanked by two buttress pinnacles. Inside, the Church will be provided with Aisles for passages, Transepts, and a Chancel, together with an Organ Chamber. The plans do not show any Gallery. Immediately at the back there will be a large Hall, a Session Hall, Vestry, and Ladies' Waiting Room, with Lavatories for each.

ROMFORD.—New School buildings erected by the Romford School Board on a site in Mawney's Road were opened last week. The Architect was Mr. Charles Bell, and the builders Messrs. J. S. Hammond and Son, of Romford. The new buildings are designed to accommodate 650 children, and the approximate cost, including the site, is just under £10,000. The School Rooms are to take the place of the present Albion Street Schools, which have been condemned by the Education Department. They have been most substantially built, and are fitted throughout with the most approved apparatus for scholastic purposes.

BRIGHTON.—It is expected that the new Cookery School at the Elm Grove Board Schools will be completed before the end of the present month. The Architects are Messrs. Simpson and Son, and the builders Messrs. Botting and Son, and the new Cookery School stands quite separate from the other School buildings on the western side. It practically consists of one large room, 28 ft. by 22 ft., and 17 ft. 6 ins. in height, with the offices round it. The Architectural design conforms with that of the other School buildings. It is lined with tile dados, and fifty-six children can be taught in it at one time. It takes the place of the old Cookery School at the Finsbury Road School which was condemned by the Inspector as being too cramped and altogether out of date. The cost is estimated at £1,200.

MAJOR-GENERAL H. D. GROZIER, R.E., recently attended at the Urban District Council Room, Porthcawl, to inquire into the application of the Council for a loan of £8,000 for the purposes of a complete drainage scheme. There was but little opposition to the scheme.

SHEFFIELD IMPROVEMENTS.

AN EXPENDITURE OF £220,000.

APPLICATION has been made on behalf of the Corporation of Sheffield for sanction to borrow various sums of money, amounting in the aggregate to nearly £220,000. Of this total, £59,772 is needed for the purposes of the Crofts Improvement scheme, £62,205 for street paving and other improvements; £3,727 for Hillsborough and High Hazels Parks; £6,030 for the extension of Endcliffe Woods; £19,140 for the provision of a highway depot near Olive Grove; £30,354 for Public Baths; £16,009, for a Refuse Destructor in Lumley Street, Attercliffe; and £19,541 for the purposes of water supply. The £19,541 for the purposes of water supply is required for the completion of the Dam Flask Reservoir. In reference to the £6,030 for the extension of Endcliffe Woods, the Corporation already owns Endcliffe Woods—a park between thirty and forty acres in extent—and with the portion proposed to be added there would then be a lovely walk of over two miles in length. It is said to be the general desire of the ratepayers that the Corporation should not lose this opportunity for purchasing, for there is little doubt that if the site is not acquired by the Council, the land will soon be in the hands of the builders. The price is considered very reasonable. The loan for Hillsborough and High Hazels Parks is required to make walks and otherwise improve the parks. At Hillsborough, a substantial shelter and bathing sheds are to be erected. The various sums required for street paving, and also the expenditure on the proposed highway depot near Olive Grove, are required, according to the City Surveyor, Mr. Wike, at the new depot to make sidings on to the Midland Railway, and facilitate the delivery of stone for use in the city; premises will be built for the steam rollers and cottages erected for the workmen. With regard to the sum for Baths a portion of the money is required for the new Baths, which have been constructed in Upperthorpe, and £9,584 for the provision of Baths for the district of Brightside. £5,500 for the repairs of the Glossop Road Baths, and the provision of a Ladies' Swimming Bath. In regard to the destructor at Attercliffe, it is felt that the arrangements for the disposal of refuse in Sheffield are altogether behind the times and the Corporation is anxious to do something better. By their Act of 1890 the Council could in certain cases order the conversion of ashpits and privies into water closets, and they could also insist on water closets being placed in new property, and these powers are being enforced. There is, however, still a great amount of refuse to deal with, and the Corporation has purchased a site on which they are erecting a destructor. The land cost £7,763, and the remainder of the expenditure is for buildings and plant. The Crofts Improvement Scheme is to be carried out under the Housing of the Working Classes Act, 1890, and the present intention is to borrow £59,772, which is stated as the net cost of the whole scheme. In consequence of the restrictions laid down as to the manner in which the property should be dealt with, it will require the whole of the £80,000, the gross cost of the scheme. The Corporation is not allowed to deal with No. 2 Section of the scheme until it has put up certain buildings on No. 1 Section, and the same restriction applies to No. 3 Section. The present application for £60,000 must, therefore, be only considered on account.

Now that the Czar is about to visit Paris, the proposal is renewed to send back to Russia the Great Bell of Sebastopol, which hangs in one of the Towers in Notre Dame. This act, it is thought, would be a pleasing souvenir of his visit. A similar proposal was made in 1889, but it was not complied with.

ST. BENEDICT'S CHURCH, Norwich, has long been famous for the feature—which it has shared, with only one other Church in the kingdom—of a tree which, in some unexplained way, had rooted itself in the side of the tower, nearly at the summit. This curiosity was removed last week as, in the course of repairing the Tower, it was discovered that its continuance would probably endanger the whole structure.

RESTORATION OF A SCOTTISH CHURCH.

AT Arbroath last week the restored Parish or Old Church was formally opened. The old building, which was destroyed by fire early on the morning of Monday, 14th November, 1892, was built about the year 1590, being thus at the date of its destruction almost exactly three centuries old. It was largely reconstructed in 1762, and contained, with its double set of galleries, sitting accommodation for 1,400 persons. Of Architectural pretensions the building was entirely destitute. The spire —a handsome structure—was erected in 1832, and fortunately escaped the conflagration. After the burning down of the Church the question arose as to who was liable for the restoration of the building. The point occasioned a considerable amount of discussion, but eventually it was decided that the Church was a Burghal Church, and that the primary obligation to restore it lay with the Town Council. At a meeting of the Council held in March, 1893, it was agreed to invite competitive plans, and the result was that designs by several of the leading Architects in Scotland were received. Mr Hippolyte J. Blanc, Edinburgh, was appointed adjudicator, and the result of his adjudication was that the first place was awarded to plans sent in by Mr. J. J. Burnet, Glasgow. These were accordingly accepted by the Council. Delays and difficulties arose, however, and the reconstruction of the Church was not begun until 19th April, 1894. The cost of the new edifice is about £10,000, but this is exclusive of the Memorial Window which has been fixed in the east gable of the Church by the members of the Macdonald family in memory of their parents. The site of the new Church is practically that of the old building, with the exception of a small portion cut off on the Hill Place side to widen the access in Kirk Square, and improve the line of Academy Street. While undoubtedly it would have been better, so far as the old spire is concerned, to have taken Mr. Burnet's suggestion to place the main building free of the Tower, with its gable end in a line with the centre of Hill Place, such an arrangement would have permanently broken the line of Academy Street. The new Church was, therefore, restricted to the building lines of Hill Place, Abbey Street, and Kirk Square, and the whole design results from an acceptation of these lines. The plan consists of a Nave, 80 ft. long by 70 ft. high, a double Transept on the north side, and a Chancel parallel with the Nave. The Nave occupies the greatest length of the site, and the Church is amply lighted. The main entrance is from the corner of Abbey Street and Academy Street, and forms a decorated feature in the centre of Hill Place. Other doors permit of egress to Kirk Square and to Abbey Street, where the stair to the Gallery breaks the line of the Transept roof. The whole building is worked out in the style represented by the Arbroath and other Scottish Abbeys. Externally the treatment is exceedingly simple, the grouping of masses counting for more than the detail. Internally, however, a richer finish has been adopted, and the panelling of the walls, the front of the Gallery, the Organ case, the Municipal Pew, are richly treated with carved wood. The main line of the front of the Gallery is carried round the Nave, broken only at the one end by the main Entrance Porch, and at the other by the Organ case, which covers the blank wall caused by the position of the Tower, and is treated as a Reredos for the Communion Table. The area of the Chancel is treated as a Session House, but the screens dividing it from the Chancel can be removed when the space is required. The Nave, which from its great height and the fact of its having no Gallery and an open timber roof has a Cathedral-like appearance, is lined to a height of 14 ft. with wood, the panelling and decoration being carried out in the Italian-Gothic style, the whole having an excellent effect. The Screen, like the remainder of the work, is the design of Mr. Burnet, and has been executed by Mr. John Craig, Glasgow, who likewise carried out the carving work throughout the Church. The Screen is distinguished by several elaborately wrought Gothic finials and a chastely designed figure in the centre. Formerly the main entrance to the Church was from Kirk Square, the doorway being in the base of the steeple. This doorway has now been closed up, and the entrance has been placed at the north-east corner of the building facing Hill Place. The Entrance Porch consists of three archways with carved finials in stone, the centre being occupied by a canopy with pedestal on which a statuette can be placed—a feature which has been carried through the whole ornamentation and decoration of the Church. The Gateways are hung with wrought iron gates of Gothic design, and made by Starkie, Gardner, and Co., London. Double doors lead into the Vestibule. Over the main doorway into the body of the Church is an inner Porch of wood, which has been executed by Mr. David Farquhar, joiner, Arbroath, who has likewise carried out the whole of the joiner work. Over the main stairway to the Gallery is also a distinguishing feature. The inside of the whole of the doors has been lined with embossed Tynecastle cloth, and have been stained in a rich old-gold colour. The total number of sittings is 1,321. A back Gallery over the main entrance could at any time be formed without destroying the general effect, and would give additional accommodation to the extent of 80 seats. The following is a list of the tradesmen employed:—mason, Andrew Fife, Arbroath; wright, David Farquhar, Arbroath; slater, William Brand, Arbroath; plumber, Joseph Anderson, Carnoustie; plasterer, G. A. Campbell, Arbroath; heating engineer, James Keith, Arbroath; ironmongery, Highet and Roxburgh, Glasgow; interior timber finishing, John Craig, Glasgow; painter work, J. and W. Guthrie, Glasgow; stone carving, William Vickers, Glasgow; gas-fittings, railings, and gates, Starkie, Gardner, and Co., London.

SOCIETY MEETINGS.

The Glasgow Architectural Association.—A meeting of the above Association was held at the Rooms, 187 Pitt Street, on Tuesday evening, the 1st inst. Mr. McGibbon, the hon. president, read a paper entitled: "A Review of Recent Glasgow Architecture," and said the work done during the past decade had been influenced by their purpose and by the materials employed. Gothic, to-day was dormant, if not dead, unless for Church work. Buildings might be classified according to their purposes, such as Ecclesiastical, Domestic, Civic, Commercial, &c., or we may take materials, say of stone, plaster, metal, glass, tiles, &c. Delicacy has lost favour, such as the work we have in the Faculty Hall and the New Club. Referring to Church work, the essayist pointed out, the only Classic building recently executed was that at Langside. The Schools were altogether of a substantial description, well provided with all the essentials, handsomely paved, well lit, &c. Insurance companies within the last few years had been, perhaps, the most generous patrons of public Architecture. In the Equitable, the fact of its being an English office, is fittingly expressed in an Englishman's design in English brickwork. Banks, in Glasgow, are the most sumptuous of the domestic buildings. The work of the Corporation is more varied than it used to be. In all these works there is a commendable absence of prettiness. The Baths, in essayist's opinion, should be arranged more as places of public resort. The Tenements generally were of a commonplace description, but one or two instances were given of a really superior class of building. The Bridges and Chimney Stalks were referred to, and the people of Glasgow were commended in allowing such interesting and worthy landmarks to remain as the Tron Church and Mary's Church, &c. This very interesting paper was ultimately brought to a close by a hearty vote of thanks to the President.

AT St. Thomas, Plymouth, the Urban District Council proposes to borrow £7,210 for works of sewerage and sewage disposal.

THE Organ erected in the Free West Church, Perth, by Messrs. Walker & Sons, has been formally opened. The cost of the Organ and structural alterations was about £1,000.

KEYSTONES.

THE Commissioners of Northern Lighthouses have approved of the erection of a new Lighthouse and Fog-Signal Station at Blackhead, about three miles north of Portpatrick Harbour.

A BRANCH of the Dundee Free Library has been opened at Lochee, which forms a section of the buildings presented to the community by the late Mr. Thomas Cox.

COLONEL JOHN STEWART, of Ardvorich, has handed over to the authorities of the Parish Church at Dundurn, near Crieff, the old holy-water Font of the ancient Chapel of Dundurn.

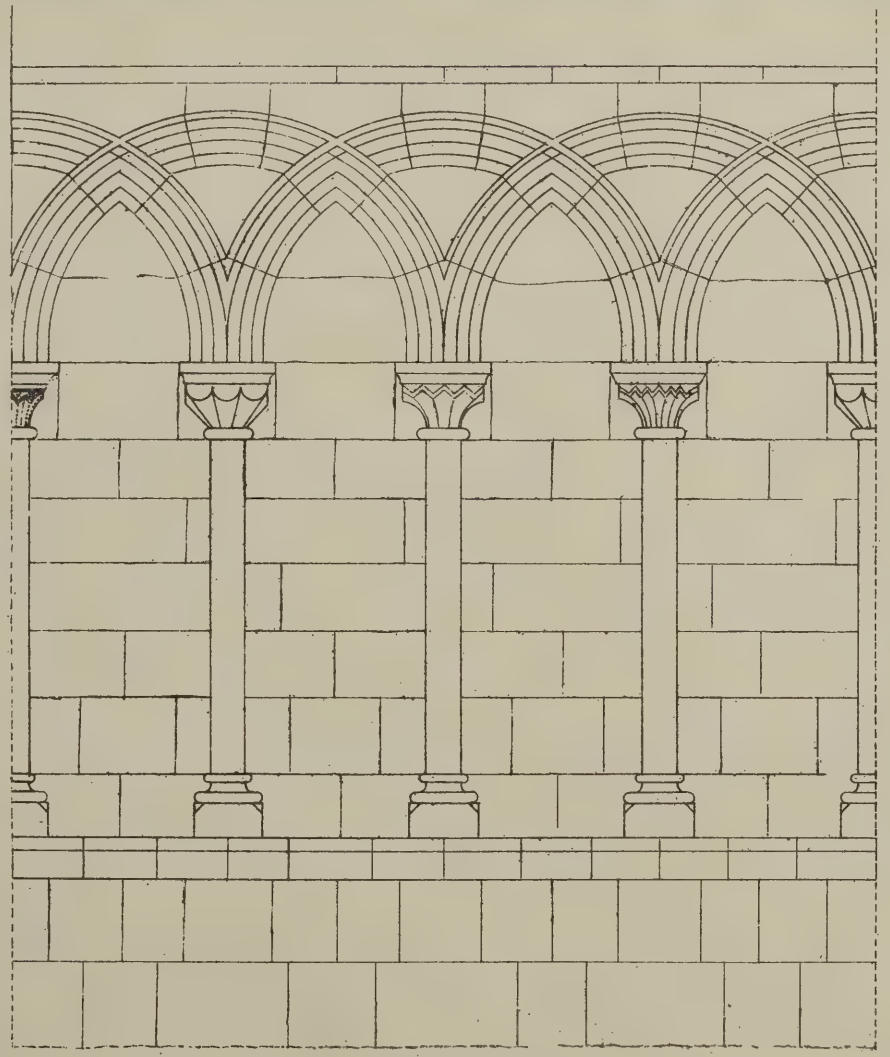
THE Whitley Memorial Fountain in Shaw Street, Liverpool, has been formally handed over to the Corporation by the Memorial Committee.

CONTRACTS are on the point of being signed for the north block of the Admiralty buildings at Spring Gardens. It is probable that operations will be actually commenced about the middle of the present month.

ADVANTAGE is being taken at the absence of Mr. Balfour to extend the system of electric lighting at the official residence of the First Lord of the Treasury in Downing Street. The electric light has been for some time in use in some of the principal apartments, but during the present recess the system will be made general throughout the establishment.

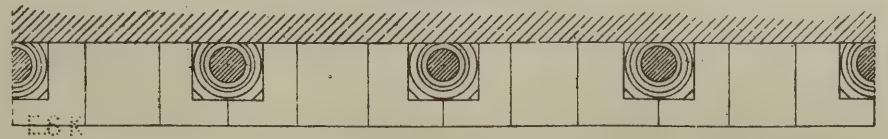
AN act of official vandalism has been perpetrated at Spalato, in Dalmatia, the Great Palace of Diocletian. The beautiful Romanesque Tower on Roman foundations at the entrance of the Emperor's Mausoleum has been torn down, and a new Tower is rising in its stead, into which capitals and sculptured stones of all dates from the third century to the twelfth are being built.

A MOVEMENT is on foot, under the auspices of the City of London Swimming and Life Saving Association, for a proposed Swimming Bath to be moored in the Thames, close to Blackfriars Bridge. Some thirty of the important City houses have promised subscriptions to the amount of £5,000, and should the Thames Conservancy grant the site the Corporation will be asked to take the matter up and provide more money.



DURING the past few days the striking apparatus of the Clock Tower of the Houses of Parliament has got out of order, with the result that the usual hours have not been struck on Big Ben. Messrs. E. Dent & Co., the makers, who have been called in, report that the striking apparatus, which has been exposed to the inclemency of the weather for nearly forty years, has quite worn out. They have therefore received instructions to repair it.

THAT historic building in Dublin, the Leinster Hall, the scene of the Irish Convention meetings, is to undergo a metamorphosis. Mr. H. H. Morell, in conjunction with Mr. F. Mouillot, have bought the building, which is to be converted into a Theatre and Opera House. The site is not without interest, for it includes the ground occupied by the old Theatre Royal, where Charles Kean, Macready, and the Kembles won some of their many successes.



AT a recent meeting of the Liverpool City Council it was resolved that an application for a provisional order be made to the Local Government Board to alter and amend certain provisions of the Liverpool Local Acts so as to require the width of all new streets to be at least 36 ft., in lieu of 33 ft.; all back passages to be at least 9 ft. wide, in lieu of the present requirements, and all back passages exceeding 300 ft. in length to have a cross passage; also that all back streets or back passages of 9 ft. wide, when constructed to the satisfaction of the Council, be adopted by the Corporation.

THE interesting and unique Lamp Columns which surround the Foreign Office Quadrangle are in process of being taken down either for purposes of repair or replacement. Each column comprises some nine sections, and while the main portion is of ordinary cast-iron, the collars and general ornamentation, including some delicately executed figures grouped round each post at a distance of four or five feet from the ground, are of gun-metal which was obtained by the smelting of guns captured by the British forces from their enemies in some of the historic battles. These castings are being removed and stored with great care to prevent damage.

"Masters—by Virtue of their Work."

PROFESSOR HERKOMER has returned, in a vigorous letter, to the subject of Welsh Art. The fervency of his appeal should do something to stir that Celtic blood to which he refers. He reiterates his belief that "Art lies organically in the Celtic race, and only needs calling forth by means of a rational tuition." The difficulty lies in the dearth of masters. Inevitably, if a man has to succeed in the Arts and Sciences he must leave his native nooks and mountains. That is what has happened in Wales. Scotland can and does maintain a certain Art independence; her national life has always been more possible, though not more distinct or defined than the Welsh. But even Scotland parts, has to part, with her sons, as they become the more distinguished, drawn at once to the higher realms of recognition and to the fatter profits of the World. In Wales itself, in Art matters, there are no diplomas and few demands for Art work. The Welsh race is not a rich race, for the Celtic blood has not *that* genius, and though a nation may rightly lament the loss of its sons, whom it cannot reward, it has no right to reproach them. The endeavour, therefore, on Professor Herkomer's part, to call Welsh Art to arms must end, at best, in the nature of a parade, and must not be expected to do perpetual duty. The Eisteddfod has its good points; primarily it is the show-ground of the Celtic talents. These talents admittedly exist in Music and Literature; by mental genealogy they should exist in Art. And, indeed, there is much evidence that they do, though singularly scattered and isolated, without comradeship. "There *must* be many Welshmen," says Mr. Herkomer, "who have learnt and are practising their Art-craftsmanship in England and elsewhere, just as we know of many musicians who have learnt their Art in England and elsewhere. The latter have invariably remained loyal to Wales, and have returned again and again to give their

EXETER, FROM THE CANAL BANKS: SKETCHED BY O. RALLING.

compatriots the benefit of their education. I appeal now to the Welsh Art-Craftsman who may be domiciled outside Wales *to do the same.* I appeal to their patriotism by asking them to compete at the next year's Eisteddfod, not for the sake of the prizes offered but for the sake of Welsh Art, which must be brought to life. The Eisteddfod is at present the only 'machinery' that can give the necessary impulse to Art work in Wales, and so lead the way, first, to the discovery of the masters, and then to the establishment of independent Schools of Art, through the help of County Councils and communities. If all the Painters, Sculptors, Metal Workers, and Carvers, who are Welsh born—living in or out of Wales—were to send works to this yearly Eisteddfod, Wales would soon discover the workers who were masters by virtue of their work. Whereas now a Government certificate is the only guarantee of efficiency in an Art master." *Masters by virtue of their work; whereas now a Government certificate is the only guarantee of efficiency in an Art Master!* That italicized sentence practically sums up the whole problem of Art tuition. Some standard for mastership, be it in Art or any other subject, must be maintained. We abhor the Government certificate system, with its "payment by results," its fictitious "standards," its debasing "schedules." But what can be substituted? *Masters* by virtue of their work? Yes, but who is to assess virtue? There is, in reality, no Art Tribunal in England. The Royal Academy is not; the various Art Societies are shadowy or nebulous. What is one man's meat, the axiom runs, is another man's poison; what is virtue in Art to the Royal Academy would be the senility of vice to younger Schools. Artists are not necessarily the best judges of Art; they are too impassioned or too prejudiced; but they are the best we have. Clear and comprehensive criticism without the bias of personal and executive Art ability, is the rarest of British intellectual qualities. Originally, Mr. Ruskin had it, but in the end he became the most impassioned of prophets, the most singular of partisans; Mr. Hamerton almost had it, but an overfondness of one branch of the painter's Art and a great facility in one method warped the range of his critical gifts. A man with the temperament of Matthew Arnold, and a far wider emotional grasp and vision, might be able to "value a man according to his work," but Governments cannot. We see no hope for Professor Herkomer's new diploma, though a National Eisteddfod may succeed in gathering together representative work. We hope it will, but it cannot be expected to elect those who, being Masters by Virtue of their work, are in the relation of sheep to goats. At the same time we recognise the senses of Colour, Rhythm, of the Tragic Muse, in the Celtic race, and if these could be welded with a growing sense of form and proportion, a more reticent expression, the "Celtic blood" might confidently be expected to yield to us some of the finest Art-work of the World.

A NEW Baptist Church, to seat 550 persons, is to be erected at King's Heath, at a cost of £5,200, towards which £2,100 has been promised.

A NEW Cycle Track has been made at the Crystal Palace wnich is three laps to the mile, and which takes the place of the old cinder one, which has been disused for some time past. It has been designed and constructed by Mr. H. Woodham, the constructor of the track at Catford, and is banked to 8 ft. It is 25 ft. in width at the northern rounded bend, and 27 ft. at the southern or home curve, and widens to 30 ft. in the 130 yards straight. The base of the track is formed of cement-concrete, faced with a composition. The banking is on timber trestles, on which the cement is laid.

STRAY NOTES ON SOME CHURCHES IN BELGIUM AND NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

HAVING spent a very enjoyable—and it is to be hoped profitable—holiday among some of the Cathedrals and Churches of Belgium, the Rhine, Westphalia, Hanover, and Saxony (including Tournai, Bruges, Ghent, Malines, Louvain, Liège, Mons, Aachen, Neuss, Dortmund, Soëst, Paderborn, Münster, Hildesheim, Halberstadt, Naumburg, Erfurt, Limburg, and the Rhine from Coblentz to Cologne), I venture to lay before your readers such excerpts from the somewhat voluminous notes made upon their structures, as may prove interesting and useful, either to those contemplating a similar Architectural tour, or to others less fortunately circumstanced, but who may like to be informed as to the points in which the buildings of these countries differ from our own. The proximity of the Netherlands to our shores, and the greatly increased facilities afforded by the steamboat companies for visiting this part of the Continent, have, perhaps, rendered Englishmen more familiar with such cities as Antwerp, Bruges, Ghent and Malines than with any others. Yet the few "considerations" that I propose making upon the structures of their Cathedrals and Churches may, I hope, tend in some degree towards awakening a renewed interest on behalf of these stately piles, in the minds of those whose reminiscences of their many beauties are grateful ones. After a somewhat boisterous passage from Dover to Ostend, there was something peculiarly charming in the first sight of Bruges just as a magnificent sunset was bathing the variously outlined red-brick steeples of the Cathedral, Nôtre Dame and St. Jacques, as well as the octagonal Beffroi, in a crimson glow. Something very pleasant there was, too, in finding one's self strolling once more around the procession path of a Continental choir, with all the sights and sounds, and I may add smells (pleasant ones), peculiar to their locale, fully in evidence around you. Parts of the Cathedral of St. Sauveur at Bruges are fine, especially the First Pointed arcades of the Choir, the tall arches of the Crux, and the slender reed-like shafts of the middle Pointed Nave arcade—these last clustering "like stems in cornsheaves" in a manner

PARTICULARLY CAPTIVATING.

The upper stories of the building, although designed on a noble scale, show a great decadence. Indeed, here, as in almost every Belgian Church, we miss that poetry of design, that elegance of proportion, and that beauty of well ordered and carefully considered detail which rarely fails to charm us when contemplating the "dim and mighty Minsters of old time" scattered over the faces of England and France. These defects in the detail of Bruges Cathedral are, in some measure, concealed by the polychromatic decoration which has been so lavishly applied to its interior, so that with its rich fittings of Renaissance date—among which must be reckoned the marble jubé sustaining, Exeter-wise, a noble organ,* may lay claim to a high place among picturesque European interiors. The shortness of the Nave compared with its height is not the least remarkable feature of St. Sauveur, at Bruges. To St. Bavon, at Ghent, the same remark applies. At Bruges, internally, this shortness of Nave is rendered disagreeably apparent by the presence of an immense wall space—relieved, it is true, by polychromatic decoration—but communicating with the western Tower by a low archway only, whereas at Ghent the defect of this truncation is completely neutralised by the noble arch, which, reaching to the whole height of the Nave, admits to the space beneath the Tower. And this leads us into a few thoughts upon

BELGIAN CHURCH STEEPLES.

It must be borne in mind that until the middle of the sixteenth century there were only four Bishop's Churches in the Low Countries—*i.e.*, Arras and Cambrai (suffragan sees to Rheims); and Tournai and Utrecht (suffragan to Cologne). In 1560 a large number of additional bishoprics were created, those with which our present paper is more immediately concerned being Bruges, Ghent, Malines, Namur, and Ypres. The last, however, was suppressed in 1809, together with another in French Flanders—that of St. Omer. According to Teutonic rule, which has governed much of Belgian Architecture, Churches which were either Cathedral or Collegiate were alone entitled to a pair of Towers. The presence, therefore, at Bruges, Ghent, and Malines, of the solitary western Steeple and the absence of such entourages as Cloisters and Chapter House sufficiently indicates their origin as great town Churches pure and simple. This western position for the Steeple seems to have been a very favourite one throughout Belgium, and where its arch opens into the Church, as for instance several of the Liège Churches at a great height, such a locale for the Tower rarely fails to invest the interior with a considerable degree of grandeur. Besides the examples thus quoted, we have the unfinished Towers at Mons, Huy, and Louvain, but of these I shall speak more in detail hereafter. Sometimes, as in the case at Tirlemont, the Towers of St. Germain and Notre Dame du Lac, they have short Transepts branching from their north and south sides, and these additions assist in imparting an air of great breadth and majesty to the façade.* Of Tower groups Belgium cannot present any very notable example beyond that of Tournai, a Cathedral which, although lying in the main line from Calais to Brussels, is but little visited by the tourists who daily hurry by it intent on getting to Cologne and the Rhine; yet it is undoubtedly the grandest Church in the Low Countries, comprising a Romanesque Nave of great length, and in style, quite *sui generis*; of Transepts with the aforementioned cluster of five Steeples, all in a very German Transitional style; and a Choir which, as thoroughly French, we are unable to help admiring in spite of the faultiness of construction, for the daring *elancée* which is its leading characteristic. Such a fusion of styles as is exhibited in the Cathedral at Tournai, seems only natural in a country like Belgium which has been yclept

"THE COCK PIT OF EUROPE."

Although it is not easy to draw a very hard and fast line across its map, generally speaking, we may look for a French style as exemplified in the lofty clerestories and coronæ of apsidal Chapels of the Churches in the flat district of the centre and north west; and for a German one in the tall aisleless apsidal Choirs of the Churches in the hilly portion of the country about Liège. I do not, of course, mean to imply that there is no special Belgian style; that there is a complete Gothic style, and a very disagreeable inferior one, the true artist will not be long finding out, but at no period can that country be said to have established a great School of its own, like the Early Pointed of Yorkshire or the Iles de France, or the Perpendicular of our West and East Anglia. Perhaps the style in which Belgium shows best is the Early Flamboyant; see this from the large scale in which it is carried out in such Churches as St. Martin and St. Jacques, at Liège; St. Pierre, at Louvain; St. Gommer, at Lierre; and St. Wandru, at Mons. It rarely fails in captivating the beholder, despite a certain raggedness and incomplete look about many details.

(To be concluded).

AT a Special Meeting of the Manchester City Council, held last week, a Drainage Scheme for conveying the effluent sewage to the Estuary of the Mersey was adopted. The scheme involves the construction of an enormous Conduit over 15 miles in length, and with a discharging capacity of seventy million gallons a day. The cost is estimated at £258,000.

---

* Admirers of fine organ cases will be gratified at Bruges, for besides that in the Cathedral, another will be found in the spacious, but architecturally uninteresting, Church of St. Jacques, where it occupies a similar position. At Ghent, the organ, in a most charming case, is bracketed above the arch leading to the North Choir Aisle from the Transept.

* Although my acquaintance with these two Churches has only been made from the railway line, I should imagine that the western Transepts formed internally a species of gigantic Narthex, such as we meet with in such of the Rheinish School of buildings as St. Cunibert's and the Apostles' Church at Cologne.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

STROLLING SKETCHES.

No. II.

EXETER AND ITS CATHEDRAL.

ILLUSTRATED BY OCTAVIUS RALLING, S. NEWCOMBE, AND G. J. F. HOOKWAY.

EXETER is a city planted upon a hill, but surrounded by hills higher than its own. This was no disadvantage in ancient days, as the hill to the south and west ended abruptly where the river Exe formed a natural moat, and the site generally offered many facilities for making it a strong fortified city. The foundation of the city is lost in the mist of ages, but it is certain that the Romans recognised the advantage of the position, and it was no mean city in their days; and although no actual Roman work can now be discovered in the remains of the ancient wall, which can be traced round the older portions of the city, the reason, probably, is that it has been breached and repaired so often that little beyond the actual foundation remains of the original walls. Antiquities in the shape of mosaic pavements, cinerary urns, glass work, and numberless coins are, however, witnesses of Roman occupation; and the two main roads of the city from east to west and north to south, although the former has been known to be slightly diverted, are to all intents as laid down by the Roman conquerors, and the portion of the road, now St. Sidwell Street, is identical with Icknield Street.

It would be impossible to give even an outline of the history of Exeter, but from the time when any record has been kept it is practically identified with the history of the nation, and as the recognised and undisputed capital of the west, and the fourth city of the kingdom, it has been the coveted goal of invaders in ancient times and of contending parties in the Middle Ages.

The present walls in their main construction are the reputed work of King Athelstan, who also had a Palace within the city, and the Castle, or what remains of it, was the work of the conqueror, and intended to dominate the city, as a warning to the citizens for the obstinate defence they offered—it being the last city to succumb—to the rule of the Norman. Of the subsequent sieges in the unsettled times which followed, little need be said; suffice it to say that, as a rule, Exeter was loyal to the reigning powers, and that it was held in high repute by successive sovereigns, the numerous charters which are in existence amply testify. Exeter, having an almost unrivalled series of records of priceless value in her possession, as well as the original sword and cap of maintenance, presented by Henry VII., which is still carried before the Mayor on official occasions and ceremonials. To quote from the historian Freeman: "Isca Damnoniorum, Caer Wisc, Exanceaster, Exeter, keeping the same name under all changes, stands distinguished as the one great English city which has, in a more marked way than any other, kept its unbroken being and its unbroken position throughout all ages. The city on the Exe, in all ages and in all tongues, keeping its name as the city on the Exe, allows of an easy definition. It is the one great city of the Roman and the Briton which did not pass into English hands till the strife of races had ceased to be a strife of creeds; the English conquest had come to mean English conquest, and no longer meant havoc and extermination. It is the one city of the present England in which we can see in recorded times the Briton and the Englishman living side by side. It is the one city in which we can feel sure that human habitation and city life have never ceased from the days of the early Cæsars to our own. It is the one city of Britain which beheld the paganism of Rome, but which never, save for one moment of foreign occupation, beheld the heathendom of the Teuton. Here alone we can say with confidence that Jupiter and Mars were once worshipped by the citizens of Isca, but that Wodin and Thunder were never worshipped by any citizen of Exeter. To this day it is the undisputed head of its own district, and both in feeling and in truth Exeter is something more than an ordinary county town."

Architecturally, the great feature is the Cathedral, although, curiously enough, its position on the south side of the High Street is comparatively secluded, and strangers visiting the city frequently require direction, but from the low-lying lands by the river or from the hills surrounding the city, the two Norman Transeptal Towers and the long unbroken roof of the Nave and Choir are conspicuous objects enough, and its enormous mass completely dominates every other Architectural feature of the city.

The seeming obscurity of its position, prominent though it actually is, may be accounted for by the fact that the Church was grafted on to the city and not the city growing up around and under the shelter of the Church. Originally the Bishopstool of the See was at Crediton, but for additional protection in perilous times, and to obtain the greater importance which the important city of Exeter could confer, the Bishopstool was transferred to Exeter in 1050, with Leofric as its first Bishop.

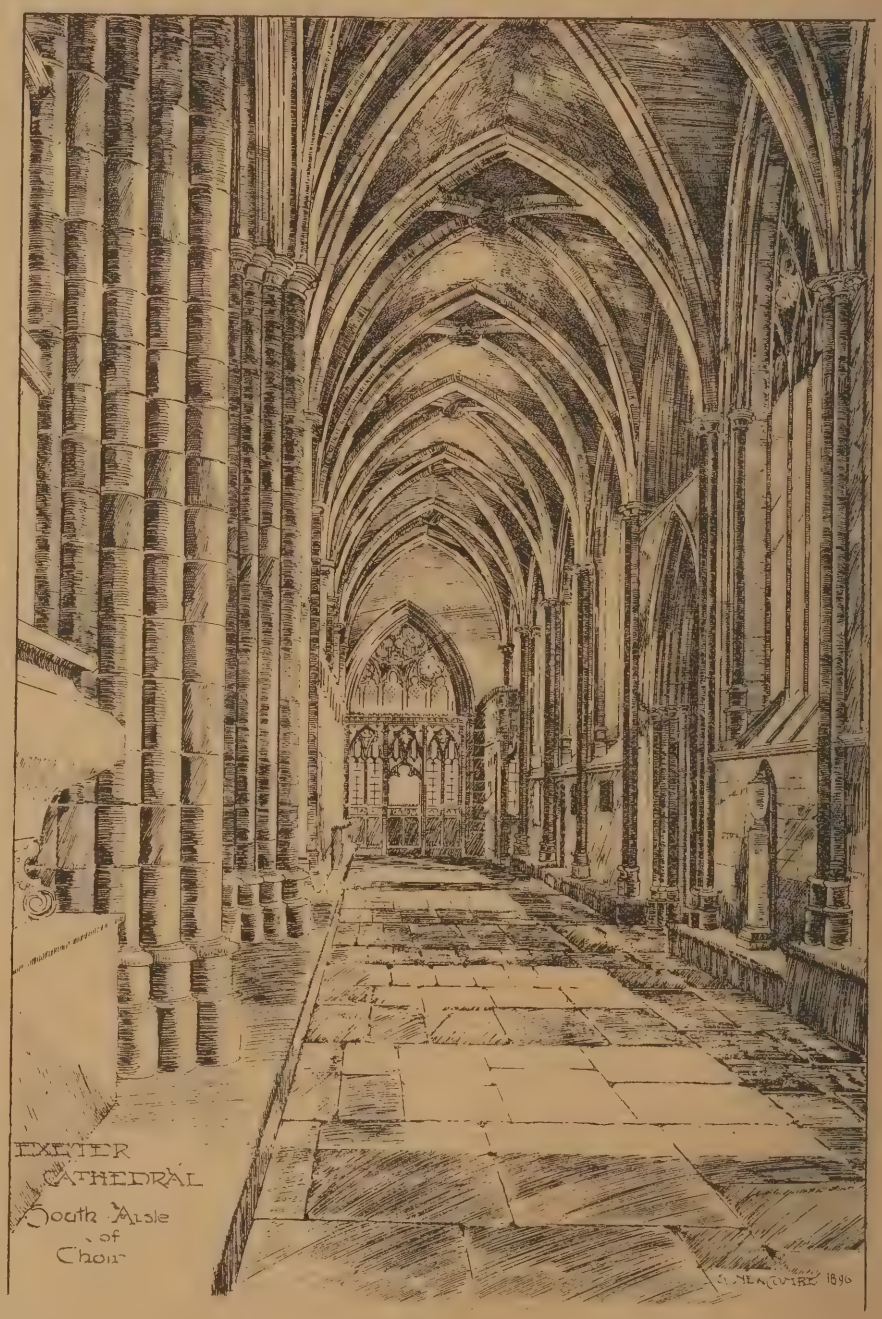
There was, probably, at the time a Saxon Church in Exeter which would form a nucleus, as it were, of a Cathedral, but Leofric and his successors lost no time in erecting a Cathedral, and although all that now remains of this buildihg are the two Transeptal Towers of Norman character, it was, or presuming that it was never completed, was intended to be of a truly monumental character, and probably the finest Norman Cathedral in the World.

FROM BISHOP'S PALACE GARDENS; SKETCHED BY S. NEWCOMBE.

"Of the present building," to quote again from the historian Freeman, "Peteo Quivil may be fairly called the author. Some smaller changes may have been made earlier, but it was in his time that the step was taken which gave the Church of Exeter its marked and unique character. The Fabric Rolls of 1284 and 1285 record the insertion of large windows in both Towers, the Northern Tower of St. Paul and the Southern Tower of St. John. Whatever the Towers had been before, they now became Transepts. This ruled the whole plan of the building. If the Towers were kept the Church could not follow the ordinary type of an English Minster. Western Towers might still have been added, which would have given the building an outline like some of the German Churches, but the Mid-Tower, the pride of the Minster of England and Normandy, was forbidden. The Church as rebuilt had to take the shape of a long unbroken body, running between the two Towers retained from the elder building. The effect within and without is unlike any other great Church in the World.

None of the foreign examples of Towers forming Transepts, or standing over Transepts, or standing at the ends of Transepts, have the same air. Even the gigantic Choir of Le Mans

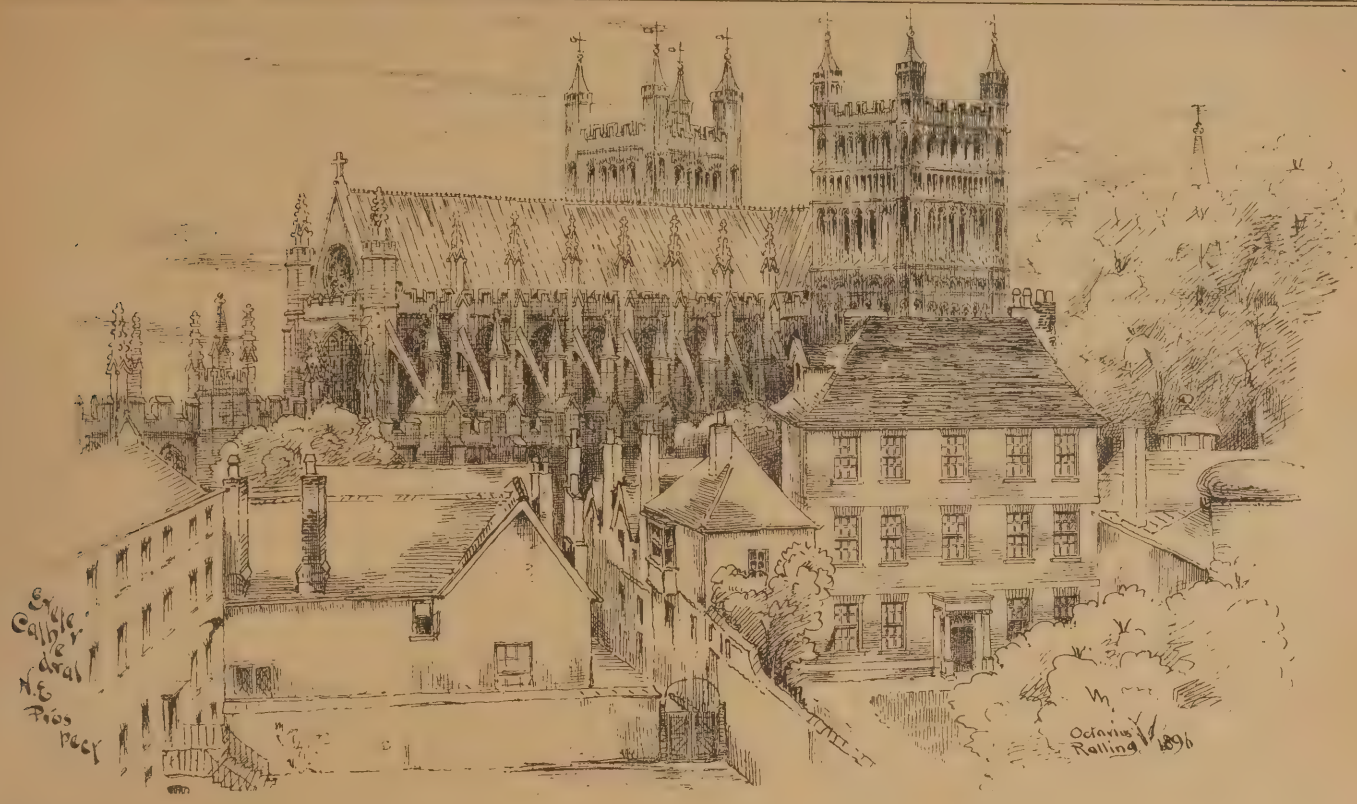
is much shorter than that of Exeter. At Geneva the Towers are little more than Side Towers to an apse. But English Churches, as compared with those of the Continent, are commonly long and low, and this of Exeter is yet longer and lower than usual. It had to be low so as not to dwarf the Towers between which it had to run. Moreover, the English fashion of a long eastern limb was now well established. The Church of Exeter, even though its crossing took another shape from its fellows, must still have a large part of its length east of that crossing. The Choir is little shorter than the Nave, and Choir and Lady Chapel together are longer. The length of the main body within and without are unbroken. There is the unbroken ridge line without and the unbroken vaulting line within, approaching to the effect of Bourges. But the extreme eastern part, the Lady Chapel, is not as at York, Lincoln, and Ely, of the full height of the Nave and Choir. In those Churches the Lady Chapel was part of a great extension to the east; at Exeter it was an extension to a building which it must have been already intended to destroy. It was, therefore, naturally lower than the building which afterwards rose to the west of it. As it is, the Church of Exeter is a remarkable case of one general design being carried out through more than a hundred years. It was fixed, once for all, what the new St. Peter's should be like, and it grew up after one general pattern, but with a certain advance in detail as the work went westward. Bishop Grandisson, when the Church was about half built, said that, when it was finished, it would surpass in beauty all Churches of its own kind (*in genere suo*) in England and France. Whatever he meant by *genus suum*, the prediction was safely risked. As far as outline and general effect goes, the Church of Exeter forms a class by itself, and can be compared with nothing save its own miniature at Ottery St. Mary. As far as detail goes, no building of his age shows us the taste of that age in greater perfection.



"The style of the Church is necessarily that of the latter part of the thirteenth and the earlier part of the fourteenth. The windows throughout supply excellent studies of the growth of tracery from its earliest fully developed forms. But they are all kept within the range supplied by its geometrical and flowing varieties, which are mingled even in the great west window without any sign of Perpendicular. The proportions of the building were ruled by the necessity of keeping it low. The designers clearly liked large windows; they would get a taste for them in the single bodied Lady Chapel. But two rows of large windows in the Aisles and Clerestory could only be had by keeping the Triforium low. The result was a somewhat massive Arcade, with a large Clerestory well filled in with windows, while the Triforium is cut down to a small Arcade. The Vault is in the best style of the time, the vaulting shafts rising from rich corbels. The long unbroken line of roof from west doorway to High Altar, unique in England as it is, is clearly the right thing where there is not the real break of a real lantern."

Exeter Cathedral was not exempt from the neglect of the ages succeeding the Reformation, and not till 1871 was the work of actual restoration begun, between which date and 1877 a sum of £50,000 was expended under the direction of the late Sir Gilbert Scott, and the work is generally considered eminently satisfactory as a restoration.

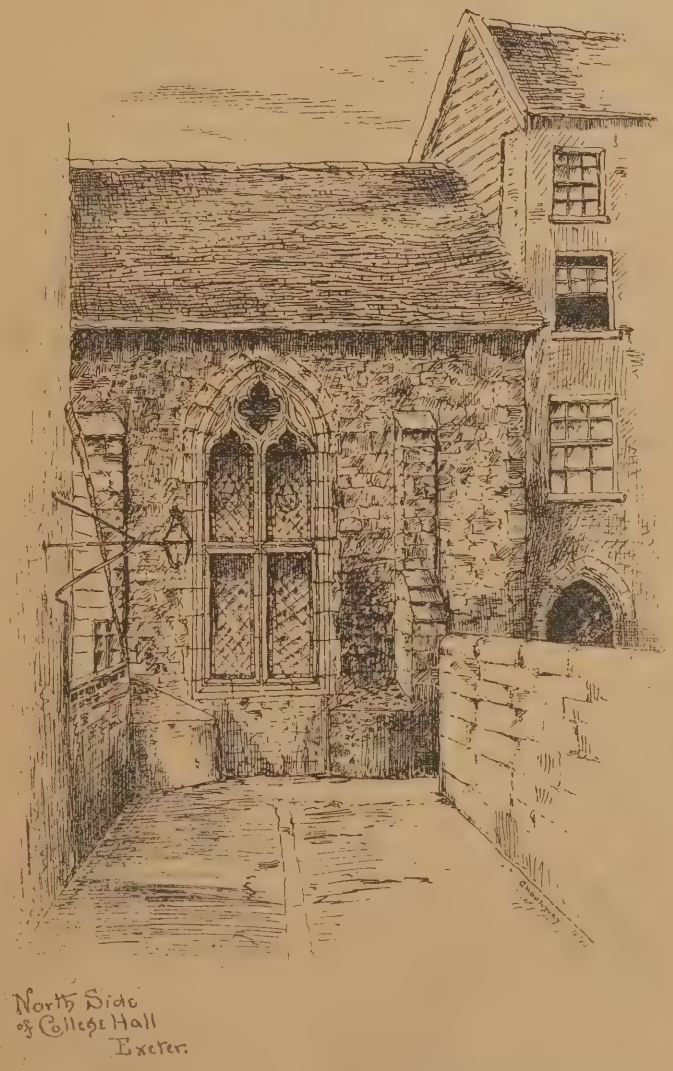
As the Cathedral is the centre of the ecclesiastical, so is the ancient Guildhall the centre of civic life, and is now the chief Architectural attraction. The Castle of Rougemont, which in ancient days dominated the city, now being only a memory, only the remains of the ancient Gateway standing, and this, though in ruins, conveys some slight idea, by its massive strength, of the kind of Castle it was which held its own for so long against all the forces which King Stephen brought against it in his famous siege, besides the many other sieges which it successfully withstood. The Gates of the city, which rivalled those of York, are all gone, sacrificed to the utilitarian instincts of the first part of the present century.



Although so many of its glories, both Architectural and political, have departed, the history of the city is one of the deepest interest, alike in points in which its history is typical of the older English cities and in points peculiar to itself. The city which has sat on its hill as a dwelling place of men, with an unbroken life of more than eighteen hundred years—a city by the side of which most of the capitals of Europe are things of yesterday—can hardly sink, like some of its fellows, to the forsaken ruin of a common market town. Still, Exeter is emphatically a city of the past. But the city in which Briton and Englishman have an equal share, the city which has stood so many sieges at the hands of so many enemies, a city which received one William at its eastern gate and the other at its western, a city which still keeps at least the successors of the never gave way to Woden—British Caerwisc, Roman Isca, West-Saxon Exeter, may well stand first on our roll-call of English cities. Others can boast of a fuller share of modern greatness, none other can trace up a life so unbroken to so remote a past.

(*To be concluded.*)

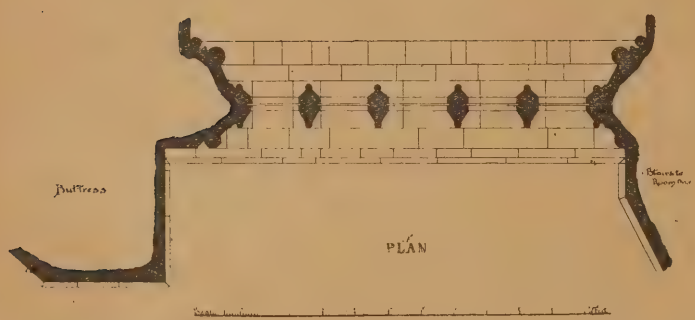
At Gibraltar the excavations for one of the Dry Docks is so advanced that the new slanting roadway by its side leading to the future main entrance to the Dockyard, will be used at the disembarkation of the troops from England next month. Instead of having to ascend a narrow staircase the troops will be able to march en masse to the road above, and the baggage wagons will come alongside the transport, thus saving an immense deal of labour.



The School of Art Wood-Carving, Central Technical College, Exhibition Road, South Kensington, has been re-opened after the usual summer vacation, and we are requested to state that one or two of the Free Studentships, maintained by means of funds granted to the School by the Institute, are vacant. To extend the benefits of the School, a remission of half fees for the Evening Class is made to artisan students connected with the wood-carving trade.

NATIONAL FREE LABOUR ASSOCIATION.

IN the Annual Report of the general secretary of the National Free Labour Association, which will be read at the fourth annual Congress at Manchester next month, it is stated that the usefulness of the Association, as an organization in neutralizing the disastrous effects of labour disputes, had been manifested by results. The Association had thoroughly justified its existence by the efforts it had put forward in this direction in almost every centre of trade. At the end of 1895 the total membership enrolled stood at 131,650. On the 31st of July, 1896, the membership, having steadily increased, had reached the most respectable figures of 150,355 *bona fide* workmen. This rate of increase was still going on, notably in the northern ports on the Mersey and Clyde, and in the chain of Bristol Channel ports. In connection with the strike in the London building trade in 1895—96, it was claimed that the cardinal feature which the London Building Trades Federation struck for—a drastic alteration of the working rules in order to exclude free labour from being employed in the building jobs throughout the Metropolis—was signally defeated. During the past three months arrangements had been made for opening new labour bureaux at Glasgow, Greenock, Leith, Dundee, Aberdeen, Bristol, Newport, Cardiff and Swansea. In regard to the threatened great strike in the London docks and outports in the country, it was stated that on the publication of the manifesto issued by Messrs. J. Havelock Wilson, Ben Tillett, Tom Mann, and other new union leaders, declaring for a general strike in the shipping and maritime industries of the country, the National Free Labour Association decided that if the trade of the Port of London and the outports was again to be paralyzed by the devices of the strike advocates, they would use every weapon at their command to checkmate and destroy the baneful work of the strikers. It was gratifying to find that the strike leaders had wavered from their original course, and the threatened strike seemed to have blown over.



THE strike in the Leeds building trade has now reached its 20th week, during which time the strike hands have received from 10s. to 15s. per week, with every prospect of these sums being continued. Amongst the works at a standstill are several Corporation contracts, two Board Schools, and a Bank.

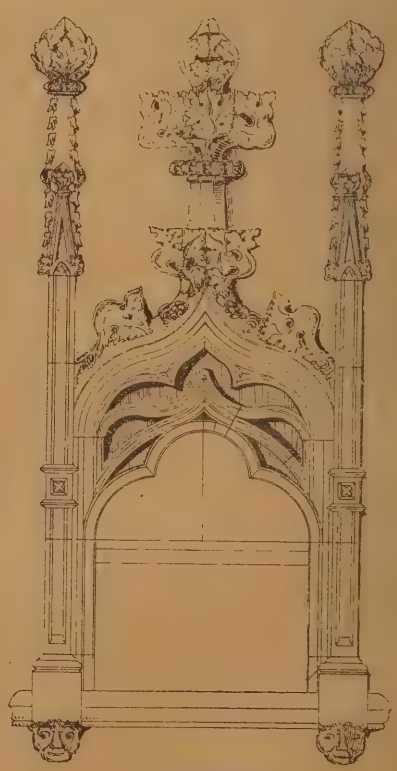
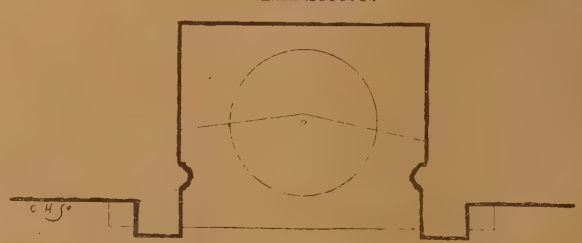
NATIONAL ASSOCIATION OF SLATE MERCHANTS AND SLATERS.



CONFERENCE IN NORTH WALES.

THE Fourth Annual Conference of the National Association of Slate Merchants and Slaters was held during the past week at Llandudno. At the Annual Meeting held at the Masonic Hall, Mr A. B. Partridge (Leicester), President, occupied the chair, supported by the Vice-Presidents, Messrs. J. Braby (London), W. Follitt (London), T. Flewitt (Nottingham), R. Mascall (Middlesbro'), D. Nelson (Sunderland), H. Shenton (Derby), Mr. J. Hunter, Hon. Treas. (Hull), and Mr. James Townsley, Hon. Sec. (Hull). The President, in his address, said the meeting was quite unique, for, so far as he knew, there had been no similar occasion when the merchants and slaters had been invited to meet the quarry owners. Their Association had given birth to and cultivated just dealing with customers, just dealings with each other, justice in buying, justice in selling, a good standard of workmanship, fair wages to the workmen, a consolidation of their trade by the removal of misunderstandings and petty jealousies, reasonable prices and a fair remuneration for their labour and the risk of capital, the discontinuance of unfair competition, and the bringing about of uniformity of work and prices. They were not banded together to form a ring to force up prices against the public, which, as Alderman Leonard warned them at Leicester, would be sure to end in an enormous disturbance of business. Their interests were one and the same, and if they continued to work together the trade would remain in its present satisfactory condition. Referring to the threatened strike at Penrhyn, he said a cessation of work at this or any other large quarry at the present time would be deplorable in the extreme. It was a satisfaction to feel that the difficulty had been met for the present, and he trusted might be soon overcome, by the wise and sagacious way Lord Penrhyn and Mr. Young met the men's demands and as he thought exposed the weakness of the men's cause and the falsity of their claims. The Hon. Secretary's report spoke of a steady growth made during the past year. They began with a register of 168 firms, and this had been increased to a total of 204, a net increase of 36, or 12 more than the preceding year. From this had to be deducted eight firms whose membership had lapsed from various causes. The election of officers resulted in Mr. A. B. Partridge being reappointed President. Messrs. C. Braby, W. Follitt, T. Flewitt, J. Hollis, R. Mascall, and Digby Nelson were elected Vice-Presidents. Mr. James Townsley and Mr. J. Hunter were re-elected Hon. Secretary and Hon. Treasurer respectively. The Central Board was also appointed. On the 8th inst. Blaëran was visited, and the Oakley, Greave's, Votty and Bowydd, Maenofferen, New Welsh Slate Company, and Craig Dhu Quarries inspected. The visitors were entertained to luncheon at each of the quarries. In the evening the members were entertained to a banquet at the Town Hall, Portmadoc, by the Festiniog Slate Quarry Proprietors' Association. On the 9th inst. the business of the Conference was concluded at the Masonic Hall, Portmadoc, and visits were then paid to the different places of interest. On Thursday a visit was paid to the Divorure Quarries, the property of Mr. Assheton-Smith, and on Friday the party inspected the Penrhyn Quarries, and at Beaumaris were the guests of Lord Penrhyn.



THE Model Lodging-house erected by the Town Council of Peterhead at a cost of £1,500 has been formally opened. The building is certified to contain 62 lodgers, and separate dormitories are provided for males and females, and a certain number for married couples.

IT is stated that a telegraphic cable has been destroyed by insects. The cable was laid in Tonkin in 1894, and was composed of seven copper wires protected by an insulating envelope coated with cotton and jute. In addition to this, it was placed in a leaden pipe. Notwithstanding all these precautions, the cable, which was laid on a marshy soil, commenced showing signs of decay in 1895, and it was found necessary to replace it in the spring of the present year. On examining the cavities in the protecting envelope M. Bouvier discovered they had been made by termites. It is suggested as a preventive measure to steep the cotton and jute in a solution of sulphate of copper.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
September 16th, 1896.

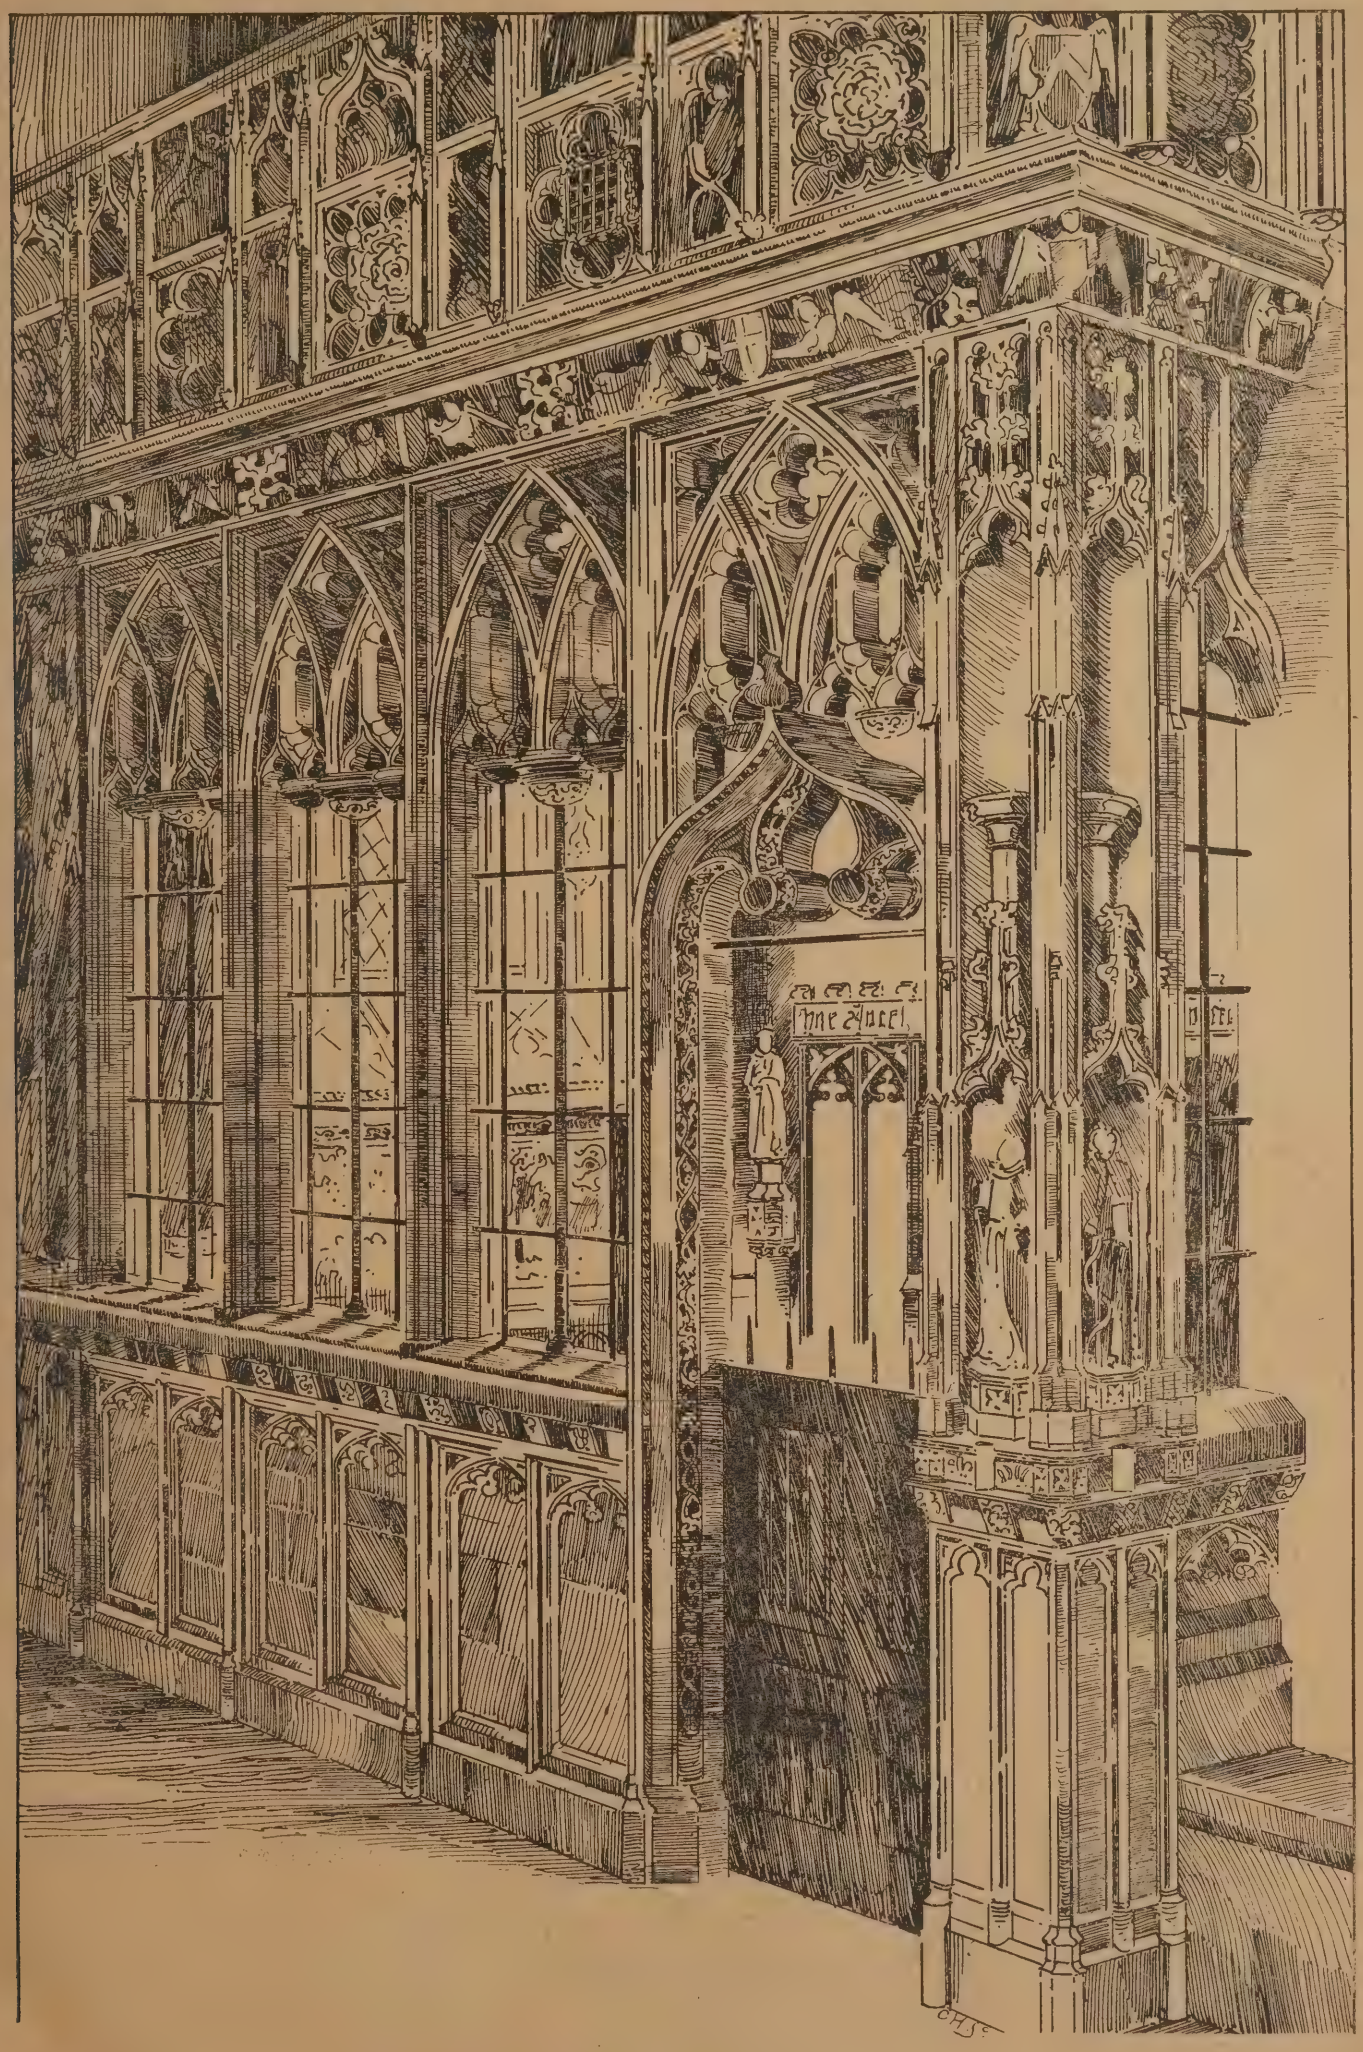
"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs." —JOHN RUSKIN.

IF the change in the title of the South Kensington School from the "National Art Training School" to the "Royal College of Art" is not merely an empty compliment to a much-criticised institution, it is a distinct promise, says the "Globe," of a very definite alteration in the educational policy of the Science and Art Department, a promise that everyone will be glad to see fulfilled in a really adequate manner. As a Royal College, South Kensington should rank with the other similarly designated bodies to which is entrusted the duty of setting the standard in the professions they represent: and to do this it will need many amendments and much modification in its manners and customs. There is no reason why, with judicious revision, it should not thoroughly act up to its new title; but this revision is certainly necessary, for, as it is at present constituted, any pretension on its part to pose as the leading influence in Art education would be worse than ridiculous. A change of designation will certainly not hide its present deficiencies, but would rather accentuate them, and make the contrast between its professions and its practices the more glaring. At the same time, the National Art Training School, by adopting such a title as the "Royal College of Art," is decidedly turning its back upon the countless professions which it has for years been making about its special mission. Art, its apologists have declared over and over again, was not what it existed to promote; it was a teaching place where intending masters of Art Schools would learn how to produce the particular type of student whose work would be likely to earn for the School in which he might be studying a comfortable proportion of the money grants which a not too liberal Treasury has been accustomed to put at the disposal of the Science and Art Department. That anyone should use the School as a means of acquiring the capacity to work as an artist was always horrifying to every believer in the Training College as it has hitherto been constituted. Now, apparently, all this is to be changed, and as a Royal College, the School will have to make Art its chief subject of study, and will have to encourage artistic aims that it has for many years most consistently avoided.

A CRAFTSMEN'S and Industrial Exhibition has been opened at the Royal Aquarium. Apart from the interesting patents and works of skill displayed, the Exhibition is noticeable for the number of contributions that fairly come within a category of the "misplaced ingenuity and industry" section. The working man is immensely fond of occupying his spare time in making useless articles, and while in some instances the results of the labour of leisure may be fairly described as "things of beauty," in many cases it is difficult to imagine what satisfaction is derived from the toil and trouble incidental to the production of articles neither pleasing to the eye nor possessed of the slightest utility. One of the most interesting features of the Exhibition, which will remain open until the beginning of next month, is the working potter from Lambeth, who sits at the ancient wheel and turns the clay into all manner of beautiful forms. The glass-blower, however, runs him very close, and an extremely expert workman is employed to evolve bright and fantastic articles. Cooking by electricity is another interesting demonstration, and the comparatively slow process of brush-making by hand is likewise well worth seeing.

FINIAL TO PISCINA, ST. MARY MAGDALENE CHAPEL, EXETER CATHEDRAL: SKETCHED BY O. RALLING.

WE understand the authorities at the War Office have an elaborate scheme in hand with respect to the building of the new Barracks and Military Hospital at Chelsea. It is proposed to remove the Duke of York's School for the Sons of Soldiers into the country, and to disestablish the Chelsea Hospital for Pensioners, provision being made, of course, for the inmates on much the same lines as those adopted in the case of the old Greenwich Hospital. The old institutions removed, the land will then be utilized for the purpose above named, Chelsea being regarded as a peculiarly advantageous position for the proposed extension of barrack and hospital accommodation in the Metropolis. It is very much to be hoped that this scheme will meet with the strongest possible opposition from many quarters. To destroy Chelsea Hospital would be an act of monstrous vandalism, and the Duke of York's School is an excellent institution, doing admirable work. If the War Office wants another Barrack in the neighbourhood, there is plenty of ground available, for whole acres of small houses are just now being demolished in Chelsea and Pimlico. But why should we have more Barracks in London? Surely it is better for the health, the good conduct, and the efficient training of soldiers that they should be in the country.



So accustomed are the people of Japan to floods that after the first shock they quickly recover their light-heartedness and resume their occupations with cheerfulness. New houses spring up on the sites of those destroyed, the embankments are patched, and the farmers hope that next year their locality will escape devastation. This resignation to the inevitable is particularly noticeable at Gifu, which, ever since 1891, when earthquake and fire destroyed the town so that only a few houses remained, has each year suffered catastrophe. With regard to the recent calamity it is stated that at Kioke the people had been working two days to strengthen the embankments, and, thinking their labours had made them secure, retired to rest. But the embankment collapsed in four places, sweeping away the houses. At Kurozu the inhabitants were driven to take refuge on the roofs of the houses, which were not submerged, and there without food were exposed for three days to the heat of the sun, which after the rain was intense. Without means of escape they clung to the roofs, afraid to sleep lest they should fall into the water. They were finally assisted from Nagaoka, three miles off, the police coming to their rescue in boats.

IT is understood that two of the most eminent painters of the Royal Academy, Mr. G. F. Watts and Mr. W. Q. Orchardson, have refused to accept the presidency — Mr. Watts on account of his advanced years, and Mr. Orchardson because he cannot spare the time for the official and social duties which attach to the post. Mr. E. J. Poynter is now regarded as the most likely successor to the late Sir John Millais. He is the Director of the National Gallery, but that cannot be considered an insuperable barrier to his appointment, as Sir Charles Eastlake held the same office during his term as P.R.A.

THOSE who exerted themselves unavailingly to save the Rolls Chapel from destruction in December last, will learn with a melancholy interest that the last remaining fragments of the walls have lately disappeared. Torrigiano's tomb of Dr. John Young, Henry VIII.'s Master of the Rolls, and the other monuments deemed worthy of preservation have been carefully removed and housed in a shed. It is hoped that when the new wing of the Record Office is completed, in about eighteen months' time, they may be restored as nearly as possible to their old positions.

THE LADY CHAPEL: DRAWN BY S. NEWCOMBE.

ST. SAVIOUR'S CHAPEL, EXETER CATHEDRAL: DRAWN BY S. NEWCOMBE.

THERE is a not unnatural disposition to invest very ancient stones with a romantic history, due to the situation in which they chance to be found. Both the stone and the legend may be individually authentic; but sometimes neither really belongs to the other, and we have what —for want of a better phrase—may, perhaps, be called an antiquarian misfit. Not long since a stone with a Runic inscription was dredged up in the Harbour at Havre. This was at first stated to be a relic of the old Viking settlers in Normandy. But, though perfectly genuine in itself, it presently transpired that the stone had formed part of a Norwegian exhibit at the Paris Exhibition of 1867, having been accidentally lost overboard on its return to Norway shortly afterwards. Another Runic stone, now in the Guildhall Library, was dug up in St. Paul's Churchyard in 1852, and, on the doubtful interpretation of an inscription, is associated with Tokig, a minister in England of Canute. But if, as is asserted, this formed part of a London monument of the eleventh century, other stones of similar character might surely have been expected to occur in the same locality. A yet more venerable example of the occasional fallacy of this form of lapidary legend is furnished by the so-called "Stone of Job," situated not very far from Damascus. Immemorial tradition has asserted that the patriarch rested upon it in the course of his wanderings. Later investigation, however, has conclusively shown that, instead of the inscription having anything to do with Job, it refers to Rameses II., a King of Egypt who reigned 200 years later.

AN eating-house made of paper has been erected in the port of Hamburg. Its walls are composed of a double layer of paper stretched on frames and impregnated with a fire and water proof solution. A thin wooden partition affords further protection against the inclemency of the weather. The roofs and walls are fastened together by means of bolts and hinges, so that the entire structure may be rapidly taken to pieces and put up again. The Dining Room itself measures 30 by 6 metres, and is capable of accommodating 150 persons. There are 22 windows and four skylights, and the heating is effected by a couple of isolated stoves. A side erection contains the manager's Offices, Kitchen, Larder, and Dwelling Rooms. The total cost of the construction is said to have amounted to 1,500 marks.

CANON M'LARNEY, Rector of Clonfert, is appealing for funds for the restoration of Clonfert Cathedral. He writes:—"The Cathedral was founded by St. Brendan in the year 558, 39 years before St. Augustine landed in England. It has had a very chequered and interesting history. It suffered greatly from the incursions of the Danes, who frequently sailed up the River Shannon from Limerick and attacked Clonfert. It was burnt six times between the years 774 and 1179, and was plundered three times between the years 949 and 1065. In the year 1541 it was almost totally destroyed. Bishop Woolley repaired the Cathedral in the year 1664. Since that time up to the present, a period of over 230 years, some alterations and improvements have been effected, but no general work of restoration has been done, consequently the building is in great need of repair. It is one of the smallest Cathedrals in the Kingdom, and is considered very beautiful. It is now used as a Parish Church. It is celebrated for its magnificent 12th century doorway, one of the finest remaining specimens of Hiberno-Romanesque work in existence. It is also remarkable for its Chancel window, nearly a thousand years old, which is similar in design to that of Temple Righ, at Clonmacnoise." The amount required is £1,500.

THE excavation of the tumulus on Parliament Hill, which was undertaken by the London County Council, aided by private enterprise, has not been very promising of results. The excavators thought probably to recover the silver girdle or belt supposed to have been worn by Boadicea when she marched against the Roman Legions. As a matter of fact, however, an old Roman coin and a bullet was all that was discovered as a reward for the pains and labour of excavating. It is probable that the mound, which no doubt is artificial, had been opened in comparatively modern times, and if anything had been buried there it has long since been removed. Besides, it is doubtful whether the great battle ever took place at Hampstead. It is more probable that the famous fight was carried on in Essex, possibly in the neighbourhood of Chelmsford.

M. DE SELVES, the new Prefect of the Seine, who exercises a sort of bureaucratic control over the municipality of Paris, has just inaugurated a reform that will be watched with interest beyond the borders of France. It will be generally admitted that the persons elected to represent local interests on town councils and analogous bodies, however competent to deal with financial, mechanical and sanitary matters, seldom possess the æsthetic sense or imaginative faculty which ought to be brought to bear on the Architectural features of a great city. We need not look abroad to find abundant confirmation of the fact. To keep the Municipal Council of Paris from indulging in vagaries of which future generations may repent, M. de Selves has created a non-elective committee of works, with advisory powers only, its duty being to report to the Council on all plans involving the harmony and beauty of the capital as a whole. He proposes to appoint the painters Detaille and Puvis de Chavannes, the sculptors Dubois and Barrias, the Architects Garnier and Boileau, and the engineers Denfor, Bourdais and Badois, to act as independent members, with an equal number of official colleagues chosen from the highest ranks of the public administration. The idea does not appear to find disfavour with the popular representatives, and the Press receives it with general approval. We are anxious to hear how it will work out.

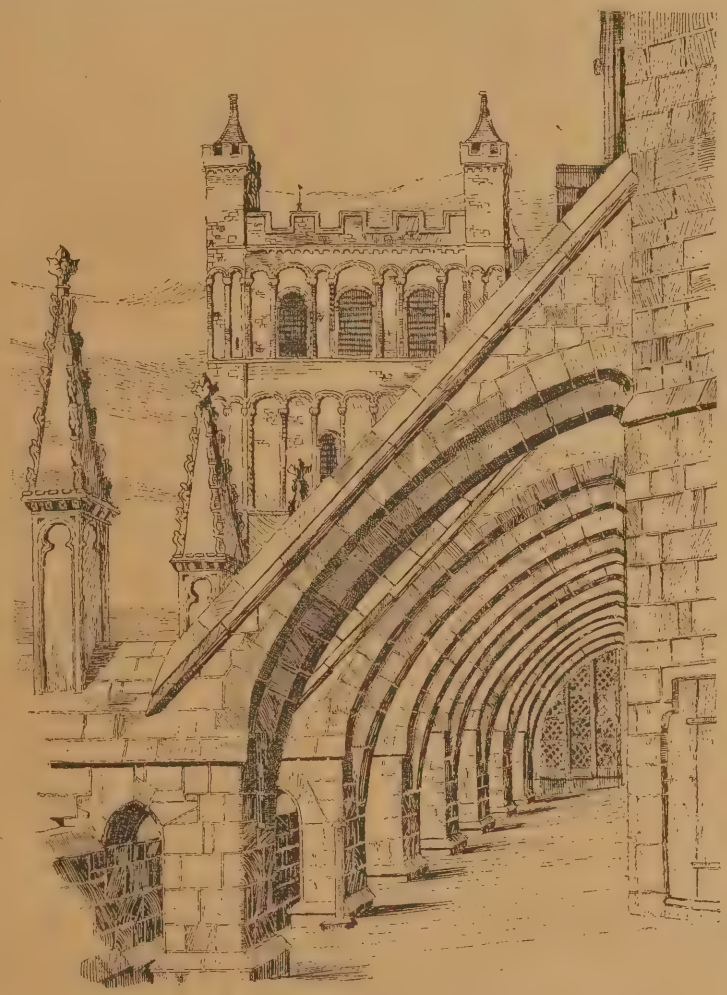
AMONG the Parliamentary Papers issued last week is the report of the Select Committee on Government Offices (Appropriation of Sites), together with a report of the evidence taken by the Committee. The Committee reports that it is desired to acquire as soon as possible the various interests in the property bounded by Whitehall on the West, Whitehall Place on the north, Whitehall Avenue on the east, and Whitehall Yard or Horse Guards Avenue on the south, and to proceed with the erection of a new War Office on this site, called the Carrington House site. The Committee also finds that there are many other Departments which stand in pressing need of concentration or extension and improvement of accommodation. These should, it considers, be brought together on the site now being acquired in and behind Parliament Street, on the surplus land belonging to the Government in Spring Gardens to the north of the New Admiralty, and in the neighbourhood of Downing Street.

EXTENSIVE improvements are being carried out in the Tower of St. Thomas's Church, Bristol. The old building, which was known as St. Thomas's Church, was destroyed in 1789, and the men who demolished it found their task very difficult. So solid was the masonry that some portions of it had to be blown up by gunpowder. The work of erecting the present building was completed in 1793. The original Tower, which is a very good example of the Perpendicular style, was allowed to remain, but it has now become so dilapidated that much restoration is necessary. A considerable portion is being refaced, and a new parapet and pinnacles are being added. As far as possible the old lines of the Tower are being followed, and the surface is being disturbed only where the stone is decayed. The cost of the work, which amounts to about £1,600, is being defrayed out of the legacy left by Mr. Frayne. Mr. Gough, of Bridge Street, is the Architect, and the work is being done by Messrs. Cowlin, who restored the Tower of Bristol Cathedral. It may be mentioned that the scaffolding erected around the Tower is well worth inspection, for the difficulties which interfered with its erection, owing to the lack of facilities for acquiring a suitable foundation for the structure, have been overcome with considerable ingenuity.

THE special report, agreed to by the Board of Management of the Royal Masonic Institution for Boys, Wood Green, will lead to considerable discussion, as it concerns the removal of the School. In 1891 attention was drawn to the undesirable site on which the School is placed, and in consequence thereof the Board was instructed to entertain negotiations for the sale of the property, with a view to the removal of the School. Through a period of forty years the present site and buildings have cost £100,000, but much of the expense has been due to alterations, the institution assets only being entered as £30,400. The Board has engaged to use every endeavour to dispose of the property to the best advantage, and it is anticipated that a sum much nearer half the complete cost will be realised by the sale. The number of the boys and the demands on the space have so increased that something must be done speedily to meet the needs of the institution. About twenty boys have to be educated out of the building because of the lack of accommodation, and at the present time at least £10,000 should be spent to adapt the building to the requirements of the period, which would lead to a still greater encroachment on the playground space, which now is lamentably little in extent, and the boys have to go, and do go, a considerable distance from the site to secure more accommodation.

SOME curious details are given in a contemporary anent the early days of the Liverpool and Manchester Railway. Travellers in the thirties were vastly pleased with the very indifferent accommodation provided for them, and thought that to pay five or six shillings to go thirty miles in one-and-a-half hours was the perfection of cheapness and speed. The compartments then in vogue were about as commodious as our London four-wheeled cabs. The first-class vehicles were painted yellow, and bore such names as Queen Adelaide, Marquis of Stafford, Treasurer, and Despatch. Being usually 18 ft. long, upon a base of only 6 ft., they pitched up and down considerably as they ran. To the second-class coaches there were light roofs or awnings, but often no sides and no doors; the colour of these airy conveyances was blue or pink. Lime Street Station, Liverpool, was not opened till 1836, prior to which "the passenger trains started from an obscure little place, rather like an inn yard, at Crown Street."

AT a recent meeting of the Belfast City Council an important report relative to the sanitary condition of the houses was submitted. The report, which deals exhaustively with the subject, states that there are upwards of 22,000 houses, chiefly occupied by the working classes, which have no back doors, and consequently all refuse matter has to be carried through the dwellings to the public street. In the case of many thousands of houses decomposing matter is retained for months within a few feet of the houses themselves. The radical cure for this state of things, the report points out, would be to close up all such houses as being unfit for human habitation, but this would mean the turning out of house and home of a population of about 100,000 people; and the providing of suitable dwellings for such a number of persons would be simply impossible. In this case the remedy would be worse than the disease.



THE troubles of the East London Water Company at their West Warwick Reservoir are by no means ended. After having suffered for months from a drought which not even the first advent of rain relieved to any satisfactory extent, they are now in grave difficulties owing to the flow of water into the engineers' works. They have been pressing on the making of the new reservoirs with splendid energy, this particular work being likely to attain completion in April, or about four years before it is due according to the company's pledge. The flooding of water is due to the great depth of the reservoir, which in one corner is 30 ft. below the level of the Lea, and its close neighbourhood to the river. Another vast receptacle is to be finished this week, and another in a month.

CANTERBURY Cathedral restoration is making satisfactory progress. The work in the Crypt, which was commenced in the time of Dean Payne Smith, is now approaching completion. The bases of the columns, which have been covered with earth for centuries, have been uncovered, and by this means some of Ernulf's finest work is disclosed to view. With improved drainage, a concreted floor, and glazed windows all round, there will be no danger of the flooding which led to so stupid a disfigurement in the past. The beautiful work of the Lady Chapel is left intact, and in the Norman portion of the Crypt the exact spot where à Becket's body was hidden is indicated by a stone slab in the shape of the original coffin lid. The interior of the Chapter House is wholly occupied by scaffolding, it being hoped to have this part of the restoration completed in readiness for the great gathering of next year in connection with the thirteenth centenary commemoration of King Ethelbert's baptism. The stonework of the large windows at the west and east ends was crumbling, and it was found necessary to put entirely new jambs and coping above; but the delicate tracery of the windows and the mullions are to be preserved. This work is almost completed at the west window, and the other will be commenced shortly. Two out of four other windows which were blocked up have been opened. The fund at present amounts to about £12,500.

ANOTHER immense cavern, rivalling the famous "Mammoth Cave," has been found in Kentucky. It was discovered by Mr. Pike Chapman, near Proctor's Station, on the Mammoth Cave Railway. The entrance is halfway up a neighbouring hillside, and the floor of the cave is reached by descending a series of ladders. It contains a "Colossal Dome" 137 ft. high, and is now called the "Colossal Cavern." The main cave is 40 ft. high and 60 ft. wide, and is ornamented with fine groups of stalactites. The "Pearly Pool" is lined with tufts and sprigs of crystalline alabaster, and the water is clear as glass. Pillars of stalactites and stalagmites conjoined surround it, and the roof overhead is fretted with countless small stalactites. The cave extends for miles, but has not yet been fully explored. Crusts, rosettes, and "flowers" of gypsum, crystals of selenite, mantles of fibrous gypsum, branching crystals standing out from the wall like stags' horns, and deep pits are among the curios of the cave.

DURING the forthcoming session of the Architectural Association, the following papers will be read at the Institute, 9, Conduit Street: November 6th: Roof Coverings: (1) "Lead, Copper, and Zinc," by Mr. G. Ewart; (2) "Tiles," by Mr. F. Walker; and (3) "Slating." November 20th: "Garden Design," by Mr. F. Inigo Thomas. December 4th: "Street Architecture," by Mr. H. H. Statham. December 18th: "An Unwritten Chapter of English Architectural History," by Mr. A. S. Flower. January 15th: "Decorative Plaster Work" (with models), by Mr. E. Prioleau Warren. February 5th: "A Plea for the Application to Architectural Design of Natural Forms as Revealed by the Microscope" (with illustrations), by Mr. W. H. Seth-Smith. February 19th: "The Architect and the Public," by Mr. W. H Bidlake. March 5th: "Greek Sculpture and Greek Legend" (with lantern illustrations), by Mr. F. S. Granger, D.Litt.Lond. March 19th: "Eighteenth Century Work," by Mr. J. A. Gotch. April 2nd: "Architecture in Relation to the Crafts," by Mr. T. G. Jackson, A.R.A. April 30th: "The Classic Cornice," by Mr. Hugh Stannus. May 21st: "Plumbing and Sanitary Work" (with demonstrations), by Mr. S. S. Hellyer.

ONE of the most curious structures in Dublin is St. Michan's Vaults. The Church was erected just one thousand years ago in memory of St. Michenus, a Danish bishop, whose granite effigy in mitre, alb, and chasuble lies in the building. Underneath the sacred edifice, and restored in 1686, are receptacles for the dead, which arrest decomposition in corpses deposited there. There are five of these preservative chambers—namely, two under the Nave, two under the South Transept, and one under the Chancel. No one can form any idea beforehand of the sort of place, with its surroundings, where these old sepulchres are situated. As soon as one enters the sloping iron doors, and by the aid of nine steps has reached the ground floor, he at once inhales warm air, and quite dry, while the limestone walls display not the smallest trace of damp. Among the various theories which have been proposed to account for these phenomena, one may be mentioned. St. Michan's is built over an old oak forest—from which William Rufus obtained rafters and beams for the ceiling of old Westminster Hall, taken down in 1397. It has been suggested among other theories that it is the tannin here which solves the mystery of the undecayed dead.

ON THE LEADS, EXETER CATHEDRAL: SKETCH BY S. NEWCOMBE.

BUILT in the reign of Edward II., Chelsea Old Church was placed near the river in order to serve as a landmark. The Church, as originally designed, consisted of a narrow Nave, the length of which may be seen when the arch, in front of which the organ now stands, and which originally contained the west window, is examined, whilst at the north-west end was a Tower There are in the building characteristic specimens of fourteenth, sixteenth, and seventeenth century work. The arch at the east end is evidently part of the first Church, whilst the thickness of the rubble wall may be seen where it has been pierced to form a doorway to the Vestry. Robert de Hyde, in 1368, is said to have built a Chapel on the north side of the Church, and this Chapel is virtually the North Aisle of the Church, and is seated for worshippers. The South Aisle, the "More Chapel," as it is called, was built by "Blessed Thomas More" in 1528 the date is on the eastern pillar, the capital of which is Italian Renaissance work. This is especially interesting, for it affords an indication as to the direction to which English Architecture would have turned, had it not, as was all ecclesiastical Art, been checked by the Reformation. The second column, which was evidently carved by an English sculptor, still shows the holy water stoup and sprinkler. In 1666, when things had quieted down after the Restoration, the North and South Aisles were lengthened to the westward, the walls raised, the windows enlarged, and the whole building "beautified." Mr. Bowick, writing some thirty years after, declares, "The Church was furnished with all necessary ornaments, and the steeple with a good ring of bells by the great bounty of the noble and worthy inhabitants." They have at Chelsea a feature which is almost unique in London, namely, "chained books," books which were intended for public reading, but which it was found necessary to have chained to the wall.

M. BERTHELOT, the French chemist, proved a year or two ago, chiefly by analysing the copper sceptre of a Pharaoh of the Fourth Dynasty (4,000 B.C.) that the Egyptians of this early age did not know the use of bronze. The neighbouring peoples of the East, for instance, Mesopotamia, were also ignorant of this alloy. Berthelot has recently sent out an assistant, M. De Morgan, to visit the abandoned copper mines of the ancient Egyptians, which were situated in the desert of Sinai. The mines are in much the same condition as when they were abandoned by the ancient workmen. M. De Morgan has penetrated some of the galleries, and brought away specimens of the ore, the materials used in smelting it, with charcoal, the crucibles, tools, &c. Among the tools is a burin containing a little tin, but not enough to make bronze. A hammer of copper has a trace of arsenic in it, probably to harden it. There is also a hollow needle of pure copper.

KNOWN as the "Iron Gate," the great obstacle to the navigation of the river Danube, is now practically overcome, and it is intended that the canal for the passage of the rapids shall be formally opened by the Emperor of Austria on the 27th of this month. At this particular point the breadth of the Danube is only 129 yards, and the piled up waters attain a depth of 28 fathoms. Ledges of rock, we are told, "lift their tooth-like points above the surface, and a seething stretch of whirlpools, cataracts, eddies and counter-eddies combine with the river's rapid falls to present a serious and formerly impassable obstacle to navigation." It was to overcome this formidable obstacle that the cutting of the canal, now about completed, was undertaken. It has taken six years to complete the work. The canal, which runs alongside the ruins of one built by the Roman Emperor Trajan to effect the same end—the passage of the Iron Gate—is four miles long and 73 metres broad. The lowest part of the Canal, which opens into the broad bed of the river as it flows past Roumania, is hemmed in for the length of 1,700 metres by quay walls formed of enormous blocks of freestone blasted out of the rocks of the Iron Gate. This wall is twenty metres higher than high water mark.

SANITARY ENGINEERING AND HOUSE ACCOMMODATION.

BY SIR ANDREW NOBLE, K.C.B.

SIR ANDREW NOBLE, the President of the Engineering and Architectural Section of the Sanitary Congress, in delivering his inaugural address said, although an engineer, he had never devoted special attention to that branch of engineering with which the Congress was more immediately concerned. He said "special attention" advisedly, for no man of ordinary intelligence could avoid paying some attention to such vital questions as were involved in sanitary engineering. He was old enough to claim to have seen the very beginnings of sanitary engineering, in the modern sense of that term, for he thought they might fairly attribute its inception to the passing of two measures in 1847 and 1848—The Town Improvement Act and the Public Health Act. Certain Architects, engineers, and mechanics, were then led to devote special attention to the practical methods of ameliorating public health, and proved to be the forerunners of the sanitary engineers as we have them to-day—a class as necessary, as able, and as much appreciated as any in the community. The drainage of private houses, which must always remain by far the most important of any sanitary scheme, was altogether defective. The houses themselves were generally badly designed from a sanitary point of view. There was, as a rule, no public water supply, and the wells from which most houses drew their water were contaminated. There was no comprehensive scheme of town drainage. But even after the awakening, progress was at first very slow. It was the last quarter of a century that had witnessed those

SWEEPING SANITARY REFORMS

that had placed England so far in advance of any other country as regarded hygienic matters. In these days of fierce competition, when Continental rivalry was such a bugbear in almost every trade, it was satisfactory to find that England more than held her own in the field of sanitary engineering. In some foreign hotels he had seen statements to the effect that the sanitary arrangements were by some English firm; this being regarded as a practical guarantee of their hygienic efficiency. It was curious to reflect how very dependent on one another were the doctor and the sanitary engineer. The plague of smallpox at Gloucester had shown that all the advantages of modern sanitation would not avail where medical precautions were neglected, and the doctor, on the other hand, would find his skill and medicine impotent if his patient were living in an ill-drained and ill-ventilated house. There were many problems arising out of the growth of population which called for the attention of the sanitary engineer; but none were more urgent, he thought, than that of the water supply for large towns. It was not too much to say that an ample supply of water was the first requisite of town sanitation. Apart from drinking purposes, personal cleanliness was impossible without it, and healthy dwellings were impossible without it, because experience had shown that a water-borne system of sewage disposal was the only one admissible for town use.

THE WATER-BORNE SYSTEM

had no doubt grave disadvantages, yet all efforts to supersede it had so far been unsuccessful; and it might be taken for granted that the water-borne system must prevail in towns for many years to come. The limited space available in towns for building purposes, led very often to the erection of houses in situations where a thoroughly satisfactory fall was not obtainable. Such situations demanded exceptionally powerful flushing of the sewers, and much more water was required for that purpose. Water closets were coming into nearly universal use, and baths were very common even in low-rented houses. This meant more water. The bath was now a recognised feature of even the most modest house. He knew scarcely any direction in which sanitary progress had been more marked than in this essential. There were now baths in houses in Newcastle with a rental as low as £15, and they were being fitted, he was told, in many of the superior tenement houses. The ordinary bath in a private house used perhaps 20 or 30 gallons of water. The fixed bath in houses, the common use of water closets, the more perfect flushing of sewers, the more frequent watering of roads, the more general employment of hydraulic machinery all meant more water. If our houses presented a great contrast with those of his youth in both accommodation, they presented an equally favourable contrast in their arrangements for dealing with sewage. The water closet of former days was an evil thing, with complicated gear which was constantly getting out of order, and so boxed in with wood that it could not readily be got at. In most cases, it was a disseminator of foul gases through the house, and a fruitful source of disease. All was now changed. The cry of "something wrong with the drains" was heard much less frequently, and an outsider like himself could not fail to be struck with the evidences of anxious attention and clever design exhibited in these common-place but very necessary appliances. In such matters as

VENTILATION AND WARMING,

enormous progress had been made. Warming with hot water, which, in the South of England, was more or less of a luxury, was, in a colder climate, almost a necessity if larger houses were to be maintained in winter at a comfortable temperature. Enormous improvement had, during his lifetime, been made in the sleeping accommodation of an average house. In even the larger houses of a former date, everything was sacrified to the so-called Reception Rooms. The sleeping accommodation was altogether starved, the Bedrooms for the family were small and ill-ventilated, and those for the servants disgraceful. One often wondered, in looking through well-known houses at the end of the last century, and the beginning of the present, how the large gatherings of friends that certainly took place there were ever accommodated Such houses seemed large enough outside, but when it was attempted to allot Bedrooms to visitors, the Bedrooms were found far too few, and, with some exceptions, far too small for modern requirements. He fancied that the explanation of such anomalies was that our ancestors were content with

VERY MODEST WASHING ACCOMMODATION,

and that, in the case of the men, at least, and probably of ladies, too, each Bedroom did duty for several occupants. A mattress on the floor, or any other "shake down" was as much as an ordinary bachelor or spinster expected on a country visit at Christmas or other generally festive season. He remembered a passage in George Eliot's "Silas Marner" describing the heroine's visit at Christmas to the squire's house, which he ventured to quote:—"There was hardly a Bedroom in the house where feminine compliments were not passing, and feminine toilets going forward in various stages in space made scanty by extra beds spread upon the floor; and Miss Nancy, as she entered the Blue Room, had to make her formal little curtsey to a group of six." In Miss Burney's "Evelina" two daughters of a well-to-do silversmith were driven to dress somewhat hurriedly in the Drawing Room before their guests arrived. As for the servants, they slept as they could, huddled together in tiny rooms, in cupboards, or in the space under the stairs, in Box Rooms, or in any other recess that would contain a mattress. The country houses of Northumberland, so far as he had had opportunity of judging, were bad in their servants' accommodation, though he had no reason to think they were worse in that respect than those of other counties. Modern practice had greatly improved these matters, and a much better balance was now observed between the living and sleeping rooms of a large house. He was inclined to think that we erred, if anything, in devoting too much attention to our sleeping rooms, and were carrying a good theory to a fad in demanding that they should be so spacious and elaborately furnished. In conclusion, he would say, that though the details of sanitary improvement seemed often petty or commonplace, they should not, therefore, be led to think them unworthy even of master minds

FLUSH TESTS.

THE DIAMETERS AND INCLINES OF DRAINS.

BY ARTHUR B. PLUMMER, F.R.I.B.A., HON. SEC. NORTHERN ARCHITECTURAL ASSOCIATION.

IN March of this year, as Hon. Sec. of the Northern Architectural Association, I received a letter from Messrs. Oliver and Leeson, Architects, drawing my attention to the fact that the Newcastle and Gateshead Water Company were again requiring in their revised regulations (then issued), that service cisterns in connection with w.c.'s should not allow of a flush of more than two gallons. I was desired to get up a memorial amongst Architects and others requesting that four gallons might be allowed. With the use of the fittings recommended and used by the company, it was reasonably maintained that a two-gallon cistern was all that was necessary for flushing purposes within a residence, and it was mentioned that water companies were not required to provide water for flushing drains outside a dwelling, but simply for

DOMESTIC PURPOSES.

The representatives of the Water Company next invited Mr. Leeson and myself to the Manor's Yard, and kindly arranged to fit up various cisterns and w.c. fittings, and lengths of drains for our further private inspection before inviting the members of the Council of our Association to give the matter their consideration. On May 29th, Mr. Leeson and I spent a morning at the Manor's Yard, together with Mr. Alfred L. Foster and Mr. Askwith of the Water Company. We made a number of experiments aud tests in connection with the various apparatus then fitted up. There were two lengths of drain pipes laid (each about 83 ft. long). One length was formed of 6 in. drain pipes, with a fall of 1 in 40, and having a Buchan trap at 19 ft. from where the drain gradient commenced, and with an obtuse bend at 12 ft. from the discharge mouth of the drain. The second length was formed of 4 in. glass lined pipes, with a fall of 1 in 60, and having a Buchan trap at 6 ft. from the start of the drain gradient, with a right angle bend at about 12 ft. from the discharge mouth of the drain. Various w.c. apparatus were fitted up in connection with these two lengths of drain, and were placed at heights representing the ground and first floor levels of a dwelling house. We first tested the 6 in. drain with a ground floor Shanks' two-gallon flush syphon cistern with a 1¼ in. flush pipe. The distance from the water line in the cistern to the top of wash-down basin was 3 ft. 8 in., and from the top of the basin to the bottom of the pipe where the drain gradient commenced was 3 ft. 8 in. A mixture of soft soap and sawdust, weighing 10¼ oz., and without paper, was placed in the basin. The first flush cleared the basin, but it was not till the sixth flush that half the charge came out at the mouth of the drain, and at the eighth flush the remainder came out. We carried out eight other similar courses of tests with various flushes, &c., detailed particulars of which have been retained. We noticed from the foregoing tests that although the 4 in. drain was not of so steep a gradient as the 6 in. pipe, and although it also had a much more acute bend in it, the result of these experiments was decidedly in

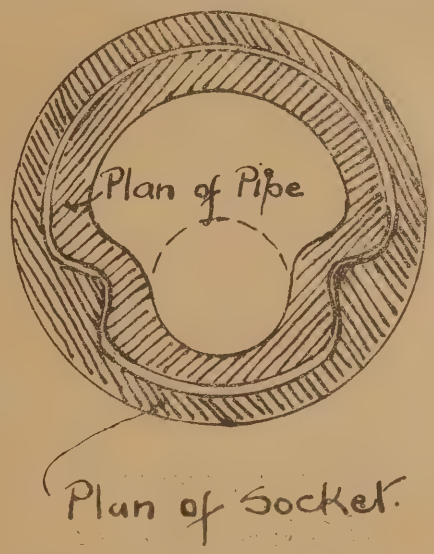
FAVOUR OF THE SMALLER DRAIN PIPE.

Sufficient had been done during this morning's work to convince those present of the importance of these experiments; it was felt, however, that the only way to obtain exact results was to make a very large number of similar experiments in connection with each drain and apparatus, and to strike an average of the results in each case. The Water Company's representatives proposed that the Northern Architectural Association should send a representative to work in conjunction with their Company's agent in connection with these proposed further tests, and in accordance with

* Extracts from a Paper read before the Sanitary Congress, at Newcastle.

this suggestion such arrangements as desired were subsequently agreed upon. I think we may take it for granted that no Water Company would desire to supply less water for flushing purposes than such an amount as may be the minimum quantity necessary. It would be undoubtedly penny wise and pound foolish to supply too small a flush, as in such a case two or more flushes would be found to be necessary, and would undoubtedly be used by the consumers instead of one of adequate amount. Now that pedestal closets are being universally introduced, and are used at all times and for all sorts of household purposes, the much greater amount of water wasted and used than was formerly the case, becomes a matter of serious consideration for any Water Company. I am clearly of opinion that all

SYPHON CISTERNS ARE A MISTAKE,



so far as water companies are concerned, and they are not necessary from other points of view. Of course, in the case of syphon cisterns, the full amount of the flush, say two gallons, is obliged to be used upon every occasion, whereas with other cisterns only half a gallon can be used if desired, and in many instances may be all that is necessary; on other occasions it is, however, quite indispensable that the handle should be pulled until the full two gallon flush is obtained. Various Architects have for long been convinced that many local authorities often compelled drains to be laid of unnecessarily large diameters in connection with private properties, and have felt that if only such authorities could be convinced that such is the case, it would be a decided advantage. If the Water Company's experiments help to prove that drains of as small a diameter as necessary are more easily flushed and kept clean with a minimum flush than drains of unnecessarily large diameter (which more easily choke up and become foul), we may reasonably expect that some good will be the result of these experiments. I know of instances where, in the case of drains from even single w.c.'s nothing less than a diameter of six inches will be allowed by local authorities. I may mention that the Education Department seem to understand the importance of not having large drains; in their Code of Regulations they state that four inches in diameter is sufficient to receive the discharge of as many as ten w.c's. I find that the bye-laws of the various local authorities in the north of England practically leave the question of diameter to the discretion of authorities. It is generally stated that "the drains are to be placed in positions, of such size, and of such materials, and at such levels as may seem to the Council sufficient for the purpose of effectually draining the same," or else it is stated that "every drain shall be of adequate size, and if constructed or adapted for conveying sewage to have an internal diameter not less than four inches." It would seem to me to be desirable that the maximum as well as the minimum size of drains should be stipulated and considered, and that

A REGULAR SCALE OF SIZES

of drains should be drawn up and included in the bye-laws (as in the case of the various thicknesses of walls); if such scale were not binding in every case it would, at any rate, be able to be referred to as a guide by any council or architect as to how they should use their discretion. I may perhaps mention that the London County Council made an application to the Local Government Board last year desiring that the flush might be increased from two to three gallons, the result of this enquiry was that the two-gallon flush was adhered to. I am of opinion that two gallons is sufficient for satisfactory sanitary apparatus, but not enough for flushing large drain pipes laid to a gradient of from 1 in 40 to 1 in 80—of course, many cisterns, nominally two gallons, contain both more and less than that amount. If consumers obtain water by meter, they can, of course, have a larger flush, and in certain cases this may be necessary, or else by some means they should have drains of a size and incline, &c., that can be flushed with the Company's allowance of water. On August 11th a new series of tests were commenced, when four 82 ft. lengths of drain were laid to a gradient of 1 in 40, and alongside each other, viz.: 6 in. and 4 in. sanitary pipe drains, and 4 in. and 3 in. glass-lined metal pipes. Each length had an almost right-angled bend at 12 ft. from the mouth, at a further distance of 4 ft. there were Buchan's traps in the 6 in. and 4 in. pipes, and a Dubois' trap in the 3 in. pipe, at a further distance of 8 ft. there were four junctions in connection with yard conveniences, 58 ft. beyond the drains were connected with four soil pipes, each having connection with ground and first floor w.c.'s. All the cisterns were two gallon, with 1½ in. flush pipes and Hopper basins. We started to experiment with the 6 in. drain by charging the top floor w.c. with a six ounce solid mixture of soft soap and sawdust, &c., as before, and flushing with two gallons; the same thing was next done in connection with the ground floor closet and then with the yard w.c. We commenced again and continued in rotation as before till each of the three closets had been flushed and charged twenty times. After the fourteenth round the

DRAIN WAS ENTIRELY BLOCKED.

Of twenty-two and a-half pounds put in only seven passed out. Considerable force was necessary with a hose-pipe next morning to clear this drain out again. Similar experiments in connection with the 4 in. sanitary pipe resulted in the charge passing much more freely through it till a stoppage took place at the end of the

Section of Drain Pipe proposed by Mr. Plummer, maintaining the advantages of the circular exterior, and also obtaining the small and large circular interior, for flushing and flood purposes, and avoiding the objection of being top-heavy and difficult to manufacture as is the case with the otherwise excellent egg-shaped pipes.

sixth round, and again a very considerable flush was necessary to clear the drain. In the case of the 4 in. metal pipes the results were satisfactory, and the 3 in. metal even more so, each charge practically came direct through the drain with each flush, and it therefore became unnecessary to again test this drain under less severe circumstances. It must be remembered that in allowing a two-gallon flush, the Newcastle Coupany are only doing what almost all other companies in the kingdom do (who give the matter much consideration) with I understand the exception of Southend, where a two-and-a-half gallon flush is conceded. This was, however, agreed to before the date of the Local Government Board enquiry, already referred to. This also is the case with Bradford where there is (or was) a three-gallon flush. I may, however, mention that there was a very serious water famine at Bradford two or three years ago. It would, perhaps, be possible satisfactorily to meet the requirements of the water companies, and the present demands of local authorities, by having large drains of a V or egg-shaped section. Another satisfactory course would be to convey waste water from baths, etc., to a flushing tank at the head of the drain, or where bath wastes can be conveyed direct there, no better flush could be desired under almost any circumstances. We conducted a further series of tests at the Water Company's yard, allowing consideration for other water flowing in the drains between the use of the w.c.'s. The closets were therefore charged in the same way as before, and in the same rotation, but after each flush with the charge in it, each cistern was discharged a second time into the drain simply as water without any charge. In no case was this second flush of the nature of a four-gallon flush at one time, because the first flush was allowed to be cleared through the drain and the cistern to fill again before the second was discharged into it. In the case of the six inch drain the second flush had the effect of preventing the stoppage, as was the case in the former tests, and the four inch and three inch pipes worked satisfactorily. A third series of tests, similar to the first, was conducted with a two and a half instead of a two-gallon flush, with the result that the six inch pipe now worked satisfactorily, and it therefore became unnecessary to test the four inch and three inch pipes in this way. I am of opinion that wash-down closets are the best from a sanitary point of view, and for flushing purposes.

KEYSTONES.

WALMER CASTLE, the official residence of the Lord Wardens, is to be thoroughly done up and the grounds put into good order.

IT has been decided to enlarge and rearrange the present Unitarian School buildings at Todmorden, at a cost of from £800 to £1,000.

NEW Sunday Schools have been erected by the Baptists in King Street, Desborough, Northampton, at a cost of £800.

A NEW organ has been placed in Long Eaton Parish Church, built by Messrs. Brindley and Foster, Sheffield, and decorated by Messrs. Guttridge and Son, Long Eaton.

AT Kirriemuir a new Parish Church Hall is to be erected, and the committee has invited competitive plans for the erection of the building.

IT is suggested to build a new Bridge on Crookston Road, over the river Cart, at Howford—the probable cost of a new Bridge and approaches is estimated at £5,500.

IT is proposed to pave the whole of the Chancel of Holy Trinity Church, Bury, with marble or mosaic work, and to raise the Altar by one step.

FOOT'S CRAY PLACE, the well-known Kentish home of the late Sir John Pender, and the scene of some notable Saturday to Monday parties, is about to be sold. Built a century and a half ago, it is full of historical associations.

THE large works of Messrs. Humphrey, situated at the corners of Ebury Bridge and Buckingham Palace Road, were destroyed by fire last week. The structure was chiefly of corrugated iron, and a large area of this material covered in a vast amount of timber.

A BLOCK of School Buildings is in course of erection in Pomeroy Street, Cardiff, near Clarence Bridge. The Schools will be in the Gothic style, with best faced bricks and Bath-stone dressings, and there will be a large Play Ground adjoining. The cost of the building is estimated at £2,000.

ON October 12th the new Central School of Arts and Crafts, organised by the Technical Education Board of the County Council, will commence operations in Morley Hall, Regent Street, under the direction of Mr. George Frampton, and Mr. W. R. Lethaby. The chief classes will be held in the evenings, but the School will also be open in the daytime.

PERMISSION has been granted to the Cumberland and Westmoreland Antiquarian and Archæological Society to undertake a series of excavations at Furness Abbey. Many carved stones and other relics have already been found, and at present a beautiful staircase, supported on massive masonry, is being brought to light.

DURING the long vacation the Benchers of the Middle Temple have taken steps for the purpose of completely renovating the buildings in their charge. Plowden Buildings, fronting Middle Temple Lane and adjoining the spacious and renowned Hall, are undergoing considerable internal alterations. The Middle Temple Hall has also received attention in the matter of decoration. The historic Temple Organ is being completely restored.

VEHICLES FOR HEAVY TRAFFIC.

HORSE *v.* MOTOR.

AN address on the subject of "Motor Vehicles for Heavy Traffic" was recently delivered by Mr. W. Worby Beaumont, editor of the "Engineer," to members of the Liverpool Chamber of Commerce. Mr. Beaumont remarked that the public would soon be free to run motor vehicles under conditions much more satisfactory than those which had hitherto obtained. Time would show whether engineers and others who were entrusted with the construction of these vehicles would make the freedom a blessing or otherwise. At the outset it must be admitted that they were not much further ahead at the present time as regarded the heavier class of traffic than they were sixty years ago; and they might look back with very great pride to the pioneer work of Hancock and several of his contemporaries in arriving at a greater degree of success than had even yet been achieved by those who, in France, Germany and elsewhere, were now making the vehicles of which so much was heard. While he did not wish to underrate the importance of the light vehicles which were now constructed—most of them of the benzoline motor kind—he had pleasure in referring to the fact that it was due to Englishmen that motor vehicles were invented and brought to a great state of perfection, and only kept in the background by another class of Englishmen. Summing up the present position as regarded heavy traffic, he remarked that, with the exception of the teachings of the traction-engine makers and the makers of light road locomotives, they had nearly everything yet to learn. The experience already gained had been almost entirely relative to the lighter vehicles, not weighing at the outside more than perhaps from 30 to 35 cwt., and incapable of conveying more than from 10 to 15 cwt. of goods. With one or two exceptions these modern vehicles had all been light petroleum or benzoline motor vehicles. Steam vehicles had been very few in number, and only of the same character as those built years ago, so that they had yet in a greatmeasu at all events to commence experiments the direction of constructing something which would do the work of a traction engine combined with a useful vehicle of one of the numerous forms required for different descriptions of merchandise. Changes would come very slowly, and those who owned horses must still look to them as their most important means of conveyance. The traction engine was certainly one of those vehicles which would stand any amount of work, and the experience of the builders of these ought to be of very great value; but at the same time they were only beginning to imagine what vehicles might be constructed for highway work. With the growth of the motor vehicle and the improvement of the roads which this would necessitate, higher rates were bound to come. But for the restrictive legislation, more particularly of local governing bodies, they would have had all the time which had elapsed since the day of Hancock for the improvement of motor carriages, and these would probably have reached at least as great perfection as the locomotive. Proceeding to describe the possibilities of various motor vehicles, Mr. Beaumont said the steam motor must be regarded, for a considerable time at all events, as the one which gave the greatest amount of promise. Not only light carriages, but omnibuses and vans for light traffic were being built in France and Germany, but the frequent hitches in their working led Englishmen to hope for something better from their own engineers. At present goods might be hauled by the light road locomotives over average good roads at a cost of from 1¾d. to 2½d. and 3d. per ton per mile. Electrical motor carriages were out of the question for long distances and country roads, though they might be advantageously employed in towns (where charging stations were convenient) for carrying light loads; inasmuch as the rotary motor ran very smoothly, and possessed the flexibility of the steam motor. Mr. Beaumont next proceeded to point out the difficulties of steering motor vehicles, remarking that the horse was always of help to its driver by reason of its instinct, which led it to avoid obstacles and to prepare itself for stoppage or starting. Drivers of motor vehicles would require considerable experience and training, and it would be necessary to employ two men, or, at all events, one man and a boy, where only one man was at present required. Mr. Beaumont concluded by repeating that satisfactory self-propelling vehicles for heavy traffic had yet to be designed, and that those who at present employed ordinary cartage could not do better than "stick to their horses."

THE TRADES UNION CONGRESS.

THE Trade Union Congress held its final sitting on Saturday. It has had a busy week, and has passed resolutions by the score, some of them of a very far-reaching character, and for many reasons open to remark. On one point, however, it has shown itself more moderate in its aims than former Congresses have been. Mr. Keir Hardie's famous resolution for the nationalization of land and of all the means of production, distribution, and exchange, though not actually rescinded, has for all intents and purposes been set aside, and its place has been taken by a new resolution in favour of the nationalization of land, mines, minerals, royalty rents, and railways, and of the municipalization of water, artificial light, and tramways. It was urged by some of the delegates that the list was incomplete, since factories and workshops were still to be permitted to remain in private hands, but the suggestion that they should be included fell flat, the Congress being of opinion that its Parliamentary Committee would have quite work enough in obtaining the sanction of the Legislature to the list in its more modest form. The desire of the Congress to extend the functions of Government in so many new directions contrasts curiously with the complaints it makes about the conduct of the Government in matters already under its control. It declares that the Labour Department of the Board of Trade is totally inadequate for the purposes for which it was instituted; it finds fault with the Postmaster-General and with the Secretary of State for War for having refused to meet deputations about the grievances of Government employés, and as for the state of things in Government dockyards, it finds that all trades employed have good cause to complain of what goes on. The grievances are that labourers are put in to take the place of skilled workers—presumably to do work which they are perfectly well qualified to do—and that there is a wholesale system of "blacklegging," which means, we suppose, that Trade Unionists are not employed to the exclusion of free labourers, as in the judgment of the Congress they ought to be. There was a protest, too, against recent decisions of the Judges about picketing, but as the decisions went no further than to declare that pickets must limit themselves to persuasion and must not employ or threaten to employ violence, the protest very prudently does not explain exactly where the wrong comes in. A legislative eight hours' day for miners was approved by a majority vote. A motion for a new Employers' Liability Act with no contracting-out clause was generally approved. We should have welcomed a more clear proof that the lessons to be learned from the proceedings at the late International Workers' Congress had been kept in mind by the delegates in Edinburgh and that something more had been done in the direction of practical reform. One or two resolutions there were of a really practical character, but most of the proposals were of the same abstract, impracticable kind as those which the International Congress has by universal consent been rightly blamed for confining itself to. On the important question of income and expenditure, the accounts for the past year are not very satisfactory. The Congress had a total income of £2,677, of which £1,104 was derived from the surplus from the year before. It has now a balance of £752, so that the actual year's income has been considerably overspent. Among the items of expenditure we find £250 put down to the account of the International Congress, and this, at all events, we may consider as money absolutely wasted. Trade Union Congresses have so long been in the habit of passing resolutions for all sorts of impossible reforms, and have had such ample experience of the negative results which have followed, that we hardly think that they will feel any acute disappointment when they find, a year hence, that the land and the mines and the railways have not yet been nationalized, that our system of education has not been entirely remodelled, and that the taxation of ground values has not been settled, and that it is as open to them as ever, on these and on a variety of other subjects, to pass resolutions and to maintain about all of them the same expectant attitude as before.

EXTENSION OF THE NATIONAL PORTRAIT GALLERY.

THE annual report of the Trustees of the National Portrait Gallery was published on Saturday. After mentioning the loss of Lord Leighton and Sir John Millais, the report states that since the publication of the last report the work of cleaning and repairing the whole collection has been brought to a satisfactory completion. The whole collection of paintings has been surface-cleaned, and in some instances the pictures have been re-varnished, other repairs have been executed, and the re-arrangement of the whole collection of portraits in painting and sculpture has been completed, the classification being as far as possible chronological. As to the required extension of the Gallery, "The Trustees find themselves constrained to call attention to the fact that the space for hanging pictures in the New Gallery is almost entirely occupied, and already raises difficulties, which are certain to increase every year. It is already barely possible to add any portraits to those already on the walls except by placing them in or shifting others to places which, from want of light and from other deficiencies, are wholly inadequate for the exhibition of pictures. An extension of the building is inevitable in the future, and the only possible means of carrying it out is by building over some portion of the ground to the west of the building, now occupied by the military authorities." In reply to a question by Mr. W. E. H. Lecky, M.P. one of the Trustees of the Gallery, in the House of Commons, on May 5th, 1896, the following statement was made by the Right Hon. A. J. Balfour, First Lord of the Treasury:—"I understand that negotiations are now going on with the War Department with regard to this site. At the end of three years part of the site will revert to the National Gallery. We have no ground for supposing the remainder will not be required for military purposes. If this should prove not to be the case, the claims of the National Portrait Gallery will be considered." The Trustees desire to urge the absolute necessity that no partition of this site should take place which does not provide for the extension of the National Portrait Gallery.

A PARIS correspondent writes: the most powerful lighthouse in the World, now being built at Penmark Point, in the Department of the Finisterre, is now more than half finished, and will, it is said, be inaugurated at the end of next summer. The "Petit Journal" gives some interesting information concerning it. The height of the Tower is 63 metres, which will enable it to be seen during the day from a distance of 30 kilometres in fine weather. During the night its light will be visible for 100 kilometres. The Penmark light will have cost, when completed, £24,000.

THE old town of Bruex, in the centre of wide-spread peat bogs between the two famous thermal places, Carlsbad and Teplitz, is threatened with ruin by the irruption of subterranean water into the peat bogs. The water has broken into the Anna mine, and the ground above the mine was set in motion. Deep and wide pits opened in the railway station, and in the neighbouring streets three new built houses are falling in. Many other houses are damaged. A pier of the iron railway bridge is hanging free without support. The railway traffic is interrupted.

Professional Items.

RYTON, CONDOVER.—A new Mission Room is being erected from plans prepared by Mr. J. Nurse. The builder is Mr. J. Price, of Bayston Hill.

RHONDDA VALLEY.—A new Baptist Chapel was recently opened at America Fach, in the Rhondda Valley. The Chapel was built by Messrs. Jenkins and Son, Porth, and will seat over 600.

LEEDS.—Considerable alterations and extensions have been made at the Leeds College of Music under the superintendence of Messrs. Swale and Mitchell. The whole of the premises formerly occupied by the Yorkshire Technical College have been purchased and utilised for Class Rooms, &c.

SOMERSHAM.—For some time past workmen have been carrying out various alterations and improvements in the Baptist Chapel. The contract price of the work was £250, and the contractors are Messrs. Parren, Watson, Grounds, and Peaks, under the direction of Mr Robb, who was the Architect engaged.

PENARTH.—On Wednesday, the new Parish Room for the All Saints' district of Penarth was opened by the Lord Bishop of Llandaff. The building, which is close to the Church of the Parish, has been very substantially built from the designs by Mr. J. Coates Carter, and will accommodate about 300 persons. The total cost will be upwards of £1,100.

PORTRUSH.—The memorial stone of the Kelly Memorial Schools, Portrush (now approaching completion) was recently laid by Lady Macnaghten, of Runkerry. The new Schools occupy a site opposite Victoria Street, and are of modern design and ample proportions. Mr. R. W. Seaver, Belfast, is the Architect, and the contractor, Mr. Alex. Graham, Portrush.

STANDISH.—The new Wesleyan Methodist buildings consist of Chapel, with Orchestra, School Room, five Class Rooms, &c., and are set back 50 ft. from the street. The Chapel will seat 350, and the School will accommodate about 400 children. Mr. W. H. Dinsley, of Chorley, is the Architect, and Mr. Joseph Wilson, of Wigan, the builder. The cost is estimated at £2,500.

STAMFORD.—The new Cattle Market which has been built by the Corporation, at a cost of nearly £8,000, was opened last week by the Mayor. The new Market stands on what was formerly known as the George Close, near the Midland Railway Station, and its area is about 7,000 square yards. The usual offices are provided, and there is an enclosed weigh-bridge. The contractor was Mr. John Woolstone, of Stamford.

BRYMBO, WALES.—Memorial stones of a new Calvinistic Methodist Chapel were recently laid by Lady Morgan. The Chapel is being built on the site of an old one, and is designed to seat 540. There will also be a School Room attached, which will accommodate 250, having two Class Rooms. The estimated cost of the building, including the fittings, is £2,300. Mr. Bradshaw, Gwersyllt, secured the contract, while Mr. J. E. Lash, Wrexham, is the Architect.

BURY.—A new Wesleyan Chapel and Schools, the memorial stones of which were laid in the early part of the year, were recently opened at Pits-o'-th'-Moor, Bury, by Mrs. Clifford Davies. The building has been erected at a cost of about £3,500, from designs and under the superintendence of Messrs. Green and Brockbank, Architects, of Liverpool. There is accommodation for about 700 in the Chapel, while there are also six Class Rooms, a Guild Room, two Lecture Rooms, and two Vestries.

DUMFRIES.—A new Catholic School has just been opened at Dumfries. It is situated in Brooke Street, and is a large rectangular building of two stories. There is accommodation for 500 pupils, and the cost is £5,000. Mr. James Barbour, Dumfries, was the Architect, and the contractors were Messrs. Crockstone and Son, masons; Mr. R. Tinning, joiner; Mr. R. Milligan, slater; Mr. R. M. Glover, plumber; Mr. W. Walker, plasterer; Mr. R. M'Gill, painter and glazier.

BILBAO.—The members of the Iron and Steel Institute, at their Annual Meeting at Bilbao, will doubtless have noticed that the Municipal Authorities are engaged in carrying out a complete system of Sewerage on the most approved plans. The engineer's specification is exceptionally stringent in regard to the quality of the materials and manufacture. The stoneware pipes are all subjected to the severest tests under inspection before leaving the manufactory and the specification provides that they shall be made by the Albion Clay Company, Limited, and must bear the impress of the trade mark, "Granitic Stoneware," and after testing to be marked "Tested."

MOSS SIDE.—The foundation stone of a Free Public Library, to be erected by the Urban District Council, was recently laid. The site is at the corner of Bradshaw Street and Moss Lane East, and adjoins the Council Offices. The building, which has been designed by Mr. Acton, the Council's surveyor, is to cost about £2,500. It is to consist of a basement and two stories above ground. The basement will be available for Class Rooms and small meetings. The ground floor will be devoted to the reference and lending libraries and News Room. The upper story will consist of a large room (which can be divided when necessary) suitable for lectures, meetings, concerts and exhibitions.

LEEDS.—It is proposed to erect a new Hotel, which will be known as the Hôtel Métropole, and the site chosen is a portion of the Old Cloth Hall Estate in King Street. The entrance will be in King Street. Here a projecting Porch will give access to the Vestibule—a Hall and Lounge, divided by columns into two arcades, and lighted from a domed ceiling. The centre part of this Hall will be carried through two stories, and a picturesque feature will be a couple of Balconies corbelled out from the first floor corridor, from which a view will be obtained of the Hall below. The whole of the Public Rooms will be on the ground floor. On the other floors will be provided various Reception Rooms, and some 150 Bedrooms, &c. The exterior of the building is designed in the Renaissance style, treated with considerable richness. The material will be red brick and terra-cotta. Messrs. Chorley and Connon are the Architects.

HARWICH.—New Board Schools, situate in the Main Road and Bathside, were publicly opened by Mr. James Round, last week. The building is divided into two divisions, one for girls and one for infants. It is a well-built structure of local red brick, with Bathstone dressings, having a frontage of 136 ft. On the right first floor are three Class Rooms, affording adequate accommodation for 240. On the left of the same floor there are three Class Rooms for infants, accommodation being provided for 218, making a total accommodation for 458 children. On the ground floor is a Cookery Class Room, Cloak Rooms, Teachers' Room, Lavatories and covered-in Play Grounds. The buildings are well lighted throughout and provision is made for efficient warming and ventilation. The floors are fireproof, faced with pitch-pine blocks, while the rooms have matchboard dados. The Architect is Mr. J. W. Start, of Colchester, and the builder, Mr. E. Saunders, of Dovercourt. There is a large open Play Ground for the School for the girls, and a smaller one for the infants.

The Bathside School, opened at the same time, is situate only a few hundred yards from the Main Road building, across the railway, abutting on the Stour Road. This building which has accommodation for 150 girls and 240 infants is also a substantially built structure, much resembling the one already described. It has a frontage of 126 ft., and the building contains two spacious well-lighted and ventilated Class Rooms for girls and three for infants. All the rooms are on the same floor. An open Play Ground adjoins the School. Mr. Start was the Architect of these buildings also, the builders being Messrs. Smith, Beaumont and Dawson, Dovercourt.

CARDIFF.—A new Temperance Hall at Cardiff, built by Mr. John Cory, in memory of his late father, was opened on Wednesday last. The Hall, which is situated near the Taff Vale Railway Station, has elevations to Station Terrace and Edward Street, and is constructed principally of Bathstone, relieved between the columns with Llantarnam red brick. The main entrance is from Station Terrace, a flight of steps leading to a vestibule. The interior is of light appearance, considering that the Gallery, which goes round three sides of the building, is of unusual width, and that the exterior of the structure does not appear to be of great height. There are three separate staircases leading to the Gallery, which will greatly facilitate ingress and egress to and from that part of the building. On the side facing the main entrance a commodious Orchestra has been erected. The Hall will seat about 1,400 persons. Underneath the main Hall is a room calculated to seat about 400 persons, and there are several Ante Rooms suitable for committee meetings, &c. The Architects are Messrs. J. P. Jones, Richards, and Budgen, and the contractors Messrs. Evans Brothers. Messrs. Trapnell and Gane are responsible for the furnishing of the Hall, while the lighting and ventilation has been carried out by Messrs. James Stott and Co., Manchester.

NORTHALLERTON.—The plans prepared by the Oxygen Sewage Purification Company, Limited, for the purification of the town sewage have been approved, and the system adopted. The process is based on the researches of Mr. W. E. Adeney, with whom Mr. W. Kaye Parry has been associated in the practical features of the system. Mr. Adeney has dealt exhaustively with the scientific principles upon which his work has been based in a series of communications to the Royal Dublin Society. He has also read a paper before the Institution of Civil Engineers of Ireland, showing the application of his methods of research to the questions of river pollution and standards of purity. The oxygen system was tried last year on a large scale at Halifax, and favourable reports upon the effluent were obtained from Sir Charles Cameron and Professor Hartley. The District Council does not intend to apply for a loan for the purpose of erecting the works, but to make a special rate for one or two years and to pay for the whole of the cost of the installation, including works and plant within this period. The very inexpensive character of the tanks, buildings, and machinery required for the oxygen system render this method of payment practicable. The Northallerton Sewage Purification Works have been designed by Mr. W. Kaye Parry, and they will be carried out under his supervision.

IT is stated that fifteen large establishments in Paris have abandoned electric for Welsbach gas lighting, with 2,300 burners; eight large Cafés, including the Café de la Paix in the Place de l'Opera, have put up Welsbach's in addition to electric lighting, and several works are said to be waiting until their agreements with the electric companies have run out to put in Welsbach's.

M. KILDISCHEWSKY, a Moscow electrician, claims to have made a very important discovery in the improvement of telephonic communication. The essential principle of the improvement is that distance makes no difference to the carriage of sound, or, at least, that a telephonic communication may be carried over distances as long as in the case of a telegraphic current.

THE Monument to the late Archdeacon Denison has just been finished, and been placed above the grave in East Brent Churchyard. It consists of a massive coped body-stone of simple grey Dartmoor granite—a monolith weighing in its finished state over two and a half tons. At the head is a low cross, whose shaft and arms are octagonal in plan, and made of the same material.

Trade and Craft.

THE SPANISH IRON INDUSTRY.

The most interesting feature of the visit of the Iron and Steel Institute to Spain, from a trade and technical point of view, was the excursions made to the different works in the neighbourhood of Bilbao, where the manufacture of iron and steel is carried on. There are three works of importance in this locality, the first and the earliest of these is that known as the Altos Hornos Works, belonging to a Spanish company. The second is the Vizcaya Works, which is also the property of a limited company, owned entirely by Spaniards, and the third is the San Francisco Works of the Marquis de Mudela. There are in addition two small Tin-plate Works, a Dockyard or Shipbuilding establishment, where three of the largest vessels in the Spanish Navy have been constructed within the last few years; and there are also some works of minor importance for the manufacture of tubes, &c. All these works are modern in their origin and equipment. The conditions as regards labour are not unfavonrable, although it was remarked that a considerable number more men are employed for a given production than would be employed in English works of the same character. Women and children of tender years were found doing labour that would not be allowed in England. With an annual output of about 100,000 tons of pig-iron, the Altos Hornos Company can turn out 45,000 tons of rails per annum, 6,000 tons of plates, and 15,000 tons of other steel. They also have a forge in which they produce about 12,000 tons of puddled iron annually. The Works employ about 3,000 workmen, who are well looked after compared with the Spanish workmen generally. At the Vizcaya Works the most interesting feature of the operations carried on was the Robert process, a modification of the Bessemer system.

BUILDINGS IN ABERDEEN.

The plans of the following new buildings have been sanctioned:—Additions and alterations at No. 21 Albyn Place, for Mr. James Hay, per Messrs. Matthews & Mackenzie, Architects. Alterations at No. 65, Union Street, for Messrs. John Falconer and Co., per Messrs. W. and J. Smith & Kelly, Architects. Four dwelling-houses on the north side of Carlton Place, for Messrs. J. King & Co., per Messrs Brown & Watt, Architects. Five dwelling-houses on the west side of Balmoral Place, per Mr. John Cameron, builder. Store on the north side of Raeburn Place, for Mr. John Grant, per Messrs. Walker and Duncan, Architects. Two dwelling-houses on the west side of Brighton Place, for Mr. David Smith, per Mr. John Cameron, builder. Alterations in connection with the Aberdeen Comb Works, for Messrs. S. R. Stewart and Co., per John Rust, Architect. Dwelling-house on the south side of Desswood Place, for Mr. Joseph Corbett. Dwelling-house on the south side of Urquhart Road, for Mr. J. Innes, per Mr. Isaac Wishart, View Terrace. Rebuilding of premises Nos. 33-35, Miller Street, for Mr. G. Brown, per Messrs. Brown and Watt, Architects. Offices and Show Room on the west side of Market Street, near Palmerston Road, for the Seaton Brick and Tile Co., Limited, per Messrs. Ellis and Wilson, Architects.

THE MANCHESTER ENGINEERS.

The Manchester working engineers have applied for an advance of 2s. per week in wages, which the employers have refused. The number affected is many thousands. In their reply to employers, issued on Saturday, the men say that they regret the tone of the employer's reply, containing as it does a blank refusal. They add that, being satisfied that their wishes are just, reasonable, and opportune, they have determined, before proceeding with extreme measures, to make another pacific effort to obtain the advance. If a strike occurs, important engineering industries will be paralyzed.

THE Opera House at Benton Harbour, Michigan, has been destroyed by fire.

SOCIETY MEETINGS.

Glasgow Institute of Architects.—The Annual Excursion of this Institute, under the leadership of the President, Mr. T. L. Watson, took place on the 3rd inst., and was made to Ayr, Maybole, and Culzean Castle. The old College and Castle at Maybole were visited, and the party continued their drive *via* Crosraguel Abbey and Kirkeswald Old Church. Under the guidance of Mr. J. A. Morris, of Ayr, who has written a book on the subject, a careful examination was made of Crosraguel Abbey, and the party then proceeded to Culzean Castle, where the members visited the interior and the gardens through the kind permission of the Marquis of Ailsa and Lady Ailsa. The fine staircase and the principal rooms of the Castle, which is among the most interesting of the works of Robert Adam, and the collection of old arms, pictures, and articles of vertu were greatly admired.

Devon and Exeter Architectural Society.—The members of the Plymouth, Devonport and Stonehouse Branch of this Society had a most enjoyable and interesting excursion to St. German's Church on the 5th inst. Mr. H. G. Luff, the Architect for the recent restoration, conducted the party and explained that the Church was named after St. Germanus, Bishop of Auxerre, who came across in 429. The Church, which was the seat of the Bishopric of Cornwall from 936 to 1049, was dedicated in 1261, and is said to contain more remains of Roman and Saxon Architecture than any other Church in England. It has a fine west doorway with a splay of 17 feet, and an arch containing seven carved mouldings. The quaint and very early miserere, the Monument to the Hon. Granville C. C. Eliot, who was killed at the battle of Inkerman, November 5th, 1854, and the new Pulpit, Screen and Choir Stalls, which contain some fine carvings by Messrs. Harry Hems and Son, of Exeter, and the "wagon" roof, with its carved bosses, proved of much interest. The next excursion will be held at Truro on Saturday, the 26th inst.

Northern Architectural Association.—With a view to encouraging the students (and associates not in practice, nor yet 25 years of age) to prepare themselves for the R.I.B.A. Examinations, this Association again offers a 1st prize of £2 2s., and a 2nd of £1 1s., for the best set of Drawings, or "Testimonies of Study," as required by the R.I.B.A., to be submitted for their final examination. Similar prizes will also again be given for the probationary work of the Intermediate Examination. All particulars as to the R.I.B.A. requirements may be obtained from the Hon. Sec., or from the Institute Kalendar. The Drawings are to be delivered to the Hon. Sec., Mr. Arthur B. Plummer, not later than 11 a.m. on the 27th February, 1897 (under motto).

IN the Arboretum at Kew the great Flagstaff is the second of two spars which were presented to the Royal Gardens by Mr. Edward Stamp, of the firm of Messrs. Anderson, Anderson, and Co. The first was from British Columbia, and was 118 feet in length. It was broken in the course of erection in 1859. The existing spar came from Vancouver's Island, and is 159 feet in length. It was erected in 1861, and is believed to be the tallest spar in England. The age of the tree from which it was cut was about 250 years, and its total height 180 feet.

THE great catalogue of Cuneiform Tablets in the British Museum has just been completed. It consists of eight large quarto volumes, and gives a complete list of some thousands of tablets which are preserved in our national collection. The most important collection is the so-called Kouyunjik, which was discovered in the ruins of Nineveh in the palace of King Assur-bani-Pal. There is also a large collection which was made by George Smith, now deposited in the British Museum, and also a large number of inscriptions which were discovered and brought to England by Mr. Hormuzd Rassam. The catalogue contains accurate information concerning each tablet, together with its size and other useful information.

Correspondence.

"A NEAR NEIGHBOUR AND A READER FROM THE FIRST."

I note your communication, and I also note that you are anonymous. The information you refer to was sent by "a correspondent" who is not only competent to speak with authority upon the subject, but has only returned within the past fortnight from Holland. If, as a proof of your "bona fide" you will send me your name, I shall have no objection to informing you the name of my "correspondent." Having been a "reader from the first" you must be aware that it is not our custom to attach the author's name to small paragraphs.—ED.

THE ARCHITECTURE AND BUILDINGS OF CHINA.

To the Editor of THE BUILDERS' JOURNAL.

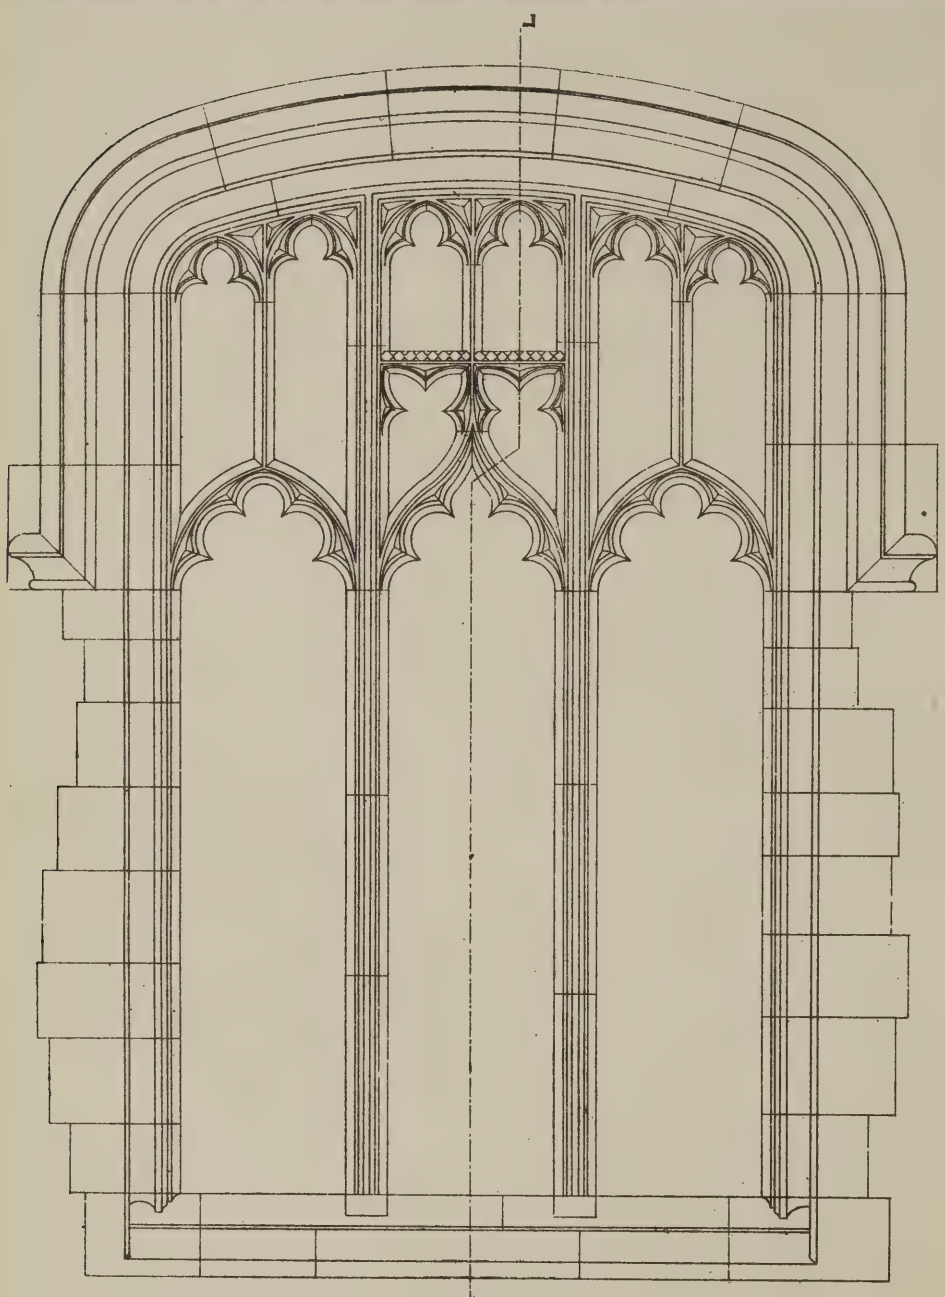
SIR,—Those who have read the article under this heading in your issue of August 19th will be interested in what the late Professor Zerffi said of the Chinese:—"They have produced an art different from any other, and it always will be different. What they may, in the future, copy from other races will always be translated into Chinese. The Chinaman when he builds a bridge, builds it crooked, so that you cannot see where you are going, and thus meet with surprise on the way."

Yours, &c.,
STUDENT.

FARM STREET CHURCH.

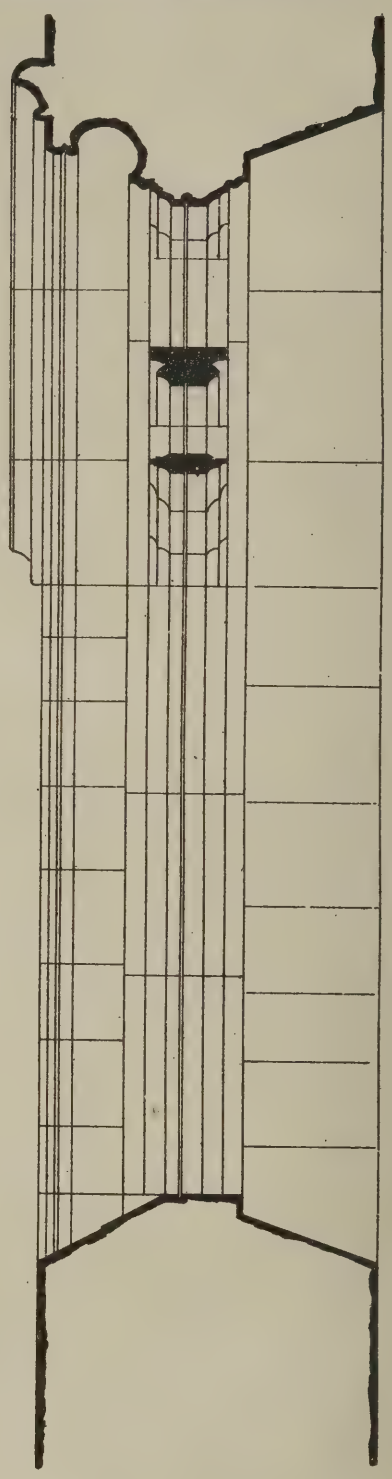
To the Editor of THE BUILDERS' JOURNAL.

SIR,—To your notice of the Farm Street Church I should like to supply one omission—the name of the Architect, Joseph John Scoles. Owing to difficulties connected with the site, which was only obtained in portions, the erection covered a long space of time; indeed, I pretty well served my apprenticeship upon it, subsequently acting as clerk of the works. Knowing, therefore, so well the difficulties which had to be surmounted I feel that my old master's memory does not deserve to be slighted in connection with so important a work.



Yours, &c.,
S. J. NICHOLL.

THE Glasgow Corporation Tramway Committee recommend that the Tramway Manager and Engineer should be sent to America to make further inquiries about Electric Motors. The Corporation have purchased the Govan and Ibrox Tramway for £7,500.



As some men were removing the stones from a quarry between Lynton and Minehead for roadmaking they came upon the end of a stone coffin, and saw inside a skull and some bones. The coffin is made of unworked slabs of stone about 1¼ inches thick, varying in size from 12 to 9 inches wide, some of them 2 feet long, very similar in character to the wider ones lately exposed on Barry Island. The bottom of the grave is 4 feet 6 inches from the top of the heather-covered soil. The total length of the grave is 3 feet 4 inches long, width 20 inches, and height 14 inches. A pitcher was also found in the coffin.

THE works of the Dublin Main Drainage Scheme on the northern side of the river are proceeding satisfactorily, and at the present rate of progress they will be considerably advanced before the close of the present month. The men employed are working steadily up to Butt Bridge, and from Eden Quay at the corner of Sackville Street onwards along the Quay to a depth of something like 10 ft. has been excavated, this being piled with timber on each side. A short railway line, sufficient for present requirements, has been laid down along Eden Quay, and this gives the necessary facilities for the travelling of a couple of steam engines which are engaged in drawing up the excavated soil and in pumping the water from the deep cutting, which is shot into the Liffey. The quantity of water met with here is very considerable.

"Architectural Gingerbread." In one of the current American Magazines with an English edition—we refer to "Scribner's"—a very trenchant and slashing article on "Perverted Standards of Art" is to be found. Particularly does the writer fall foul of the Architectural Gingerbread of the day; more especially in regard to its use in gross and gaudy hotels. He says: "The large hotels of the larger cities are a tremendous power for evil, where they might be missionaries for all that is good in Art. The New Rich from the smaller cities and the well-to-do of the larger towns coming to the Metropolis accept as the Gospel of the best Taste—'Art' they call it—whatever manifestations of apocryphal judgment they see there. A massive 'pile' of Architectural gingerbread is the exterior of equally meaningless frippery. Gaudy ceilings, beds and chairs groaning with embellishments, dining rooms of riotous design, offices of divers marbles and overmuch gilt, parlours of oppressive elegance—these are set up at once as the ideals of Beauty, the summit of good Art. When the pilgrim goes back home he carries perverted standards that will prove a huge impediment to the judgment of many a later generation." To all save the Writer's final contention we agree. The *blasé* hotel with its infernal cornice and lintel in stucco; its brassy glare within, the raw Revolution of primal colours upon the walls and the whole impertinent suggestion of Art, does impress the New Rich, is calculated so to do, and is, in a way, the reflection of monied vulgarity itself. The tendency to gild and gaud is becoming more and more extreme; the Tariff goes up accordingly, and where the Public once paid "Three and Six" for its comfortable dinner, it now pays "Five Shillings, without Wine," and is luckier than it deserves to be, or Colour Blind, if it escapes without a headache. The old somnolence of the Inn is gone; the dark mahogany in fashion of Chippendale; the tall ale-glasses, like Lombardy poplars, on the table; the winking candles in Sheffield Plate, of the days when they hammered the silver on: now we are so electro-plated—Electric-Plated, New-Rich would say. The atmosphere of Johnson and Goldsmith has evaporated from the taverns, and in their place we get gilt by the gallon, questionably Indian Ceilings in an English blinking fog and Arabesque fire-places where the faggot and the fire-dogs should be. It is a pitiable change, in itself, and a dominant indication of the barbaric termination to an opulent century. Hotel after hotel is springing up, a fungus growth, not only in our cities, but in those sequestered places where "God's signet is set on English ground." We know many such debased hostelries; the bedaubed "May Good Digestion Wait Upon Appetite and Health on Both," the meritorious Minstrels' Gallery above, the violent stained glass of the stairway windows; the disgusting sense of plush; the shadowless lizard gaze of the electric lamps; the thin-cased iron stanchions and columns, deluding the New Rich into remembering such a place (mentioned in school books) as Carraros; the shouting walls and reverberating ceilings; does the British Public really take its "comfort in an Inn"?

A COURTYARD OF THE CLOSE, EXETER: SKETCHED BY OCTAVIUS RALLING.

More Iconoclasm. The news that the War Office is contemplating the abolition of Chelsea Hospital and the Duke of York's School and the sale of the site for building purposes, has caused the Secretary of the Metropolitan Public Gardens Association to vigorously protest. The Hospital, which is the chief among the many historic monuments of Chelsea, was founded in the reign of Charles II. as a home for old and disabled soldiers of the British army; while the Duke of York's Royal Military School, which lies not far from the Hospital, was established by Frederick, Duke of York, for the education of children connected with the army. The Hospital was built between 1682 and 1690 by Sir Christopher Wren, and it is, indeed, said by one

authority that Wren was "not merely its Architect, but the contriver of its laws, regulations, and whole internal economy, which to this day are esteemed a model for similar establishments." Another interesting feature about the Hospital is that it occupies part of the site of King James's curious "College for Religious Controversy," incorporated in 1610 "to this intent, that learned men might there have maintenance to annswere all the adversaries of religion." Only one wing of the projected building was ever erected. It was used as a prison during the Civil War, given to the Royal Society after the Restoration, and finally repurchased and pulled down when the present Military Hospital was established. The Hospital estate comprises some sixty-six acres, and the public enjoy "what is practically a right" of using a considerable part of the gardens. The Secretary of the Association submits, therefore, that it is in duty bound to do everything in its power to prevent the destruction of this valuable open space. But he also objects to the abolition of the threatened Institutions on other grounds. He supposes that the promoters of the scheme will say that by pulling the present buildings down and selling the site the money realised will, when doled out in pensions, benefit a larger number of people than can be provided for within its walls. He doubts, however—and many people will doubt with him—whether the pensioners of the Hospital would be "half so happy or well cared for if in their old age they had to shift for themselves on a small money pension, instead of spending their last days in dignified comfort and repose in buildings suitable for the purpose and in the congenial society of those who have all fought life's battle on much the same lines."

KILDARE CATHEDRAL.

Early History and Restoration.

NOTHING in Ireland is more singular than the comparatively modern character of the Churches. One sees none of those old parish Churches, as in England, with their walls covered with the names and virtues of those who for hundreds of years have been quietly sleeping beneath and around. The reason for the contrast is not far to seek. Since the time when the iron hammer of Old Rome welded into one concrete whole the petty provinces of Britain, the tradition and impress of a central government, and of a settled order have made themselves felt even amidst the fierce struggles of competing races, and the jealous feuds of rival chiefs. Hence it came that, shielded by a strong and recognised central power, and sanctified by prescription, the institutions of England acquired that permanence and stability which are the basis of national greatness, and buildings founded by the pious benefactions of individuals, or by the generous offerings of congregations, were left unaffected even by national convulsions. The only periods in which this continuity was affected were those of Henry VIII. and the Puritans. The former was marked by the destruction of most of the Abbeys and monastic foundations, whilst the Churches unattached to them were left intact. The latter was too brief to affect the great majority of the Cathedrals and Parochial Churches. And so, except for the inevitable ravages of time, the Churches of England present to-day the same air of restful calm and hoary tradition as they did to our forefathers. Ireland, on the other hand, never enjoyed the benefits of a strong central government. Even after the introduction of Christianity its message of peace and amity was but feebly responded to by those whose greed of power or racial hate impelled them to raid or outrage. For long centuries these conflicts were carried on even under the very shadow and citadel of English power. The earlier Christian edifices either perished at the hands of the ruthless Norsemen or fed the torch of semi-barbarous tribesmen in their periodic forays in search of prey or plunder. This accounts in a large measure for the

Poverty of the Architecture

and crudeness of design exhibited by most of the Churches founded during the three centuries which preceded the establishment of a settled government and the spread of principles of toleration and enlightenment. Few cared to expend labour and treasure in beginning to build Churches which the vicissitudes of the times might hand over to their hereditary foes or reduce to the condition of unfinished ruins. Most of the Cathedrals in the Ireland of to-day are either entirely modern or have come down to us in whole or in part from an age when the freshness and purity of early faith were not yet tainted with tribal jealousies or marred by sectarian hate. Amongst these latter there is one which, in its origin and history, embodies traditions and memories coeval with the introduction of Christianity into Ireland—Kildare, *i.e.*, the Church of the oak, founded by St. Brigid, of 1,400 years ago. We have very little information as to the materials or construction of the Church founded by St. Brigid. It probably differed but little from similar structures of that age, being built mostly of the wood which abounded in its neighbourhood. For 300 years the history of the Church and See of Kildare presents no marked or striking incident. It was an age in which Celtic piety and learning reached their highest development. The humble Church erected by Brigid and the town which grew up around it had frequently been subjected to the vicissitudes of fire and foray, but as often as they were damaged or destroyed they were restored or rebuilt. The accurate and learned Cogitosus, who wrote about 817 A.D., gives us an outline picture of the Cathedral of Kildare

As it then Existed.

In shape it was oblong rather than cruciform, being divided laterally and longitudinally into three parts by two partitions, or by a kind of ornamented screen and one partition. The Sanctuary enclosed between the screen and the east end was entered by two doors, one on the right for the Bishops and Clergy, and the other on the left for the Abbess and her household. The western portion of the Church was divided longitudinally into two parts, and was entered by doors on the north and south sides for the respective use of the male and female worshippers. On the north side of the Cathedral was probably situated the ancient Fire-house of St. Brigid, in which the sacred fire is said to have been kept alive for long centuries. All previous calamities which the Church underwent were, however, as nothing compared with those consequent on the Danish invasion. These fierce devotees of the gloomy faith of Thor and Odin, attracted doubtless by the report of accumulated treasures, as well as by the defenceless surroundings of the place, swept down in irresistible fury from their neighbouring settlement of Dublin, and in A.D. 835-6 plundered and partially destroyed the Church and its surroundings. Amongst other spoils they carried off the magnificent shrines of St. Brigid and St. Conlaeth, which were placed beside the Altar under crowns of gold. The remains of St. Brigid, which rested under her shrine, were said to have been removed for greater safety to Downpatrick, where they remained until the reign of Elizabeth, when to escape destruction, the head of the saint was carried off by those who reverenced her memory to Neustadt, in Austria. From thence the Jesuits removed it, by permission of the Emperor, to their Church at Lisbon. The history of the Church and Abbey during the next 200 years was one of unparelleled disaster. They were plundered at least fifteen times by the Danes. The perishable materials of which the buildings were constructed made them an easy prey to fire, and during the same 200 years they were seven times the prey of the flames. No sooner were the buildings destroyed than the work of reconstruction was entered on and successfully accomplished. In 1223 was consecrated the first Anglo-Norman Bishop, Ralph of Bristol, the forty-sixth in succession from St. Conlaeth. During the next 400 years the Cathedral and its surroundings were taken and retaken times without number by Irish or English, and on each occasion they suffered either in defence or assault. Ralph rebuilt the Cathedral in stone, but in the reign of Henry VII. it had again become a ruin, when it was restored by Bishop Lane; but the restored Cathedral had little of that stately and suggested solemnity of style which mark the Church

Architecture of the Seventh Henry.

During the latter half of the sixteenth century the Cathedral—or what was left of it—was frequently plundered by the revolted Irish. Sallying down from their mountain fastness in Wicklow, or issuing from their inaccessible retreats in the bogs and marshes of Ossory and Allen, they took summary vengeance on the clerical representatives of English power who held the See and parishes of Kildare. In the great rebellion of 1641 the Irish army, under Lord Castlehaven, directed the fire of their artillery on the Cathedral, which they afterwards occupied and plundered. In 1647 it was recovered by the Parliamentary forces, but having been recaptured by the Irish, it was finally taken from them by the great Duke of Ormonde. The building, already sorely damaged, could hardly be expected to survive so many sieges and assaults. At and after the Restoration the whole fabric, with the exception of the Choir was in ruins. The Cathedral, after the English occupation, like some of the other Irish Cathedrals, was as much a fortress as a temple. Its walls were immensely thick and surrounded by parapets. The building was sufficiently large to accommodate the inhabitants of the town, and being accessible only by small doors it was available for defensive purposes in the absence of any other fortress. The last restoration before that now completed was carried out by Bishop Moreton in 1683. This restoration, however, only affected the Choir, and the work of decay was allowed to progress in the Nave and Transepts. Hewetson, the friend of Wilson, afterwards Bishop of Sodor and Man, gives a graphic account of the consecration of the Choir in 1686. The subsequent history of the Cathedral does not present any points of special interest. During the eighteenth century the condition of the Anglican Communion was one of slumberous inaction. Churches which at the beginning of that century were more or less dilapidated were at the end of it shapeless ruins, and Kildare Cathedral furnished no exception. In 1870 the Cathedral was a mere ruin, services being held with difficulty in the Choir. A deputation of the parishioners waited upon the Dean and Chapter to ask their aid in restoring the Church. The deputation succeeded in securing the preparation of a report on the state of the Cathedral by the late Mr. Street, who was requested to prepare it by the late Archbishop Trench and by the Dean and Chapter. That report was, as might be expected, able and exhaustive, but it erred, as many of such documents do, in underestimating the cost of restoration. This it placed at £5,000, but even twice this amount has been already expended, and a further sum of £1,500 is urgently necessary.

THE Dock Road and Eastgate Schools in St. John's Parish, Worksop, are to be enlarged at a cost of from £800 to £900.

THE new Technical School for Women, which has been erected under the auspices of the Surrey County Council, in Hubert Road, South Wimbledon, and is to be opened in a few days, is a red brick structure, built at a total cost of £2,500. It consists of two floors. The largest room will be set apart for recreative purposes, and is to contain a billiard table. Another is to be fitted up as a laundry. A spacious room will be devoted to the teaching of cooking and dress-cutting.

THE Ecclesiastical Art Exhibition is always one of the most interesting features of the Church Congress. This year there is reason to hope that some exhibits of peculiar interest will be available. Efforts are being made to collect specimens of the pewter communion vessels, of which a considerable number were known once to exist in Shropshire and neighbouring counties. Communion vessels of historic interest from their associations are also to be collected.

NOTICE.

In October will be issued from the Office of the Builders' Journal

THE ARCHITECTURAL REVIEW,

a Monthly Magazine for the Architect, Artist, Designer and Craftsman.

The Magazine will consist of 56 pages of Letterpress with numerous Illustrations,

THE PRICE WILL BE SIXPENCE.

Amongst the distinguished contributors to the first and early numbers will be :—

JOHN L. PEARSON, R.A.	J. McNEILL WHISTLER.
ASTON WEBB, F.S.A.,	GEO. C. HAITE, R.B.A.
W. D. CAROE, M.A.,	JOSEPH PENNELL.
WM. ANDERSON.	A. GILBERT, R.A.
EDWARD F. STRANGE,	MRS. PENNELL.
HUGH STANNUS,	NELSON DAWSON.
ARNOLD B. MITCHELL,	W. AUMONIER.
A. N. PATERSON, M.A.	C. F. A. VOYSEY.
ALEX. N. PRENTICE.	FRANCIS HOOPER.
JOHN NEWBERRY.	C. E. MALLOWS.

Specimen Copies may be had on application to the Publisher

TALBOT HOUSE,
ARUNDEL STREET, STRAND.

STROLLING SKETCHES.

No. II.

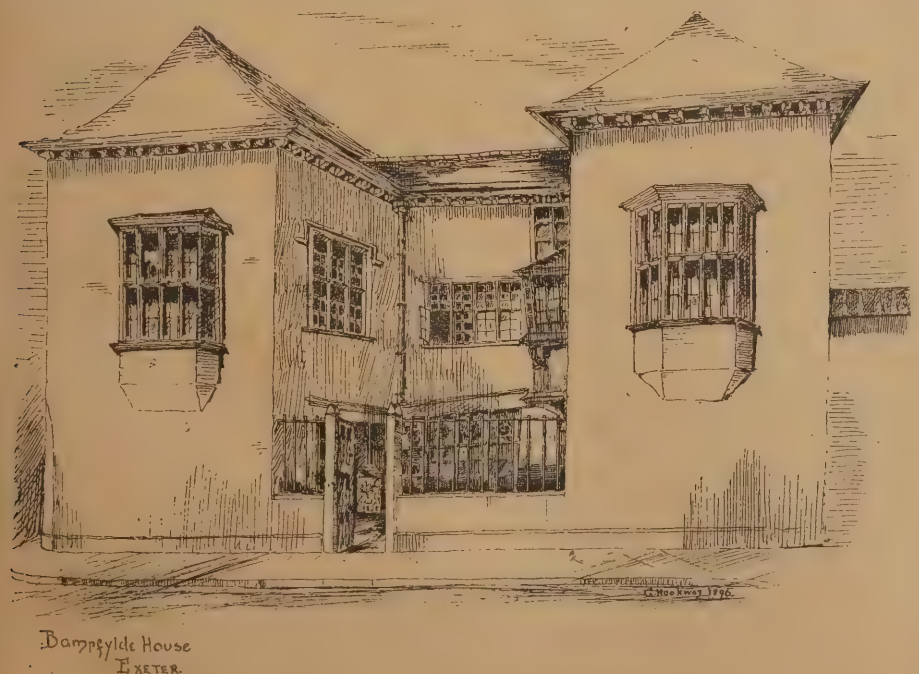
EXETER AND ITS CATHEDRAL.

(Concluded).

ILLUSTRATED BY OCTAVIUS RALLING, S. NEWCOMBE, AND G. J. F. HOOKWAY.

IN the previous article attention was devoted principally to an outline historically of the City of Exeter, and to the Cathedral which forms its principal Architectural monument. We now propose to look more closely at some of the civic and domestic buildings which have survived the destroying hand of time, and the still more disastrous assault of the modern improvement fiend, to say nothing of the fires which, up to a decade ago, made Exeter their happy hunting ground, earning, for a time at least, the name of being the most fiery city of the times.

The main thoroughfares ran from west to east, and from north to south, forming a cross, and until 1770, the ancient enriched Carfax at the *Quatre Voies*, by corruption Carfoix or Carfax, stood at the point where these roads met and crossed, marking the centre of the city. One of these, the High Street, is very quaint and picturesque, and, although a large number of the old houses have given place to those which were modern seventy years ago, still there are some few half-timbered mediæval fronts left, and the more modern are so varied in design that picturesqueness is not destroyed but is emphasised by the narrow width and the gentle curves of the street which prevents anything in the shape of monotony.



SKETCHED BY OCTAVIUS RALLING.

The most striking feature is the ancient front of the Guildhall, which dates from 1593, and is carried over the pathway upon arches supported on granite columns; the upper work is a great mixture, English mullioned windows between Italian columns, and a vast amount of carving. The stone used was of a soft description, probably Beer stone, and has much decayed, so that the detail is not easy to follow. The whole is blackened by age, and is only held together by iron straps and bolts. It is greatly venerated by the citizens, and the city would undoubtedly lose much of its character should it be destroyed. This front forms a screen or portico to a more ancient and purer Architectural building in the rear, namely, the Council Chamber, measuring 62 ft. by 25 ft. and 37 ft. to the roof. Unfortunately, this is so hemmed in by houses that the exterior is completely hidden from view. The interior is, however, very dignified, and although it was restored some five or six years ago, and new aldermanic and councillor's benches were erected, the work was most skilfully done, and all the details of interest most carefully preserved. The high dado is of oak panelwork, in the frieze of which are shields containing the arms of the various city companies, and the mayors of the city emblazoned in colour. And above the dado hang valuable portraits of mayors and other persons connected with the city, including the Princess Henrietta, Duchess of Orleans, who was born at Bedford House, in the city, during the troublous times preceding the Commonwealth, and which was presented to the city by Charles II. and painted by Sir Peter Lely. Another of Lely's is a portrait of General Monk, and others are Charles Pratt, afterwards Lord Camden, and George II., both by Hudson; Sir Thomas White, founder of St. John's College, Oxford; John Hoker, Chamberlain and Historian of Exeter, and many others of lesser note.

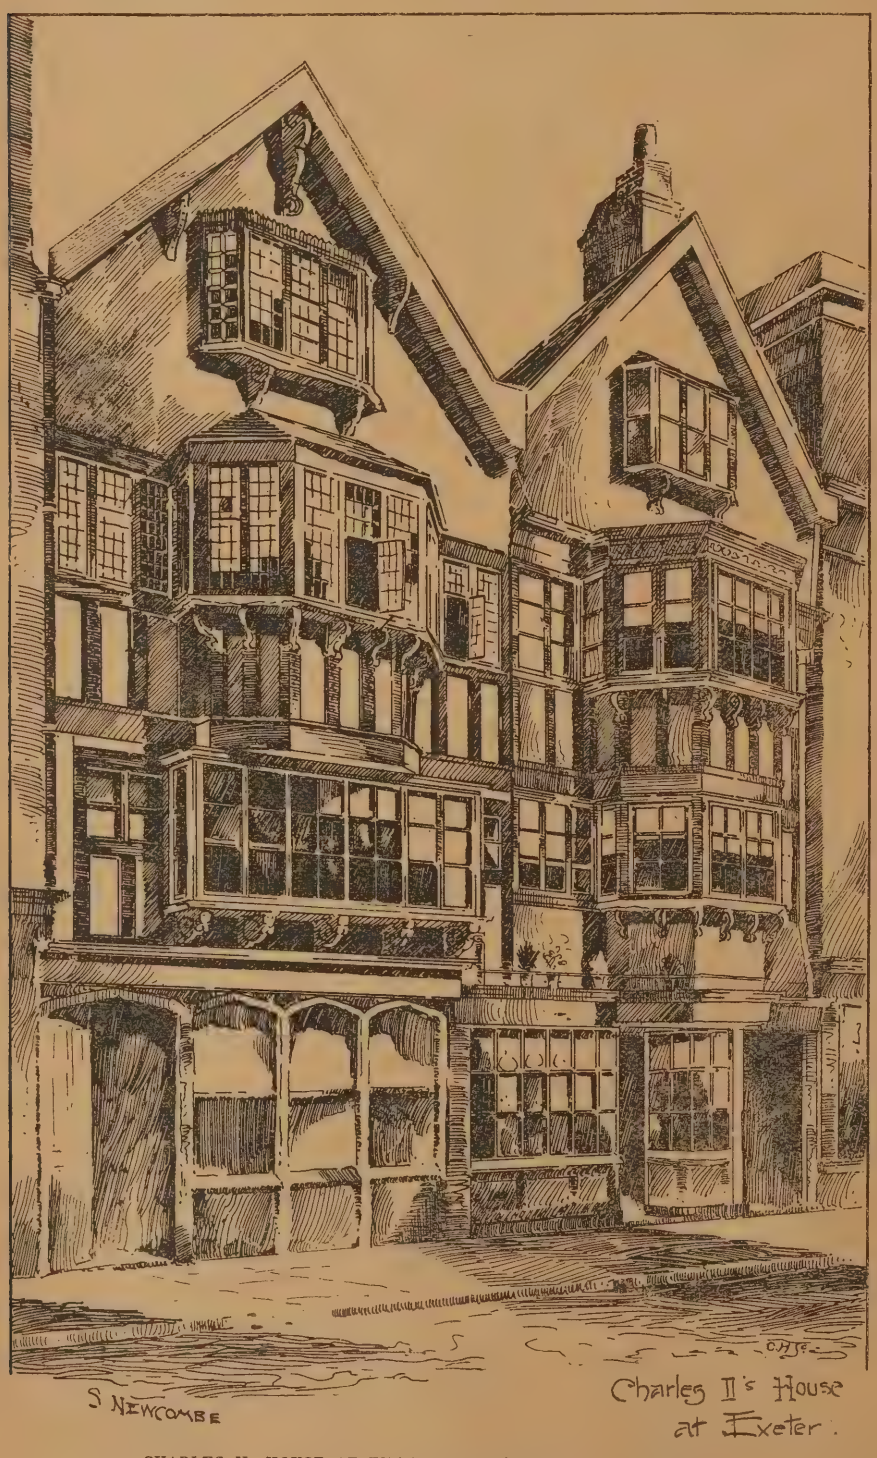
The city muniments are of the greatest interest, the series of Royal Charters being almost unique, and commence with that of Henry II., and coming down to 1770. The records of the city commence in the reign of Edward I.

The regalia is most valuable, with its sword and cap of maintenance; its silver maces, loving cups, and the plate used at the Mayoral feasts, and the city seals, are highly interesting and valuable.

The chief military memorial, known as Rougemont Castle, from its being situated on the Red Hill, the highest land in the city, and its north-east corner, after having withstood siege after siege and had its walls battered by rams, shattered by mines, and weakened by the wear of generations, still retained much of its massive strength, and its donjon and sally ports fairly

BAMPFYLDE HOUSE, EXETER: SKETCHED BY G. J. F. HOOKWAY.

complete; it remained for the hand of man, in the shape of the county authorities, to complete the ruin and sweep away all that remained of the chief defence, and at the same time, upon occasions, the menace of the city.



The Castle site was selected by the Conqueror with the intention of overawing the citizens, and the superintendence was assigned to Baldwin de Brioniis, and the custody of the Castle with the office of Sheriff of Devon was granted him. The Castle is still the property of the county, and has been from that time, and not under the jurisdiction of the city authorities.

There is no record of the character of the Castle buildings, and its strength can only be inferred from what it withstood, and from the massiveness of its gateway, which, fortunately, has been preserved in some amount of completeness. The principal building now within the Castle walls is the County Sessions House, about as inappropriate in Architectural character as can well be imagined, and it was to accommodate this abortion that the more ancient buildings were pulled down, to the everlasting disgrace of the county.

The walls on the east, west, and north side are in fair condition, and a bastion Tower and gate remain, as well as a square angle Tower, both facing towards Northernhay. Sketches of these are given.

The Churches within the city boundary are, as a rule, insignificant, their chief peculiarity being that they are all yardless and abutting upon the thoroughfares, shoulder to shoulder with houses and shops, and in some cases the strong wall of the Tower is made the back or side wall of an enterprising tradesman's house, and in one a 3 ft. entry is the right of way and all that marks the existence of the Church from the High Street.

There is no particularly interesting work in them either, if we except St. Mary Arches, with its double arcade of Norman work and the ingenious way in which the levels are treated at St Mary Steps, which is built on the side of a steep hill. Two at least of these, St. Martin's and All Hallows', stand at the corner, and their lives have been threatened time after time for the purposes of thoroughfare widening. They have weathered the assaults, however, and the present generation will have them with them at any rate, whatever fate may be in store for them in the future.

CHARLES II. HOUSE AT EXETER: SKETCHED BY S. NEWCOMBE.

The Churches which have been built within the last twenty years are, however, dignified, particularly that erected by Mr. Gibbs and dedicated to St. Michael and All Angels, situated on Mount Dinham, which is a lofty mount with well nigh perpendicular sides, facing the river, and commanding excellent views of the valley of the Exe. On this mount, too, are about forty houses, erected and maintained for the benefit of decayed tradesmen with small incomes by one of the benefactors of the city, Mr. John Dinham. Exeter is peculiarly well off in the matter of Almshouses; the most ancient and picturesque of these, quadrangular on plan, situated in Magdalen Street, and called Wynard's Almshouses, is the constant resort of Artists and lovers of the picturesque.

The Bridge which crosses the Exe is of very good form. It was erected in 1777 and 1778, and designed by Mr. Goodwin, who at the same time continued a Viaduct on stone arches spanning Exe Island, and reducing the gradient of Fore Street Hill, which hitherto had been perilously steep. This Bridge was not on the site of the old, but considerably to the north of it, thus avoiding the circuitous route down Fore Street, through West Gate, and by St. Edmund's Church, and enabling the new thoroughfare to be continued in a direct line from High Street, on the Exeter side, to Cowick Street, on the county side of the river. The new street was called New Bridge Street and Fore Street.

The streets in the neighbourhood of Westgate, and on the south side of Fore Street, and locally known as the West Quarter, are now the least desirable in the city, steep and ill paved, and decorated by clothes lines across from upper window to upper window. They are, however, exceedingly picturesque, and the houses, many of them, show signs of having been the residences of merchants and the well-to-do classes. Stepcote Hill still has the old steps which gave it its name.

Exeter was one of the few cities allowed to produce the coin of the realm, and there is a thoroughfare bearing the name of the Mint.

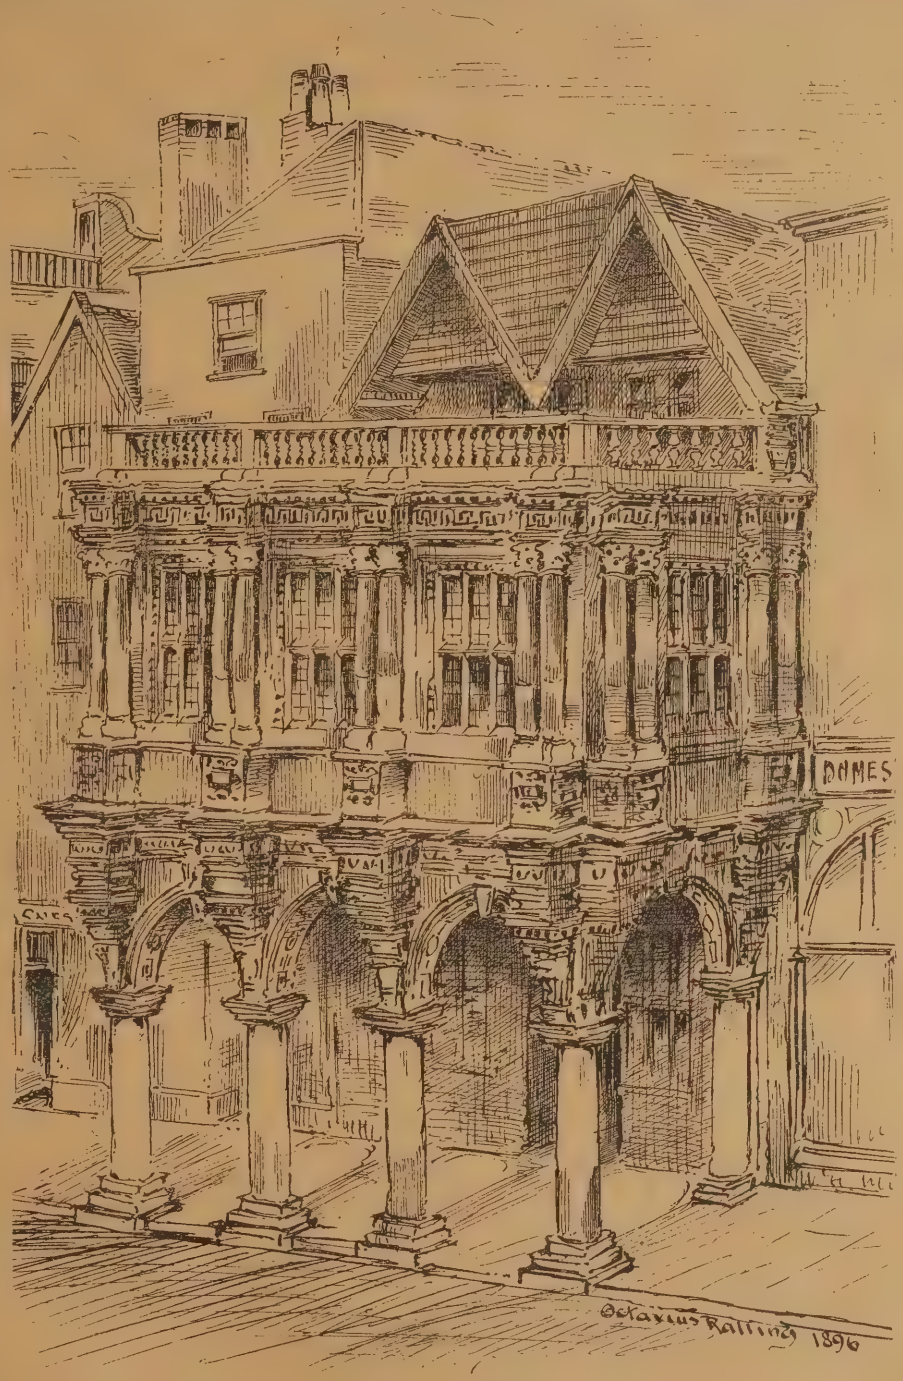
Of the modern streets, Queen Street is of by far the greatest importance from an Architectural point of view. Therein is the Higher Market, a Classic façade of some dignity, and called the Higher Market to distinguish it from that in Fore Street, which was erected in 1836, from the designs of Mr. Charles Fowler, of Bristol, while the Higher Market was by Mr Geo. Dymond, also of Bristol.

In Queen Street, also, is the Albert Memorial Museum and Free Library, erected by public subscriptions to commemorate Prince Albert. It is of Venetian Gothic style, and from the designs of the late Mr. Hayward, of Exeter. The old Post Office formerly stood in this street, and is also of Classic character, in fact, the whole street partakes more of the Classic Renaissance than any in the city. It is laid out at right angles to the High Street, which makes the turning somewhat awkward, and the traffic is sometimes difficult to regulate in consequence.

The Rougemont Hotel is a lofty building at the corner point in the street which faces the L. & S.W.R. Station, and is a striking feature, rather too lofty, however, as a point of convenience.

North Street, which is the main road leading to the city from Barnstable and the northern part of the county, was another of the ultra steep streets, but in 1831 an iron Bridge was erected to carry the roadway and this effected a marvellous improvement in what hitherto had been a most dangerous declivity.

In this street are some very fine old houses still, but the finest were taken down a few years ago to effect a widening of the street. The timbers of the front generally have, however, been saved by a private individual, and there is the prospect of its being re-erected on a different site some time in the future.



The College Hall, in South Street, built by Bishop Brantingham, is all that remains of the College of the Vicar's Choral of the Cathedral. The interior is very rich in oak furniture. Of the remaining ancient houses, which are dotted about in all parts of the city, there is little of actual history. Charles II.'s house, of which a sketch is given, was traditionally the residence of that monarch when

a prince and practically an exile, and what was his favourite walk towards the country still retains the name of Blackboy Road, the Black Boy being an endearing name presumably from the dark complexion which he is reputed to have had.

The others were, probably, the houses of the lords and gentry who had their town houses in the capital of the West, namely, the Bampfyldes, the ancesters of Lord Poltimore, the Carews, and others. The Earls of Bedford had a fine house and grounds where the Queen of Charles I. was entertained when she fled to the West, and where Princess Henrietta was born. This was sold during the latter portion of the last century, and in 1773 Bedford Circus was built, formerly as residences, but now almost entirely given over to professional men and used as offices.

Of semi public buildings the Workhouse and the Devon and Exeter Hospital are interesting as types of the eighteenth century work.

The Cathedral Close contains some fine old houses. At the corner near St. Martin's Church stands Moll's Coffee House, which boasts of very early history. It is practically in precisely the same condition in which it was when first built, and stands upon the foundation of what was known as the Annuellors' College, the residence of the Annuellors or Chantry Priests, which was closed during the reign of King Edward VI., in 1437-9, and some time in the reign of Queen Elizabeth was pulled down and the present building erected; till recent years, upon a pediment in the upper part of the centre of the house stood the carved royal arms of Elizabeth, bearing the date of 1596, which has led to the presumption that the house itself was used for a club or meeting place for the noblemen and gentry directly associated with the statesmen and government of the realm, many of whom were Devonshire men. Upon the first floor is an ancient oak panelled room, and upon those panels nearest the ceiling are forty-six shields of arms. During the Commonwealth (*i.e.*, A.D. 1649-60), on the introduction of coffee, the building changed hands, and was known as "Mol's Coffee House," and was used as a club to the year 1829.

THE GUILDHALL, EXETER: SKETCHED BY O. RALLING.

The surroundings of Exeter are very charming, the walks by the river and the banks of the canal—which has the reputation of being the first canal cut in England, 1563—are extremely pretty. The junction of the canal and river is at Turf, the Greenwich of Exeter, where Whitebait teas are a time-honoured and popular institution. Of the villages within easy walking distance—Countess Weir holds the palm, and has formed the subject of innumerable pictures, and is a favourite resort of artists. Pinhoe is renowned for the great battle in which the English worsted the Danes in the famous battle of Pinhoe, and the rector still receives the pension of a mark a year granted to the priest of Pinhoe in perpetuity for the services rendered in obtaining arrows for the British Army. Ide, Alphington, the various Clyst villages, Stoke Canon, and others are very picturesque, and have, in many cases, fine Churches.

As a centre, whether for sketching or purely a pleasure holiday, there are few better places. Within easy distance of either the south or north coast, Exmouth, Dawlish, Teignmouth, Torquay, on the one hand, Ilfracombe, Lynton, Lynmouth and Clovelly on the other, with the vast expanses of Dartmoor, and the fringes of Exmoor, as the centre. Of the attractions, there are fishing, shooting, hunting, and sport of all kinds, with a climate, if sometimes relaxing, as equable and health-giving as one could wish to find.

Nothing has been said of the actual living Architecture of the city, but as the capital city it forms the rallying point for a good many Architects, whose practices extend into the county in all directions; and there are some good specimens of modern work in business houses and private dwellings, to say nothing of the Churches which have been built to meet the requirements of the spreading and thickly populated suburbs, which, as a rule, are the work of local men. Exeter is the headquarters of the Devon and Exeter Architectural Society, affiliated to the R.I.B.A.

IT is proposed to restore the parish Church, at Bradford, at a cost of £10,000.

EXTENSIVE improvements are being made by the Great Western Railway Company in connection with Millbay Station, Plymouth.

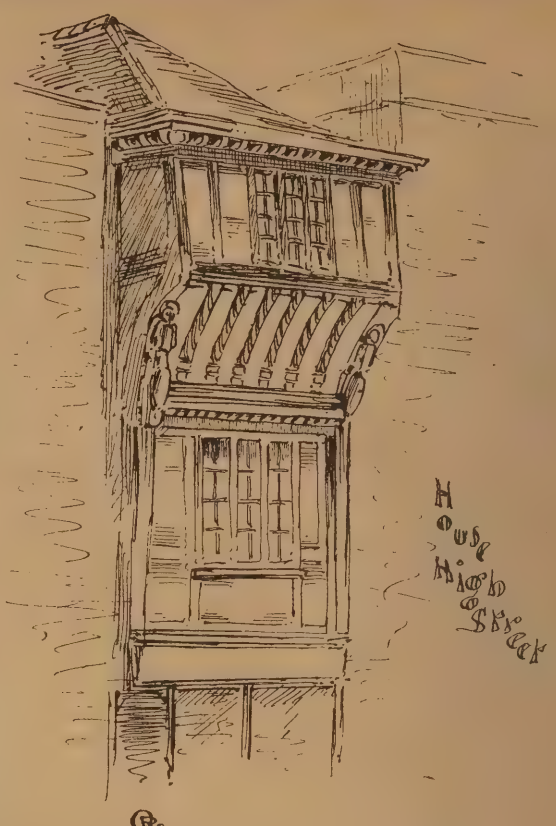
A NEW Hall attached to the Church of St. Catherine, Brynammam, Carmarthenshire, was opened recently. The Hall has cost £800, and it is intended to spend another £200 on a Library and Reading Room.

IN compliance with the requirements of the Education Department, St. Agatha Schools for girls and infants, attached to St. Peter's Church, London Docks, have been rebuilt at a cost of £5,000.

The Queen is going to expend a considerable sum on improvements at Osborne. Large kitchen gardens are to be formed, and extensive hot-houses are to be built.

THE Mayor of Newcastle's Fund towards the erection of a new Infirmary in that City has now reached a total, in round figures, of £15,000. The Mayor intends to convene a public meeting early in October. The total sum which it is hoped to raise is £60,000.

IT is not generally known that there is in the British Museum of Natural History, a section of the trunk of a large fir tree from British Columbia, the growth rings of which indicate that it was more than 500 years old when it was cut down in 1885.



The South Solitary Island lighthouse on the New South Wales coast cost £31,259 to build, exclusive of the lantern equipment. The Marquarie light on the same coast is one of the most powerful in the World, and is visible 25 miles at sea.

AT a recent meeting of the Heywood Town Council, the Water Engineer was instructed to prepare plans and estimates for a new Embankment in connection with the upper storage reservoir at Nayden. Some time ago a portion of the Embankment gave way, and since then the reservoir has been practically empty. It was deemed imprudent to store water in it, and it is from this cause that Heywood has during this summer experienced a scarcity of water.

THE preservation of the remains of the famous wall of Antoninus between the Firths of Clyde and Forth, built in 140 A.D., has been occupying the attention of the National Trust for Places of Historic Interest or Natural Beauty. Communications have passed on the subject between the Trust and Lord Balfour of Burleigh, who has taken considerable interest in the matter, and is visiting the neighbourhood of Falkirk in order to personally examine what remains of the rampart.

EXCAVATIONS AT FURNESS ABBEY.

MR. W. H. ST. JOHN HOPE, M.A., Assistant Secretary of the Society of Antiquaries of London, and a well-known authority on monastic buildings, who has superintended the excavations at Furness Abbey, recently stated that the eastern part was given up to the monks, and on the west was the Private Chapel of the working brothers. The division wall, however, disappeared after the twelfth century. The Church was of later date than the foundation of the Abbey. Originally there was a central Tower, but this gave way to the west Tower, which was not any higher than the remains now show. The monks lived in the Cloister. There was no such thing as the Day Room; the actual Day Room was the Cloister. The centre was always a green glass plot—never a cemetery. The Chapter House was the place where the monks transacted their business. Over it was the Scriptorium, but Mr. Hope discredited the statement that "transcriptions were here made of the most important works of the fathers, classics, and of the principal historical occurrences of the kingdom." The monks of this Abbey did not do much reading, and, therefore, little transcribing. The room over the Chapter House was simply a division of the Dormitory. The room called the Dining Hall was unquestionably not so, but this block was more likely to have been given up to the novices. The only way of ascertaining the locality of the different rooms was by comparing one Monastery with another, and to read the rules of the Order. This was avoided because they were written in Cistercian Latin. Mr. Hope doubted whether the building known as the Abbot's Hall or Lodging was anything of the kind. He rather inclined to think it was the Infirmary, on account of its large dimensions. The Infirmary was not a place set apart entirely for sick persons, but was for the use of retired abbots and sick monks. A Chapel was always attached to this place, and is one of the few parts of the Abbey that has retained its roof. Four hundred cart loads of surface refuse had been removed and the foundations of a building laid bare. This Mr. Hope believed to be the Abbot's Lodging. The abbot was not allowed to have a lodging at all, but was supposed to take his meals and live with the other monks in the Dormitory. But this rule began to be evaded, and by joining the Lodging to the Dormitory the Abbot considered he was sleeping in the Dormitory. Up to the present they had not traced the foundation until it joined the Dormitory, but no doubt they would do so as the work of excavating proceeded. This building was not at all suited for an Infirmary, as suggested by the present plan. It was not built according to the plans of an Infirmary. It was not of any very great length, and consisted chiefly of one block, which had evidently had a nice vaulted roof. There had been windows round the sides, and four doorways. The suggestion that this was the infirmary, and that the sick monks used to put their arms through these openings in order to have their pulses felt "would not work" at all, inasmuch as no monk had an arm four feet long—the thickness of the walls. Finding, no doubt, that the house was too small for the purpose it was built, they made a curious alteration. The structure then consisted of a lower vaulted Hall, with several rooms above it. The upper part of the building was pulled down, and the second floor made double its former dimensions by carrying it over a series of arches. At the back the floor arched over into the rock behind. There were appearances of a small spiral staircase, which was supposed to have led from one floor to another, but the abbot probably had access to the upper floor by a stately staircase from outside, supported on massive mason work. By the published plans they knew nothing of these apartments. The excavations showed them, and showed how they had been enlarged. But they would have to extend the digging and do a great deal more than had been done. A little apart from these foundation walls appear traces of what may have been a stable and a kitchen, where there is unmistakable evidence of a fireplace.

EXETER: SKETCHED BY O. RALLING.

SKETCHED BY OCTAVIUS RALLING.

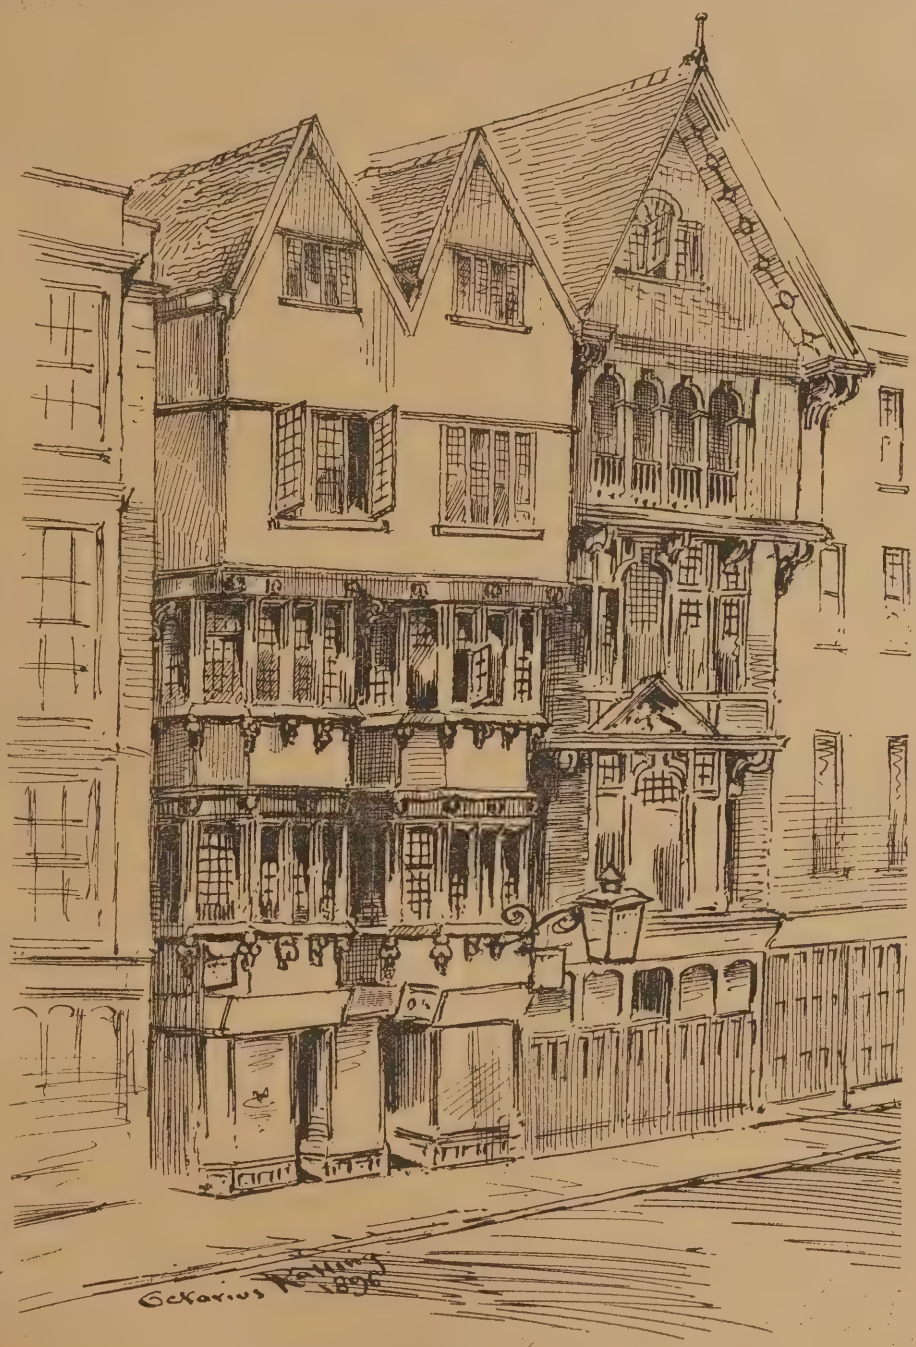
THE Ayr Model Lodging House, the erection of which is to begin immediately, is to cost about £10,000.

THE late Lord Leighton's rare collection of drawings and studies by early Italian masters has been purchased for the Print Room of the British Museum. It includes some very fine works by Andrea del Sarto.

THE mountain railway between Beyrout and Damascus, which necessarily crosses the Lebanon and Anti-Lebanon, is finished. It was begun in 1891. The steep portions are on two systems—the cog-wheel and adhesion. The former covers a much larger section than the latter. Two classes of locomotives, one for cogs and the other for adhesion, are employed. They have been made at Winterthur, and both the plant and design of the railway are Swiss.

THE Northampton Institute that has been set up in Clerkenwell at a cost of something like £100,000 was to have been opened by about this time. It was commenced in the early part of 1893, and much of it has been finished for some time past. But the scheme includes some fine ranges of workshops for technical education, and there was considerable delay in securing the site for this part of the building. Now it is said that wet weather has greatly retarded the contractor's work, and the actual date of opening is still undecided. The Architect is Mr. Chas. Bell.

Bricks and Mortar.



TALBOT HOUSE, ARUNDEL STREET,
September 23rd, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN his opening lecture to the students of the Glasgow High School Construction Classes, Mr. D. Bennett Dobson illustrated his remarks by reference to numerous diagrams of Cottages, Villas, and Mansions, as well as by a specially-prepared design of a small Science School which admirably showed the application of details. During the last Session visits were made to Somerville Free Church (W. G. Rowan, Architect), Ruchill Hospital (A. B. McDonald), Kelvinside Brick Co., Central Drill Hall (H. K. Bromhead), T. B. Campbell Sanitary Depôt, City Saw Mills, Sanitary Chambers (A. B. McDonald), Savings' Bank (Burnet, Son, and Campbell), Glasgow Art Galleries (Simpson and Allen), Mr. Young's Villa (John Gordon), Langside Free Church (Alex. Skirving). For the Monthly Visits for the incoming Session, 1896-97, the following buildings have been chosen:—Empire Music Hall (Frank Matcham, Architect), Young Men's Christian Association and Bible Training Institute (Clark and Bell), Sanitary Chambers (A. B. McDonald), Broomsloan School, Govan (H. and D. Barclay), Lancashire Insurance Co., Ruchill Hospital (A. B. McDonald), Glasgow Art Galleries (Simpson and Allen). Five students get prizes for last Session's work.

THE Leeds Corporation purposes borrowing the large sum of £270,000 for the purposes of Waterworks, Sewerage, and erection of Baths, and an official enquiry was held last week by the Government Inspector at the Town Hall. Of this sum £150,000 is to be used for reconstructing the Eccup reservoir and the extension of the water mains. The amount required for sewerage purposes is £100,000, and this is to be used for the construction of sewers for the general drainage of the city, and for the half cost of sewering new streets. For the erection of Public Baths at Holbeck and Hunslet, £20,000 is to be spent, under the superintendence of the Architect, Mr. Hanstock, of Leeds. The sites for these Baths have already been purchased, the one in Holbeck Lane costing £1,519, and the other in Joseph Street £1,288.

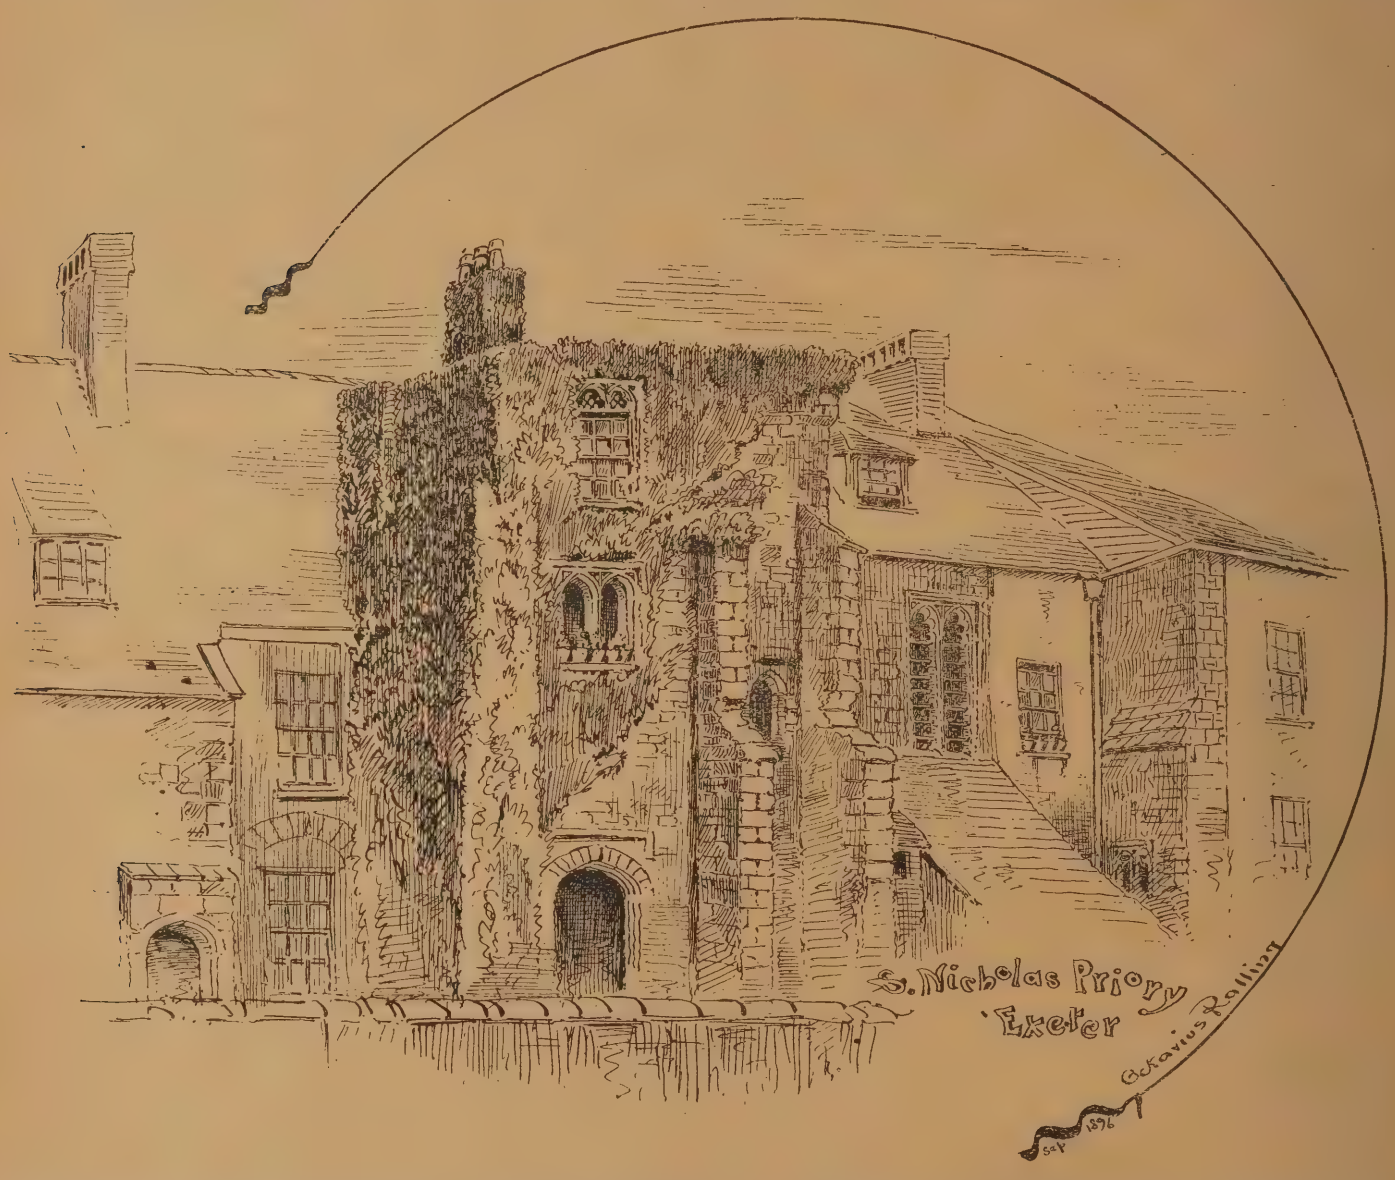
SOON Clement's Inn, at the junction of Fleet Street and the Strand, will be no more, its place being taken by brand-new offices, and chambers, the property of a limited company. Hundreds of years have passed since an hostelry was first built there for the comfort of pilgrims to the Holy Well of St. Clement. Its sanctity no longer recognised, the well was covered by a pump, and in 1874 was destroyed altogether by being filled up. The site is within the pale of the Law Courts. Clement's was an Inn of Chancery, and received law students more than five hundred years ago. It was sold in 1528 to William Holles, Lord Mayor of London, ancestor of the Earls of Clare and Dukes of Newcastle, whose names are borne by the neighbouring Clare Market, Holles Street, and Newcastle Street.

OLD HOUSES, HIGH STREET, EXETER: SKETCHED BY O. RALLING.

AN exceedingly high scaffolding now mars the stately quadrangle between the Foreign Office and the India Office. It is necessitated by the great enlargements and improvements being carried out in the Library of the latter department. The books were stored and the Reading Room was situate at the very top of the building, and the projected extensions are being made in the form of a new story. Save those immediately connected with the India Office, and a small number whose special studies in Oriental antiquities or literature have secured them the privilege of using the Library, few people are aware what a valuable collection of Eastern manuscripts is there, not to mention the interesting early documents and chronicles relating to the "Gouvenoure and Companie of Merchauntes of London trading to the East Indies," the tercentenary of whose incorporation will soon be celebrated. It is hoped that the actual work of building will be complete in about five or six months, but the rearrangement of the vast collection of books will occupy considerably longer.

CONSIDERABLE interest will doubtless be aroused amongst sanitary inspectors and municipal adminstrators by a novel kind of competition which is to be settled early next year under a scheme for giving effect to a certain provision in the will of the late Sir E. Chadwick, K.C.B., the eminent sanitary reformer, who died in February, 1895. In accordance with the scheme, which was approved by Mr. Justice Chitty, a shield, worth £100, to be called the Chadwick Shield, will be given to the Local Sanitary Authority (presiding over a population of not less than 50,000 persons) which, having adopted the most complete application of the separate system of drainage, shall, during the five years preceding next January, show the best reduction of the death-rate in its district, as indicated by its official statistics.

IN a recent number of the *Academy* an account is given of an interesting stone at Grenloaning, Perthshire. The writer is Mr. E. W. B. Nicholson, of the Bodleian Library, Oxford, author of "Vernacular Inscriptions of the Ancient Kingdom of Alban." His attention had been directed to the stone by Professor Rhys, the great Celtic authority. It stands upon the farm of Townhead, a short distance from Greenloaning Station. In Mr. Nicholson's opinion it is an inscribed Pictish stone, belonging probably to about the tenth century. The inscription, which is partly legible by the naked eye, is in Roman capitals, but of course in old Celtic speech. The interpretation would seem to imply that it was a march-stone, it giving the names of the proprietors on either side of it. The first line is "Quatt's cottage hearthside," *i.e.*, Quatt's freehold; and the second line, which is later in date, "Umchama's new dwelling."



LOOKING to the present congested condition of the traffic in the Strand, and to the possibility of a near future when some relief will be imperative, proposals are made to the County Council from time to time for the construction of subways for pedestrians. The Benchers of the Middle Temple were among the first to take up the matter, and they have recently renewed a proposal originally made as long ago as 1882, for the construction of a subway between the Temple and the Law Courts. The Strand Board of Works has again refused to consider the suggestion unless the public shall have right of access to the passage.

IN the Journal of the Anthropological Institute, Mr. R. M. W. Swan gives an interesting account of the ruined Temples of Mashonaland, which are built in the style of the Zimbabwe ruins, that is to say, in the form of arcs, more or less circular. That at Lundi River is, however, rectangular, and built of granite blocks in level courses. The circumference of it is nearly 170 ft. Between the Lobsani and Lundi rivers, along some 250 miles of road, Mr. Swan visited no fewer than twenty Temples or other ruins of the race who built Zimbabwe, and he thinks the number of ruins between Limpopo and the Zambesi must be very great. These crescent-shaped Temples are, in fact, so numerous in the country that Mr. Swan supposes them to have been wayside shrines rather than Churches.

A SWISS National Exhibition is being held at Geneva. The Swiss have always been famous engineers and mechanicians, and to many visitors this engineering faculty is now being made too much use of in the construction of funicular railways, and the consequent desecration of many of the mountain heights of the country; but the excellence of sculpture and of painting, the beauty of textile and embroidery work, will come as a surprise to many. The president of the Exhibition, M. Turretini, an engineer of world-wide fame, who has, by the utilisation of the water power of the Rhone, enabled Geneva to obtain so complete an electrical installation for motive as well as lighting purposes, has worked hard to achieve success with the Exhibition, and has succeeded. In the Swiss Village the Heimber pottery may be seen; the Tessino workmen make wooden clogs; the silkworm industry of Murano is shown, and also the manufacture of the celebrated Appenzell embroideries. Brienz sends its wood-carvers, and the Oberland its lacemakers. The section devoted to machinery and electricity is one of the most important, no less than 150,000 square feet of floor being devoted to it. The turbines, duplicates of which are used for the generation of electricity by the Rhone water power, are here exhibited, and all descriptions of transport machines, from locomotives, motor carriages, to cycles, as well as the ever occurring funicular railway with which they propose to decorate (desecrate?) the majestic Matterhorn. The Raoul Pictet Pavilion demonstrates the manufacture and uses of liquid air and other gases, and generally of the production of excessively low temperatures, the Pavilion being lighted by acetylene.

THE Museum of Arms in the Kremlin, Moscow, has just received in trust from the Emperor of Russia an historical sword of King Charles XII. of Sweden. This weapon was left behind him at Bender, and became the property of the Pasha of that place, who, in turn, made it a present to General Tutchkoff, Russian Governor of Ismail. In 1822 General Tutchkoff gave it to another Russian General on his way to St. Petersburg, and since that date it has remained in the latter's family. His daughter, now aged 78, presented the sword to the Emperor, who has just passed it on, as stated, to the Kremlin Armoury. The authenticity of the weapon is incontestable, and has been vouched for by the Director of the Paris Artillery Museum, and it has the inscription in gold letters, "Carolus XII."

WE learn that the phenomenal activity in the building trade at Sheffield shows no sign of waning, although it has continued for several years. Builders, contractors, and Architects have still as much work on their hands as they can execute, both as regards domestic and commercial requirements. Among new erections which have been decided upon are the Church at Hunter's Bar, the Woffinden Almshouses, the extension of Heeley Church, a Pupil Teachers' Centre at the corner of Orchard Lane and Bow Street, reconstruction of premises in Angel Street, premises for Mr. John Walsh and Messrs. Nicholson, Greaves, Barber and Hastings at the corner of Fargate and High Street, and many other undertakings. The works in course of construction which are rapidly approaching completion are the High Street buildings, premises in Church Street, and the Prudential Assurance Company's great block in Pinstone Street. The last bit of vacant land in Pinstone Street—the site opposite the front of the Empire Theatre—is now in the hands of the builder, and new shops and business premises are to be erected thereon from plans prepared by Messrs. Holmes and Watson.

ST. MICHAEL'S ISLE derives its name from the Chapel and Burial Ground on it, the more modern name—Fort Island—being no doubt due to Derby Fort, which also gave to Ronaldsway its present name of Derbyhaven, and it was to this island and Langness that the Isle of Man Antiquarian Society recently made an excursion. The Chapel is accurately described by Cumming. It is rectangular (31 ft. by 14 ft.), the walls 3 ft. thick; the door, 9 ft. from the south-west corner, has a semicircular heading, the jambs being of limestone. There were four windows—the north and south very near the east end are now gone, the west one is square-headed, the east a long single light with a semicircular head, 10 in. in breadth outside, splayed within. At the west end there is a Bell Turret; no mouldings or carvings are to be seen. Under the east window is the foundation of the stone Altar, also the remains of "three stone steps which may have served as an ambo or pulpit." The height of the side walls is 10 ft. The graveyard measures about 64 yards by 33. No tombstones now remain, the low earthen fence round the graveyard is almost obliterated, and altogether it has a very deserted aspect. The boundary fence should, at least, be restored, and the graves, chiefly of shipwrecked mariners, respected. The portion of wall under the east window is in a ruinous condition, and a very small outlay would prevent further ruination.

AT the northern extremity of the island stands the circular embattled Fort, about 25 yards in diameter, erected by the seventh Earl of Derby. Over the doorway is an oblong stone bearing an Earl's coronet and the date, which Cumming reads: "1650"—the last two figures are now obliterated. The walls are thick, but not solid. The parapet, in one part, is in a dangerous state, and it was suggested that this should be put in repair to prevent an accident. Near by are the remains of a much older earthen Fort, rectangular, about 41 yards square. Oswald mentions "some small low barrows and indistinct traces of foundations on the southern limb of Derbyhaven Bay, a few hundred yards from St. Michael's Island, and not far from the edge of the water." At Langness the copper mines are of great interest. In early days they were carried on in somewhat primitive fashion, above sea level, by following the lode from about south-west to north-east—almost parallel with highwater mark. Meeting the water, they were obliged to work uphill until an occasional cross-lead from the beach gave an opportunity of easy and profitable working, at the same time enabling them to get rid of the water and secure ventilation. No doubt the depressions in the surface and the arches were formed by the action of the sea working up these cross-leads. This is found by cross-cutting from the beach, both through the old workings and through the lode beyond the end of them. The new workings partly follow the old, and run both into the slate and the conglomerate with good promise. The old workings were almost entirely into a soft ore-bearing deposit of the consistency of putty. The schists at the southern point of Langness are remarkably contorted between the numerous intercepting trap-dykes.

AT a recent meeting of the Institution of Mining Engineers a paper on "Anthracite Coal" was read by Mr. W. D. Wight, who said that out of an approximate area of a thousand square miles in the South Wales coalfield, it was estimated that no less than 410 square miles contained numerous seams of anthracite coal of excellent quality and of more than average thickness. The slow development of which could only be explained by the circumstance that in the past the purposes to which it had been applied in this country were very limited. It was only in very recent years that anthracite colliery owners generally had awakened to the fact that it is possible to create a trade for their coal for domestic purposes if it were supplied to the consumer in such a condition that it could be burned with facility. Stoves were now made with special appliances to meet the requirements of anthracite fuel. The benefits to the community, especially in great cities, arising from the use of an absolutely smokeless combustible, must not be lost sight of. Experience had shown that the size of coals called "nuts" was most suitable for domestic stoves. Anthracite coal was being burned in almost every variety of grate in Wales, although, to those inexperienced in its use, it was slow to kindle. There were large districts in which anthracite coal constituted the fuel of cottage and mansion alike, giving a bright and cheerful fire. Mr. Hart (Huxham) said in burning anthracite coal for household purposes they must discard the old-fashioned notion of poking the fire. All that was required was to keep the bottom clear from ashes.

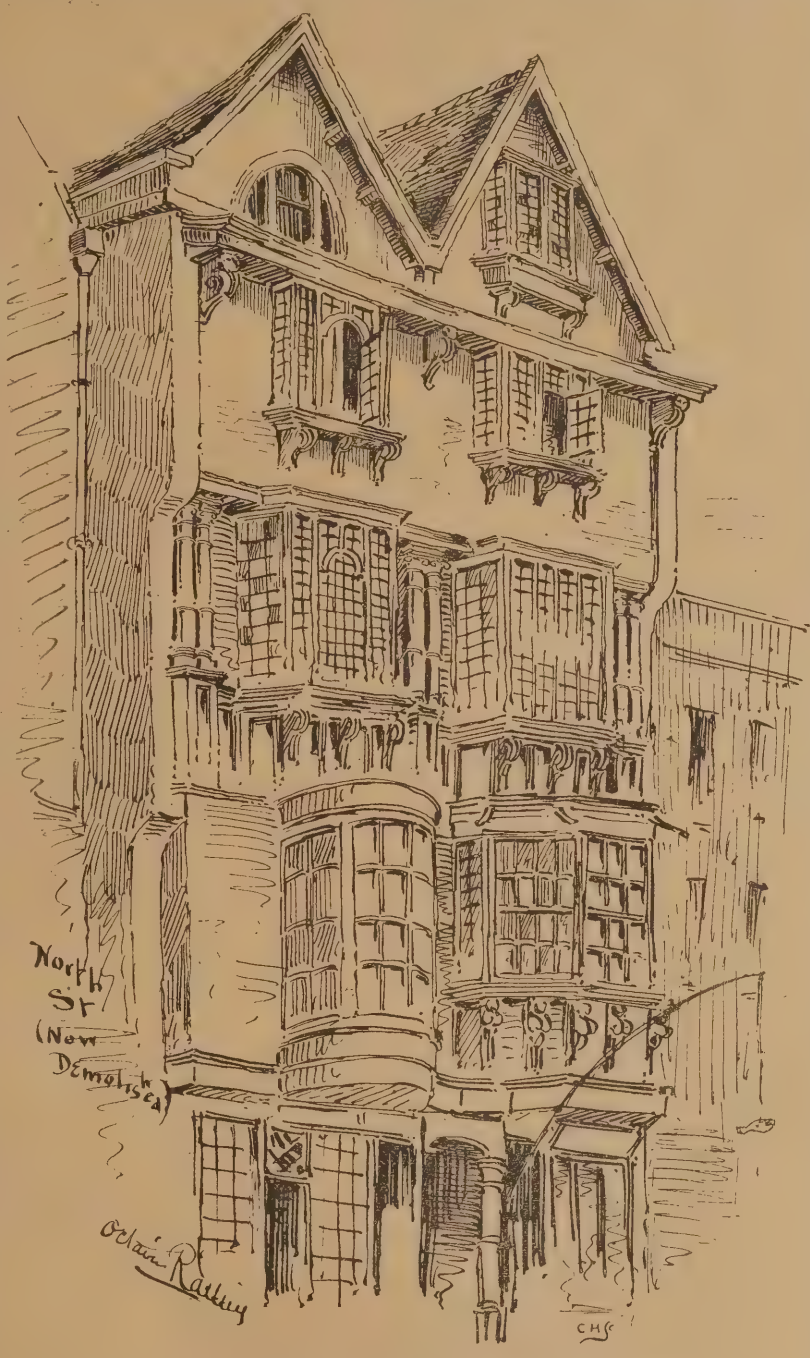
AN excursion was recently made by the members of the Yorkshire Archæological Society to Mount Grace Priory, near Northallerton, the interesting Carthusian Priory, where excavations are being made for the society by Mr. W. H. St. John Hope. Mr. Mickelthwaite, of Westminster, described the general habits and customs of the old Carthusian monks. Mr. St. John Hope then explained the ruins, stating that though the Priory of Mount Grace was founded in 1397 by Thomas Holland, Duke of Surrey, for monks of the Carthusian Order, and dedicated in honour of the Assumption of Our Lady and St. Michael, yet it was only partly built at the founder's death, and was not completed until the ratification of the foundation by Henry VI., in 1440-41. It was suppressed in December, 1539, when pensions were assigned to the prior, John Wilson, who also received the House and Chapel called Le Mounte. The ruins of this still remain on the top of the hill behind the Priory. Since the visit of the society in 1882, the ruins of the Priory have been almost entirely freed from ivy and other plants, and during the spring of the present year the excavations carried out by Mr. Brown and himself had brought to light a number of interesting features. The eastern part of the Church has been cleared out, disclosing the base of the High Altar, and on the south side of the Choir had been uncovered the walls of a side Chapel containing the bases of a tomb and two Altars. The Chapter House had also been found and cleared, and the sacristan's house identified and partly excavated. Some interesting remains have also been opened up to the west of the Church, and three of the houses on the north of the great Cloister freed from the accumulated rubbish. Much more, however, remained to be done. The Priory of Mount Grace is one of the most perfect examples to be seen in England.

AMONGST the old Churches to be found in Staffordshire, St. Nicholas' Church, Abbot's Bromley, is one of the most ancient and interesting. Unfortunately much of its past history is forgotten, and no complete record exists to show when and by whom it was erected, but there are good reasons for supposing that it dates from the eleventh or twelfth century. At the time of its last restoration, an old Norman arch was found in one of the walls, which was, however, unfortunately hidden by new masonry. Many years ago the old Tower and Spire fell down, and the present Tower, which is in the Italian style, was erected about 1688. The Nave was also pulled down and rebuilt in a totally different style from that which it had originally assumed, being erected in close resemblance to the one at Blithfield, which was probably constructed at the same time and by the same Architect. The present Nave is in the Perpendicular style, with Clerestory of good character, and presents a bold and lofty appearance. The Tower resembles the Church Tower at Burton. It contains five bells, four of which are very ancient, the remaining one—the second bell—having been cracked many years ago, and recast in 1858 by Mears, of London. The oldest portion of the Church is said to be that part known as the Mortuary Chapel, situate at the south-east end, which is in the First Pointed style of Architecture, and is remarkable for its lateral windows, which are triplets. It is said that there are only two examples of such lateral windows in existence in the kingdom. These, however, are not so old as they have been supposed to be, having been actually designed by Mr. Street, the Architect. This Chapel abuts on the Chancel, which is of the next period, the Early Decorated. On the other side is another Mortuary Chapel, of the same period as the Chancel, while the inner door leading from the Vestry is of great beauty. The north door is especially interesting from an Architectural point of view, the arch springing direct from the door-posts, which have no capitals. It is considered to be a specimen of very early work. At the north-east end is a Perpendicular window, decorated, of very curious design, also designed by Mr. Street. The whole of the wall, on the south and east sides, from the Tower to the Vestry, is new work. The Chancel is spacious and possesses many fine specimens of the early Decorated style. The pillars on either side are exceedingly short, and were originally continued down the entire length of the Church, the continuity being broken when the Nave was newly erected. The Sedilia are of stone, set in the wall at the east end. They are, stone for stone, a reconstruction of the originals, which were much broken, and have been carefully restored. From 1852 to 1857 between £4,000 and £5,000 were expended in the work of restoration and rebuilding, the Architect being Mr. G. E. Street.

MOL'S COFFEE HOUSE, EXETER.

THE British Association held its Annual Meeting at Liverpool last week, and numerous papers were read. Sir Douglas Fox, the Vice-President of the Institution of Civil Engineers, presided over the mechanical science section, and in his address sketched the progress, general and local, that has been accomplished in the various departments of civil and mechanical engineering during the quarter of a century that has elapsed since the Association last met in Liverpool, paying special attention to the application of electricity. On Friday Mr. J. W. Barry read a paper on the Tower Bridge, with lantern illustrations.

SKETCHED BY G. J. F. HOOKWAY.



AMONG the forty-two donors of £1,000 to the building fund of the new Westminster Cathedral are Viscount Llandaff, the Marquis of Ripon, Cardinal Vaughan, the Duke of Norfolk and the Marquis of Bute. During the last quarter the Cathedral works were stopped owing to a strike among the labourers, who wanted better pay. New hands were taken on, and the old labourers were defeated. The foundations are finished. Part of the Cathedral will stand in solid concrete which once supported the old Prison of Tothill Fields. The expenditure to date has been about £14,000. This sum does not include the enormous sum paid for the site, which was bought and paid for in the days of Cardinal Manning.

REGARDING the intention of the Manchester Corporation to construct a sewage tunnel, 16 miles long, to Randal's Sluices, and discharge the sewage of the city into the Mersey estuary, it is stated that opposition to the scheme will be forcibly offered by the authorities who are in a greater or lesser degree concerned with the Mersey. Some time ago complaints were forthcoming that a good deal of the refuse taken out daily by hoppers returned to the Wallasey shore, thus causing a decided nuisance, and it is now considered that Manchester's scheme will result in palpable pollution of the Mersey. It is further anticipated that the fishing of the river will likewise be seriously interfered with. There is also no doubt that the proposal of the Corporation "to pollute the Mersey with the effluent and sludge from their sewage works at Davyhulme" will meet with the most strenuous opposition from the rural and urban authorities of Runcorn. Randal's Sluices, where it is proposed to pour the effluent into the Mersey, is situate about three miles from Runcorn, and it is almost opposite Norton Priory.

NEAR Bedford, where once stood Newham Priory, an interesting discovery has just been made in a field. Excavations were being made, when the workmen came across a stone coffin, about 6 ft. 6 in. long, tapering from the head to the foot, and having the usual recess hollowed out to receive the head. No lid, however, could be found, but the fragments of apparently another coffin showed traces of carving. It is difficult to assign with exact certainty the date of the coffin, but it would appear to be of about the twelfth or thirteenth century.

AT the sites of nearly all the fourteen stations of the Central London Railway excavations are being made, and at one or two of them that work has been carried down to the line level. From all these points the tunnelling may be carried on, and it is hoped that by about this time next year both tunnels may be finished. That, of course, does not imply the completion of the work, which will probably require almost another twelvemonths after that to finish. The construction of the circular subway before the Mansion House is proceeding satisfactorily, though more slowly than would be the case if the engineers were at liberty to open the ground at one or two other points. It has been determined to enlarge the station that had been planned for the vicinity of the Post Office, and if negotiations which, it is understood, are in progress, for the removal of property at the corner of Newgate Street and Cheapside should result satisfactorily, it is probable that some slight alteration may be made in the projected course of the line at this point.

MR. ALBERT HARTSHORNE says he finds some difficulty in accepting from Mr. Ferguson, a Norman date for a fortress like Sandown Castle, with a plan so very dissimilar to that either of a rectangular Norman stronghold such as Rochester or Hedingham, or of a polygonal shell-keep like those of Berkeley and Castle Acre. That the Normans covered their concrete walls with an encasement of ashlar stones, large or small, as, for instance, at Kenilworth and Castle Acre, according to the stone-bearing capacity of the different districts—working *more romano*—is well ascertained, and this system of building was continued throughout mediæval times. On the coast of East Anglia church walls are formed of hard pebble concrete with a most durable and time-resisting outer case or skin of shaped flints; and the walls of the Block House of Camber, between Rye and Winchelsea—which towns were added to the Cinque Ports, Dover, Sandwich, Romney, Hythe, and Hastings, by Henry III.—are made of a core of pebble concrete with a thick facing of brickwork. More particularly with regard to the conformation of Henry VIII.'s Block Houses or independent Forts. They are all founded upon the same plan, and their arrangement for purposes of defence, as contrasted with Norman and Edwardian systems of castrametation, would form a most interesting subject for technical discussion. A Block House consists of a circular Keep, with its well, as in Norman strongholds, and circumscribed by an outer wall, from which four or six semi-circular bastions project. Mr. Hartshorne says that from plans made by his father sixty years ago, Walmer Castle, of which the walls are 18ft. thick, and Sandown are of the same conformation and with four outer bastions, and Deal Castle has six engaged bastions on its central Tower, and six on the outer wall. The arrangement of Camber is much the same. Refined concentric plans such as these would have been quite impossible in Norman times, aud quite at variance with the systematic methods both of attack and defence of that period. The remarkable circular bastion called "Tour de François Ier," which stood on the left side of the entrance to the harbour of Havre, was of similar character to Henry VIII.'s Block Houses. It was demolished about 1865. Hollar's map of Kingston-upon-Hull, 1640, shows three great concentric bastions facing the town, and apparently of the time of Henry VIII. As to the diagonal tooling on facing stones at Sandown Castle, it seems that this is a test of date which may easily be pushed too far. Though diagonal tooling of stone is a prominent characteristic of Norman work, it is also an attribute of masons of much later times, owing to the traditional manipulation of stoneworkers. On the Norman Tower of Bradbourne Church, *circa* 1150—to take an example—the bulk of its stones are certainly diagonally tooled, but many are not so treated, while diagonal tooling occurs on adjacent work of the 14th and 15th centuries.

NORTH STREET, EXETER: SKETCHED BY O. RALLING.

A SCULPTOR either imitates the forms of living animals and plants or he ornaments objects with geometrical designs. But it is possible to mix the two classes of figure together, and Owen Jones, in his Grammar of Art, says that so far from its being necessary to faithfully copy the natural forms of plants and animals, in the best periods of Art the imitation is conventional, and true enough to recall the original, but fictitious enough not to destroy the unity of the work. This rule, he observes, has been invariably followed during great periods of Art and violated in periods of decadence. Dr. Regnault, however, has shown from a comparison of savage ornamentation that this rule is not merely a characteristic of great periods of Art, but is founded in the nature of man, for it is exemplified in the canoes of the South Sea Islanders, the war clubs of the Negro, the heraldic posts of the Haidahs in Colombia, Central America, and elsewhere. The principles which guide the ornamental Art of to-day come not from the Renaissance or the Classical period, but from the very origin of Art.

ELECTRIC railway engineers in Switzerland are busy constructing roads to the summits of the various mountain peaks to enable tourists to examine the surrounding ranges and valleys. A new road has now been completed to the summit of Mont Saleve, a huge mass towering above Geneva to a height of over 4,000 feet. The view from the plateau on the top is magnificent, surpassing all other Alpine panoramas throughout Switzerland. The whole pile of Valaisian Alps, from Mont Blanc on the right to Lake Leman on the left, are visible. The electric part of the road is about four miles in length, and runs chiefly over French territory. As upon other Swiss roads, the system used is that of the third rail, the current carrying rail being placed a few inches above the ground for insulation on short posts. Between the rails, which are solidly laid on a well-ballasted track, runs a rack rail. Where the grade is extreme the rack is double, the teeth being set so as to give the car a two-fold grip. Additional security is also furnished by air-brakes. Current is supplied to the line at a potential of 600 volts for a water-power plant, and is brought to the road across the mountain sides by ærial cables connected about midway in the system. The generators are 12-pole machines, and each weighs 19 tons.

THE Church of St. Mary the Virgin, Coddenham, is famous amongst the famous Churches of Suffolk for the glory of its hammer-beam roof, its deep and leaning Chancel, its quaint Porch facing the village street, and the great hight of its Tower. Some eight years ago its roof was by competent authority declared unsafe and restored, but the Chancel was still filled with family pews, and the school children all occupied benches outside the Sanctuary. This has been recently restored on ancient lines, and a new Reredos erected at a cost of some £800. On removing the old Chancel pews before alluded to, illuminated panels, forming part of the fifteenth century screen, were discovered, and these have been placed in the Vicarage Library awaiting funds for their restoration and the setting up of the screen.

IN our criticism of the National Competition on the 2nd inst., we mentioned Mr. James A. Swan's Church design as having gained a book prize. We learn from Mr. Swan that the award he gained was a bronze medal, and also that the drawing was the result of a test examination, the time allowed for making the sketch design being only one hour and three-quarters, which had to be rigidly adhered to in the finished drawing. It was a pity, under the circumstances, that this fact was not mentioned on the drawings.

A GLASS-HOUSE under water, according to "Truth," is the latest luxury. A rich man, who has a large lake upon his estate, recently caused it to be drained, and in the deepest part he has had a house built which contains three rooms—a Smoking Room, a Dining Room, and a servant's Waiting Room. The framework of the house is of iron, and the floor is stone resting upon a foundation of concrete. The sides and the roof, however, are entirely composed of very thick plate-glass. There is a passage under the water from the boat-house to the glass-house, and air is obtained through large clumps of artificial water-lilies which rest upon the surface of the lake. This is decidedly a new luxury. The house and the passage, moreover, cost comparatively little to build.

WE are pleased to acknowledge our indebtedness to Messrs. H. J. L. J. Massé, Leonard Crosse, and T. Raffles Davison, for the photographs and sketches which were in part used for the illustration of the article which appeared in our issue of the 9th inst., upon the work of Mr. C. F. A. Voysey.

STRAY NOTES ON SOME CHURCHES IN BELGIUM AND NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

II.

THE finest and most satisfactory piece of First Pointed work in the Low Countries is, perhaps, the south Porch of the Church of St. Servatius, at Maastricht—whose ensemble recalls some of the great Romanesque examples of the Rhine. The Porch in question is of gigantic dimensions, being 40 ft. in height. During the restorations carried out here under Cuypers, the bold yet refined detail of this Porch has been concealed with a somewhat too lavish hand by the polychromatist, who, doubtless found sufficient traces to go upon. The great screen-like façades, such as we meet with in the Hildesheim, Halberstadt and Goslar Churches, are distinguishing features, both of St. Servatius and Notre Dame, at Maastricht. The town also contains a desecrated Church, which needs but a little repair to bring back to its pristine condition. It is in an excellent state of preservation, and the Early Pointed groining of its Apse is most lovely. The unfinished state of so many of the great Belgian Church Steeples may be attributed to the fact that the main portions of their fabrics were in progress during the fourteenth and fifteenth centuries, when the Netherlands were at the height of their commercial prosperity, and that the building of their Towers, the last portion to be taken in hand, was allowed to drag on until a sudden change in the fortunes of the country led to an abandonment of the works—sometimes when they were in a very incipient condition, as at Louvain, Huy and Mons. Here the Towers, whose lowest stages all exhibit an overgrandeur of conception which it has never been possible to carry out, truly reach to the apex of the Nave roof. Louvain was to have had a noble trio of Steeples—somewhat after the manner of those we see at St. Servatius, at Maastricht—and of these the centre one was to have attained an altitude of 500 ft., while the side ones should have reached no inconsiderable height. At present, unless extraordinary individual munificence is forthcoming, or such works are made a national affair, there seems little likelihood of their ever emerging from the state in which we now see them. There is, to be sure, not only the novelty of the unexpected about an unfinished Steeple, but a certain massive grandeur which we should be unwilling to see disturbed.* Louvain, Huy and Mons, St. Michael at Ghent, and St. Jacques at Antwerp, all illustrate this. Of completed Belgian Church Steeples that of Antwerp holds the first place. Of so apparently delicate and graceful a construction is it that Charles V. used to say that it should be preserved in a case. Next in point of completeness comes the Steeple of Malines—Somewhat too attenuated for a solitary western Steeple, but when viewed at an angle, apart from the Cathedral, and scaled by some houses to the north of that edifice, is a truly noble conception. Just after sunset when the delicate grey stonework of its windows has been thrown into deeper shade by the buttresses which lend it a character peculiarly its own, this Steeple at Malines charms beyond expression. The collegiate character of the Church of St. Gudule, at Brussels, has entitled it, like Antwerp, to a pair of western Steeples. They are of uniform height, and although exhibiting a rigid, and it may appear to some, excessive verticality, have a dignified sobriety about them which is perhaps more appealing than the colossal specimens just alluded to. I may refer, among other tolerably completed Steeples in this part of Europe, to those of St. Bavon and St. Nicholas, at Ghent—the latter interesting on account of its central position; and to those two noble western ones which, belonging respectively to the quondam Cathedral and the ruined Abbey of St. Bertin, unite in rendering the first view of St. Omer from the railway so refreshing to the student after the dreary journey from Lille or Calais. In some instances, we find an unfinished Tower capped with a slate or lead dome, often fantastically coloured, and sustaining a splendid Spire. Almost every town offers a specimen of this kind, but the true stone Spire—such Spires as are the pride and glory of our Nene Valley, or the Holland of Lincolnshire—are very rarely to be met with in Belgium. The red-brick Spire of Notre Dame, at Bruges, and an openwork one belonging to a Church in the western part of Louvain, being all that I can at present call to mind. However engrossing the subject of Steeples may be, I must reluctantly quit it, and proceed to say a few words upon the colour of Belgian Churches internally. I need not remind those familiar with the interiors of such mid-Anglian Churches as Chester, Lichfield, Shrewsbury and Worcester what an important factor the roseate hue of their stonework is, in investing them with more than ordinary religiosity and beauty. Belgium presents us with numerous instances of this effect of natural polychromy, and produced chiefly by a less costly material, *i.e.*, red brick, so largely used in the construction of Churches, both inside and out, and nowhere, perhaps, used with such pretty effect, and to so great an extent, as at Bruges, where such details as window tracery are moulded in it. One of the most beautifully-proportioned Church interiors is that of St. Waudru, at Mons. St. Waudru has had the good fortune to escape those demons, whitewash and yellow dab, which have united in rendering so many a noble Belgian Church cold and unattractive to the true artist. At Mons we see the original pale blue of its piers, arches, mullions, tracery and vaulting ribs, and this, taken in conjunction with the deep red of its brick vault, produces a richness and warmth that is eminently pleasing and grateful to the eye fresh from the white interiors of Antwerp and Malines. At Mons, then, we have a true instance of the natural polychromatic work of the sixteenth century.* Among other Churches in which the clearance of waste and plaster has brought it to light may be named those of Notre Dame de la Chapelle and Notre Dame du Sablon at Brussels; St. Paul's Cathedral, and St. Martin's Church at Liége; Ghent Cathedral, and the pretty triple-steepled St. Jacques in the Marché de Vendredi there. Now the roofs, pillars, vaults and walls of all these Churches stand forth in all their pristine beauty of pale blue and tawny yellow stonework (sometimes as in the Triforium of the Cathedral at Liége curiously pieced together) and red brick. The *toute ensemble* of all these Churches is now *cela va sans dire*, indisputably gorgeous, notwithstanding a slight effect of glare inseparable at present from the recently cleansed brickwork. In all these instances the comb has done its work well! Most of the Antwerp, Bruges, Louvain and Malines Churches are still smothered in wash and plaster, which, however, cannot rob those buildings of their proportions, which, despite the poverty of much of their detail, are truly majestic. Antwerp, with the entrancing vistas across its seven Aisles of simple arches springing from piers without the intervention of capitals. Malines, with its noble array of tall cylindrical columns—a thoroughly Belgian feature, and one which seems to have lasted through all the epochs of the country's Pointed—and its unencumbered area, so admirably adapted for imposing ceremonials. That red brick does exist in the vaults of this Cathedral is evident from the fact of a large piece of the plaster having fallen from it. With this objectionable material removed, and the ancient red brick exposed, Malines Cathedral would present an internal aspect, taking it *en masse*, as fine as anything of the kind on the Continent. It seems like presumption to criticise such buildings as these, erected by men of old time for the worship of their Creator, yet I know not the use of Architectural study if it is to be followed with that blind faith which constrains people to go into ecstacies of admiration over every building from the thirteenth to the sixteenth centuries. In no captious spirit, then, have such remarks as I have made been undertaken. That Belgium—taking its extent into consideration—is richer than France in ecclesiastical buildings cannot be doubted, but then its Architecture is not of the best or most refined description; and it is certainly not the first country of Europe towards which the Architectural student should turn his attention. Exigencies of space, to say nothing of the title I have selected, preclude me from descanting upon Belgian ecclesiology. Much as I should like to dwell upon the furniture with which almost every Church there is equipped—though, to be sure, a great deal of it, owing to the Calvinistic iconoclasts of the sixteenth century, is of Early Renaissance date—I must pass on with my readers to a more historically interesting country from a purely Architectural point of view—Germany.

* Some of my readers will doubtless remember how very grand the Tower of Sir G. G. Scott's masterpiece—St. Mary's, Stoke Newington—used to look, before the erection, six years ago, of the present belfry stage, and infelicitous spire.

* In the buttresses of the Apse of St. Anne's Church, Louvain, occurs a delightful example of polychromy. The alternate courses of brown and white stone recall the "veal and ham" work of Higham Ferrers and its vicinity.

KEYSTONES.

AN interesting piece of work in the shape of a Lectern Stand has just been placed in St. Michael's Church, Neepsend, designed, carved, and made by Mr. Kent, a member of the Sheffield Art Crafts Guild. It is in oak, and stands on a massive base, with bevelled ends.

ST. RONAN'S WELL, immortalised by Sir Walter Scott, has been taken in hand by a company, who have leased the land from Mr. Maxwell Stuart, of Traquair. Of recent years they have been sadly contaminated by surface drainage, but now a spacious Pump Room has been erected, and the whole place has been improved.

WHAT is supposed to be an ancient barrow, or burying-place, has been discovered on Pale Hill, Marsden. A shepherd found an arrowhead and two small vases, or urns, with human bones inside, and also two skeletons of adult persons. The vases were broken during excavation. The bones of the skeletons began to crumble on being pressed and exposed to the atmosphere.

THE authorities at Bale have resolved to proceed at once with the building of an Electric Generating Station. The Rhine will be tapped at Augst, about three miles from Bale, and a channel about three-quarters of a mile long will carry the water to the Turbine House. According to the "Electrician," at first 7,700 cubic feet of water per second will be available, representing about 9,000 horse power; but should necessity arise a dam could be built into the river and the capacity increased.

BUILT by George Stephenson for the Killingworth Colliery Company, "Puffing Billy," which is believed to be the third locomotive he constructed, has for the past fourteen years stood on the end of the High Level Bridge at Newcastle. The position, while conspicuous, has exposed the engine rather too much to wind and weather, and despite successive coats of paint it has been manifesting signs of decay; so it is now to be removed to less exposed quarters under the roof of the Central Station.

THE Battleship "Illustrious," recently named by Lady Bedford, is the last of the trio of first-class battleships entrusted to Chatham Dockyard to construct. The principal dimensions of the new battleship are—extreme length over all, 420 ft.; breadth 75 ft.; draught, forward 27 ft, aft 28 ft.; freeboard, forward 25 ft., amidships 18 ft., aft 18 ft. 6 in.; displacement, 15,000 tons. The engines are the inverted vertical triple expansion type. With natural draught it is expected 10,000 horse-power will be obtained, and a speed of 16½ knots on the contractors' eight hours' trial, The "Illustrious" has six decks. The middle deck amidships and lower deck at extremities form the armour deck, averaging 3 in. in thickness throughout the ship, protecting the propelling machinery, hydraulic machinery, air compressors, steering gear, also the magazines, shell rooms, &c. The armour on the side of the vessel will extend from 5 ft. 6 in. below the water-line to 9 ft. 6 in. above it, and will consist of Harveyised steel 9 in. thick. The coal-carrying capacity of the Illustrious will be 1,800 tons, a supply which would enable her to steam 28 days at ten knots. Electricity will be employed for lighting the ship internally.

IS A WATER CISTERN DESIRABLE IN A HOUSE?

TO be discussed fairly, the subject is obviously one that cannot be approached entirely from the sanitary point of view. It must also be considered from the point of view of convenience and comfort to the householder. When, for example, the supply is for some reason or other likely to become restricted for any length of time, it is difficult to see how a cistern in the house can be dispensed with. In short, it can only be dispensed with when the supply is absolutely constant. Supposing that the water supply of London were at all times greatly in excess of that required for all purposes, still it could never be regarded as being always "laid on" to the house of the consumer. To cite one instance, the repairing of mains in the event of leakage is an operation frequently involving several hours', if not days', work. In that case a large district might be without water for a serious, if not an inconveniently long, period of time. That, perhaps, is the only argument for the adoption and retention of cisterns for storing water on a small scale for domestic purposes. From the sanitary point of view there can be little doubt that most people not only give no attention to the cleanliness of a cistern, but do not even trouble themselves to find out whether it is situated among wholesome surroundings. And so, in many cases where the pollution of water has been suspected, startling revelations in regard to the position of the cistern and of the nature of its contents have, on inspection, been brought to light. Nor is the householder to be entrusted to carry out the periodical cleansing of the house reservoir properly unless he understands the responsibility attached to the task. No matter how irreproachably pure a water supply may appear to be, yet the continual passage of a large volume of it through a reservoir will invariably result in the deposition of more or less slime on the walls of the tank. This is due principally to the growth of algae and other probably harmless vegetable matter. Indeed, this slime is accorded by bacteriologists certain actively virtuous qualities, not the least important of which is that of entangling microbes in its slimy interior. But it is in consequence of this very fact that the slime is found after a time to teem with organisms, and thus may prove an unexpected source of danger. Hence periodical cleansing is an imperative step. That the system of storing water is not without some redeeming features is also indicated by bacteriological experiment. It is not possible, in fact, that the wholesome effects of storage on a large scale could apply on such a small scale as in the cistern of the householder. The consideration of facts leads but to one conclusion, and that is that "storage" and settlement should be left entirely to take place at the sources of water distribution. In other words, the community should draw from one big cistern—the waterworks—and the interception of a small container can only be warranted on the ground of scarcity or irregularity of supply. It has been suggested that the difficulty would be completely met if a large expansion of the service-pipe in the house could be made. This expansion or box should, of course, be made large enough to meet the requirements of the house in the event of the main being turned off. In fact, what is proposed is that so long as the mains are full the water direct from them should be made available, while when the supply is shut off the cistern would come into use. But in this case it is obvious that precautions to keep the cistern clean should be just as rigorously observed, and therefore the interior of the cistern should be accessible for the purpose. While the system of cistern storage has met with considerable opposition from many who are adjudged sanitary experts, yet we believe that it is a fact that in very few instances has any serious illness been traced to their employment, in spite of the reports received from time to time of the negligent way they are kept. The whole question may be summed up in a few words. If cisterns are to be abolished then the supply must be absolutely constant. Obviously, a constant supply can only be given when the storage capacity of the waterworks is adequate and the distributing services highly efficient. Assuming, however, that the supply can be guaranteed in liberal and unstinted quantities at all times, the question as to whether any occasional emergency necessitating the cutting off the water for a time would make it essential that the cistern or some modification of it should be retained, remains to be decided.

CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

DURING their excursion to Aberystwyth the members examined the ruins of the Castle. This at one time important stronghold has been so battered by successive combatants that the ground upon which it stood is cumbered with shapeless masses of masonry, rendering its study a task of great difficulty. The Castle is almost entirely of the date of Edward I., though a pre-existing Keep seems to have been utilised during the Edwardian construction. Mention is made as early as A.D. 1109 of a Castle at Aberystwyth, and at another time one at Aber Rheidol, the two rivers which join their waters at the instant of their combined fall into the sea. The celebrated Strongbow is said to have erected a Castle here to secure the territory he had managed to acquire from the Welsh. A hundred years later Llewelyn ap Iorwerth rebuilt what has been conjectured was the first fortified post on the site of the present Castle. In 1277 Edward I. secured the conquest of Mid-Wales by building a strong Castle here, which, as has been said, may have been incorporated with a portion of an earlier work. Edward's Castle is constructed upon the same general plan as those of Beaumaris, Conway, and other great works of his period. It consisted of a gateway, with strong flanking Towers, an inner baillium, guarded at angles by Towers, and an outer ward, protected by strong walls. The whole was surrounded on the landward sides by a deep moat. Llanbadarn Church was also visited. This, the third or fourth in size in Wales, has been thoroughly restored internally. The boldness and massiveness of design, especially of the splendid central Tower, have been recognised by antiquaries of every rank, and bespeak the influence and power of the former head of the See of St. Padarn. The present Church dates from about the close of the twelfth century. The fine Early English doorway seems to be a later insertion, and gives weight to the popular tradition that it came from Strata Florida Abbey at the dissolution of that house. In the Chancel is buried the famous antiquary Lewis Morris. An interesting discussion arose upon the correct reading of an inscription built into the internal wall of the Chancel. A tall incised Cross stands in the churchyard, where its details are slowly vanishing under the influence of the weather. It is probably of the tenth or eleventh century, and bears no inscription. The ancient Church at Towyn, said to be one of the oldest in the Principality, was also inspected. The fame of the holy St. Cadvan, who is supposed to have flourished in the early part of the sixth century, probably led to the construction of a small Oratory, or group of Oratories, after the manner of Glendalough and other Irish examples, on the spot hallowed by his labours or rendered sacred by his burial. This primitive edifice gave way, some time during the twelfth century, to a more important Church, a portion of which forms the Nave and Aisles of the present building. The Nave is of three arcades, supported upon enormous stunted piers in the Norman fashion, but it would be difficult to decide whether they really are of that period or not, owing to the absence of all ornamental detail. They are, at any rate, of extreme age, and, though coated with plaster to such an extent as to entirely hide their true character, have much in common with the earliest work of the kind in the small Churches of Normandy. Above is a range of small deeply-splayed Clerestory windows, of apparently the same age as the Nave arcade. The roof of the Nave is Late Decorated of very good character. The arches of the north Aisle of the Nave have been strengthened by building them up in the shape of buttresses, but those on the south side remain in their original condition. The portion of the early Church forming the present Nave extended further to the west, but has been cut off short by a poor West Front. The Church, always one of considerable reputation, became a collegiate foundation, modelled after the later Monastic type, and this development probably led to the reconstruction of the Church into the form common to the collegiate Churches of Wales. It became cruciform in shape, with a central Tower. The Transepts and Tower have been completely restored, and not a vestige of their original character can be traced. There are two interesting effigies in the Church, one a knight of the period of Edward III., and the other a priest in canonicals of the fourteenth century. The Tower fell in 1692, and in 1736 another Tower was built at the western end of the Church, which was taken down at the recent restoration. On the floor of the Church lies the famous stone of St. Cadvan, which has proved a greater puzzle to Cambrian antiquaries than probably any other of the Welsh inscriptions. After a lengthy examination the antiquaries came away as puzzled as when they arrived, but careful rubbings were taken by Mr. Romilly Allen, which may lead to the correct elucidation of its meaning. In the north Transept is a tablet bearing an inscription placed there to the memory of the mother of the celebrated bard "Dafydd Ionawr," who was born in this parish. St. Cadvan's Well, which stood outside the churchyard, and which was celebrated for its miraculous properties, has been enclosed within the precincts of some newly-built stables, and has been robbed of all its pristine associations.

At the general meeting officers were appointed for the following year, and the vacancies created on the Council by the retirement in rotation of three of its members, filled by the election of Mr. Henry Owen, F.S.A., Mr. T. Mansel Franklen, of St. Hilary, and Canon Llewellyn Thomas, of Oxford. An appeal for funds towards the expenses incident to the publication of the great archæological survey of Wales that the Association has undertaken, met with gratifying support, and the survey of Pembrokeshire will be proceeded with with the utmost despatch.

A NEW Primitive Methodist Mission Hall has been erected at Hunsworth at a cost of £500.

AT Winchcombe a new Wing has been added to the Cottage Hospital. The cost has been £225, which is being met by Mrs. Dent, of Sudeley Castle.

THE demolition of Toole's Theatre, in King William Street, Charing Cross, has commenced, and within the next few weeks the building will be no more.

THE Chatham Corporation has decided to build a Town Hall at a cost of £20,000. It will be erected on a site acquired from the War Department at the top of the Military Road.

THE plans submitted by Mr. Joshua Jowett for the Royalty Theatre, in Cheapside and Market Street, Morecambe, have been rejected in consequence of the main wall being brought out in front of the main wall of the adjoining buildings.

AT the Blaker Recreation Ground, Brighton, a Clock Tower has been erected at a cost of some £400. The Clock Tower was designed and erected by Messrs. Gillet and Johnston, Croydon, and is the gift of the Mayor to the Corporation.

SHOULD the plans be passed by the Commissioners of the Exhibition to be held in Paris in 1900, it is proposed to construct a Tower with twenty-four stories, which will contain Theatres, Concert Halls, Restaurants, and similar places of public entertainment. It is intended that the whole building shall revolve on its axis.

THIRTY thousand lamps, gas, electric, and naphtha, are required to illuminate the streets, avenues, parks, docks, and bridges of the city of New York. The number of electric lights, slowly but visibly superseding gas lamps for purposes of street illumination, is 3,300, and the city expends in a year more than £200,000 for lighting. The appropriation this year is exactly £250,000 for lighting the highways and public properties.

WROUGHT IRON WORK.

RELICS OF HUNTINGTON SHAW.

A DISTINGUISHED Italian is said to have declared that nothing impressed him so much as the magnificence of our modern Domestic Architecture. During the last quarter of a century, says the "Westminster Gazette," our cities have been adorned with a profusion of buildings beautiful enough to afford some compensation for the antiquarian loss on the demolition of the older structures. But in one thing we fall lamentably below the work of our forefathers. We do not seem to be able to set up a beautiful gate or screen. Yet nothing gives so notable a finish to a handsome building as a beautiful gate. Where shall we find anything among the productions of to-day to rank with the magnificent work of Huntington Shaw, smith, of Nottingham, who about two hundred years ago wrought those twelve exquisite gates and screens at the command of William III. for his Palace at Hampton Court? Several of these have happily been placed in the South Kensington Museum, where they are preserved, and worthily bear comparison with the finest examples of German, French, or Italian work. Or where shall we look for anything comparable to the exquisite gates which adorn the Wrenean Terraces of Chelsea, Kensington, Hammersmith, Richmond, or any of the suburbs fashionable in the period roughly covered by the years 1650-1750? Yet the art of the smith has not been neglected in this era of artistic revival. Great credit is due to the firm of Messrs. Starkie, Gardiner, and Co.; but they do not stand alone. Many beautiful objects for the adornment of the home—lamp-brackets and stands, window-grilles, balusters, &c.—are being produced; scores of them may be noted in the course of a stroll through the newer portions of Chelsea and Kensington. Here and there a good gate is to be seen; there is an exquisite gate and grille to one of the new houses in Sloane Street, and another in Cadogan Square. As a general rule, these modern productions fail in over-elaboration. Nothing is so remarkable in the older work as the chasteness of the design and the healthy restraint which the designer has placed upon himself. This is especially noticeable in the beautiful screen from Frome Church. It would have been very easy for an inferior designer to have filled up the vacant spaces with repetitions of conventional forms, but only an artist could have imposed so severe a restraint upon himself while producing a work so graceful and delicate, and so entirely satisfying the artistic instinct. A goodly proportion of the beautiful old gates and screens came from the extinct Sussex ironworks. These were chiefly conducted on what would now be considered a very small scale, and by very old-fashioned methods, but this order of things is that which is most favourable to the production of true artistic work. Thus it is that we are now carefully treasuring the relics of these bygone furnaces, both in cast and wrought iron. There is some ground for believing that the beautiful grilles in St. Paul's were produced in this county, probably at the Gloucester Furnace, Lamberhurst, where the great railing of the Cathedral was executed. The traditional skill of the Sussex smiths still lingers in the county, but there are sufficient examples of fine workmanship scattered over the country to show that this skill was not circumscribed either by place or time. Examples of twelfth-century work, showing both skill in construction and elegance in design, may be seen on the slype door of the South Transept of St. Alban's Abbey, and in the grille of St. Catherine's shrine at Winchester. A century later a great advance in both respects may be observed in the grille of Queen Eleanor's Monument in Westminster Abbey. The screen at Frome is early seventeenth century; two elegant specimens of the latter end of this century may be seen in the mace stands (decorated much in the taste of Shaw's Gates) which came from the Church of Newcastle-under-Lyme, and are now preserved at South Kensington. The gate from Rosslyn House, Hampstead, demolished in April of this year, is a pleasing example of the light and graceful work of a later time. Notwithstanding the destruction that is continually going on, a very large number of specimens of this old Art yet remain, though often badly worn and rusted through neglect. The commonness of the material has generally been their salvation: they are not worth melting as brass or bronze would be.

SOCIETY MEETINGS.

Glasgow Institute of Architects.—The Exhibition of Metal Work will be open from about the 12th October till the end of that month. The exhibits will include cast and wrought iron, brass and copper work, ormolu, lead, silver, or other metals capable of decorative treatment. Contributions of old examples are invited, as well as the best class of modern work. Drawings and photographs of metal work will be included. All articles intended for exhibition must be delivered at 187, Pitt Street, Glasgow, on Thursday, Friday, or Saturday, the 1st, 2nd, and 3rd of October. Each article should have securely attached to it a label with the exhibitor's name and address.

Sheffield Art Crafts' Guild.—A meeting of this Guild was recently held. The master, Mr. T. Swaffield Brown, was in the chair. There were also present Messrs. Green, Tuck, Halliday, Crowder, Shephard, Crichton, Douglas, and others. A report was read by the Treasurer on the late Exhibition, and Mr. Charles W. Crowder read a Paper on "Some of the Uses of Photography." The Lecturer sketched the progress of Photography in recent years, and enumerated a number of the multitude of processes now in use, with the effect they have produced on past and existing methods. He also suggested that Photography might be of considerable use to the sculptor by taking a photograph from the drawing, or model, and from it make a transparency, projecting it by means of the optical lantern on to the stone.

Cumberland and Westmoreland Antiquarian and Archæological Society.—The annual meeting was held last week after the excursion, in the Coniston District, for the appointment of officers, the election of new members, &c. Among other reports and papers laid before the members during the two days were "The Sawreys of Broughton Tower," by Mr. John Fell; "Notes on the Church Bells of Cockermouth, Crosthwaite, and other Churches in Cumberland," by the late Rev. H. Whitehead; "Folk Lore of Hawkshead," by Mr. H. S. Cowper, F.S.A.; "Aske's Rebellion," by Mr. George Watson; "The Mountain Sheep, their early origin, markings, and numberings," by the Rev. T. Ellwood; "Report of the Cumberland Excavation Committee, 1896," by Mr. F. Haverfield, F.S.A.; "Notes on Excavations on the Roman Walls, 1894-95-96," by Mrs. Hodgson; Prehistoric Implements in Furness," by Mr. Harper Gaythorpe; "Local Effigies," by the Rev. R. Bower; "Broughton Church," by the Rev. F. A. Malleson; "Thomlinson of the Gill," by Mr. G. W. Thomlinson, F.S.A.

IT is said that the John Bright Statue is to be removed from the Central Hall of the House of Commons.

MR. BUCHANAN has been elected President Harbour Engineer at Dundee. The appointment is worth £400 a year.

THE decision of the Board of Trade as to the proposal to remove the Platters Rocks at Holyhead may be expected in the course of next month. Besides the removal of these rocks it is also proposed to puild a Pier from Salt Island.

DURING service in St. Stephen's Church, Ipswich, an oak beam fell in the Choir Stall, but fortunately no one was injured. This part of the roof is very old, and, it is said, rotten with age. Steps will be at once taken to examine the roof.

IN the thunderstorm on the 8th inst., the ancient parish Church at Lamberhurst, Kent, was struck by lightning. The spire was partially stripped of its shingles, the interior timbers split or displaced, the west window and door received serious damage, and two longitudinal cracks revealed themselves at the top of the south walls of the Nave and south Aisle respectively. The whole Church received a very serious shock, and, but for the rain, probably would have caught fire.

Professional Items.

SKERTON.—A new School Chapel, designed by Messrs. Pugin and Pugin, was recently opened at Skerton, Lancaster. The contractor was Mr. Wm. Harrison, of Lancaster.

WOODHALL SPA.—On Wednesday the new Roman Catholic School Chapel was opened. It is well and substantially built from the designs of Mr. Adolphus Caine, and the builder was Mr. Oliver Cromwell, of Woodhall Spa.

ARUNDEL.—At Arundel Castle the Duke of Norfolk recently gave a dinner to all the employés engaged upon the work of restoration. The contractors are Messrs. Rattee and Kett, of Cambridge, and the work has been carried out under the superintendence of Mr. Butler, the Architect.

COWBRIDGE (Glam.) — The Intermediate Girls' School was opened last week The new Schools, which are in close proximity to the Railway Station, have been erected from the plans of Mr. Robert Williams, of Lee, S.E. The accommodation is for 40 scholars and 12 boarders, and the building has been erected at a cost of £2,500.

GLOUCESTER.—A new and admirably-arranged Depot has been erected, and embraces stabling for twenty-six horses, shed for all kinds of carts, and workshops. The Depot is built on the pattern of that at Birmingham. The contractors were Messrs. Gurney Brothers, and the premises, which cover an acre and a half, cost nearly £6,000.

GOOLE.—A Reredos has just been placed in the Church of St. Bartholomew, Eastoft, near Goole. It is of Baltic oak, rising to a height of 12 ft. with a canopy, the top of which is carved and pinnacled and gilded. The Reredos is the gift of the late Mrs. F. Sykes, of Boltgate, and was the design of Mr. Hodgson Fowler, of Durham.

HAMMERSMITH.—The new building of the Hammersmith Liberal Club was recently opened by Sir C. Dilke. The Club House, one of the most convenient of its kind in London, will accommodate between 700 and 800 members. The Architect of the new building is Mr. T. Woodbridge Biggs, and the builder, Mr. H. E. Tomes. The cost of building and the freehold site has been £5,000.

DIDSBURY.—Within the past eighteen months a sum of £2,500 has been spent in enlarging and decorating, and erecting a new organ, in Didsbury Parish Church. This instrument has been built at a cost of nearly £600 by Messrs. Jardine and Co., of Manchester, and the oak front case, erected from a design of Messrs. Preston and Vaughan, Architects, of Manchester, was presented to the Church by Mr. H. T. Crofton.

NEWBAWN, CO. WEXFORD.—The new Catholic Church of the Sacred Heart has been dedicated. The Church supersedes an old relic of the penal days. It was built by Mr. Andrew Cullen, New Ross, from the design of Mr. Wm. Hague, C.E., Dawson Street, Dublin. The style of the building is early Gothic, and it consists of Nave, Aisle, and Apse. Interiorly the principal proportions are 100 ft. in length and 32 ft. across the Nave and Aisles. The total cost was about £3,000.

MOUNTSORREL.—On Thursday foundation stones were laid of a new Primitive Methodist Chapel and Schools, at Mountsorrel, near Loughborough. A site fronting the main street was secured for the sum of £300, and the contract for the Chapel and School Room has been let for £1,100. There is to be accommodation, in the Chapel for 200 worshippers, and the School Room, which is situated at the rear, will accommodate a similar number of children. The Architect is Mr. R. W. Dakin, of Leicester and Barrow-on-Soar, and the builders Messrs. A. Faulks and Son, Loughborough. Plans showing a building of Gothic design have been approved, the materials being pressed bricks with stone dressings.

PENDINE.—The Peter Williams Memorial Chapel was opened last week. The building is very unpretentious in its style of Architecture, and has been built at the lowest possible cost. It has cost about £400, and will accommodate about 250 worshippers. Almost square in shape, the front is of lime stone with yellow brick facings, the other three sides being plastered. The Architect was Mr. Morgan, Pendine, and the contractors Messrs. David Rees and Sons, Whitland.

BRIDGNORTH.—The Infirmary which the Viscountess Boyne recently opened at Bridgnorth is built from the designs of Mr. Maidman, of Edinburgh. The building is in the English Domestic Architectural style, and is well in keeping with its surroundings. The Wards have been placed in a southerly aspect, and are screened from the east winds by the Administrative Offices. The building, which stands on an elevated site, has been erected by Mr. Merton Hughes, of Birmingham.

ABERFELDY, N.B.—Comrie Bridge is erected on the site of the old bridge which was destroyed in the early years of the century. The new structure consists of three spans, each 55 feet long, and is constructed of steel lattice work. The piers and abutments are built of stone set in cement and rest on rock. The roadway is 16 feet wide. The work has been carried out by Mr. William Oliver, Edinburgh, from a design prepared by Mr. William Bell, Aberfeldy.

ENNISKEEN.—To the grey and venerable Gothic parish Church an entrance and flight of terraced steps have just been built. The piers, walls, and steps are of chiselled limestone, from the quarries of Cork and Aherla, and the main and side gates are of wrought iron of a highly ornate character. The work is from the design of Mr. M. A. Hennessy, Architect, Cork. The stonework is by Messrs. McCarthy and Lynch, the ironwork by John Perry and Sons, and decorations by Messrs. O'Connell.

GLOSSOP.—Fitzalan Street Church was recently opened. Of the total amount required —£3,500—about £300 is all that remains to be provided. The Church, which is of stone, has been built, from designs prepared by Mr. J. Lindley, of Hyde, by Messrs. S. Robinson and Son, also of Hyde. Its most striking feature is a stained-glass five-light window filling the east end of the Church, the gift of Captain Partington. The subjects are taken from the Old and New Testaments. The work has been carried out by Messrs. Swaine, Bourne, and Son, of Birmingham.

DUNS.—Berwickshire High School, which has been established at Duns by the Berwickshire County Council, was formally opened last week. The premises, formerly a residence, situated at the west end of Newtown Street, have been purchased and fitted up, at a total cost of upwards of £2,500, after designs by Mr. R. A. Bryden, Architect, Glasgow. On the ground floor are two Class Rooms, each fitted up for forty pupils; and on the second floor a Drawing-Class Room, to accommodate twenty pupils, and a Chemistry Room, with the necessary benches and apparatus for ten students.

SCARBOROUGH.—In order to push forward the Marine Drive round the foot of the Castle Hill to connect the North and South Bays, it has been decided to borrow an additional £10,000 over and above the £70,000 authorised by the local Act for the construction of the Drive. When the tenders were opened it was found that the lowest tender was £69,270, and as certain necessary work was not included in the specification it became plain that the sum of £70,000 specified in the private Bill would be insufficient, and further powers would have to be obtained. It is still intended that the contract shall be placed with Messrs. Cooke and Son, Battersea.

WEST MALVERN.—A special meeting of the Malvern Link District Council was held on Thursday for receiving the tenders for the West Malvern Sewage Works. The tender of Mr. G. Law, £4,625, was the lowest, and he was strongly recommended by Mr. Baldwin Latham, the engineer. Some members were in favour of Mr. Moffatt's tender being accepted, while others thought Mr. Law's tender should be accepted, and a good clerk of the works employed. After a desultory conversation as to the merits of the three persons whose tenders were the lowest, Mr. J. G. Bennett moved that the tender of Mr. Law be accepted. This was carried, and it was resolved to advertise for a clerk of the works.

LUNDY ISLAND.—A new Church has been erected, built of granite quarried on the island, with stone dressings to windows and doors, and the opening ceremony will take place next month. The building is lined with brick of three colours—red as a body, with buff and blue to relieve it. The Chancel rises two steps and the Altar two steps. The Choir stalls are of English oak as well as the reading desk. The Architect is Mr. John Norton, of London, and the contractors are Messrs. Button and Pickett, of Ilfracombe. The east window has been placed in the Chancel by Messrs. Clayton and Bell, of London. The reredos and statue of St. Helen is by Messrs. H. Hems and Son, of Exeter. The roof of the structure is covered with tiles from Tetbury, in Gloucestershire.

MANCHESTER.—At Knot Mill the new Station is well advanced towards completion. The main entrance is faced with dark-brown glazed bricks and a gold and brown dado, and there is a slight incline to an easy flight of steps, 15 ft. wide, which leads into the Booking Hall. A subway leads to the down platform. The platforms have been raised, widened and lengthened on the Deansgate side, where the Bridge has also been widened by steel girders to the extent of 80 ft. Lifts will be used to raise passengers' luggage from the Booking Hall to the different platforms. The platforms are partially roofed with steel and glazed. The buildings have been erected from designs by the joint engineers of the London and North-Western and Manchester, Sheffield and Lincolnshire Railway Companies (Messrs. Francis Stevenson and Alexander Ross), and the contractors for the work are Messrs. R. Neill and Sons.

PORT ERROLL.—The Directors of the Great North of Scotland Railway are about to erect an Hotel on a site about half a mile from the Railway Station. It is designed in the Baronial style of Architecture, and will be constructed throughout of Peterhead granite, with Kemnay granite dressings. The building consists of a large centre block of five stories, with two projecting wings at the back. The front elevation, which faces the south, and extends to 118 feet in length, will present a massive appearance. Its distinguishing feature is a Tower, rising some 80 feet above the ground floor level, having an embattled front, and flanked on each side with turrets. The east and west elevations, although possessing less multiplicity of detail, are still of imposing design. The plans have been prepared by the Company's Architect, Mr. J. J. Smith.

ORMSKIRK.—A Corn Exchange and News Room has been opened. At the present time considerable improvements are being carried out in Ormskirk, the present Lord Derby laying out new streets, and the local authority taking steps for the better development of the traffic of the town. Recently a number of old houses in the vicinity of the Parish Church were pulled down, and in several quarters commodious buildings have been erected. Mr. John Riding, Ormskirk, was the Architect, the chief contractors being Messrs. Chisnall and Constantine, Messrs. Whittle, Messrs. Riding and Son, Mr. Thomas Ball, Mr. J. J. Balmforth, Messrs. J. Ball and Co., and Mr. J. Bisset. The Corn Exchange and News Room are heated throughout with hot water, and afford about 3,000 feet of floor space, besides convenient Offices and Committee Rooms.

NEATH.—Another old landmark has disappeared in the Old Academy Buildings in order to allow new shops and premises to be erected on the site. The new buildings have already been commenced, and will form another Architectural feature in Neath. The façade will be of red and white stone, worked in alternate courses, the front being broken up into bays and projecting shafts, terminating at the roof with a large gable surmounted with a huge carved griffin. The whole of the work will be carried out in the best possible manner, great care and attention being paid to all the sanitary arrangements, which will include the latest improvements. The contract is let to Messrs. Gustavus Bros., of Swansea; and the work has been designed by Messrs. Wilson and Moxham, Swansea, who are also the Architects for the new buildings on the Parade, for the London and Provincial Bank, Limited.

EDINBURGH.—An enquiry was recently held with reference to the scheme proposed by the North British Railway Company for providing houses for the labouring class, in lieu of the labouring-class houses removed for the enlargement and improvement of the Waverley Station. The Company propose to erect ten tenements of houses. The number of new houses proposed to be erected is 120, as follows: houses of two apartments fronting St. John's Hill, 48; houses of two apartments fronting Pleasance, 26; houses of one apartment fronting internal courtyard with access from St. John's Hill, 44; houses of one apartment in Pleasance, 2. All the one-roomed houses are fitted for two beds. All the houses have Pantries, Coal Closets, and w.c.'s, except in the case of the one-roomed houses, which have a w.c. common to two houses. There are six common Bath Rooms provided for the houses, and eighteen common Wash Houses, with fixed earthenware tubs and clothes boilers.

BRIXTON.—The new Theatre was opened on Monday. The Foundation Stone was laid, it may be remembered, by Sir Henry Irving in 1894, but difficulties of various kinds have delayed the completion until some time later than was originally expected. The Architect is Mr. Frank Matcham, and the style French Renaissance of red brick with stone dressings. The site faces Brixton Oval and adjoins the Free Library. The entrance to Stalls, Dress Circle, and Boxes is from the front in Brixton Road, while the Pit and Gallery are reached from Ardville Road. The "exits" are numerous, and as the Theatre is practically isolated, it should rank as one of the safest in London. Inside, the principal staircase has decorative brass banisters or ornamentation. The general scheme of colour is cream and gold. The Stage is 38 ft. deep and 60 ft. wide. Electric light is installed throughout the building. The seating capacity is just 2,000.

BIRMINGHAM.—St. Stephen's Church was reopened last week after undergoing structural repairs with internal decoration. St. Stephen's is one of several Churches built half a century ago of a local soft red sandstone, which has been found unable to resist the action of the Birmingham air. Before the work of restoring St. Stephen's was taken in hand the Church was fast sinking into a ruinous state, and it became necessary to repair the buttresses on the south side, and to reface the west end. It was thought the wisest plan to case the whole Church with brick and terra-cotta, and this it is hoped to accomplish in time. So far, the buttresses mentioned and the western façade have alone been treated. The latter is remarkable for its great beauty and dignity, especially as regards its deeply recessed doorway, with a fine double-door having great hinges of hammered ironwork. When the present designs of the Architect, Mr. W. H. Bidlake, are carried out to completion, St. Stephen's will be one of the finest modern Churches in the Midlands.

A NEW Post Office has been erected at East Grinstead, and was recently opened by the Duke of Norfolk.

THERE is now being built at Chicago a Tower something after the pattern of the Eiffel Tower, but of larger proportions. The total height is 1,115 ft., and at the level of 225 ft. from the base there is a spacious platform; again at 450 ft. a floor 150 ft. square, and a third at 675 ft. From this point elevators travel to the landing at 1,000 ft., whence stairways lead to the top of the Tower. The cost is estimated at £800,000.

Trade and Craft.

WAGES OF THE BELGIAN ARTISAN.

At Ghent an Act was recently passed by the Municipal Council calling for the insertion in all its labour contracts of a minimum wage clause which, although referring only to Ghent, throws some light upon the customary wages throughout the country. In Brussels the rates are higher, but, on the other hand, in some provincial towns they are even lower than those paid in Ghent. The tariff fixed by the Municipal Council of that city is as follows:—Cabinet makers, 37 centimes per hour; carpenters, 37; bricklayers and masons, 34; bricklayers' labourers, 20; plasterers, 38; plasterers, labourers, 27; paviors, 42; paviors' labourers' 32; navvies, 32; slaters' labourers, 26; stonecutters, 38; glaziers, 37; house-painters, 32; plumbers, 34; ironworkers, 34; compositors, 40; printers, 40; dredgers, 47; dredgers' labourers, 32. The hours of Belgian workmen are long, and even with the low cost of living throughout the country, which is far cheaper than in England, the pay is not sufficient to keep the men in good health. This small wage for the men sends the women to the factories and workshops, and prevents the families from eating meat almost from one year's end to the other. Already the working man has accomplished a great deal. It was he who, in 1892, succeeded in bringing about a total reform in the suffrage system, and caused a Minister of Labour to be added to the Cabinet. Already have factory laws been passed since that date which protect the working man in many ways. Soon he will succeed in having the minimum wage law passed. It is evident that the Belgian workman, be he a docker or ordinary artisan and labourer, does not ask for or wish the interference of foreign labour leaders, more especially as several large undertakings are now under way, and work is abundant both for skilled and unskilled labour. The construction of the different new ports, the enormous railway station at Antwerp which is in course of construction, will all take several years to complete, and the Brussels Exhibition is likewise giving work to many.

CUXHAVEN DOCKS.

The new Docks which have just been inaugurated at Cuxhaven have been constructed at a cost of £350,000, the whole of this amount having been defrayed by the city of Hamburg. The river Elbe up to the great port is only to be kept in a navigable condition at a large and constant expenditure, and this, together with the fact that the demand for dock accommodation at Hamburg is making such rapid strides, renders it necessary that there should be further shipping facilities near the mouth of the river. This step made itself felt fully 20 years back, when Hamburg started various new lines to North and South America, Africa, Australia, and Eastern Asia. Six years ago the Senate of Hamburg, with the approval of the Town Council, decided to construct improved deep Docks at Cuxhaven. It was calculated at the outset that the work would be completed within three years, whereas, owing to unforeseen difficulties, the time occupied was five years. The total area of the new Docks at present amounts to 60,000 square mètres, but this can be enlarged and extended whenever it may be found necessary. The Depth of the docks is about 26 ft., below the average low-water level, and is, therefore, capable of accommodating the largest ocean-going vessels.

A NOVEL CASKET.

The casket in which the address to the Tsar from the municipality of Aberdeen is to be enclosed will be a fine piece of silver-work. The casket will be cylindrical in form, as being preferable to the conventional box type. The cylinder will be about ten inches in length and about two and a half inches in diameter. The ends will be left open, and thereby the vellum on which the address is to be illuminated will, when rolled up, be inserted. The ground of the casket will be polished silver. Round the ends there will run ornamentation of a leaf pattern. The shaft itself will be encircled by four bands. These bands will each be three-quarters of an inch in width, and will consist of pierced silver work of fine design, the polished silver ground showing through the apertures. Midway between the ends of the cylinder will be a circular piece of ornamentation. The feature of this will be a representation of the arms of the city. Underneath will be two Scotch thistles crossed and running up the sides of the ornaments. To one end will be attached the city seal by means of a ribbon. The casket has been designed by Messrs. G. Jamieson and Son, jewellers, Aberdeen, and the whole of the work is being executed on their premises.

MESSRS. SHANKS AND CO.

At the Health Exhibition, held in connection with the Sanitary Congress at Newcastle, a Bronze Medal was awarded this firm for their Fin de Siecle Bath, the particular feature of which is the quick discharge and thoroughly sanitary arrangement of the waste. They also received a Bronze Medal for their Patent Improved Glazed-back Urinals, and their Barrhead Syphonic Closet has been selected by the judges for further practical trial, as also has their Patent Automatic Water Heater.

A NEW DOCK.

It has long been a reproach to the Clyde that there is no adequate graving dock on that river, notwithstanding the fact that the largest of our Atlantic liners have been built on the banks of that river. Now, however, the Clyde Trustees have recognised this drawback, and are constructing a new Graving Dock, which, when opened, will be only second in size to that which is being built by the Mersey Dock Board at Liverpool. It will be called the Cessnock Graving Dock, and is 900 ft. long—the same length as the new Liverpool Dock—but the dimensions of the Mersey Dock in other respects are considerably larger.

NEW ROADS IN THE FOREST OF DEAN.

A commitee meeting of the members of the East Dean Rural District Council, Mr. Arnold Thomas presiding, was recently held to consider the routes to be determined upon in respect of the proposed new roads which the Office of Woods have consented to construct in the Forest at the instance of the local authority. A draft plan was submitted and accepted, in every instance, except that with respect to Ruardean Hill, to which exception was general, and another route was recommended. The proposed roads and the cost of construction are scheduled as follows:—Joy's Green, £1,200; Pope's Hill, £1,450; Ruardean Hill, £1,950; Bilson Road, £360; Station Road (Cinderford), £900; Blakeney, £550—total, £6,500.

ALTERATIONS OF CONTRACT.

Seventy unionists have been fined at Rotherham. The case was a simple one, involving no disputed principle. The defendants were in the employment of Messrs. Wright and Co., Burton Weir Stove-grate Works, and were charged with breach of contract. The company appears to have altered the terms of a contract with the men, whereupon the latter, refusing to sanction the alteration, left work. A deputation of four workmen afterwards waited upon Messrs. Wright, and had an interview which lasted three hours, and the whole of the grievances were discussed. The outcome of the interview was that an arrangement was come to by which the men agreed to resume work on the old rules of 1890 on Monday, and the new rules have been withdrawn. A mass meeting of the workmen was held, when the deputation made their report, and the terms were accepted unanimously. The speakers also expressed the good feeling which had hitherto existed between the employes and the firm, and special allusion was made to the senior partner, Mr. G. W. Chambers. The strike began on September 2nd, and although there was an attempt to settle the dispute at the time, it failed.

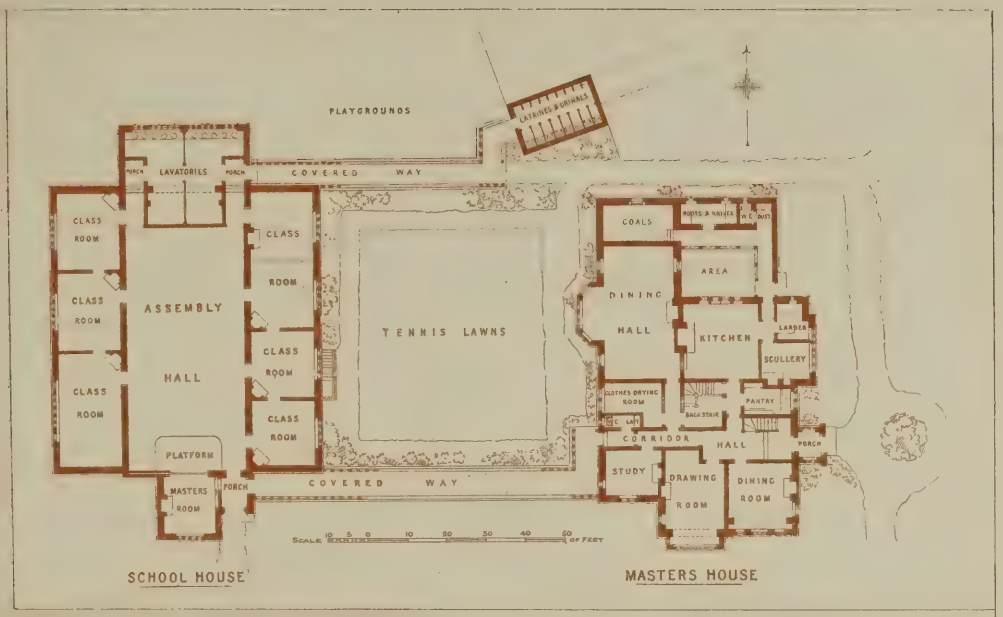
STATE OF TRADE IN THE WEST.

For all classes the "Labour Gazette" for September contains a great deal of information of an industrial character as concerning the West of England. Upon the various features of the principal trades Mr. J. Welland contributes a comprehensive summary as affecting changes. We find from his official statement through the Labour Department of the Board of Trade, that whilst in Cornwall employment in metal-mining exhibits no improvement, the china clay-workers and quarrymen continue to be well employed. Another good sign of trade revival is shown in the statement that there is no compulsory idleness amongst operatives in the engineering and kindred trades, such as ironfounders, boilermakers, brassfounders, smiths, and wheelwrights, of whom in Plymouth and the South-Western district over fourteen hundred men are employed. Another favourable sign is revealed in the building trades report. It is stated that the South-Western branches of masons, builders, plasterers, carpenters and plumbers, with over two thousand members—we presume these figures relate to affiliated societies for trade union purposes—show only nine men as on the "unemployed list" during September. Amongst painters in Plymouth employment shows a decline; and at Torquay the state of that branch is decidedly bad, though, on the other hand, builders' labourers continue well occupied. It is only reasonable to presume that now the summer is virtually over a certain class of painting and house decorating is at an end. This, no doubt, accounts for the drop in the general employment of painters and decorators which characterises that branch every year.

SOME OLD WATER PIPES.

During the past week new mains have been laid in Piccadilly, and some very old wooden pipes were removed. These pipes were made from the trunks of trees, and averaged between 5 and 6 feet in length, being about 18 inches in diameter at the largest end and 9 inches to 1 foot at the smaller end. The bore appeared to be about 6 inches. They probably belonged to the old Chelsea Waterworks. In the times of the Stuarts there were in Hyde Park a number of pools, to the number of eleven or twelve, all communicating with one another. They were fed by a small stream, the West Bourne, which, rising on the western slope of Hampstead, passed through Kilburn and Bayswater, and then intersected the Park, which it quitted at Knightsbridge on its way to join the Thames al Millbank and Chelsea. These pools used to supply the western parts of London with water until a complaint was made that so much was drained away that it left none for the deer. These were probably afterwards the source of the circular reservoir which is to be found in old maps of Hyde Park (about 1737), and which belonged to the old Chelsea Waterworks. From it, along the pipes now brought up in Piccadilly, were supplied not only Kensington Palace and the "suburb" of Piccadilly, but also the new buildings about Oliver's Mount (now Mount Street) and the northern parts of Westminster. The machinery used for forcing the water was at that time so primitive that the water had to be conveyed to the houses on the high ground near Grosvenor Square by means of a mill turned by horses. The licenses of the old Chelsea Waterworks Company terminated towards the end of the reign of William IV., when the engine-house opposite Grosvenor Gate was taken down. The pipes were laid at a depth of about 3 ft.

Correspondence.



IN reply to the letter of "A. B. C.," Croydon, we think the suggestion as to more attention to students, is already being met by the introduction of a series of articles on the South Kensington Museum and its facilities for Students. The more solid and technical side of structural matters will also shortly be considered. With regard to our new monthly magazine, "The Architectural Review," the first number will be issued in October, and specimen copies may be had on application by letter to the Publisher. —ED.

THE Commissioners of Northern Lighthouses, it is said, have approved of the erection of a new Lighthouse and Fog-signal Station at Blackhead, about three miles north of Portpatrick Harbour, on the west coast of the Irish Channel.

The Study of our own Land.

Is there room in the cast-iron curriculum of the Education Department for a suggestion? The suggestion is inspired by a remark of Professor John Rhys at the recent meeting of the Cambrian Archæological Association. Professor Rhys, dealing with the utter lack of instruction in national Archæology, called attention to the action of the House of Keys, in the Isle of Man, wherein it had gone forth as an order that in all the schools a diagram shall be suspended showing all the most common types of antiquities likely to be found in the Island, explaining their use, and giving such information about the law of treasure-trove as would prevent the concealment of discoveries of ancient relics. We would recommend this, as a suggestion, for the serious consideration of the Education Department. If there is one subject more than another upon which the Board School or Voluntary School child is hopelessly ignorant, it is that of Topography and Archæology. It is notorious that while the malformed little mentality of our cheap schools can rotate you the usual formulas:—"Manchester for cotton goods; Bradford and Halifax for woollen goods; Birmingham for hardware" (you may hear the screech through Board School windows on any day in the year should the ventilators happen to be open), with the utmost glibness it is completely plucked by any inquiry as to the localities of these very considerable cities. It is the same with the history of the country. The dry bones of many battles, the regnant succession of Kings and Queens, with a saturated course of Treaties, are the ingredients in the historic dish. What know these "super-educated" children of the Monastic Movements; of England's magnificent building period; of the great families of Feudalism, of the Architects, the Painters, the Sculptors, the Smiths, whose work has been the Art expression of the land! We have been told on good authority that the authenticated instruction books for Board Schools do not even contain a reference to Sir Joshua, and that Wren is dismissed as "the Architect of St. Paul's." What Art appreciation is to be expected from such sawdust? For all that, Free-hand Drawing forms part of the curriculum, and dabs in colour, and some flinging of clay. Why not suggest that a poet attempt poems, being deprived, at the same time, of words, or that an Architect rely upon king-posts and air? The whole Art training of this country—especially in the Preparatory Schools—is so absurd as to be serious. No man can express the indigenous emotion or expression of his native land unless he be steeped in its history, learned in its antiquity beaten by the countless storms that have weathered its face, roused by the roll of the drum of the nation. The National Expression of Arts—that cornet which everyone blows—can only be taught by the proper emphasis of the Past, and we must not expect from the rising generation any individuality in Design, any originality of Thought, unless its habit of mind is brought more into sympathy with Antiquity. The Archæological and Antiquarian records of Britain are inexhaustible sources of inspiration; neither legend nor mythology wanting; and we do suggest that the lore of English lanes would provide more fertile material for the impressionable mind of childhood than an early defeat over French verbs or the struggle to learn Musical Notation. A great field is opening for the working craftsman, but he must be something of an artist, not a dull dog of beer and bed. Youth has always an innate love of Romance, from which much Imaginative work may spring; why not, then, take a leaf out of the Book of Man?

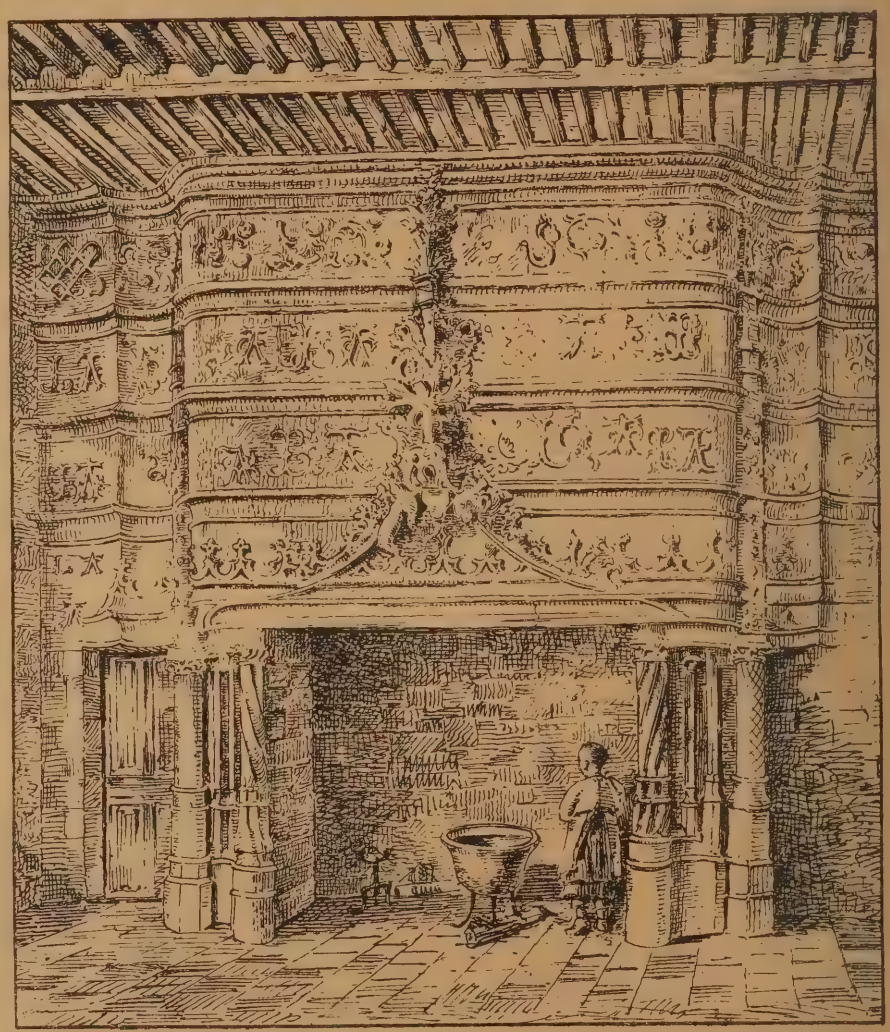
ENTRANCE PORCH, THE ELMS, ROEHAMPTON: W. H. SETH-SMITH, F.R.I.B.A., ARCHITECT.

A MUSEUM OF LONDON CURIOS.

IN the course of modern improvements many relics of Old London have been utterly destroyed and broken up to make road-metal. Others, however, although vanished from the Londoner, are still in existence. There used, for instance, to stand in the midst of Seven Dials a pillar bearing seven sundials, which, indeed, gave this locality its name. Many years ago this stone pillar was removed, and found a resting-place on Weybridge Common, where it may still be seen. But at the little seaside place of Swanage, in Dorsetshire, may be seen all the unconsidered trifles that in the course of business found their way into Messrs. Mowlem and Burt's, the contractors, yard at Westminster, which ornament—more or less—the streets and quays of the town. Swanage has thus become a veritable museum of London curios, first among which is the front of the Town Hall, which was at one time the entrance to Mercer's Hall, Cheapside, pulled down a few years ago. Fronting one of the old houses in the town is a Roman tesselated pavement, found at a depth of 20 ft., near the Mansion House, and near by are two stone urns from one of Sir Christopher Wren's City churches—that of St. Mary Somerset, Upper Thames Street, pulled down, with the exception of its tower, in 1870. A stone column from the Borough acts as a finger-post outside the town; while, within it, the street lamp-posts are seen to have hailed at different times from the City, from Marylebone, Westminster, and St. Giles's. Prominent among the things is a Gothic clock-tower of stone, which now ornaments the neighbourhood of Swanage Pier. This was at one time one of the many memorials to the great Duke of Wellington, and stood, until about 35 years ago, on the south side of London Bridge. When the roadway was widened at that point the people of Southwark gave it to Mr. Mowlem. The stones of Old London Bridge, too, have had many wanderings, and have been put to widely different uses. Some of them went to build Ingress Castle, near Gravesend; while others were used to build Warden Church, in the Isle of Sheppey. One of the City churches—that of St. Mildred-in-the-Poultry—was pulled down some years since, and its materials sold by auction, to be purchased by a Lincolnshire squire, and re-erected as a private chapel on his estate. The site occupied by Old Temple Bar—which serves as an entrance-lodge to Lady Meux's place at Theobalds, near Cheshunt—is well-known; while, in conclusion, may be mentioned the famous statue of the Duke of Wellington that once crowned the archway at Hyde Park Corner, but is now banished to Aldershot.

OLD LONDON.

BY DR. PHENÉ, F.S.A.*



FROM references to Cæsar, Pliny, Strabo, Tacitus, it would seem that the great roads of commerce, usually called Roman ways, must have existed long prior to the Roman invasion. The principal proof of this was that Cæsar refers to *the well-known roads and ways*. This is supported by reference to the commercial traffic, which must have been considerable; the large trading fleets mentioned by Cæsar as being in the Rhine, Seine, and other rivers of the Continent; the corresponding roads of traffic south of the Channel, still recognised by French *savants*, and the exchange of metal for foreign imports. A comparison drawn between the dwellings of the citizens of pre-Roman London, those of the Gauls, and also those in Rome, renders Cæsar's description of the houses in Britain very emphatic. The derivations of the names of the great roads in Britain were doubtless Greek in origin, as "Ic-nield," from the Greek word *ichnos*, a way, &c. The ford passed over by Cæsar would probably be at Chelsea, from such a ford having been found on repeated surveys at that place. This is supported from evidences of a large number of

ROMAN AND NATIVE ARMS

and armour found from time to time at that ford, and also from many crania of opposite types, deeply blackened by long deposit in the mud of the Thames, discovered in making the Chelsea suspension bridge. The native method of fording at *low tide*, as described in the transit of tin in the south-west, still maintained between Alderney and France, would enable the Romans to pass over at so short a distance from London; and the Greek word *bastazo*, a raised way (causeway), and with the "s" mutative, pronounced "battaso," is suggestive as the origin of the name Battersea, the low level at which place made a causeway necessary. On Cæsar's crossing the ford, the surrender of the capital followed at once, and that of the adjoining states, and of the General-in-Chief followed, the capital being occupied by the Roman forces. The late Mr. Roach Smith's discoveries of the Roman river wall, in which were built architectural sculptured columns, friezes, cornices, &c., show that old as the wall was, it was built with materials of pre-existing decorated stone buildings. A similar discovery on the site of part of the present Liberal Club, near Whitehall, was made by myself. The old portion of the whole corresponding with Mr Roach Smith's discovery of the

ROMAN RIVER WALL.

Some of the blocks of sandstone and schist removed by him were nearly half a ton in weight, and the cost being great (the cartage alone costing £150), he left behind many vast blocks of sandstone about 9 ft. long, which were subsequently used in the foundations of the Liberal Club. On preparing this paper on Old London, the details of Mr. Roach Smith's discoveries came under my notice; from them great interest attaches to these relics. Drawings were made before the removal of the base of the structure, the dimensions of which appeared to have been a solid square of 20 ft., and about 5 ft. in height, but from stray blocks found on excavating, it may have been much higher. There were three distinct styles of erection and materials above this base, one over the other, the most modern being of fifteenth century masonry. Specimens of the Roman

OLD CHIMNEY PIECE, CHATEAU DE LOSSE, DORDOGNE, FRANCE: SKETCHED BY W. H. SETH-SMITH.

latter building was purchased and removed to make way for the Club. After reducing a massive stone wall to about 16 ft. below the surface, a structure built of large blocks of schist and sandstone was reached. On applying at the Government office it was found that the whole construction was included in the purchase, and seeing the

GREAT ANTIQUITY OF THE MASONRY

and the consequent interest attaching to it, large sums were spent on the careful separation of each block, which carried the excavations down below 20 ft., and considerably under high-water mark. The upper part of this structure was restored to prepare for a subsequent erection, and within the external faces of a thick wall had been placed, with a number of Roman bricks, a quantity of delicately-carved architectural enrichments, sculptured in the same hard, close-grained sandstone as that composing the base of the structure, the bricks, sandstone carvings, and schist, with the different kinds of mortars still adhering to each, varying from the hardness of cement to ordinary mortar, may still be seen. A Roman pagan temple is traditionally said to have been at Westminster, and the discoverer, not unnaturally, assumes the relics are portions of its remains.

* Read at the Congress of the British Archæological Association.

THE Great Western Railway has decided to spend about £5,000 in improving the Newport Station. The contract will be let forthwith. The chief improvement will be on the "down side," where an independent luggage entrance for the Western Valleys, near the bottom of the foot-bridge steps, will be made. On the "up side" a booking office will be erected, and a telegraph-office, cloak-room, and increased waiting-room and lavatory accommodation will also be provided.

NOTICE.

In October will be issued from the Office of "THE BUILDERS' JOURNAL,"

THE ARCHITECTURAL REVIEW,

a Monthly Magazine for the Architect, Artist, Designer, and Craftsman.

The Magazine will consist of 56 *pages of Letter-press with numerous Illustrations.*

THE PRICE WILL BE SIXPENCE.

Amongst the contributors to the first and early numbers will be:—

BLOMFIELD, REGINALD, F.R.I.B.A.
BRYDON, J. M., F.R.I.B.A.
CARÖE, W. D., M.A., F.R.I.B.A.
COLCUTT, T. E., F.R.I.B.A.
HOOPER, FRANCIS.
MITCHELL, ARNOLD B.
NEWBERRY, JOHN E.
PATERSON, ALEX. N., M.A.
PEARSON, JOHN L., R.A.
PRENTICE, A. N.
STANNUS, HUGH H., F.R.I.B.A.
STOKES, LEONARD, F.R.I.B.A.
WEBB, ASTON, F.R.I.B.A.

CRANE, WALTER.
GILBERT, A., R.A.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

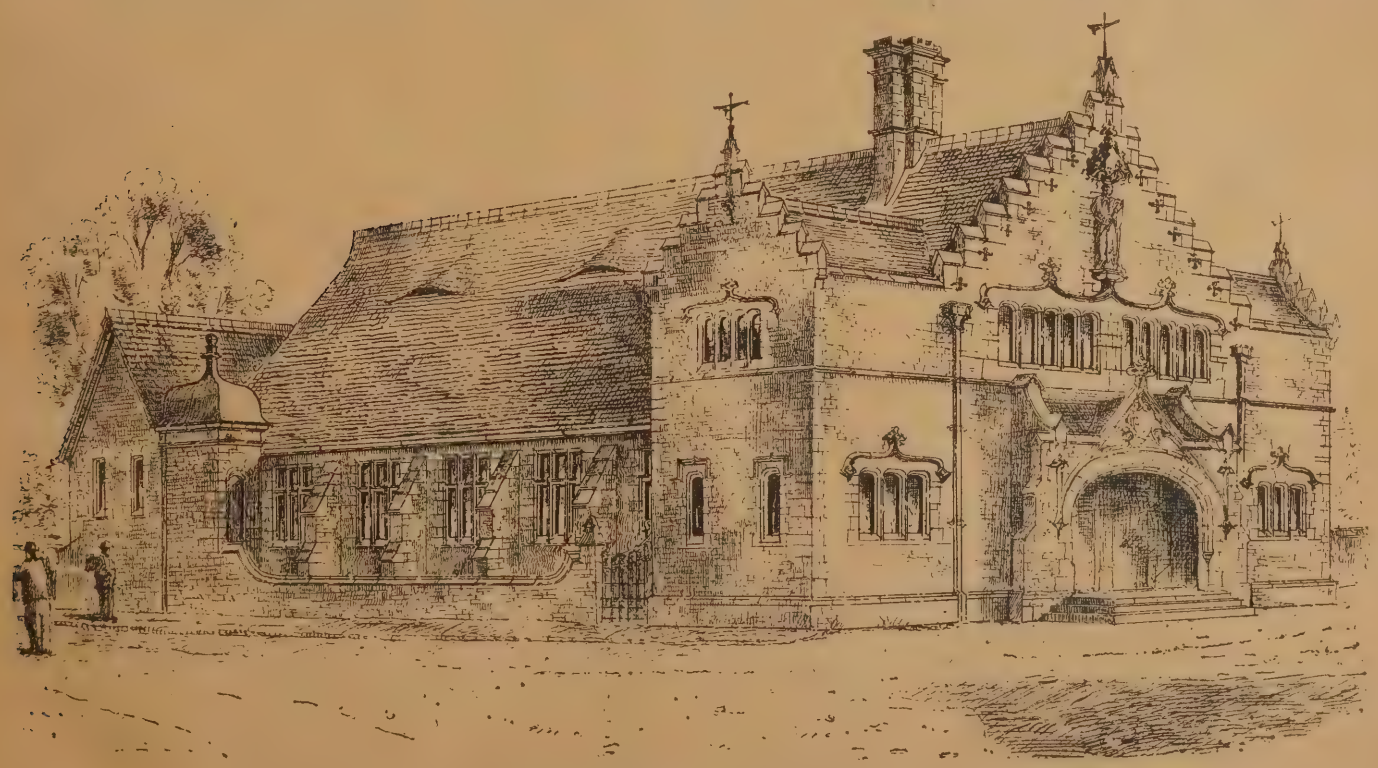
MEN WHO BUILD.

No. 46.

MR. W. H. SETH-SMITH.

IN his very charming room with its glimpse of green—in Lincoln's Inn Fields—Mr. Seth-Smith and the writer chatted while the clock hurried us to the stroke of an autumn holiday. No stroke, unless it be that of Good Fortune, is more significant than that. A holiday has so many reverberations that you cannot easily hear anything but the tinkling of kine bells on the lower slopes of the Simplon, or the St. Gothard, or the incessant Angelus of Brittany, or the carillons of Flanders. But the oak chairs of Lincoln's Inn Fields goaded us into sensibility, and with many of Mr. Seth-Smith's well-known perspectives on the walls, one managed to realise that "*we* are such things as dreams are made of"—and occasionally—but how rarely!—*houses*, too.

The son of an Architect, Mr. Seth-Smith had early the atmosphere of building about him even before he was articled to Messrs. Habershon and Pite. How much depends, in the way of our enthusiasms, upon first and childish impressions. It has been said, by Lombroso, I think, that no man ever becomes what was impossible in the child. And it is singular that proclivity and tendency and professional prestige may be developed, but enthusiasms cannot be induced. They are not atmospheric in all senses; they are the air we breathe, not the steam we generate.



"I attribute," said Mr. Seth-Smith, "what enthusiasm I have for Beauty in Design chiefly to my association with artists, travels and study on the Continent, and to perpetual drawing and sketching of existing buildings, both old and new, and I strongly advocate the study of the best new work as quite as important as classical, if not more so.

"It seems to me of the first importance, however, to encourage the study of the best mediæval architecture rather than Greek, Roman, or Renaissance, for the obvious reason that its spirit is that of our own latitude, climate, race, religion, and social instincts. The word 'Freedom' sums up the principal characteristics of the Gothic

work, and one may fairly tremble for the future of British Architects if the present tendency of our Art Schools is continued, namely, that of ignoring if not condemning the study of Gothic design. It can only be as we plan and design with the unfettered spirit of a Gothic Architect of old that we can progress. We shall then be free to adopt and assimilate all kinds of details and achieve real interest and real beauty.

"But to my mind the subject of the general education and welding together of the Profession eclipses all others in importance and urgency, and in its settlement lies

NEW TOWN HALL, LYDNEY, GLOUCESTERSHIRE: W. H. SETH-SMITH, F.R.I.B.A., ARCHITECT.

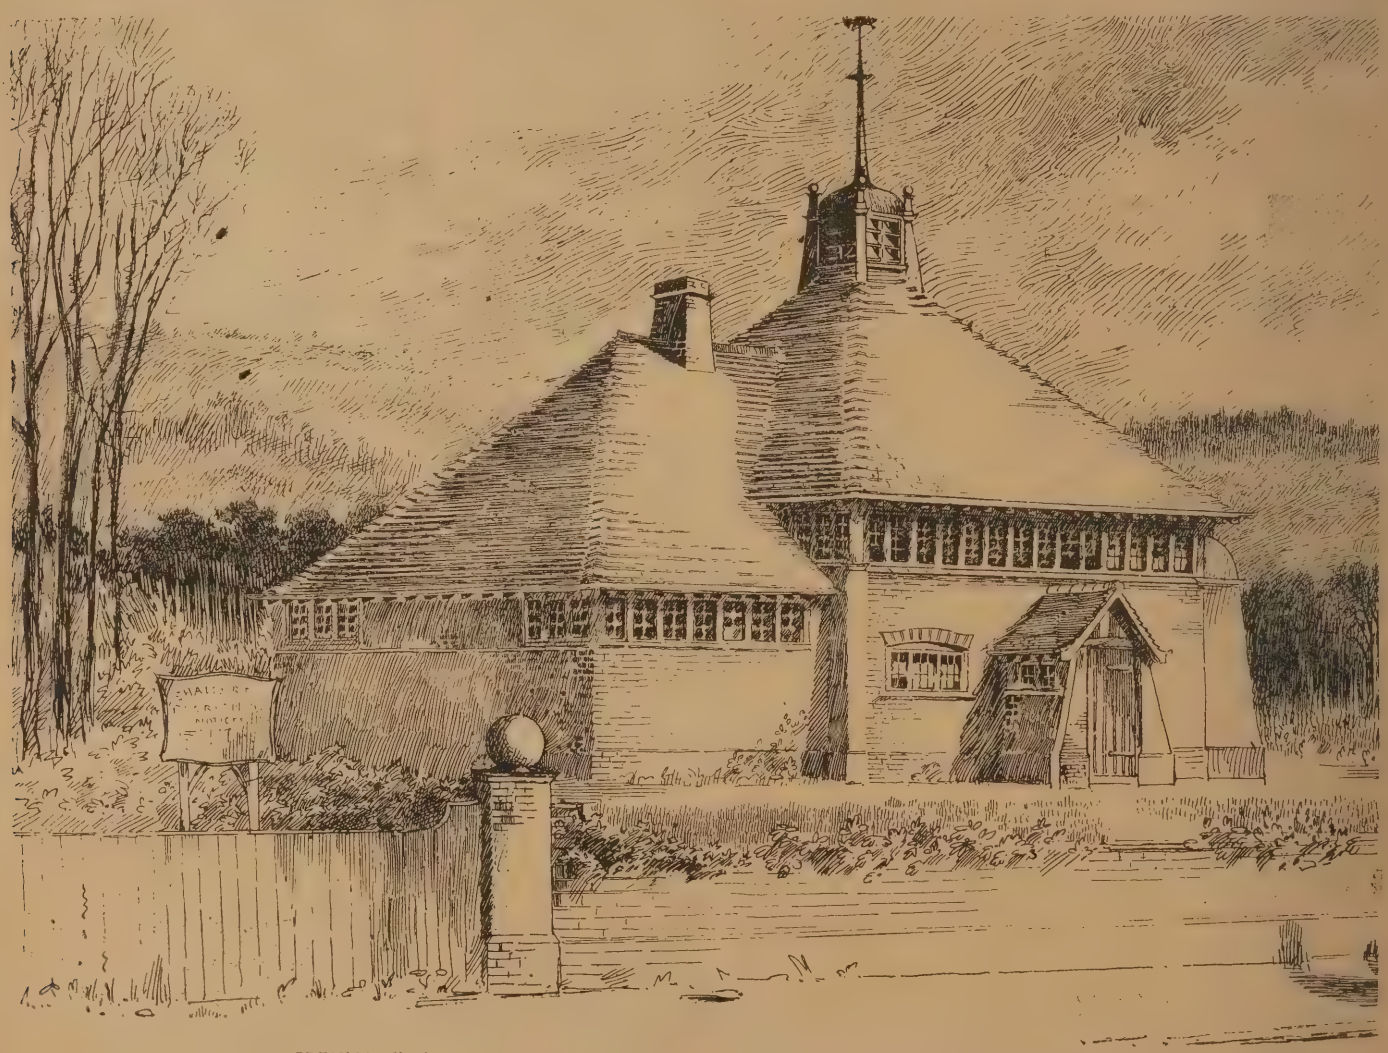
the solution of nearly all our greatest grievances. 'Registration,' as we all know, is merely the book-keeping of the business; education is everything. Well grounded and systematic training, such as the Architectural Association has undertaken, only making it compulsory instead of optional. There are two or three cardinal arguments in favour of this great movement which, if grasped, it seems to me are strong enough to convince any unbiassed mind of its necessity.

"First of all Architecture is the Art of beautiful building (whether we, the Professors of Architecture, call ourselves a Profession or a Craft, or what not, matters not a rap).

"Secondly, that the general public know very little about Art, and care less, but they do know and care very much about building, construction, and planning, upon which our Art rests. There can be no two opinions that an Architect's most responsible functions are to plan skilfully, and construct and sanitate safely. His appointment in 99 out of 100 cases is to this end. It follows, therefore, that if we want our Art to prosper we must at all costs secure the confidence of the public in our competence as constructors and planners.

"Without such a training, both in the theory and practice of building, such competence and skill is impossible, and simply because a large portion of those styling themselves Architects have proved themselves incompetent to plan and to build, and others incompetent to design, a *beautiful* building, the public have not a respect for us as a body of Professional men, and hence our Art (surely the noblest!) has never been popular in England. It certainly never will flourish until it becomes popular."

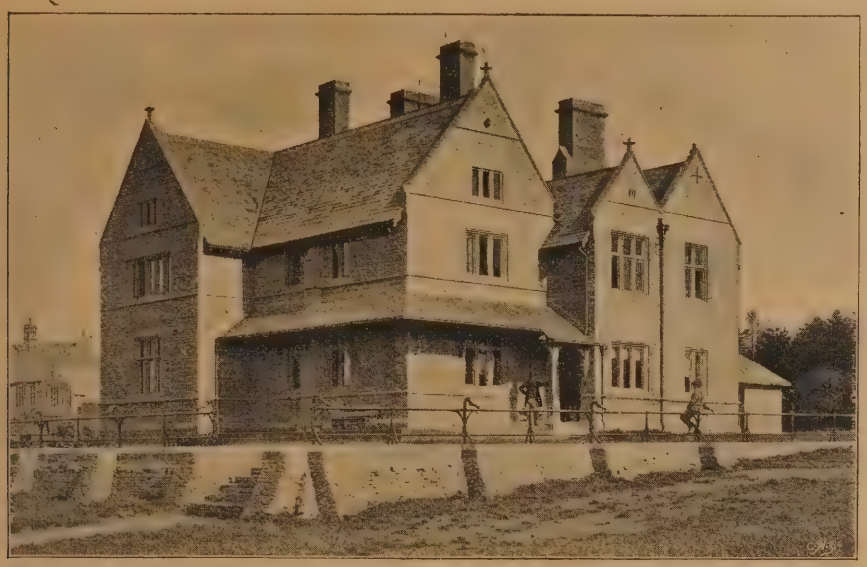
We were so entirely in agreement, on this last count, that I was sorry to cast, perhaps, a somewhat feeble shadow on the Gothic arch. Here was a very bold theory, surely: Gothic conjugated in the Verb To Be. What of all the talk of the Gothic, the Ecclesiastic note, having passed away? What, too, of the debased, draggle-tailed, starved suburban Gothic of modern churches and chapels: the irreligiousness of a denuded and commercially cheapened style; the windows of beggarly tracery, the dwarfed arches, the squat Tower—"with a spire to add"—ending in a spirelet of the size of a marling-spike, and the roof-line "broken" by a "Gothic" ventilator in metal; the interior effect "enriched" by tinted "cathedral glass"? Was this "Freedom"—the unfettered spirit of Gothic Architecture?



We laughed, mutually, and Mr. Seth-Smith's answer was very simple: "It *isn't* Gothic; it isn't worthy of that or any other name.

"But for this lack of popularity for Architecture, the fault lies, clearly, with ourselves, and not with the public, and there is no remedy other than excluding from those using the title of Professional Architect such persons as have not had a proper training. The health and purse of the public are so dependent on the reasonable competence of all Architects, that it seems to me that no further argument is needed in advocating legislation.

"If the Institute objects to 'Registration' of all now in practice, it is quite practicable to obtain an Act merely registering those who have passed the tests successfully, in fact, extending the R.I.B.A. Examinations, and confirming its principle of 'Registration.'



"That the Royal Institute of British Architects has realised all this and given practical application to its convictions in establishing compulsory examination for its own membership, is a grand step in the right direction. If such measures as are needed to effect this involve injury to Art, things had far better remain as they are, but I am convinced that they would, on the contrary, result in great improvements in the Art of Architecture, provided that the Institute is wise enough to secure to herself, as she has still the opportunity of doing, the control of the courses and the nature of the tests thereof to be applied. The importance of the Curriculum and the Examinations remaining in the hands of the Architects themselves can hardly be exaggerated, and it cannot be too strongly urged that, at the present moment, the Institute is the sole examining body, and probably can, if she will, secure that privilege by Act of Parliament.

"It may be well to remark here in respect to the all-important point of the Test of Ability to Design—as Mr. Brydon said in his recent speech on the Fellowship question—that it may be fairly admitted that a Council of about 15 experienced Architects, representing all shades of Style, professional practice, and opinion, are not likely to misjudge the qualifications of a man as to design. This applies to both Students and Fellows. Very naturally the solution of the R.I.B.A. Fellowship question follows that of a general systematic training of all who aspire to our Craft. The 'Registration' of a man as having successfully passed such tests of study as the Institute may

GRESHAMBURY INSTITUTE, CHILWORTH, SURREY: W. H. SETH-SMITH, ARCHITECT.

impose should not carry with it the right of Fellowship of the R.I.B.A., for the reason, so well urged by the 'Memorialists,' that the passing through an Examination does not necessarily prove a man morally or professionally to be a good or successful Architect, although a properly regulated Examination constitutes by general consent the one guarantee the public have a right to demand, namely, that those who profess to advise them have well studied their subject.

SCHOOLS, WEST OF ENGLAND: W. H. SETH-SMITH, ARCHITECT.

"Fellowship should be the proud distinction granted by the R.I.B.A. to those who have, under the only infallible test of experience in actual building practice, proved themselves to be capable Architects: priests in whose hands the sacred Lamp of Art will suffer no desecration. As regards the present system of Examinations, I hold that the professional teachers should be much better represented on the Board of Examiners, and that the Examiners should be more largely selected from those who have themselves passed their Examinations. Another improvement which it seems to me only an Architect's Education Act could effect would be the due payment of Examiners for such highly responsible work. I am also an advocate for excluding from the Examinations all subjects (such as land surveying and quantities) which are not essential for every Architect to know, and for making the tests in the science subjects as simple as is consistent with the absolutely indispensable technical acquirements. Any extra subjects a man may find himself in need of in view of his practice he can easily get coached in elsewhere.

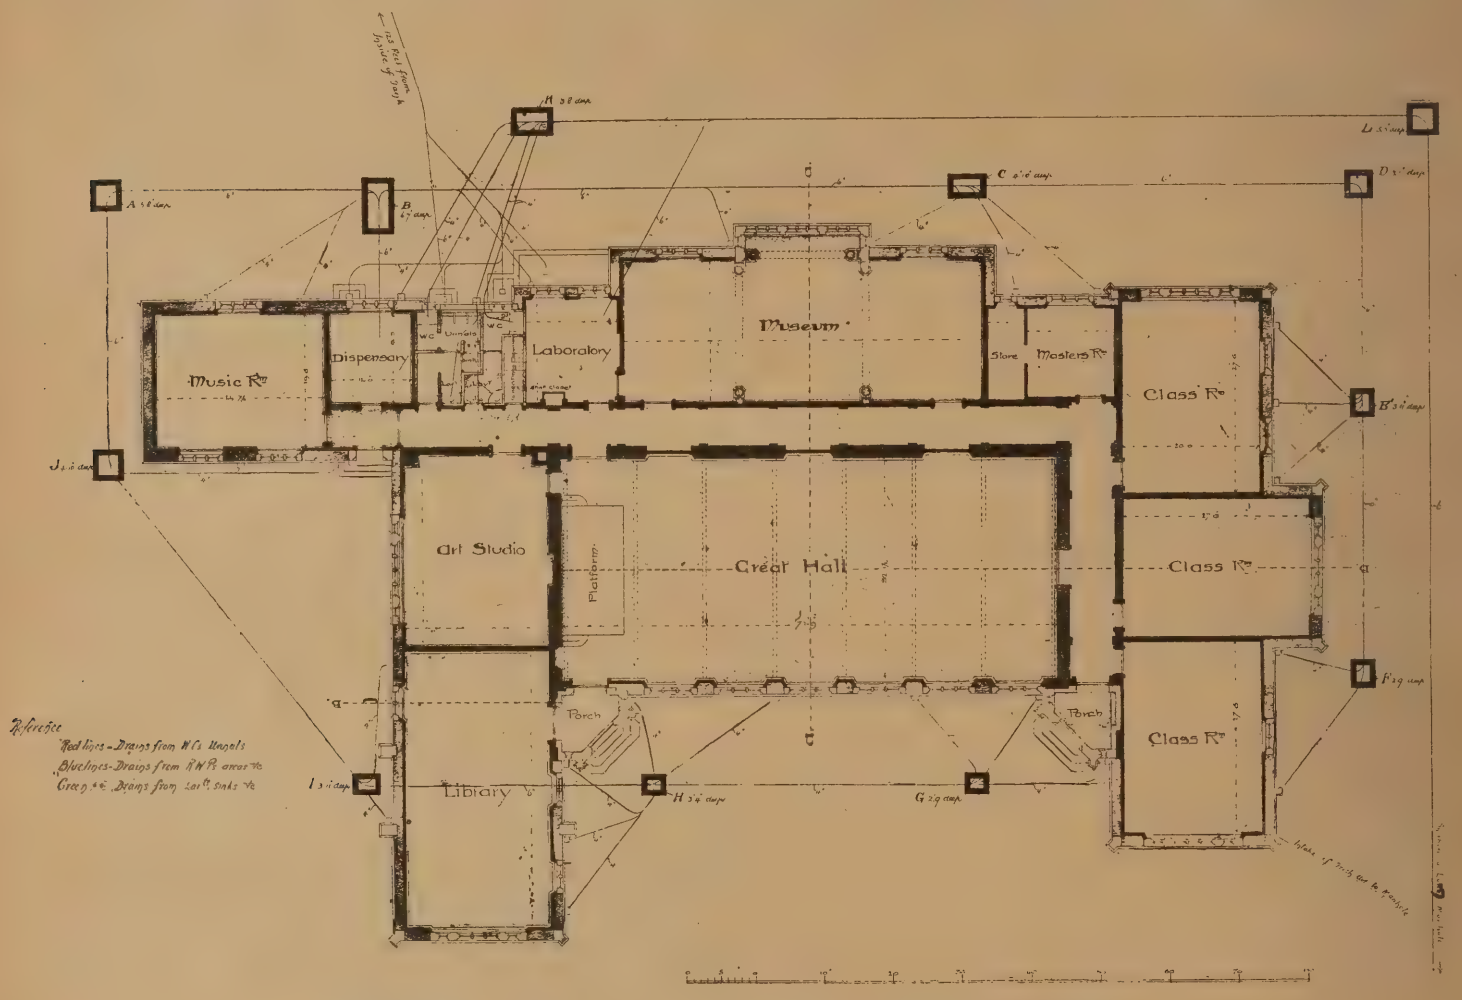
"As to draughtsmanship, I believe that an Architect's success will be proportional to his combination of the three qualities: (1) Imagination, (2) Skill in drawing, (3) His refinement of taste in form. A man who cannot convey his ideas to his assistant by means of rapid and intelligible sketches, perspective and otherwise, cannot acquire a large practice and at the same time keep up the quality of his design. A sensitive discrimination of the Beautiful in Form is undoubtedly and infinitely the most essential factor in Architecture, for the reason that without it a conjunction of the most fertile imagination and a wonderful dexterity of hand results in failure.

"It must not be forgotten that an Architect with a good practice cannot, if he give the requisite time to his all-important details generally, make his own finished perspective drawings for illustration or exhibition, and that it is only fair to his work that it should not suffer from hasty, inexperienced, or coarse draughtsmanship, that in a large majority of cases photographs which convey a fair impression of the merit of the Design, cannot be obtained even if they could be admitted into our Art Exhibitions, and that there is no other way of informing the building public as to the best works of Architecture being built throughout the country year by year than by sending such drawings to the Academy or to similar Exhibitions, where experts in Architecture have the selection of those which are most worthy of a place. That more space should be given by the Academy, and a larger body of judges should be arranged, goes without saying, and I further consider that some evidence should be forthcoming that the designs are those of the exhibitor."

It may be as well to set forth here Mr. Seth-Smith's views of the qualification of the Architect, and of the danger in the Gospel—if we may so describe it without irreverence—of All Soul. "Failing the Art qualification," says he, "a person has no right to the title of Architect. Those who oppose the establishment of examinations have, in their efforts to emphasise an important truth, lost sight of the first and foremost principle which regulates architectural employment, the principle, namely, that our opportunities of practice are dependent upon the confidence of the public in our qualifications. But enthusiasm for the Art side of our calling is fascinating and contagious, and this fascination is so irresistibly felt by many young students and budding Architects, who have not the ballast of an average professional experience, that it constitutes a very real danger to the future of Architecture; for let us remember:—1. That a man is not necessarily any the worse designer because he is an accomplished constructor. 2. That we cannot regulate the training of the profession generally on the lines of experience of a dozen exceptionally able men who have attained distinction (in spite, perhaps, of an imperfect training in constructive and sanitary science) by the sheer force of their originality and skill as designers; it is absurd to say that such men would have been excluded by the proposed tests; we must deal, as in all other professions, with the average man, and establish a curriculum which will raise the standard of the craft generally.

"Who are the men who obtain the largest practice? Obviously those who combine with considerable artistic ability exceptional technical knowledge and capacity for the multifarious business of which every Architect's practice is, and must ever be, largely composed. But very many men whose works declare them to be absolutely devoid of taste or power to design, manage to obtain and uphold a good practice. Why? For the simple reason that every client can recognise business and constructional ability, but comparatively few can discriminate between good and bad design; hence the great importance of an Art test as a qualification to practice, if our British Architecture is to make progress.

STEAM BAKERY AND WORKSHOPS, WEST OF ENGLAND: W. H. SETH-SMITH, ARCHITECT



"Once satisfy the public that we are competent to supervise all branches of the building trade, and in other matters of business in connection with contracts, and building regulations, to safeguard their interest, and you have at once created a basis of employment in which your Art acquirements will find their proper opportunities. I submit most emphatically that if both taste and its expression can be tested sufficiently to qualify for the Royal Academy, and other Art Schools, they can surely be tested well enough for architectural practice, and to prevent in the near future the costly disappointments in Design which have had almost as much to do with the existing discredit and suspicion in which the Profession is frequently held, as has the want of scientific training. An Architect may have noble ideas and a sense of beauty which may lead to his employment, but if he lack sufficient skill to convey his ideas to the mason and the carver, the most costly features in his work will be a disgraceful and standing failure—in other words, the Architect must be a draughtsman of no mean skill. Is it impossible or inexpedient to require an examination test of his skill?"

These militant and eager words, uttered originally some few years ago, have their significant bearing to-day and are still a warning to those students of ill-balanced and jejune enthusiasms, who scoff and scorn the "constructional element," the "business instinct," which are quite as essential to Architecture as an insecure, if felicitous, picturesqueness of gable.

Mr. Seth-Smith's attainments in pastel are well known. It will be interesting to give his views upon the usefulness of pastel to the Architect:—"Among artists generally pastel work is now much in vogue, and the Architect, if he takes a high view of his vocation, will despise no movement which may refine his sense of colour, assist his imagination, or enable him more expeditiously to express his intentions. It is true that a busy Architect cannot be expected to be proficient in more than one method of pictorial drawing, be it water-colour, pencil, pen and ink, or combinations of these, but no great skill is necessary to enable one to make some practical use of each and all, including pastels.

"I am not sure that I should recommend them for the architectural pupil, for a beginner cannot be too precise, especially in the representation of form, whereas pastel work is eminently suggestive; but if one uses water colour, pencil, pen and ink, or a hard chalk frequently as a corrective to more hasty and suggestive work, nothing but good can come of the effort; just as an artist will turn from time sketches to finished efforts, that he may become neither ragged on the one hand nor too realistic on the other. The special uses so far as I have tested them (though I have no doubt that many others will suggest themselves to you when once they have been tried) are as follows:—*Firstly.*—The rapid production of exterior and interior perspective sketches, especially with a view to enabling one to judge of the relative beauty and suitability of different coloured materials, and to change those effects until one is satisfied. The flexibility of the medium and its accidental combination constantly suggest new ideas as to materials or their disposition and relationship. I am aware that there is a disposition to exclude colour from our sketch designs of buildings from the impression that an attractive bit of colour may warp the judgment and tend to weaken a sensitive appreciation of form, and I will not deny that there is much truth in this as regards drawings made to captivate competition promoters; but the man who cannot exercise sufficient self-restraint to enable him to be truthful in studying for his own practical purposes is to be pitied. Make your first roughing-out of form in charcoal if you will—it is an excellent plan as tending to freedom of idea—but let us remember that the most beautiful outline and detail may easily be marred in execution by the use of ugly or ill-combined colouring.

"Its second use, in my opinion, is to produce the exact pattern necessary to guide your decorator when instructing him as to distemper or flatting colours, and here, again, pastels are infinitely better than oils, for the reason that the luminous effect, upon which success of the finished work depends, can be produced in a moment by preparing the surface of your pattern with the most brilliant colours which you desire should palpitate through the finishing coats. In giving the patterns to the painters you must avoid their being rubbed, and caution them to the same effect. I do not think that the necessary roughness of the usual pastel paper, of which a great variety of tints can be obtained from some of the best artists' colormen, is any disqualification, as the uneven surface is soon filled up with the medium. Pastels may be used in producing schemes of colour decoration to large scale, and for studying large scale designs of wall papers, friezes, &c. Perhaps a word should be said as to the importance of avoiding contact of the chalks with any open wounds in the hand, as many of them are of a poisonous nature. With special reference to the paper to be used, one of the safest tones is a neutral grey, which, telling through in places, will generally harmonise; but where large surfaces of deep warm tones are required, as for buildings, a darker and warmer paper, such as varieties of brown

GROUND PLAN OF SCHOOLS, WEST OF ENGLAND: W. H. SETH-SMITH, ARCHITECT.

paper as near the general surface colour as can be obtained, should be used, the lights and greys being superimposed. Another merit in pastel work is that the commonest brown paper will often offer as good (and sometimes better) surface for their application than many a one specially prepared."

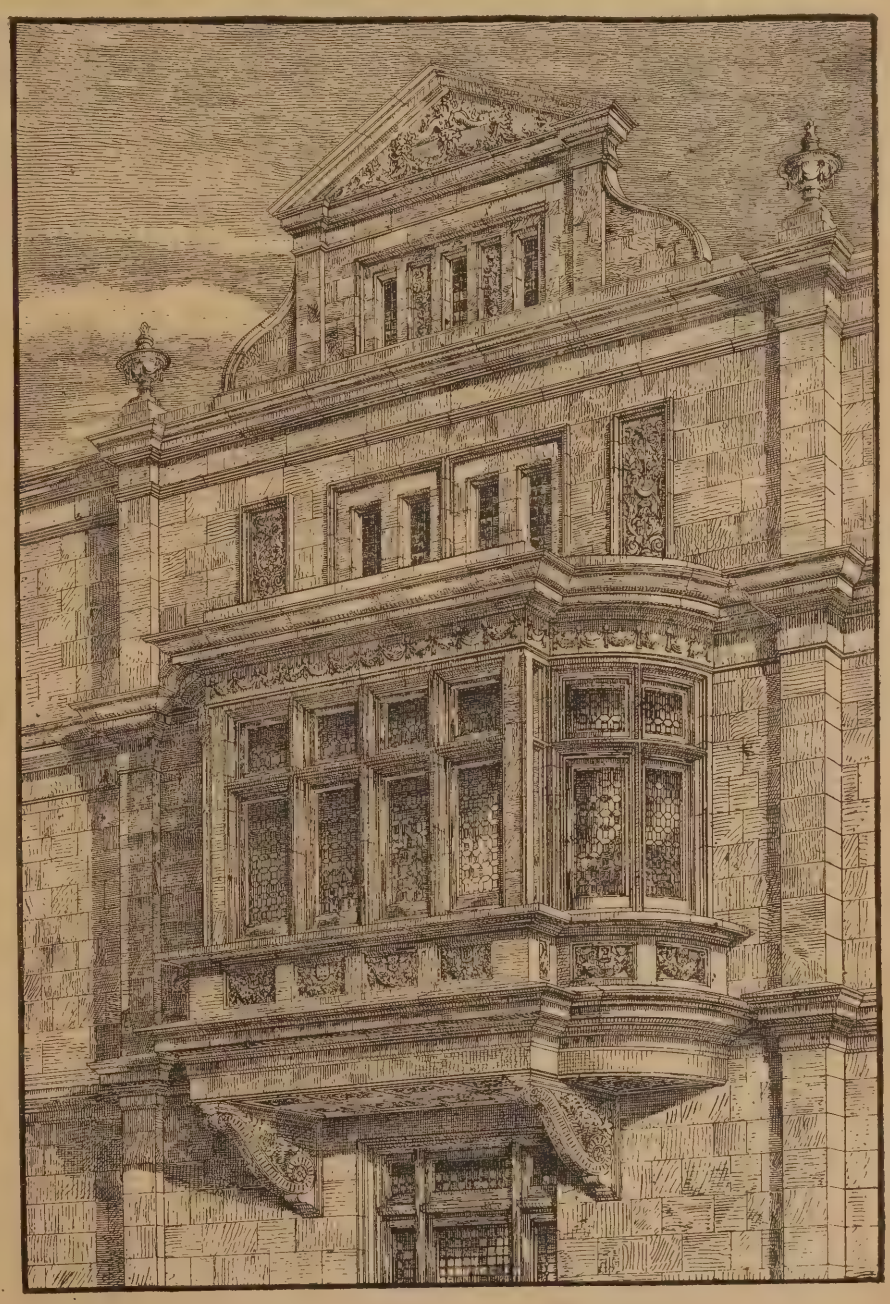
As to "pretty" drawings it seems to him extremely desirable that a man should be not only an expert draughtsman in line but should draw with facility both freehand and technical perspective, and should, moreover, understand the principles of light, shade, and colour. In short, the better he is at pictorial art, assuming he does not neglect the practical or falsify the perspective of his own work, the better he can study and record existing buildings, and the more thoroughly study and improve his own design, and, what is equally important, the more readily can he convey his ideas to his assistants and clients, and give confidence to the latter in his ability as an Artist.

Mr. Seth-Smith is a Fellow of the Institute, a past President of the Society of Architects, and a Member of the A.A. Committee. He has been engaged in Building and Architectural pursuits for 22 years, and in independent practice for 16 years, during which time he has made Scholastic and Domestic Architecture his speciality. Besides private practice he holds the following appointments:—Architect to the French Hospital, Shaftesbury Avenue; the Homes for Working Boys in London; the Homes for Working Girls in London.

NEW GOVERNMENT BUILDINGS.

WHY NOT A COMPETITION?

JUDGING from the evidence which has been recently given before the Select Committee, the strategical combinations are as complicated as ever, says Mr. Woodward, who has evidently carefully studied the New Public Offices question. A careful perusal, however, of the published report, evidence, and plans shows clearly that the present Committee is more alive to the value of open space and to architectural and æsthetic considerations than its predecessors of a quarter of a century ago, and that the great experience of the requirements of Government offices possessed by Mr. John Taylor, the present senior surveyor to the Office of Works, stands the Government in good stead in coming to a proper decision on the questions before it. It is, too, satisfactory to find that the Committee has stated in the report that the schemes call in some points for "more mature consideration," and "advises that reference be again made thereon next session." A distinctly unique opportunity has arisen for conferring upon Whitehall, a neighbourhood already enriched by some of our finest buildings, some additions to its Architecture, and some improvements in its thoroughfares, which may never again occur. The offices to be provided for in the new schemes are the War Office, the Education Department, the Privy Council Office, the Board of Trade, the Local Government Board, the Board of Agriculture, the Office of Woods, and the Office of Works, besides others, and the main result which it is to be hoped will be secured, will be the concentration of the various departments in their respective blocks, in place of the present scattered rooms in inconvenient and unhealthy



CONVERTED DWELLING-HOUSES.

The respective sites for these new offices may be termed the Spring Gardens site, the Whitehall Place site, the Downing Street site, and the Great George Street site, and it is not too much to say that the successful dealing with the buildings to be placed on these sites will exercise to the full the faculties of the most skilful architect—not only in providing healthy, light, and well-planned offices, and in clothing those offices with Architecture worthy of the surroundings and of the occasion, but also in the important questions of street alignment open spaces, views, and vistas. The Spring Gardens site is especially dominated by two leading features: 1. The opening up of the Mall to Charing Cross; and 2. The proposed Hôtel de Ville for the London County Council. As regards the first, Superintendent F. Beard, in giving his evidence, condemns, on 'traffic" grounds, the opening at the point suggested in the Office of Works' plans, but, as was subsequently (and fortunately) shown in questions asked by the Committee, the superintendent's fears can well be met, and this long-promised splendid and cheap London improvement, with its grand vista from Charing Cross, in a line with the Strand, at last seems near at hand. As regards the Hôtel de Ville it is quite clear that for a good result the designs must be made in conjunction with those for the additional Government buildings at this spot. The London County Council and the Office of Works must be together in this matter; entirely new plans must be prepared, and, while we are about it, why hamper and spoil the scheme by the retention of Drummond's Bank? True, its acquisition may be costly; equally true is it that its loss as a work of art will not be felt, and it is certain that the large and valuable addition to the position and area of the offices' site which will result from its removal will well repay the Government for its courage. We have had so many architectural ships spoiled for the proverbial "ha'porth of tar" that the public should now support the Committee in their evident desire, with due regard for the public purse, to make the scheme architecturally perfect.

The Whitehall Place site is to some extent governed by Whitehall Court and the National Liberal Club, and it is to be hoped that in the design for this block some little thought will be given to balance it as much as possible with Inigo Jones's Banqueting House. The Downing Street site involves many considerations as regards the retention of existing buildings, but Dover House surely need not stand in the way. It is thoroughly unsuited in plan for its present purpose, and, architecturally, it will not be missed. The Great George Street site opens up a fine field for artistic ideas. Alignment, traffic, open spaces, views of the Abbey and Houses of Parliament, and style of Architecture of the new buildings in the midst of such picturesque and varied surroundings may well have given rise to the Committee's prolonged series of questions, and a brilliant opportunity presents itself to solve the problem. If that problem cannot be perfectly solved without the removal of St. Margaret's Church, then what little it possesses in the way of architectural interest should not be allowed to stand to mar what may be one of the finest groupings in this or any other city. Is the work to be done by the Office of Works, or is an

ARCHITECTURAL COMPETITION

to be invited? The Committee, fortunately or unfortunately, have for their guidance some precedents, some of which may be mentioned. The

AN ORIEL WINDOW: BY W. H. SETH-SMITH, ARCHITECT.

Foreign Offices are the result of a competition, and, it is true, were erected, at the dictation of Lord Palmerston, in a style of Architecture with which the architect was not familiar; but the Office of Works could tell a tale of what was done by the Department, after the architect had completed the building, to make it healthy and habitable. The Royal Courts of Justice are also the result of a competition, and the Office of Works could tell a tale of what it has not been able to do to make the plan less objectionable than it is. The new Admiralty buildings in St. James's Park are the most recent result of a competition, and if the public thinks that, viewed on its merits as a specimen of Architectural Art, it offers a satisfactory contrast to even its poor surroundings, then this opinion should be pressed upon the Committee. The new General Post Office buildings in St. Martin-le-Grand, the Chancery Lane additions to the Public Record Office, and the Bow Street Police Court are three buildings designed and executed by the Office of Works itself, and may be pitted against the three competitive designs mentioned, leaving the public and the Committee to decide which course has produced the best result, either from the practical or from the artistic point of view. The matter is certainly one for serious consideration. It is due to the profession of Architecture in this country that it should be afforded another opportunity to vindicate its character for talent and ability, and to wipe out the stigma which now attaches to it, chiefly from the unfortunate influence exercised by the caprices of a few draughtsmen who appear to have thought that burlesqued Dutch gables, broken pediments, and cigar-shaped columns are fitting substitutes for sound construction, sanitary requirements, and dignified Architecture. If competition is decided on, it should certainly be open to all, and the Office of Works might well take part in it.

STRAY NOTES ON SOME CHURCHES IN BELGIUM AND NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

III.

MENTION was made in the first of this series of papers of the very Teutonic character presented by the Churches in the North-Eastern part of Belgium, more particularly those of Liége and Maastricht. The former of these cities was long a German Prince-Bishop's See, suffragan to Cologne. Here the twin western Romanesque Steeples of St. Barthélemi, with the ribs of their short quadrilateral Spires springing from the Gables which terminate the Towers, and the octagonal one rising above the western Apse of St Croix, quite transport us to the banks of the Rhine. It is true the French element is very patent in the lofty Arcades and almost perpendicularising Flamboyant Clerestories of the Cathedral, St. Martin, and St. Jacques, but the German predominates, as the lofty aisleless Apses which almost without exception terminate the Choirs of the Churches in the city exemplify. That of St. Denys is strikingly like the Choir at Aix-la-Chapelle Cathedral. Distinguished as it is only by a light *flèche* rising from the long line of its roof, the Church of St. Christopher is apt to be overlooked by the generality of visitors to Liége. It was terribly deformed by the Italian mask with which the unlucky piety of that period had invested it, but it has managed to issue from that ordeal with its highly interesting Nave arcade unscathed. The peculiarity of St. Christopher's Nave consists in its simple circular arches being supported on cylindrical columns alternating with square piers, after the manner of those in the two fine old Basilicas at Hildesheim, St. Michael's and St. Godehard, and with Corinthianising capitals. Another extremely interesting bit of Romanesque in Liége is the tower of St. Jean, with those flat strips of vertical and horizontal masonry relieving the brickwork, so common in Germany. The Church to which this old Steeple is attached was rebuilt in a tasteless Italian style, but it is curious from the manner in which its plan apes that of the Dom at Aachen, *i.e.*, an octagonal Nave, surmounted by a Dome, to which is attached an oblong Choir, all carried out in red-brick with stone dressings. St. Croix, with its western Apse, its octagonal Tower and Spire recalling the Rhenish Church of Sinzig, and its tall unclerestoried Middle Pointed Nave of the "hall" class is very German. By the term "Hall Church," I mean that in which the Clerestory being absent, the Nave arcades are very tall, and the Aisles carried up to and vaulted at the same level as the Nave, the whole being covered externally by one continuous sloping roof. The earliest adumbration of this class of Church, which afterwards became so popular throughout Germany, seems to be the Nave of the Romanesque Church of St. Ludger, in Münster, dating from c. 1180. Indeed there is hardly a town between the North and Baltic Seas and Austria that cannot show one or more of these "hall" Churches.* The student who takes the Brussels route to Germany will first form their acquaintance in St. Nicholas, at Aachen. He will but rarely meet with these Churches down the Rhine, but if he proceeds from Aachen towards the north-eastern part of the country, *viâ* München-Gladbach and Neuss, he will enter upon their district at Essen, where a somewhat clumsy example built on to the three remaining sides of an octagonal Church similar to, and coeval with, the Dom at Aachen, will confront him.

The Pfarr-Kirche, and St. Peter's, at Dortmund, and several of the churches in Münster and Soëst, present the same hall plan on a more *élancé* scale. Except in the case of St. Lambert at Münster, where it is relieved above each aisle window by a hipped gable, the immense expanse of roof, covering up the building like an extinguisher, is highly detrimental to architectural beauty in the eyes of an Englishman accustomed to the Clerestory, or to the separate Gables which were invariably employed whenever such a type of Church was adopted† in this country, as in the case of the great one in Austin Friars and many a village Church where the Clerestory is absent.

When we reach Osnabrück, however, these huge masses of roof are materially lightened by the gables which, surmounting each side window as well as the one at the extremity of either Aisle, are introduced so lavishly as to render us at a first glance a little perplexed as to which is the side and which the end. Herford, Lemgo, Osnabrück, and Minden present us with numerous examples of this—it must be confessed—highly picturesque arrangement of Gables. But the constant occurrence of this type of Church becomes monotonous after a few have been seen; indeed, it was quite a relief, on getting to Halberstadt and Erfurt, to once more behold a Clerestory, as exemplified in the Dom of the former and in two of the latter's noblest Churches, which, with only the intervention of a piece of water, lie parallel, somewhat after the manner of those immense Perpendicular Churches at Bury St. Edmunds. The two Churches at Erfurt in question are the *Barfusser* Kirche (Barefooted Friars Church) and the *Prediger* Kirche (Dominican Church). But of these more anon. The great glories, however, of the German "Hallenkirchen" are their windows, which, usually of great height and occasionally crossed by transomes, exhibit traceries—sometimes geometrical, sometimes reticular—perfectly bewildering from the varieties displayed. Of its class, to take a solitary instance, I know nothing more charming than the south side of St. Mary-on-the-Hill, at Hereford, with its four Gables, each surmounted by a fleuriated cross of delicate design, and lighted by as many windows, each of which is a study.

Despite a certain clumsiness and impurity of detail—too frequently the case in German Middle Pointed Work—it cannot be denied that there is a feeling of great elasticity and spaciousness about these "hall" Churches which eminently qualifies them for town use. St. Mary-in-the-Meadows, at Soëst, for instance, where the ribs of its roof die into the graceful piers, without capitals, whose immense windows glow with the finest mediæval painted glass in Germany, and rich as it is in coeval *instrumenta ecclesiastica*; or St. Lambert's, at Münster, less fortunate in the preservation of its mediæval fittings, but strikingly graceful from its tall reed-like columns and from the imposing manner in which its western Tower opens into the Nave. Besides these, there will be found in many towns Churches of the "hall" class, distinguished by moderation in height and greater depth of Chancel. They are destitute of Steeple, a light *flèche* for the bell alone breaking the long line of roof.

Such Churches are those built by the Minorites, the Franciscans, the Augustinians, and the Dominicans in Cologne, Aix-la-Chapelle, Münster, Halberstadt, and Hildesheim. Situated in the heart of those cities, they occupy the position the great Preaching Orders were so careful in selecting—

> Bernardus valles, montes Benedictus amabat,
> Oppida Franciscus, celebres Ignatius urbes.

With them may be classed the great Churches raised in imitation of them during the Early Renaissance period by the Jesuits, and which—despite solecisms of detail—are really noble structures. Specimens may be seen in the Churches dedicated to the Founder of their Order, in Paderborn and Cologne. I have introduced my readers thus early to this particular class of Church, because it is among the first to confront them on entering Germany.

The Dom at Paderborn, the Minster at Herford, and the Churches of Minden and Marburg, may be cited as the most nobly-dimensioned Cathedral and conventual Churches of the unclerestoried type. In the last-named example the architect has introduced two tiers of windows in lieu of the long openings commonly seen, but this arrangement always seems to suggest a gallery, and is not very felicitous.

Although the Dom at Paderborn and the Münster Kirche at Herford both date from the second quarter of the thirteenth century, their detail is such that, were we to see them in England or France, we should assign them to a period at least fifty years anterior. The Münster at Herford is the less altered of the two, its Aisles retaining their original fenestration of coupled lancets with round heads and other Romanesque detail. At Paderborn, grand Early Decorated windows have been inserted, and their tracery—eclipsed, perhaps, by that in the celebrated windows at Minden—is among the finest of its class in Northern Germany.

There is great similarity between the lofty Nave arcades of both churches—composed, as they are, of pointed arches with very plain soffits springing from noble clusters of slender shafts—some cylindrical, others square, but all with boldly carved caps, and grouped around a rectangular core. The closest study is required by both buildings—indeed, as a specimen of a German ecclesiastical interior, deriving its grandeur of effect, not from mural or vitreous decoration, but from nobility of design, Paderborn Cathedral is one of the most impressive I know. It is more picturesque, too, than that of Herford, owing to the great elevation of its Choir upon a flight of steps, which, rendered necessary by the Crypt, commence within the last bay of the Nave, and carry the "chorus cantorum" across the Transepts. A similar arrangement may be seen at Naumburg where, as well as at Paderborn, the "chorus" is entered by a flight of steps against the eastern wall of either Transept. In neither Church are there Aisles to the eastern limb. The Dom at Hildesheim, and the Minster at Bonn, both present these curiously shut-in and elevated Choirs; while grandly raised ones upon similarly extensive Crypts are met with in the Münster Kirchen at Essen and München Gladbach, and in the transverse-triapsidal Church of St. Quirinus at Neuss. Throughout Germany the custom of placing the "chorus cantorum" in the Transept, necessitated probably by the general shortness of the eastern limb, is very common, examples frequently coming before the notice. At Herford the Crypt, being of much more modest dimensions, is situated beneath the northern Transept, consequently the floor of the centre of the Church is level from end to end, and the internal ensemble hardly so picturesque.

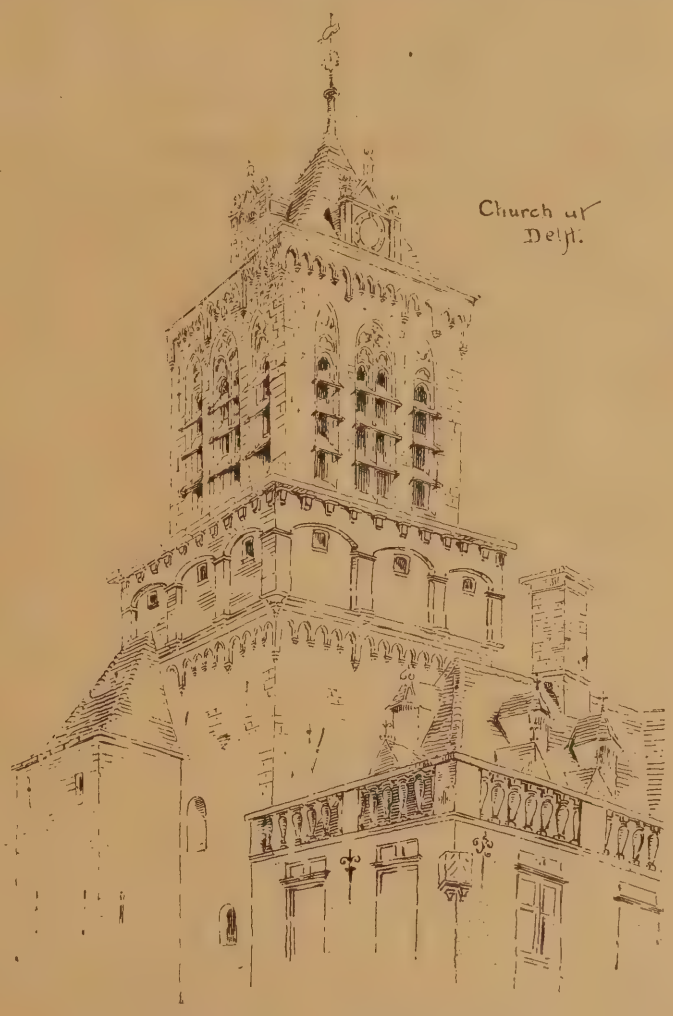
(*To be continued.*)

* It is interesting to find the "hall" Church so far north as Lille, where it appears in the imposing but somewhat coarsely featured five-aisled Church of St. Maurice.

† As an example of this I may refer to St. Severus, at Erfurt, beneath whose steep, high-pitched roof of tiles five Aisles are contained.

THE very oldest lock in existence is the one which formerly secured one of the doors of Nineveh. It is a gigantic affair, and the key is nearly 3½ ft. in length, and of the thickness of a 4-in. drain-pipe. It was found at the end of a ruined chamber, where a large wooden door had probably once stood, the gigantic brass hinges and heavy bars being still in fair condition, though somewhat corroded.

Bricks and Mortar.



TALBOT HOUSE, ARUNDEL STREET,
September 30th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN the annual report of the National Trust for the Preservation of Buildings of Historic Interest, Natural Beauty, or Architectural Value, it is stated that the Society was instrumental in the preservation of the Trinity Almshouses at Mile End, and in preventing the obliteration of the Wall of Antoninus. The Pre-Reformation clergy-house at Alfriston, Sussex, has been purchased, and will be restored as soon as the £350 required is subscribed. The purchase of Barras Head, the headland facing the ruins of Tintagel Castle, is hindered for want of funds. The Trust is considering the possibility of purchasing Cowper's Garden at Olney, Coleridge's Cottage at Nellies Stowey, where "The Ancient Mariner" was written; Dr. Johnson's birthplace at Lichfield, and the Old Joiners' Hall at Salisbury. It is surprising that the coffers of a society which exists for the preservation of whatever is beautiful and venerable in our picturesque and richly storied island, should not be better filled.

CLONFERT CATHEDRAL, for the restoration of which an appeal is made, is situate in County Galway, 8 miles from Ballinasloe Station, on the Midland Great Western Railway, and 3 miles from Banagher, on the Great Southern and Western Railway. It was founded by St. Brendan, in the year 558, 39 years before St. Augustine landed in England, and thus before Canterbury Cathedral was founded, and also long before Westminster Abbey, St. Paul's Cathedral, York Minster, Salisbury Cathedral, Winchester Cathedral, or many of the ancient cathedrals, or parish churches, existing at the present day. It has a very chequered and interesting history. It suffered greatly from the incursions of the Danes, who frequently sailed up the River Shannon from Limerick and attacked Clonfert. It was burnt six times between the years 774 and 1179, and was plundered three times between the years 949 and 1065. In the year 1541 it was almost totally destroyed. Bishop Woolley repaired the cathedral in the year 1664. Since that time, up to the present, a period of over 230 years, some alterations and improvements have been effected, but no general work of restoration has been done, consequently the building is in great need of repair. Clonfert Cathedral is one of the smallest in the kingdom, and is now used as the parish church. It is celebrated for its magnificent twelfth-century doorway, one of the finest remaining specimens of Hiberno-Romanesque work in existence. It is also remarkable for its chancel window, nearly a thousand years ago, which is similar in design to that of Temple Righ, at Clonmacnoise. Some years ago, when the plaster was removed from the fine chancel arch, a few small but very curious pieces of sculpture were discovered, one of which represents a mermaid combing her hair. This is considered to have reference to the voyages of the founder of the cathedral, St. Brendan, the navigator, in the sixth century, and to his landing in America. There were originally two transepts; one is now in ruins and roofless, the other is completely gone. There is a small, but very ancient, sacristy at the north side of its having been roofed with Danish wattles. This hurdle-roofing is considered a mark of great antiquity. Clonfert at one time was a city, and celebrated for its schools. It is now not even a village. Mr. J. F. Fuller, the architect to the Representative Body, estimates the cost at £1,500, and recommends the work be carried out at once in sections, as money is subscribed.

UNDER the title of the Photographic Salon, the exhibition of pictorial photography was opened on the 24th inst., at the Dudley Gallery, Piccadilly, and has, like its predecessors, several features of great interest. The Photographic Salon, of which this is the fourth exhibition, was started a few years ago by a handful of enthusiastic photographers, in order to give to the work of the camera a higher position among the Arts than it before occupied, by endeavouring to show that the pictures produced by the chemical action of light need not necessarily be bald statements of fact, but are so under the control of the operator, that he should be considered in the light of an artist rather than a mere mechanical agent. The Salon does not tie its exhibitors down to any hard and fast rules. They may use what process they like, modify their negatives in any way they may think proper, and use any means they can hit upon to produce an artistic result. There are certainly some among them who appear to regard this liberty as licence, and who produce pictures which owe so much to manipulation of the negative that very little of the original work of the sun is left. Such pictures cease to have the appearance of photographs and look like rough sketches in crayon or charcoal. But these are the eccentricities of an exhibition which contains some pictures of great beauty, and a large number which are highly commendable.

SKETCHED BY W. H. SETH-SMITH, F.R.I.B.A.

FURTHER excavations on the site of Newenham Priory at Bedford have led to the discovery of two pieces of bronze scroll-work close to the spot where the stone coffin was found. The fragments evidently belong to separate scrolls, but bear in very neat and clear Gothic letters part of an inscription, but quite sufficient to indicate the name and character of the personage whose memory it was intended to perpetuate. As the coffin found had no lid, it is by no means certain that these bronze scrolls were ever attached thereto, and it seems more probable that they were affixed to a monument or mural tablet in the church of the former Priory. The size and appearance of the skull found in that coffin, and the fact that it was a hewn stone coffin, lead to the inference that the remains are those of a dignitary of no small consequence. Indeed, it was suggested that it might be Robert de Parys, but some would deem it more probable that the benevolent Norman was buried within the precincts of the Hospital of St. John. In all probability the remains are those of John of London, a member of the fraternity of Canons Secular, who once formed the College of St. Paul's, and afterwards went to Newenham Priory on that establishment being founded by Simon de Beauchamp, whose memorial brass—dated 1208—in the chancel pavement of St. Paul's Church is said to have been the earliest known, and is now represented by its indent in the slab. The lettering of the inscriptions on the scrolls is of the period between 1250 and 1400.

THE first exhibition of the Society of Miniature Painters has just opened at 175, New Bond Street. It serves to remind us that the art of "painting in little" is not quite relegated to the past, though, notwithstanding an annual place at the Academy and occasionally an appearance at minor shows, miniatures can scarcely be said to divide popularity with the many other products of art in vogue. In a display of this kind it is but a concession to much patient labour to ignore sundry productions that have little to recommend them except highly-enamelled complexions and affectations of pose—two of the worst dangers in the pursuit of this flattering Art. From the best work may be selected a few examples in which good technique is combined with character or sweetness, or sometimes with a delicate sense of truth and expression in a face that is not beautiful in the conventional use of the word. The president of the Society is Mr. Alyn Williams, whose contributions include pretty portraits of Dorothy, daughter of Dr. R. Welsh Branthwaite, and Mrs. Alyn Williams. One of the vice-presidents, Mr. Robert Sauber, has been contented to design a sketch for the cover of the catalogue. Several distinguished painters, whose names figure on the list of members, have not honoured the first exhibition, though two or three have sent small cabinet-pictures which scarcely come under the head of miniature painting. Such are Mr. Herkomer's portrait of Mr. Onslow Ford, and "An Offering" in Mr. E. J. Poynter's well-known classic vein. Welcome to many will be a miniature of an Eastern girl, with red draperies, against a blue background, from the brush of the late Lord Leighton, lent by Mr. George Aitchison; and on another wall will be recognised Lord Leighton himself, from the hand of Miss Rose Carter, a careful likeness in profile.

BUNBURY CHURCH, Beeston Castle, and Peckforton were recently visited by the members of the Historic Society of Lancashire and Cheshire. At Bunbury at one time stood a Norman church, of which the only remaining traces are some fragments of carved stone, which have been dug

up in the churchyard. From these stones it was inferred that the Norman church was probably a large and highly-ornamented structure, having a chancel arch of two orders carved in the familiar dog-tooth pattern, and that the walls of the chancel were in all probability beautifully diapered. The present building consists of nave with north and south aisles, chancel, and south chapel, and a small north chapel, now used as a vestry. At the west end of the nave is a fine tower. This tower, together with the chancel and north chapel, are in the decorated style, and probably date somewhere between 1335 and 1350, and contain some very interesting tracery and mouldings. The nave, north aisle, south aisle, and south chapel are of the perpendicular style, and were probably erected about the same period in the reign of Henry VII. The south chapel is separated from the chancel by a stone screen of great elegance, which has some beautiful armorial painting on it and an inscription stating its erection by Ralph Egerton. In the centre of the chancel is an altar tomb on which rests an effigy in alabaster of Sir Hugh Calveley, a commander of one of the free companies and at one time Governor of Calais, whilst on the north wall of the sacrarium is the recessed mural tomb of Sir Hugh Beeston, who was an admiral of the high seas in the reign of Elizabeth, and fought against the Armada. The perpendicular work at Bunbury Church is very good, although inclined to be too linear. There are at the entrance of the church several old coffin lids and effigies, which have been dug up from time to time, whilst there are traces of very early mural paintings and some beautiful bits of decorated carving in stone, probably parts of a reredos or ledge for figures. The church plate is fairly modern, and not of any special interest. The registers go back to about 1570, and would repay anyone transcribing them, and it would be a good thing if the older ones were carefully repaired and rebound by some bookbinder who is used to such work. Bunbury Church was formerly collegiate, and had attached to it a college of secular canons; of this college, however, no traces remain, although its site—some 200 yards south-east of the church—is ascertainable. Peckforton Castle was built on the plan of a Norman castle for Lord Tollemache by Salvin, and is exceedingly well carried out.

AN object of great antiquarian interest has been unearthed on the removal of the surface soil in preparation for excavating upon the site of the supposed Roman station of Veratinum (*i.e.*, Wilderspool), and a few yards to the west of the Roman road, of which an interesting section 40 inches thick has been exposed. The discovery was made by Mr. Thomas May, of Warrington, who, having observed the numerous fragments of pottery and other Roman remains, obtained permission from Mr. J. Waddington, of Stockton Heath, the contractor, to examine the stones which had been dug up from what had evidently been a trench, and where the soil was darker and 2 or 3 ft. thicker than elsewhere. Whilst doing so Mr. May observed a block of regular oblong shape, which turned out to be a Roman altar. The material of which the altar is composed is the soft red sandstone of the locality. It bears no mark or trace of an inscription or lettering having been carved upon it. Its proportions are regular, and the altar is quite perfect, except where a small fragment was broken off at the left-hand corner of the base. The back of the stone is undressed, showing it was intended to be set up against a wall. It consists of three well-proportioned features, viz., a capital, a shaft, and a base, and the following are its dimensions: The capital measures 12½ in. in length, 8½ in. in breadth, and about 5¼ in. in height; the shaft is 9¼ in. high, 11 in. wide, and 8¼ in. thick; and the base is about 14 in. long, 10¾ in. broad, and 6 in. high, so that the total height of the altar is only 20½ in., which is unusually small. Three round mouldings, separated by deep horizontal grooves, and diminishing proportionately downwards, form the front part of the capital. There is a rude carving in high relief on the right side of the shaft, to represent what may be taken as the prefericulum, or pitcher, used for containing wine to be poured on the remains of the burnt offering after it had been consumed upon the altar. Many Roman antiquities have been found at Wilderspool, but this is the first Roman altar which has been found there.

AT DELFT: SKETCH BY W. H. SETH-SMITH, F.R.I.B.A.

AMONGST the schemes for public works engaging the attention of the Russian Government is one for the connection of the Baltic and the Black Sea by a waterway along the Dwina, Berezina, and Dnieper to Kherson. Our Consul-General at Odessa, in his last report, discussed this project, and observes that if it were carried out it would throw into the shade all other works ever undertaken in Russia, including the Siberian railway. The rapids on the Dnieper are said to present almost insurmountable obstacles to navigation, and the amount of labour entailed in constructing a canal navigable both ways would be enormous at this point alone, while it would be impracticable to cope with the immense volume of water that sweeps over these rapids during the spring floods. The only alternative would seem to be the construction of a canal with a system of locks to run parallel with the river past the rapids. This, too, is impracticable, for the cost of constructing such a waterway of adequate depth would be fabulous.

MR. G. F. WATTS, R.A., can scarcely fail to hear with a sense of honourable pride that he supplied the initiative to that movement for regenerating French morals through the agency of art which has recently been set going by "L'Union pour l'Action Morale." It appears that M. Paul Desjardins, on a visit to London, caught sight of a cartoon by our great idealist reproduced in mosaic as a mural decoration, and was struck by the respect with which it inspired casual wayfarers. A trip to the Brussels Exhibition convinced him that the ordinary poster of commerce, if properly handled, might exert a beneficial influence on a decadent public. He took counsel with M. Puvis de Chavannes, the well-known allegorical painter, who thoroughly entered into his views. The result was the formation of the above-named society, the aim of which is not limited to mere hoardings, but embraces appeals to man's higher nature through every form of art. But a few days ago the first popular experiment was made by placarding the Boulevard des Capucines with a carefully-executed reproduction of "The Childhood of St. Geneviève," by M. Puvis de Chavannes, who sketches in quaint mediæval style the history of the inspired shepherdess to whom Paris owed its preservation from Attila and the Huns. Whether the enterprise will have any enduring effect remains to be seen, but as a protest against the suggestive posters which

run riot in the French capital, everyone will wish it success.

IT is satisfactory to learn that reforms are at length being introduced into the management of South Kensington Museum. A scientist, instead of a soldier, has been appointed Chief of the Circulation Department, in the person of Mr. W. W. Watts, formerly a Temporary Assistant Geologist in the Geological Survey. The military element is also being gradually reduced in all the other departments. This year there are 25 inspectors, of whom 11 are civilians and 14 are soldiers. Last year the total number was 40, of whom 17 were civilians and 23 soldiers. There is still room for improvement, particularly in the London Inspectorate of Drawing.

THE following figures show how common a thing it is for engineers to underestimate the cost of various works. The cost of the Manchester Ship Canal was estimated at £5,750,000, but before the canal was completed nearly £16,000,000 were spent on the works. The cost of digging of the Suez Canal was estimated by the International Commission of 1856 to be £8,000,000, but before the end the figures amounted to £22,900,000. It is now stated that the engineers appointed to estimate the cost of the Congo Railroad fix the amount at £2,600,000. In their report last year their estimate was only £1,000,000. The underestimate of the Panama Canal nearly swamped that enterprise, before wholesale stealing completed the ruin. The Corinth Canal cost £2,400,000, instead of the estimated £1,200,000; the Senegal Railroad, which was to be constructed for £520,000, absorbed £1,800,000; and the Tonkin Railway, which was to cost only £100,000 cost £873,558 before it was completed.

MRS. HUMPHRY WARD'S settlement at University Hall has been temporarily removed from that building, as a larger building is being erected for it in Tavistock-place. The building is to be called the Passmore Edwards Institute, because the largest part of the cost, which will be £15,000, will be found by him. It will, however, be carried on by the same Committee, and in the same spirit as that which has presided for some years in the new University Hall. The old University Hall is now Dr. Williams's Library. Mrs. Ward's University Hall was only an unused wing of the old building.

RHOS-ON-SEA is the object of a gigantic scheme for the development of the Rhos Estate, near Colwyn Bay, just formulated by Mr. W. Horton, of Birmingham, who came into the Colwyn Bay district in the spring of the present year, and who has since purchased the estate of the late Mr. Bostock, of Liverpool. When the plan is completed Rhos-on-Sea will probably be the finest seaside resort on the North Wales coast. The Rhos Estate comprises about 350 acres of land at the foot of the Little Orme. It has a coast line of crescent form of over 3 miles in length, and the scheme of development includes the construction along the whole front of a marine drive 100 ft. wide, laid down in the form of a boulevard, along which it is hoped the electric tramway between Colwyn Bay and Llandudno will eventually be laid. Mr. Horton is offering three prizes of £100, £35, and £15 for the best designs for the development and laying out of his new estate, which is to be laid out on the most approved principles, special attention being paid to the question of drainage, while the advantages of the electric light will also be largely utilised. Mr. Horton further intends to extend the pier erected by the late Mr Bostock, so as to accommodate the Liverpool and Welsh coast steamers.

AN archæological discovery of considerable interest has recently been made by Mr. E. P. Andrews, a student in the American School of Classical Studies of Athens. He succeeded in deciphering an inscription on the architrave at the east end of the Parthenon. The face of the eastern architrave is thickly dotted with small holes, which were always considered by scholars to be the traces of nails used at one time to hold fast the letters of an inscription. The architrave is about 100 ft. long, and the holes extend over 90 ft. of its length. He first took what is known as a "squeeze" of the holes, and then made a transcript of the "squeezes" on a long strip of paper, marking the locality of the protuberances with dots, and subsequently drawing lines from dot to dot. In this manner he was able to find that the inscription recorded the erection of a statue to Nero in the year A.D. 61.

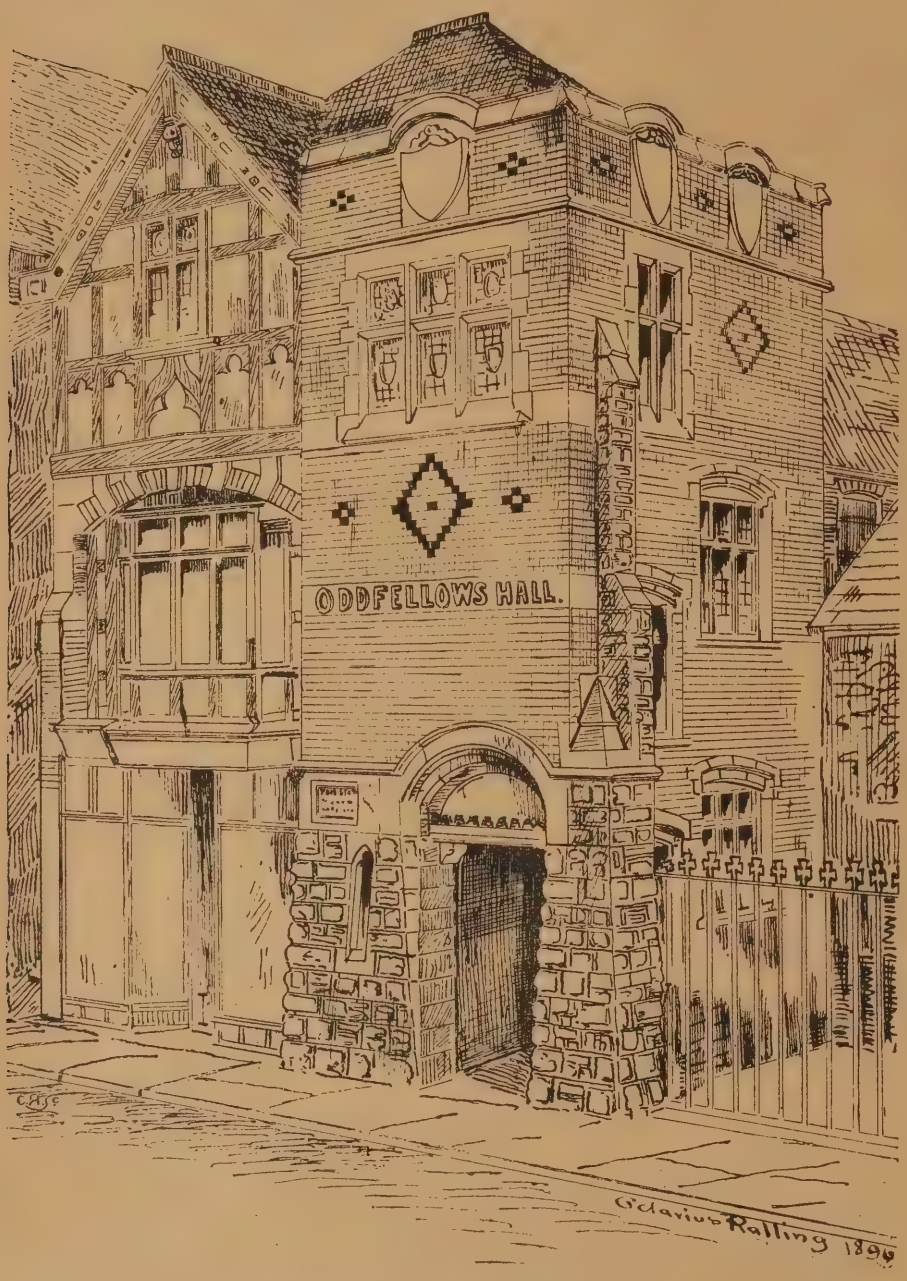
THE demand for the electric light in Edinburgh has been so great that, after six months' working, the Committee in charge saw that it would be absolutely necessary to have large additions to the plant in the station and to the mains in the streets before the winter of the present year. There are now in course of erection six engines and dynamos of the same pattern as before—each of 360 horse-power—on the low-tension side of the engine-room, and two large alternators with three engines and four rectifiers on the high tension side, thus more than doubling the capacity of the station. Five additional boilers with three mechanical stokers and superheaters are being placed in the boiler-house, making 11 boilers altogether, leaving room for other six. The boiler-house was left unfinished, but the second storey is now being put on, and this upper floor is to be used as a coal store. The wagons of coal are to be raised up by an electrically driven elevator, and run along on rails, discharging the coals on either side directly above the boilers. The cost of the machinery and buildings will be about £35,000.

BALMORAL CASTLE is not likely to make any deep impression upon the Tsar and Tsaritsa, as apart from the natural beauty of its situation, it has certainly no striking features, either of architecture or decoration, to make it worth showing to a foreigner. The tower relieves the exterior from absolute tameness, and pulls together the disjointed buildings which have been added from time to time, but the interior is plain almost to ugliness. The walls of the corridors are hung with that abomination of early Victorian days—imitation marble paper, and are lighted with oil lamps. Trophies of the chase—heads and antlers of deer shot by distinguished visitors, are fixed in every available spot, and these are quite appropriate, except that they are framed in garlands of twigs with their tips gilded. The wall-papers in the rooms are equally unfortunate—pale stripy things that ought long since to have been consigned to the flames. The pictures are perhaps a shade worse, and comprise inferior lithographs of the Great Exhibition and faded family photographs. The curtains and carpets are of tartan pattern, and there are chairs and sofas of uncomfortable shape upholstered in Berlin wool worked into representations of dogs and deer, and other incidents of the chase. In the big drawing-room glass-fronted cases, filled with an endless variety of articles, useful and useless—certainly not ornamental—combine to give the effect of a museum. The library is a pleasant room, and the banqueting hall is well conceived and has some good tapestry hangings.

IN the Mechanical Science Section of the Congress of the British Association, Mr. W. H. Preece, C.B., chief electrician to the General Post Office, read a paper in which he said that since the end of the Edison-Swan patents many cheap and nasty electric lamps had been introduced into the market. He had, therefore, for the past two years been engaged in a series of exhaustive experiments, which he described, in order to establish a fair and reasonable specification for post-office requirements. The object was to find an expeditious as well as reliable way of testing the efficiency and usefulness of electric glow lamps. A new test had now been introduced which enabled users of such lamps to determine in a few minutes the behaviour of a lamp for many months. The test was extremely simple, and all users of lamps, by forwarding samples to central electric stations, ought to be able to have the quality of their lamps determined. Mr. Preece said that gas was cheaper to produce than electricity. This was especially the case if only an hour's continuous burning was taken into comparison, but electricity was found more economical for prolonged use, inasmuch as electric lamps could be placed exactly where they were wanted and need be lighted only when they were actually wanted, besides the advantage that they were so easily turned on and off. The cost of the use of electric lamps for irregular use or for a number of hours burning was found to be little more than half that of gas. Mr. W. G. Walker read a paper on "Street Lighting by Incandescent Electric Lamps." He said that such lamps were much cheaper for lighting side streets and roads in country towns. Arc lamps were more effective and more suitable for busy main streets, but were too expensive for side roads. After describing the systems in use in various Continental towns and elsewhere, he said that it was perfectly clear that the series system of overhead wires was suitable for scattered districts, and was as cheap as gas.

THE inauguration of the monument erected by the Society of the People's Library at Boulogne in commemoration of the first æronautic voyage from France to England took place last week. The monument is the work of M. Thomas, Sculptor, and shows, on a quadrangular base, a hollow globe made of bronze, on the top of which a tiny cupid unfurls a piece of drapery, which becomes inflated by the breeze; at the four angles there are faces sculptured in marble, representing the four winds. The anterior surface is covered by a high relief, showing England in the act of welcoming the balloon, which France is pointing at as it hovers over the Channel.

NEWCASTLE is considering what steps should be taken to commemorate the centenary of the birth of Richard Grainger. It will be 100 years (in 1898 since Grainger was born), and there will be few to deny that but for his energy and the ability of the architects he got around him, that Newcastle would not to-day be the great commercial centre and town of splendid thoroughfares that it is. There was never a personality in Newcastle that excited more public interest than the man who, as a boy, was educated at St. Andrew's Charity School. He had high aims, and he completely altered the appearance of the old town. Grounds that were devoted to gardening, to residential purposes, or on which the monasteries of the fourteenth and fifteenth centuries had stood, were comprised in his scheme of public improvements, and, on their sites, Grey Street, Market Street, Grainger Street, and other neighbouring thoroughfares, were constructed. The Central Exchange, with its fine domes and handsome interior, was built; the butcher markets,—believed to be the finest in the kingdom—were reared; and he brought a distinction to his native place that has added to its prosperity ever since.



THE reopening of the Church of St. Mildred, Bread Street, which has been closed for cleaning and the installation of the electric light, will be delayed by a somewhat serious structural collapse, the exact extent of which has not yet been ascertained. The concrete floor, which covers the old burial vaults, has cracked and sunk, owing, it is believed, to the weight of the scaffolding erected for the purpose of cleaning the Church. The damage may prove very serious, as the vaults literally honeycomb the site on which the Church is built. There is little likelihood of the Church being reopened for the next six months.

SCIENCE has lost an active worker by the death of Mr. G. Brown Goode, the chief of the United States National Museum at Washington, and secretary of the Smithsonian Institution. He was an acknowledged authority on all matters affecting the administration of museums, and was ever ready to co-operate with the directors of foreign institutions, especially those in this country, with a view to the advancement of museum work as a means of education.

THE Technical Instruction Sub-Committee has organised a course of public sanitary lectures to be given on Saturday afternoons in the small lecture-room of the Liverpool Free Library. The first lecture was given on Saturday, by Sir Douglas Galton, ex-President of the British Association, the well-known authority on matters connected with ventilation and heating. The other lectures of the course are all to be given by experts in their several subjects, including the city engineer, water engineer, medical officer of health, Dr. Carter, Dr. Vacher, and other well-known gentlemen. The lectures are intended for all who are in any way interested in sanitary matters. The same Committee has also arranged for the delivery of courses of lectures on health and sanitation to be given in connection with their Technical Instruction Classes at certain centres—Toxteth, Walton, Wavertree, and West Derby.

AT present there is exposed, in Camomile Street, a considerable section of the old London Wall. It was unearthed during excavations for foundations for underpinning at 34, Camomile Street, on a portion of the site of the ancient Saracen's Head. The point at which the old wall has been laid bare clearly marks what was the boundary between Bishopsgate Within and Bishopsgate Without. The materials of which the wall is here composed consist of old red sandstone, Sussex ironstone, and Purbeck marble, the solid mass being combined by means of a lias mortar, such as was used by the Romans, but the exact composition of which has not yet, we believe, been fully ascertained. The new buildings are being constructed under the supervision of Mr. A. E. Pridmore, the contractors being Messrs. Beer and Gash, who will be pleased to show anyone the section of the wall within the next few days.

ON the walls of the National Gallery may be seen a few new pictures. Mostly they are works that are interesting rather than important. Such are "The Calm," a subject that Van der Veldt might have taken, painted by Charles Brooking, an almost unknown artist who died in the middle of the last century. A Schiavone, "Jupiter and Semele," used to hang in Lord Leighton's vestibule. It is now on a screen in Gallery VII., and might almost be mistaken for a Tintoretto. Tintoretto is said always to have kept a work of this artist in a prominent place in his studio. A little landscape by Inchbold, bequeathed by Sir Russell Reynolds, is pre-Raphaelite in its elaborate finish. In the Spanish room, amongst the Murillos and the Velasquez, a half-length of Donna Isabel Cobos, by Goya, seems rather out of key with its surroundings. Goya was living in 1828. Almost all the pictures in the National Gallery have by this time been glazed, but this precaution has not prevented some one or two showing signs of approaching ruin. Something should be done in the case of Stothard's "Green Vintage," in which the amber draperies of the nymph are sadly, and perhaps now irreparably, cracked.

ODD-FELLOWS' HALL, EXETER: MESSRS. OCTAVIUS RALLING AND LEWIS F. TONAR, ARCHITECTS.

THE work of repair and renovation annually undertaken in the fabric of the Houses of Parliament is being carried out this recess on a larger scale than usual. The principal task is in connection with the House of Commons, the interior of which is at present a labyrinth of scaffold poles and scaffolding. All the woodwork is being thoroughly cleaned, and already the fine carved oak which is the glory of the building is beginning to wear a new aspect. Seeing that this is the first time the Commons' Chamber has been thoroughly overhauled since the opening of the New Palace of Westminster in January, 1847, it is not surprising that much of the woodwork was found to be thickly encrusted with dirt. But the oak has mellowed with age, and after being carefully scrubbed its beautiful grain stands out far more distinctly than before. The closer inspection of the walls and ceiling of the House of Commons which is now possible reveals striking evidences of this superiority, which has for years passed unnoticed.

ONE of the most ancient churches round Lichfield is All Saints' Church, in the village of Alrewas. This ancient building is said to date from the year 822, and was originally of Saxon design throughout. Although the ancient building was undoubtedly Saxon, the effect of repeated restorations has been to give it a less venerable appearance, and destroy much of its antique character. The old Tower has been necessarily repaired upon several occasions, but the Saxon arch over the west doorway still remains as a witness to the great age of the edifice. It is built entirely of stone, and consists of a Nave, Chancel, and North and South Aisles. The tower has nothing peculiar about it. It contains a clock, with chiming apparatus, and the old oaken doors, beneath the ancient Saxon arch, were placed there more than two centuries and a half ago, as is evidenced by the date, 1627, still observable on the right hand side. The Nave of the Church is somewhat narrow but lofty, the roof, which is of oak, being supported by three fine Gothic arches on either side, which separate them from the Aisles, and the Pulpit, which is of oak, bears the date 1639, and has a good deal of carving about it, but show signs of decay. The Choir Stalls are also of oak, the two front ones being very old and elaborately carved. A special feature of the Church is the Chancel Arch, which takes the peculiar form known as a "Shoe Arch." It is evidently of great age. The Choir is paved with Elford tiles, while the steps leading to the Altar are of marble. At the back of the Altar is a fine stone Reredos, and on the right are two Sedilia and a Piscina. Near the arch, on the north side, is a small leper window, while on the same side are the remains of a very curious fresco.

NEW ODD-FELLOWS' HALL, EXETER.

THE site of the new hall, of which the memorial stone was laid early in June, adjoins the ancient church of St. Martin, and is a central one. The large hall on the first floor is about 60 ft. by 18 ft. There is a small lodge room on the ground floor, the floor being of wood blocks. The entrance is in the form of a tower, with rusticated stone base, worked of stone from the old buildings; the dressings are of Guiting free stone from Oxfordshire, the brickwork being of Ottery St. Mary facings, the gabled front over the shop is of oak half-timbered work, the fillings being of Guiting stone. The roof of the large hall is match-boarded, with curved principals resting on stone corbels; there is a dado of pitch-pine boarding 6 ft. high, with panelled work of the same material above. The flooring is also of pitch-pine, narrow width, and pavidillo joint. The roof over the front portion of the building is of Brosley tiles. The heating will be by one of Shorland's ventilating grates, provision being made for the inlet of fresh air, and there is ample outlet ventilation. The main staircase is of fire-proof construction. The electric light is installed throughout the building. The memorial stone is of local material—Pocombe stone, sunk for a bronze tablet with raised lettering. The Architects were Messrs. Octavius Ralling and Lewis F. Tonar, and the builder Mr. Charles Brealey.

ABOUT £17,000 is being expended in the alterations and decorations of the Alexandra Theatre, Liverpool.

THE restoration of Axminster Church tower and bells will cost more than was at first anticipated. In March last an appeal was made by the Restoration Committee for £400. This sum has now almost been raised; but a subsequent examination of the tower, however, has shown a more serious condition of affairs than had previously been realised, and it has been ascertained that a thorough restoration of the tower will cost not less than £676, which, added to the sum of £160 required for the bells, brings the total estimate to £836.

THE CHARTERHOUSE: IN THREE ASPECTS.

THE STORY OF ITS FOUNDATION.

BY GEORGE PATRICK, A.R.I.B.A.*

IN the year 1348, in the reign of Edward III., a terrible pestilence devastated London, for the dirt and crowding of the old mediæval cities made them at all times nurseries of infectious disease. Commencing in the Eastern Counties the plague spread all over London, and then to the Western Counties. The Plague of 1348 was so terrible that it is said grave-diggers could hardly be found to bury the dead, and many thousand bodies were carelessly thrown into mere pits dug in the open fields. Ralph Stratford, the then Bishop of London, shocked at these unsanctified interments, in his zeal to amend the evil, consecrated three acres of waste ground, called *No Man's Land*, outside the walls, between the lands of the Abbey of Westminster and those of St. John of Jerusalem at Clerkenwell. He there erected a small Chapel, where masses were said for the repose of the dead, and named the place Pardon Churchyard. The Plague still raging, Sir Walter de Manny, that brave knight whose deeds are so prominently recorded in the pages of Froissart, purchased of the

BRETHREN OF ST. BARTHOLOMEW,

a piece of ground called the Spital Croft, which the good Bishop Stratford also consecrated. The two burial grounds were known as New Church Hawe. Stone mentions a stone cross in this cemetery recording the burial there during the pestilence of 50,000 persons. Charterhouse presents itself to us in three aspects: the Monastic, the Historical and Domestic, and the Scholastic. In 1361, Michael de Northburgh, Bishop Stratford's successor, died, bequeathing the sum of £2,000 (about £4,000 in our money) for founding and building a Carthusian Monastery at Pardon Churchyard, which he endowed with all his leases, rents, and tenements in perpetuity. He also bequeathed a silver enamelled vessel for the Host, and one for the Holy Water, and all his books of divinity. Sir Walter de Manny, in 1371, founded a Carthusian Convent, which he called "The House of the Salvation of the Mother of God." This he endowed with the 13 acres of land which Bishop Stratford had consecrated for burial, and with the consent of the General of the Order. John Lustote was nominated first Prior. The Order of the Carthusians, as is generally known, was founded by Bruno, a priest of the Church of St. Cunibert, at Cologne, and Canon of Rheims, in Champagne, in 1080. The term Carthusian is a curious corruption of the French Chartreux. Not content with the rigorous rule of St. Benedict, the founder imposed upon the order rules so severe as to be almost intolerable, and this was probably the reason that even in the time of their greatest extension they never possessed more than 19 establishments all over the country. One of the peculiarities of the order was that they did not live in cells, but each monk had a separate house in which were two chambers, a closet, a refectory and garden. They were compelled to fast at least one day in a week on bread, water, and salt. They never ate flesh at the peril of their lives, nor even fish, unless it was given them as alms. As a rule, they lived on pulse and bread and water. They slept on a piece of cork with a single blanket to cover them. They never spoke to one another except on festivals and chapter days. Their laws professed to limit the quantity of land they should possess, in order to prevent the luxury and wealth so prevalent among the other orders. They wore hair-cloths, two cowls, &c., all of the coarsest manufacture, contrived so as almost to disfigure their persons. Their rigorous laws seem to have prevented the increase of their order. The Charterhouse had flourished for nearly three centuries in prosperity. The monks still enjoyed their high reputation for severe discipline and holy life when the storm of the dissolution broke upon them. In 1534, John Houghton, the prior, and Humphrey Midylmore, procurator, after being sent to the Tower for a month, were released on signing a certificate of conditional conformity. John Houghton, the last prior, was executed with several of his brethren at Tyburn, May 4th, 1535, his head set on London Bridge, and one of his limbs over the *gateway* of his own convent (supposed to be the perpendicular *arch* forming the entrance to the old Hospital). The majority of the brethren refused to recognise Henry's supremacy, chiefly because they objected to Henry's divorce from his wife; they had to suffer much from Henry's persecutions in consequence. The exertions, however, of the Confessor to the Brigettine Convent at Sion House, led the refractory monks to subscribe to the King's supremacy. The monks, however, had not long to rest. In 1537 the Charterhouse Brothers refused to acknowledge Henry as the supreme head on earth of the English Church. Some who had previously yielded now refused to obey, and were at once hurried to prison. Nine out of ten brothers cruelly handled in Newgate, were literally starved to death. The remnant of the order sought refuge in Bruges. Returning in 1555, they were reinstated at Sheen, near Richmond, by Cardinal Pole, but Elizabeth soon expelled them, and they fled to Nieuport, in Belgium, where they remained till the suppression of religious orders by Joseph II. in 1783. The Governors of Charterhouse are 19 in number. With regard to the building itself, three sides of a small quadrangle, an early addition, if not coeval with the building of the Monastery, still remain; the windows and doorways give evidence of great variety of structure and of date, and the joints of the brickwork are proofs of many alterations. The cells of the monks which were in the quadrangle, in the centre of which the water conduit stood, have all been destroyed, with the exception of some few doorways still remaining.

THE BUILDINGS OF THE MONASTERY NOW EXISTING

are on the south side of that quadrangle; they include the chapel, the small quadrangle already mentioned, and the courts of Howard House, including the Great Hall and the court called the Master's Court. At what time these buildings were erected between the ancient flesh-kitchen, the small quadrangle to the west, and the prior's lodgings to the north, has not been discovered. As we enter Charterhouse Square from Carthusian Street the entrance to the old hospital is on the north side. The gateway is the original entrance to the Monastery. This is an interesting relic of a Tudor arch, with a dripstone terminating in plain corbels. Above is a shelf, supplanted by two lions grotesquely carved, and probably dating back to the early part of the sixteenth century. An arched passage on the left of the Master's Court leads to Washhouse Court. A porch, surmounted by the Royal Arms, brings us to the Great Hall and Kitchen, and a passage on the right conducts us to Capel Court, which is screened by buildings to the south and west, by a piazza on the north, and by the chapel on the east.

The Chapel Cloister consists of six Italian semi-classical arches, clumsy and altogether unsuited to the purpose of the place. At the east end a door leads to the ante-chapel through which you have entered, and the south wall of which was repaired in 1842, under the direction of Edward Blore, architect. The equilateral arch at the east end leading to the main Chapel is conjectured by the best authorities to have been the nave arch of the original Monastic Church. It is filled up with a carved wooden screen consisting of a series of pointed cinque-foiled arches. The Chapel is a thorough Jacobean structure. The present chancel is supposed to be part of the original nave. A small paved hall leading from the cloister is the approach to the Great Oak Staircase of Norfolk House, richly carved with shallow old Elizabethan trophies and ornaments, the Sutton crest (a greyhound's head) showing conspicuously on the posts, probably additions to the original staircase, which is 6 ft wide and consists of 21 steps. The Governor's Room, part of the old Norfolk House, is situate next to the Library, and is remarkable for its *Elizabethan* decorations, which are of the most magnificent description. The ceiling is flat, and is adorned with the armorial distinctions, three white lions, of Thomas, Duke of Norfolk, elaborately painted and gilt. The tapestry on the walls consists of six pieces. In the windows are some curious fragments of stained glass, and most of the lead connections are the

SAME AS ORIGINALLY PUT IN.

The chimney-piece is an addition by Mr. Sutton, and is of later date than any other part of the building. In conclusion, I will only mention that the priory founded by De Manny was first set apart (after its dissolution) by King Henry VIII. as a place of deposit for his tents and pavilions. It was subsequently given by the King to Sir Thomas Audley, Lord Chancellor, by whom it was sold to Sir Edward North (Baron North of Kirtling). Lord North afterwards parted with it to John Dudley, Duke of Northumberland, on whose execution in 1553, by a grant of the Crown, it again reverted to Lord North, who died at his house called the Charterhouse, on December 31st, 1564. In 1558, when Queen Mary died, Lady Elizabeth took up her quarters for five days in this mansion of Lord North's, where she held a council each day. In 1565, Roger, second Lord North, sold it to Thomas Howard, Duke of Norfolk, on whose execution and attainder it again reverted to the Crown. Queen Elizabeth subsequently granted it to the Duke's second son, Thomas, afterwards Earl of Suffolk, founder of Audley End in Essex. In 1611, Lord Suffolk sold it to Thomas Sutton, on May 9th, for £13,000, and on the following June 22nd, Sutton endowed it as a charity by the name of the Hospital of King James. Sutton died the same year before his work was completed, and lies buried in the Chapel of the Hospital, where a sumptuous monument has been erected to him; the work was executed by Nicholas Stone and Mr. Jansen, of Southwark. We have all read of the

SENSATION WHICH THIS BEQUEST CREATED,

and of the condemnation it met generally, as it was considered as unjust to the testator's family. Lord Bacon, in his paper of advice to the King

* Extracts from a paper read before the British Archæological Society.

touching Sutton's estate, foretells many of the evils which in course of time grew up in the degeneration of the institution. But these latter have been to a great extent remedied. The foundation, as ultimately adopted, comprised a hospital for pensioners and a school for the maintenance and education of 40 boys, who are to be not above 14 or under 10 years of age at the time of their admission.

OLD INNS OF CHANCERY.

THE LAST OF CLEMENT'S INN.

SINCE the old days of Clement's Inn many and varied alterations have been made until now quite a different aspect is presented, and Clare Market is almost as respectable as Covent Garden. One almost marvels at the change the last few months have wrought. There is nothing now left of "Clement's" but a single doorway, standing erect, with neither house nor passage attached, among vast heaps of bricks and rubbish. Those who knew the place as an Inn of Chancery, famous in Shakespeare and beloved of Dickens, can scarce wonder that it is gone. For all these, curiously enough, seem elements of decay. It would be foolish to murmur because the number of places in modern London which Shakespeare knew grows smaller every year. Time lays his hand upon the poet's haunts none the less lightly because his works are immortal. As for the Inns of Chancery, London is losing them as fast as the Ancients, their supposed owners (for there has always been a question about the right of sale), can find purchasers. Sometimes they have been bought to keep intact. Barnard's Inn has passed to a City Company, and its buildings are now a school. Staple Inn exists by favour of an insurance company, to whom its Ancients sold it for £68,000. These two still stand. But of the three Inns clustered near St. Clement Danes, Lyon's and Clement's are now obliterated. New Inn, happily, still retains its character, while it belies its name. New Inn is really old, and still shows some old red-brick and mullioned windows, with a glimpse of red tiles overhead. It is another world, from Clare Market on the one side and Wych Street on the other. How long it will be before New Inn renews its youth and blossoms out in eligible flats it is impossible to say, but assuredly not long. There is no doubt that the improvement of Clare Market is the forerunner of a scheme which will eventually rebuild this part of London. So long as Clement's Inn had the moral support of Clare Market it might still have hoped to stand. But with the opening up of that most congested district Clement's Inn was an anachronism. One loitered through its prim square, looking at the red-brick hall, with facings of white stone, and the quaint doorways with the coat of arms, the eaves, the rambling buildings with their waste of room. It was all in the style of Queen Anne, most comfortable and picturesque; but it was plain how poor a comparison it would make with modern plans. Now, as one passes down Clement's Lane, instead of the old red roofs one sees a pile of six windows, one above another—a little further down and there are seven. So that, if symmetry be considered, new Clement's Inn will rear eight eligible flats up to the sky. The decay of Clement's Inn has been a very gradual process. There has been no summary destruction such as that of the Rolls Chapel, for example. Many years ago a handsome gateway marked the entrance to the Inn from the Strand. This was destroyed to make room for the grounds of the Law Courts, and from that time the tide of outside London has rolled slowly in. There is a curious history surrounding an old sun-dial which stood in the gardens for a century or more. It was brought from Italy by Goldsmith's Lord Clare, and presented to the Ancients of his day. The dial was supported by the bronze figure of a negro boy, who was a familiar landmark and by-word in the legal and literary world. At one time it was the fashion to string lampoons and scurrilous verses round his neck, and much pretty wit was wasted, or survives only by tradition among tenants of the Inn. The Inns of Chancery, of which Clement's was the most important, have long outlived their legal use. They were at one time preparatory schools for the Inns of Court, to one of which they were each attached. Clement's Inn was joined to the Inner Temple, whose rule it finally repudiated some years ago—perhaps as a preliminary to sale.

Where the Globe and Opera Comique Theatres now are once stood Lyon's Inn, an Inn of Chancery belonging to the Inner Temple, and governed by a treasurer and twelve ancients. So far back as the reign of Henry V. Lyon's Inn was an Inn of Chancery, and, according to George Buc, had originally been a guest house, or hostelry held at the sign of the "Lyon," and was purchased by gentlemen professors and students in the law, and converted into an Inn of Chancery in the reign of Henry VIII. It is apparent that, however true this history may be as to the origin given, the date is not correct. In the reign of Edward VI. Strand Inn was taken from the Middle Temple to make way for Somerset House, and the Society of the Middle Temple, backed by the two Chief Justices, endeavoured to acquire Lyon's Inn. They would probably have succeeded but for the interposition of Robert Dudley, afterwards Earl of Leicester, who sometime dwelt at what was subsequently Essex House, Strand. Lyon's Inn, as it appeared in its last days, was a quaint old place, the buildings, or some of them, dating from the year 1700. It had one entrance from Holywell Street and another from Newcastle Street. The one small court was cheered in summer by the foliage of its trees; along the north and east sides stood the chambers; and in the south-west corner was the hall, whose front elevation, topped by a pediment, bore a lion rampant. In 1863 the members sold Lyon's Inn, and it was demolished. Until a few years ago, however, Holywell Street retained a relic of the place in the carved "lyon's head." By the side of "Ye Half Moon"—a shop which retains the last old London sign *in situ*—there runs an alley into the Strand, called Halfmoon Passage. By this alley formerly stood an old timbered house to which the "lyon's head," painted red, acted as a corbel. When the timbered house was removed the "lyon's head" found a shelter at the Guildhall, where it may still be seen.

COMPETITION DESIGN FOR NEW BANK, HALIFAX, BY W. R. NUNNS.

AT Rye, new Wesleyan schools are to be built to replace the present incommodious premises, at a cost of £1,500.

THE Darwen Corporation has appointed Mr. Smith Saville to the position of Borough Engineer, at a salary of £350 per annum.

A QUANTITY of excellent clay has been found on the Peniarth Estate, Towyn, and experts who have been engaged to test its qualities report that it is eminently suitable for brickmaking.

TWO excavators in the employ of the Manchester Corporation were overpowered by sewer gas last week, and one of them, Charles Jones, lost his life. The second man lies in a dangerous condition.

A NEW Congregational mission church has been opened at Gidlow, Wigan. The building occupies half the site; the other is to be covered in the near future by a suitable church. This first instalment of the scheme has cost £1,500.

THE Sanitary Committee of the Manchester City Council visited London last week for the purpose of inspecting the lodging-houses of the London County Council and Lord Rowton's Company in operation.

IN regard to the movement, initiated under the presidency of the Prince of Wales in 1890, to raise a memorial to Nelson in the parish of Burnham Thorpe, Norfolk, it is proposed to restore the Parish Church, and to build a Nelson Memorial Village Hall. The estimated cost of a complete renovation of the old sanctuary and its important annexe is £6,000, and of this amount £4,000 has been subscribed.

Professional Items.

BRIERLEY HILL.—The new Infants' School at Quarry Bank, which the School Board propose erecting, is to be shortly commenced. The tender of Messrs. J. Bishop and Sons for the erection of the school for £2,351 has been accepted. The building is intended to accommodate 430 infants.

SHEFFIELD.—Queen Street Congregational Chapel, Schools, Visitors' Class-rooms, and Lecture Hall have been cleaned and painted, and the organ has been cleaned and tuned. The painting and decorating work has been carried out by Mr. J. Puttrell, from the design of Mr. Arthur White, of the School of Art.

BELFAST.—A new Mission Hall is being erected in Bellevue-streeet, Belfast, by Messrs. H. and J. M'Kibbin, with Mr. Charles A. Aitken as Architect. The hall will accommodate 250 persons with comfort. It is being constructed by the congregation of the Argyle Place Presbyterian Church, and will cost upwards of £450 when completed.

STOW-ON-THE-WOLD.—A Drinking Fountain, including horse and dog troughs, has been presented to the town of Stow-on-the-Wold by Captain Piers Thursby. It is late Gothic in design, and is of Farmington stone, with oak doors to the cistern recesses. It was designed by Messrs. J. E. K. and J. P. Cutts, and built by Mr. M. Hookham, at a cost of about £90.

DESFORD.—New Sunday Schools, in connection with the Baptist Chapel, were opened on Thursday. The new Schools consist of two small rooms—each capable of holding 40—on the ground floor, and one large room upstairs. This, which is made with sliding doors, so that it can be opened into the Chapel if necessary, will provide accommodation for about 120 children. The cost is about £500, but that includes the expense of renovating and redecorating the chapel.

CLYDACH.—Memorial stones of the new Welsh Congregational Chapel at Pantycrwys, Clydach, were recently laid. The new Chapel, which has to be built in consequence of increasing congregations, will be a combination of Norman and Roman Architecture. It was designed by Mr. Wm. Williams, Architect, and Instructor in Building Construction at the Government Schools of Science and Art, Swansea. Messrs. Thomas and Jones, Morriston, are the contractors for the building.

WHITLAND.—The Intermediate School built on a site given by Mr. John Phillips, Clydach Vale, was opened last week. The school, which faces Pwllyhead Road, will accommodate 100 pupils. The building was erected from the designs and under the supervision of Messrs. Griffiths and Jones, Tonypandy and Pontypridd, whose plans were selected by the local managers in an open competition. The contractors were Messrs. Rowlands and Lloyd, Trealaw, Glamorganshire, the painting being executed by Mr. G. Williams, Whitland.

LEEDS.—The Corporation has under consideration a proposal to provide a Dead-Meat Market, with abattoir and refrigerator, and also a small Cattle Market which would meet the present requirements. In many of the great towns on the Continent such establishments are found of great value. The site suggested for the purpose is the ground abutting upon Kirkgate Market—a part of the insanitary area extending eastwards, with York Street and Duke Street in the immediate vicinity. This, it is urged, would be a central, and therefore convenient, situation, and the new institution would be a desirable addition to the existing markets.

EASTBOURNE.—The authorities have under consideration an offer from Mr. James W. Hobbs, of 28, Pevensey Road, Eastbourne, to supply to the pumping station at Bedford Well Road, Eastbourne, pure fresh soft water, suitable for dietetic and domestic purposes, to the amount of 2,000,000 gallons daily. He is prepared to do all the necessary boring, build engine-house, supply engines and pulsometers, and lay a double or twin 12-in. main from Herstmonceaux to the Bedford Well Pumping Station, to acquire all rights of way, purchase land, pipes, machinery, &c. (Parliamentary proceedings excepted), for the sum of £100,000, subject to certain conditions.

LLANELLY.—The new Town Hall being completed, the Borough Council is carrying out a scheme which will make the approach to the hall one of the finest in Wales. A portion of the River Lliedi is now being bridged over so as to give a broad thoroughfare from the Town Hall to the junction of Stepney Street and Salamanca Road. The awkward corner at Bradbury Hall will be removed as soon as the lease on this house expires, and it is stated that an hotel will be built upon the site. When this scheme has been carried out there will be a public square in front of the municipal buildings. The work of bridging the river is now in progress, the contract having been let to Mr. T. P. Jones.

LEEDS.—Messrs. Joseph Smith and Margerison, Valuers, Bradford, have recently completed valuations for the Bramley Assessment Committee of all the important properties in the Union, which is part of the borough of Leeds. The London and North Western, Midland, North Eastern, and Great Northern Lines and Stations come out at—new ratings, £36,994, old ratings, £27,432, which is an increase of £9,558. The Leeds Corporation Gas and Water Works and Tramways new ratings, £10,201, old ratings, £5,190, show an advance of £5,011. And for the Assessment Committee of the Malton Union: The North Eastern line of Railway and Stations in Townships, new ratings, £23,564, old ratings, £18,766, which is £4,798 increase.

HARROGATE.—The Cottage Hospital has been enlarged and extended to provide 17 more beds. The "Clarence" wing, as the new part is called, is located at the rear of the building. The cost of the new enlargement scheme is about £2,800. The contractors for the works are:—Simpson Brothers, Harrogate, mason's work; J. W. Rudd, Harrogate, joiner; Laycock Brothers, Harrogate, plasterers; Suttill and Son, Otley, plumbers; John Cook, Huddersfield, concrete; Charles Auty and Co., Leeds, ironwork; D. E. Hutton, Shipley, painter; O. Atkinson, Harrogate, heating apparatus; Harrogate Gas Company, gas fittings, &c. The whole of the alterations and additions have been carried out to the plans of Mr. T. E. Marshall, Architect, of Harrogate.

PORTH.—Situated on an elevation on the main road about half a mile from the Porth Railway Station, the Rhondda Intermediate School was opened last week. The structure has cost about £5,000. The building includes an assembly-hall, divided into two parts, one for boys and the other for girls; four class-rooms, to accommodate about 32 scholars each; a laboratory, which is now being fitted up at a cost of over £300; a commodious cookery-room, and four private rooms for the masters and mistresses. A caretaker's house is also being built, and large dining-rooms for the scholars. The whole of the institution is well ventilated and lighted, and warmed by a combined system of hot-water apparatus and open fireplaces. The Architect was Mr. Jacob Rees. The builders were Messrs. George Jenkins and Sons, Porth.

GRANGE-OVER-SANDS.—A new Convalescent Home is now being built for the Friendly Societies of the North-Eastern Counties. The Home is built of the local limestone, with red sandstone dressings, and covered with blue Welsh slates. It is built in the pavilion style of hospital planning, having the administrative block in the centre for a tower, and the dormitory and dining-room wings on each side in the form of the letter L. For the present, only the administrative block and one wing will be built; it is hoped that funds may be forthcoming to build the other wing, and so complete the scheme. The entrance is placed on the west side in the administrative block through a glazed porch into the entrance hall. The hall is 10 ft. wide, and gives access to all parts of the Home. Immediately to the right is the door leading into the dining hall, a room 30 ft. long by 22 ft. wide, lighted by two three-light mullion windows on each side. Out of the dining-room is the day-room, 27 ft. long by 22 ft. wide, and all necessary accommodation has been arranged for. The cost of the Home will be about £3,000. The plans and specifications have been made by Mr. John Hutton, M.S.I., Architect, Kendal, under whose superintendence the work is being carried out.

OBAN, N.B.—Through the generosity of Mrs. Parr, of Killichronan, Mull, the West Highland Cottage Hospital has just been opened. It has cost £2,600. The plans were competitive, and out of a large number sent in, those by Mr. Woulfe Brenan, Architect, Oban, were selected as the best, and his design has been carried out in full. The site is on an eminence on the Glencrutten Estate, just on the borders of the town of Oban. The building is treated in the cottage style, and is of "Bonawe" granite with freestone dressings, the ridges are of red tiles and the chimney stacks are of the same material. The large wards are heated with Shorland's Manchester Grates, and the other grates, kitcheners, &c., have been supplied by Messrs. Graham and Morton, of Stirling. Messrs. D. and A. Munn, Oban, are the contractors for the mason and joiner works, the other works being let as follows, viz., plumber, P. Crawford; plasterer, P. MacCallum; slater, W. Proctor; bells and gas, J. Campbell; painter, Alex. Gray, all of Oban. As at present designed the accommodation is for 12 beds, besides two private wards and nurses' accommodation, and the arrangement has been so provided that with no disturbance nearly double the capacity can be given to the public wards when extension becomes necessary.

EDINBURGH.—Mr. Morham, City Superintendent of Works, has recently submitted sketch plans of the new Fever Hospital buildings to be erected at Colinton Mains. The committee approved generally of the plans, and instructed Mr. Morham to have them lithographed and described, so that they might be taken into further consideration. The buildings, which bear a considerable resemblance to the plan of the Royal Infirmary, will be reached on the west by a road passing Craiglockhart Hydropathic, and at the east by a road, about three quarters of a mile in length, running from Comiston Road alongside the road leading to the Poorhouse. In the centre of the buildings are the administrative offices, including the servants' and nurses' homes, these pavilions being three storeys high. To the east of the main corridor are the scarlet fever wards, two storeys high, and including observation and isolation wards. The west side is occupied by wards for diphtheria, typhus, typhoid, &c. The smaller of these wards are only one storey high, and the remainder two storeys. A temporary hospital is provided at the north-west corner of the grounds, and at the north-east are the men's quarters, ambulance, museum, and mortuary; while on the south-east corner the laundry, wash-houses, boilers, &c., are placed.

SAUGHALL.—The new Church of All Saints', Saughall, between Chester and Hawarden, was recently dedicated by the Bishop of Chester. The plan consists of Nave, with north Aisle of four bays, Chancel, with Organ Chamber on the north and Vestries on the south, a west-end central Baptistery, and a south-west Porch. The Nave is 54 ft. long and 24 ft. wide, and there is a low wall between the Nave and the Chancel, bayed out into the south-east angle of the Nave to form the base of the Pulpit. Three steps lead up from the Nave to the Chancel, which is 26 ft. long and 18 ft. wide, with apsidal east end. Open Screens on the north and south screen it from the Organ Chamber and Vestries. Over the western portion of the Chancel is arranged a low Tower with a broached Spire, covered with shingles. The walls of the Church are faced outside and in with red brick, with a dado inside the Nave of brown glazed bricks. The sills and dressings are of terra-cotta. The open timber roofs are boarded inside, and covered outside with tiles. The portion so far built, and which has recently been dedicated, is the Nave, with the Baptistery and south-west Porch, temporary walls being built east of the Chancel Arch and in the arches of the north Arcade. This portion will accommodate a congregation of about 200, and has cost about £1,300. The Church has been designed by Mr. Medland Taylor, of Manchester, the contractor being Mr. W. W. Freeman, of Chester. Messrs. Haden and Sons have executed the work in connection with the heating, which is by hot water,

DRIFFIELD.—The Wesleyan Chapel has been reopened after undergoing renovation, at a cost of over £200. The work has been carried out by Mr. J. R. Wilson, of Driffield.

BARNSLEY.—The Parish Church of Ardsley has been reopened. The Church was built in 1842, and underwent a slight restoration in 1871. The present cost is about £230. The inside of the Sanctuary has undergone a complete change, open Stalls of pitch-pine having taken the place of the old high-backed Pews, which were of plain deal.

CLITHEROE.—The Corporation has purchased the premises occupied by Messrs. Bailey Brothers, in Market Place, Church Street, and York Street, adjoining the Town Hall, the price paid being £1,850. It is proposed to utilise the whole of the buildings for Town Hall and Corporation Offices, but it will probably be some years before the scheme is carried out.

NEW BRIGHTON.—The parishioners of New Brighton are collecting funds for the erection of a permanent Church on the site of the present Mission Church of Emanuel. The cost of the Church, when completed, is estimated at £5,000, but it is intended at present to complete the Chancel and two Transepts in brick and stone, retaining the present iron building as the Nave. This will add additional accommodation for 250 persons.

BELPER.—New Technical Schools have just been completed. The school was founded in 1637, by Grace Lady Manners, the widow of Sir George Manners, the lord of the Manors of Haddo and Bakewell. To the money accumulated the County Council granted £600, and as a result of great efforts a school has been erected. The Duke of Rutland, in opening the school, spoke on the importance of technical education. Historically the craftsmen of Derbyshire occupied a very important position, and in proof of that they had but to go to Haddon Hall and look at the brass, iron, and wood work there. The London Fine Arts Club had that day asked him to allow the old enamelled fire-dogs to be lent for exhibition.

INVERGOWRIE, N.B. — All Souls' Episcopal Church was last week consecrated by Bishop Jermyn. Designed by Mr. Hippolyte J. Blanc, Edinburgh, this Church was built by Frances, the Dowager Lady Kinnaird, in memory of her husband and children, and, although the building was practically finished two years ago, the consecration ceremony has been delayed owing to a defect having been discovered in the roof. The edifice comprises Nave, Transepts, Choir, and Chancel, with accommodation for 300 worshippers, besides Vestry and Hall for school services, and is surmounted by a spire rising to a height of 140 ft. Internally, the design, as a whole, as well as the details of structure and furnishing, leave nothing to be desired—the Chancel being particularly beautiful. The Pulpit is of handsomely-carved stone, and the Lectern of fine brass work. A side Altar in the South Transept was constructed from materials forming the old Altar at Rossie Priory Chapel.

SPARKHILL.—The new Police Station is well forward in construction. A most suitable site has been chosen—the piece of land in the Stratford Road at the corner of Little Showell Green Lane, Sparkhill, and the building will be of red brick with stone facings. The new police office will be surrounded by the Women's Hospital, facing it, St. John's Schools on the south side, and St. John's Vicarage at the rear of the premises. It is being built by Mr. Frank Davis, contractor, of Showell Green Lane, Mosely, under the direction of Mr. J. Wilmot, Architect, of Waterloo Street, and when finished, about March next, will comprise an office with four cells, and living accommodation for a superintendent, inspector, or sergeant, and another officer and his family. The office door will be in the angle of the building at the corner of Little Showell Green Lane, and the sides will have embattled fronts.

SWANSEA.—A special meeting of the Swansea Harbour Trust will be held next week to receive and consider the report of the Harbour Superintendent (Mr. Law) and the Engineer (Mr. Schenk) as to the advisability and practicability of floating the Harbour. The question of the floating of harbours is of great importance. It has excited considerable interest, not only in Swansea, but also in the engineering world, and has been discussed with much warmth by experts. Strenuous efforts have been made in Swansea to induce the Harbour Trustees to give the matter that thought and attention it deserves. Until the report, which is nearly ready, of the Harbour Superintendent and Engineer has been dealt with, the proposed improvements to the North Dock will not be entered upon. There is no doubt that the floating of the Swansea Harbour would entail the expenditure of a very considerable sum of money. We understand that the Harbour Superintendent and Engineer, who have given the question very close and serious attention, hold the same opinion with regard to the floating of the Swansea Harbour as did Sir Wolff Barry of the floating of the Avon. Some time ago the Bristol authorities instructed Sir Wolff Barry to report on the matter, but he killed the enthusiasm of the promoters of the scheme, by estimating that it would cost £2,580,000.

WHITTINGTON.—Destroyed by fire on January 29th, 1895, the new Parish Church was opened last week. The edifice, which is in type Transitional, between the Early English and Decorated periods, has been rebuilt on the original lines, and consists of a Nave, North and South Aisles, Chancel, Organ Chamber, Vestry, Baptistery, Tower, Porch, and Warming Vault. The Nave is 62 ft. long by 24 ft. wide, with stone Arcade, on which the Clerestory is built. The North Aisle is in length similar to the Nave, and 12 ft. wide, whilst the South Aisle is 40 ft. long by 12 ft. wide. The difference in length of the two Aisles is accounted for by the Tower, which stands at the south-west angle of the Church. The Chancel is 27 ft. long by 18 ft. wide, the Vestry 17 ft. by 13 ft., and the Organ Chamber 12 ft. by 11 ft. The roofs are open timbered, the Chancel being of oak. The Nave, Organ Chamber, and Vestry are paved with pitch-pine blocks on cement concrete, the Aisles with Ruabon tiles, and the Chancel with encaustic tiling. The general contractor for the work was Mr. James Fidler, of Eckington, with the following sub-contractors:—For joiner's work, Mr. George Stevenson, Eckington; for plumbing, Messrs. Mellowes and Co., Sheffield; art metal work, Messrs. Hardman, Powell, and Co., Birmingham; encaustic tiling, Messrs. Maw and Co., Jackfield, and Messrs. Edwards, Ruabon; stone carving, Mr. John Holden, Sheffield; the whole having been executed from the designs and details, and under the superintendence of Messrs. Rollinson and Son, Architects, of Chesterfield.

SOCIETY MEETINGS.

Bristol and Gloucester Archæological Society.—The autumn meeting of this Society was held at Cirencester on Thursday. After a meeting of the Council at 10.30, a general meeting was held at 11.15 at the Church Institute, Mr. Wilfrid Cripps, C.B., presiding. The revised code of rules adopted at the Monmouth meeting was confirmed, and a vote of thanks was passed to Mr. Palmer Hallett, and those associated with him, who drew up the rules under which the Society had been conducted for 20 years. An interesting paper by Mr. Ernest Whatley, the Local Secretary, on a recent find of skeletons at the Barton, and two short papers by the Rev. E. A. Fuller on two incidents in Cirencester history, one on Sir Robert Morton's will and the other on the relations between the abbot and the townsfolk, were directed to be printed in the Society's transactions. After some members had visited the Corinium Museum (under the guidance of the curator, Mr. C. Bowly), Mr. Wilfrid Cripps's museum, and the fine parish church, a carriage excursion followed. Daglingworth was the first visited, where the members inspected the remains of a cell of the Nunnery of Godstow, and close by a very perfect pigeon-house or culver-house, with the original potence or revolving ladder. The fifteenth century cross in the churchyard was noted; and the interesting Church of the Holy Cross, which is undoubtedly of Saxon origin, was examined with care. Some curious rude sculptured tablets, of Saxon-Celtic origin, were explained by Mrs. Bagnall Oakeley. Pinbury, in the parish of Duntisbourne Rolls, where the great Gloucester historian, Sir Robert Atkyns, lived, dying there in 1711, was the next halting-place. Thence driving to Sapperton, the Church of St. Kenelm, rebuilt by the Atkyns family in the first decade of the eighteenth century, was inspected. It contains a handsome monument to Sir Robert Atkyns, whose Manor House stands close by. Much of the Jacobean oak formerly in the Manor House is now in the church. It was intended to visit Coate's Church, but time did not permit, and the party then visited Bullasey Wood, supposed to be the site of a Saxon village. Some 30 buildings have been traced in this wood, and four of them have been excavated by Mr. Biddulph. Few remains were found, only two pots, supposed to be of the Romano-British period (after the Roman occupation). No traces of Roman civilisation have been found, and it is thought they were dwellings of the British after the Romans left Britain. In any case, there can be little doubt that it is the site of a considerable village, and further investigations will be awaited with interest.

Glasgow Architectural Association.—On Tuesday, the 22nd inst., Mr. F. H. Newbery delivered a lecture at the rooms, 187, Pitt Street, entitled, "The Sum of Tradition." "We," the lecturer said, "are students chosen by ourselves to become workers, artists. We are heirs of tradition, are born into it, and must exhaust it before we can give to the world that something which it is in our power to bestow. One of the sums of tradition possessed by the Greeks was that they knew the human figure and recognised its value in Architecture. All great artists are great assimilators. Michael Angelo possessed this quality in its fullest degree. Don't be afraid of being considered eccentric or insane. The men who think in front of the rest of the world are firmly believed to be mad. Tradition is to an artist what money is to a millionaire. Wealth is very necessary to the artist, as he is in the power of the man who possesses it. There is too much respect paid to riches and to tradition. No Architect can design properly, till he has learnt to do without consulting existing authorities. Some of the work at our English Cathedrals was designed by men who carried their knowledge at their finger ends. Tradition to-day is too near. The sketch book is too easily referred to, the photograph too much utilised, and the plaster cast is simply a text without a sermon. Let us then endeavour to learn what tradition is and what it means, and, having learnt this lesson, accept its responsibilities accordingly." A vote of thanks terminated the proceedings.

Correspondence.

CROYDON LUNATIC ASYLUM COMPETITION.

DEAR SIR,—The drawings submitted in the above competition are now on view, and during the next few days will be the subject of much criticism. There is one feature of this competition to which I wish to call particular attention, as it seems to have been entirely overlooked by the assessors in giving their award, and is highly discreditable to the majority of the competing Architects. I refer to the fact that out of some 16 sets of plans submitted, in only three cases or so has the question of sewage disposal been considered, although it is essential that means should be devised for its distribution on the land acquired for that purpose. In the three premiated designs the sewage outfall or settling tanks are shown at the *lowest* point of the site. The authors of the first premiated design are content to leave the sewage there apparently to distribute itself on the adjoining land; in the second and third designs it is distributed uphill despite the unchangeable laws of gravitation. It can be no excuse in this case to urge that the necessary levels were not given on the plan of site; the mere fact of showing drains on the drawings presupposes that the author is cognisant of how the land lies. The premiated designs are to be submitted, according to the conditions, to the Lunacy Commissioners and the Local Government Board. Their decision is awaited with interest by

Mediæval Morris.

WILLIAM MORRIS was so mediæval a man by temperament that the curious and casual contradictions of his character were not in any way the outcome of caprice. His was one of those romantic and mythical minds singularly unadapted to our time, and yet responsible for all the glamour we get out of life. He began, one would have thought, in the right element—the Ecclesiasm of George Edmund Street's office—and found it irksome. His love of Gothic could not stand vaulting; he had to come into the open air; to the pleasances of English soil; to the deep, knightly woods of chivalry, for happy thought and robust breathing. He was in no way English, and yet he loved the Earlier English ages; and, when once passion seemed dawning on his poetry, he fell back upon Chaucer and "The Canterbury Tales." It is not to be expected that the note of archaism can ever sound the ringing note of patriotism, and we have always thought that there was something haunting, pathetic, but forlorn in the verse of Morris: "Lulled by the singer of an empty day." There was something lucent in all his verse and songful: too voluminous, doubtless, and foreign to our lore. Of his books we may say the same with the saving clause that they were sweet and trepidant or venturous phantasies, but always sweet; of distilled and pure English wording perfumed by wild essences of thought: no exotics. He was a master man at titles—in his way—and faëry, witness "The Roots of the Mountains," "The Glittering Plain," "The Wood beyond the World." He had his affinity to Spencer as well as to Chaucer, but though he had the grace, he had not the elegance of the one, and while he had the simplicity, he had not the humour of the other. He became too diffuse; he gave up his own singing message—never a mission—to translate Virgil and Homer; and, branching northward, the Sagas thralled him. The experiment, for a poet, is generally fatal, and William Morris never surpassed, in verse, "The Defence of Guinevere," though his "Earthly Paradise" was the signal for the more popular applause. He was a martinet, too, but in a kindly, bluff way, that reminded you of a hale sea-captain of Portsmouth or Plymouth in Nelson's time. But his mind was earlier than that, "a forest primæval," full of the mailed men, the clinging women of Walter Crane's pencil. There was, too, his Socialistic propaganda, which was so curious a paradox as to be a joke at which the uninitiated laughed. But he was quite in earnest, though in a dreamer's impossible way: a dreamer who could wake to strenuous language upon occasion. Ever, whether it be in books, or furniture, or wall-papers, a disciplinaire of high prices and peculiar independence, his Socialist scheme, or lack of scheme, was distinctly one of those contradictions which sprang from the man's temperament. The Kelmscott Press did nothing to bring Literature to the masses; we are full sure that the masses never heard of it; his early shop in Bloomsbury, his ultimate works near Merton Abbey, never filtered their furniture to plebeian homes; the upper middle class rarely grew to an extravagance beyond Morris's wall-papers. His distinctive work in Craft and Design flew at higher game, and found it in the halls of the nobility, the houses of the *nouveaux riches*.

But it is, after all, more than probable that the fame of the Morris wall-papers will outlast that of his poems, with the exception, perhaps, of the one or two lyrics which deserve to be perpetuated with the literature of the country. And one must always remember with gratitude that when Mr. Morris began his crusade against ugliness and bad work, the art of house decoration was at the lowest possible ebb. The furniture of the First Empire,

SWISS DOMESTIC GLASS, XVIITH CENTURY.

though somewhat meretricious in style, was, speaking generally, by no means lacking in taste. Its reign, however, ended by 1830, and from that time till some 20 or 30 years ago there was little produced which was not positively repulsive both in execution and design. The patterns on the walls and on the carpets were copied from the mechanical combinations of the kaleidoscope, instead of being due to the artistic feeling of a trained designer; while if tables and chairs could be designated as "curious" or "solid" in design, it was considered that the acme of perfection had been attained. Mr. Morris changed all this, and made the world understand that beauty need not be confined within the four corners of a picture frame, but might be introduced elsewhere into our houses.

THE INFLUENCE OF EARTHQUAKES ON ART.

THAT there should be an artistic side to the question of earthquakes appears, doubtless to many, very far-fetched, if not impossible, and yet, according to Professor John Milne, F.R.S., a little consideration will convince us that this remarkable physical phenomenon plays a most important part in the progress of the social and artistic life of those countries where it is in force, with which daily reckoning must be made. To our European mind, which but rarely has its gravity upset by the freaks and sport of Nature, it is at first difficult to appreciate how profound an influence such general instability in the conditions of life must exercise upon the character and development of inhabitants of countries like Japan. Hardly any other country has been more favoured by its physical character than Japan as regards Art materials, possessing, as it does, in abundance, a variety of the finest metals, china clay, and silk. Not unreasonably, then, she might have been expected to take a prominent place in the great Art creations of the world, and yet her position has never risen beyond the achievement of decorative work. The deeper significance of Art, the aspiration after and the expression of great conceptions, is entirely wanting. In other countries Art has sought

Expression in Architecture

in the raising up of colossal if not magnificent structures in temples, in tombs, in palaces, in castles. In Japan, however, all such work in the massive is rendered absolutely impossible by the difficulty of coping with the constant destruction of property which threatens the country in the shape of earthquakes. Hence their mind has never been accustomed to dwell upon the production of anything great or permanent, for wood alone is the material suitable for buildings, and about every 10 years, it is calculated, these are destroyed by fire. Nowhere is the absolute submission of the Japanese to the superior forces of Nature more evident than in their Architecture. It is true that repeated efforts have in the past been made to erect buildings of stone in these islands, and in a pamphlet published in 1599 by one Ludovicus Frois, we are told how the great Hideyoshi erected a palace which in magnificence and dimensions surpassed all previous efforts, his ambition tempting him even to add a tower to serve as a lunar observatory. Gold and silver were lavished upon its decoration, and for months hundreds of labourers worked upon it, when suddenly a terrible earthquake swept all away. Thus while

Stone as a Building Material

has had to be abandoned by the Japanese, and with it all conception of massive Architecture, the construction of their dwellings and temples has had to conform to what custom has proved will best withstand these earth convulsions. This has resulted in low one-storied houses made of wood, and the solemn proportions of their temples do not depend upon height but rather upon the superficial area which they occupy. In an ordinary dwelling firmly established, wooden walls are only to be found on two sides of the house; all the rest, as well as the interior partition, are composed of shutters which can be shifted with the greatest ease. Instead of glass, oiled paper fills the window spaces while the wooden frames over which paper or stuff is stretched divide up the interior spaces into rooms. To lessen the danger of these earth tremors the rooms are low, and even in the Imperial Palace, although length and breadth are given full sway in the proportions of the reception and official halls, yet in height they are extraordinarily wanting to the European eye. The Japanese in search of security also seat themselves upon the floor, and chairs and tables are unknown to them, while for beds mattresses are spread out likewise on the floor and are rolled up and packed away during the daytime. Thus the Japanese by nature and tradition exhibit a tendency to avoid giddy heights and to seek the lowest place, a tradition which, however, the last few years has shown Europe does not apply to their political aspirations. With such insecure walls there is no possibility of suspending works of Art in Academy frames, and hence their

Mural Decorations

take the form of strips of either silk or paper, upon which the artist has to elaborate and confine his ideas. These strips are hung up, and can be rolled up and packed away at will. Hence here again the scope of Art has been contracted, attention has been concentrated upon detail, and width of composition is sacrificed to depth of impression, and fineness of hand takes the place of breadth in execution. Much importance is attributed by the Japanese to their Art collections; indeed, the fortune of a family is often estimated by the value attaching to their collection of paintings, metal work, porcelain, &c.

COST OF KEEPING UP THE MANSION HOUSE.

In answer to the suggestion that the interior decoration of the Mansion House has been neglected of late years, the following figures will be read with interest, as they prove that the Lord Mayor's official residence, although it sadly needs attention at the present time, has been properly attended to. In 1887 £1,340 was spent upon it, this sum including £500 for tapestry; in 1888 £3,663 was expended upon decoration, repairs, &c., the amount including £2,052 for jobbing work for two years; in 1889 £3,851 was spent, including £310 for tapestry and £2,055 for drainage works; in 1890 £1,746 was spent, including £229 for drainage works and £152 for tapestry; in 1891 £1,930 was spent upon repairs and decorative work; in 1892 £2,180 was expended, including £300 for warming apparatus; in 1893 £1,305 was spent; in 1894 £1,527 was disbursed; and last year £1,708 was spent in works, repairs, furniture, cleaning, &c. The above-mentioned yearly expenditure only covers what has been spent upon the Mansion House as a dwelling, but does not include the cost of the installation and maintenance of the electric light and minor sums for miscellaneous purposes.

The "Carlotta" has arrived from Rockingham, W.A., with 514 loads of "Jarrahdale" Jarrah, to the order of Messrs. McLean Brothers and Rigg, Limited, 1, Fenchurch Avenue, London, E.C.

The Swansea Technical and Intermediate Education Committee has decided to adopt a scheme involving an expenditure of £10,000 on a new school. The present site of the Grammar School will be utilised, and the proposed plan will be exhibited before being finally approved.

Sir William Ingram has presented a picture to St. Saviour's Church, Westgate-on-Sea. It represents the Madonna and Child in the caves stable at Bethlehem, surrounded by a number of peasantry. It is painted on oak, and measures 6 ft. by 7 ft. This work of art was discovered hidden away in Revesby Abbey, Lincolnshire, and is believed to have been concealed to elude the despoilers of the churches during the Reformation.

Poolsbrook, near Staveley, is agitating for a better water supply, and a deputation of householders is to wait upon the Staveley Company, asking their assistance in getting a better supply of water for Poolsbrook, and to interview the Sanitary Authorities at Chesterfield, and demand a sufficient water supply. In one block of 12 cottages there had been no water for a fortnight.

The Premier and Authoritative Architectural Magazine.

The Architectural Review.

THIS MONTH. PRICE SIXPENCE.

Superbly Illustrated for the Architect, Artist, and Craftsman.

The Editors announce the following contents of the first number:

THE WORK OF JOHN L. PEARSON, R.A., with reproductions of some Twenty Drawings, Designs, and Photographs. Mr. Pearson has actively collaborated in the selection of the Illustrations. The Article will, therefore, be of a most comprehensive and complete character. The Letterpress by John E. Newberry, with Portrait of Mr. Pearson, as a frontispiece.

LONDON CITY HALLS—STATIONERS' HALL.—By special arrangement the whole of Mr. Joseph Pennell's Pen and Ink Drawings illustrating the City Halls—never before published—will be reproduced as a Series of Articles. No. 1, Stationers' Hall.

GARGOYLES AND GROTESQUES. A Series of Articles, fully Illustrated, dealing with this most fascinating subject. Sketches for the Series by Reginald Blomfield, M.A., Arnold B. Mitchell, F.R.I.B.A., Joseph Pennell, G. C. Haité, Francis Hooper, Andrew N. Prentice, C. E. Mallows, and others. The letterpress by C. E. Mallows.

THE OLDEST CHURCH IN LONDON — ST. BARTHOLOMEW THE GREAT: Its Restoration. By Aston Webb, F.S.A., F.R.I.B.A., illustrated by Mr. Aston Webb's original Drawings and Plans, showing the Restoration, with Mr. Aston Webb's own Notes.

THE WORK OF NELSON AND EDITH DAWSON, Designers, Ironworkers, and Enamellers: Illustrated by themselves.

THE SCHLOSS MARIENBURG: ITS RESTORATION. Completely illustrated, with Notes by Mr. C. Fitzroy Doll.

"LEADED LIGHTS AND OPEN VIEWS." A Series of Editorial Articles and Notes, contributed by a staff of leading Architects and Designers who will regularly contribute to this feature.

The Magazine will have all the Powerful Financial, Literary, and Artistic Resources of "The Builders' Journal and Architectural Review," at disposal for its fullest development.

Amongst the contributors to the first and early numbers will be:—

BELCHER, JOHN, F.R.I.B.A.
BELL, E. INGRESS, F.R.I.B.A.
BLOMFIELD, REGINALD, F.R.I.B.A.
BRYDON, J. M., F.R.I.B.A.
CARÖE, W. D., M.A., F.R.I.B.A.
COLCUTT, T. E., F.R.I.B.A.
HOOPER, FRANCIS.
JACKSON, T. G., A.R.A.
MITCHELL, ARNOLD B.

NEWBERRY, JOHN E.
PATERSON, ALEX. N., M.A.

VOYSEY, C. F. A.

ANDERSON, WM., British Museum.
DUNN, WILLIAM.
HORDER, MORLEY.
INCE, HOWARD.
MEYNELL, ALICE.
STRANGE, EDWARD F., South Kensington Museum.

It is requested that orders be given early at any of Messrs. W. H. Smith and Son's Bookstalls throughout the country, or to Local Newsagents, in view of the enormous demand for the Magazine.

A limited number of Specimens may be obtained from the Publisher.

Talbot House, Arundel Street, Strand.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

MEN WHO DESIGN.

No. 3.

Mr. STEPHEN ADAM, of GLASGOW.

"MY early training in the Art of Glass Staining," said Mr. Stephen Adam, "was as an apprentice with the firm of Ballantine and Allan, Edinburgh, and in the Academy School in Edinburgh—subsequently in the Haldane Academy, Glasgow. In Design, I have been greatly influenced by the work of Rossetti, Burne Jones, Williams, Morris, and Pluvis Chavanne, in the French School; and, if I may speak confidently of my work as Colourist, in Colour I found my master in the late Daniel Cottier, the eminent glass painter. Yet to be in any way original one must think for one's self, and I have heard it said (with some pardonable pride) by artists of the now famous Glasgow School that my work in stained glass greatly influenced theirs in their early Art aspirations by imparting suggestiveness and strength to their decorative quality and balance of colour effect.

"Of my own aspirations and feeling for Art you must accept me as no Literary Man but as a simple Craftsman, passionately fond of my ancient Craft and seeing much to detest in the so-called manufactured Art work about us. Decorative Art has its physical and profitable aspects. Successfully applied, Art means wealth to a country, by her sons and daughters ennobling, through form and colour, and making valuable such materials as stone, clay, iron, or wood. Take a pound of common clay. In the hands of one man it may make a dish or pot worth 4*d.* or less, while in the hands of the trained Art workman—by the magic impress of mind (and the purer the mind the more exalted the product)—it becomes a valuable vase, worth £50, or even priceless. I think it is Owen Jones who remarks 'that it is indeed a wise policy that induces a country to draw to itself all the wealth it can without parting with more of its natural product than is absolutely necessary.' If for every pound of clay that a nation parts with, it can draw to itself that amount of gold which we value at £5 sterling, it is obviously better thus to part with but little material and secure wealth than it is to part with the material at a low rate, either in its native condition or worked into common clay vessels. By those references I support my strong desire for the encouragement of Art work in our midst."

You discover Mr. Stephen Adam's love of colour in his power and wealth of expression, and are reluctant to break in upon this, even to learn something of his association with a firm which has, indubitably, played its part in the Art Renaissance beyond the Border.

It is something of a quarter of a century, you are told, since Messrs. Adam and Small established the glass-staining and decorating business now conducted by Mr. Stephen Adam. Under Mr. Adam's management the house has become noted in Scotland, and has maintained its reputation in every branch of decoration by means of stained glass. Their premises comprise six flats, admirably equipped in all parts, and devoted to—(1) workshops for lead working; (2) the drawing and designing of cartoons and painting of patterns for approval, before proceeding to the final operations; (3) glass painting and staining workshops; (4) the kilns for firing the glass after the process of staining; (5) for stock of material; and (6) packing department. Mr. Stephen Adam has done the "James Baird" memorial in Alloway Church; the "Ainslie and Galbraith" windows in Old Greyfriars, Stirling; the "Spier's" memorial, Paisley Abbey; the "Ramsden" memorial, Tadcaster Parish Church, Yorkshire; "Houldsworth" memorial, Coltness Church; Colonel Buchanan's gift of windows to Coatbridge; the "Corry" memorial, Elmwood Church, Belfast; "Kidston" memorial, Cambuslang; "Smollett" memorial, Bonhill; "Clark" memorial, Paisley. The firm's work is characterised by breadth and mastery of detail, harmony of colouring, and *technique*. The head of the firm is a native of Midlothian, having been born at Bonnington, Edinburgh, in 1848. He has exhibited regularly at the Royal Academy, and other exhibitions, water-colour drawings of stained glass and decorations. Mr. Adam is a Member of the Council of the Ecclesiological Society, and is also on the Council of the Pen and Pencil Club, Glasgow.

But it is, in the main, with the subject he has made peculiarly his own that you are concerned, and you revert to this as one would to a favourite bit of Colour or a distinctive note of Style.

"In the production of a stained glass window," says he, "there are three distinct manners of treatment, viz., the Mosaic, the Mosaic-Enamel, and the Enamel. The first, as its name implies, means, to put it clearly, that work is wrought on the principle of a tiled floor, each colour used being distinct in itself within its lead fret, and consequently very many separate pieces of glass are employed, in carrying out even a simple design. The pigments used legitimately in this work are yellow stain and brown tracing line, as hereafter described.

"Next, the Mosaic-Enamel method simply means the application of enamel colour to surface, if coloured glass, for heightening its tone; or on white glass, for producing a colour such as the white surface left after etching out blue or ruby—may be made any colour, thus enabling the painter to show various colours on one piece of glass without employment of lead work, which examples also illustrate. In pure enamel glass any coloured effects are got on white sheet glass, precisely as they are got on slabs of porcelain. The pigments used are much the same—yellow stain, when employed, being placed on opposite side of glass from painting. Lead work can here be entirely dispensed with, the panes forming a window being connected with wood astragals.

"Then, before beginning construction of a window, a coloured design to scale is prepared. When approved of, a full-sized cartoon is drawn out, showing all details. From this cartoon a cloth tracing is made, showing lead lines only. This we term the cutting drawing. On it we carefully mark the colour or tint desired. Glass which can be seen through is laid on this, and with diamond cut to forms shown. Darker kinds.

French Glass, XVth Century.

of glass are cut to shape by means of paper moulds. When settled that proper glass is cut, and that colours so far harmonise, stainers now take up the work, and proceed to pencil in outlines of face or flower, as the

HEAD OF FEMALE MUMMY.

case may be, with brown pigment composed of oxide of iron. Outline completed, to impart texture or shadow the glass is stippled over with thin wash of same material used for outline, and, there being little binding medium in it, it easily is rubbed off where clear lights are desired.

"Suppose it necessary for carrying out of design to show, say, a white or yellow flower

on a ruby or blue ground, this is done by removing the surface of such glass by action of hydrofluoric acid. On the white surface now got we trace in the desired form, and, where wanted, stain it yellow. Were we, by applying enamel blue, here to increase effect, say, in a leaf, getting it green by staining yellow the opposite side, we should be practising the Mosaic-Enamel method. Then to give necessary finish and slight notions of effect, glass is fixed on an easel against the light for finishing touches, after which it is ready for kiln. During firing much anxiety is often experienced by the

EARLY CLASSIC COIN.

artist as to the result. From differences in composition of metal, colours that appeared similar before exposure to heat often change, and destroyed work is the consequence.

"The kiln used is constructed of iron and brickwork, in box portion of which flat iron shelves are supported on flanges, where glass is laid embedded in stucco to ensure its keeping flat when exposed to the requisite red heat, after which it is allowed to cool gradually—the longer it gets the better. This firing department requires much skill and attention. Glass now finished in staining, often with more than one firing, is laid down on cutting drawing. Lead worker then

MEDIÆVAL COIN.

XIXTH CENTURY GLASS.

selects his proper lead-bands, and proceeds to unite the whole. There are many different descriptions of lead; and were it properly considered how much the durability of the work depended on the thickness of flange, greater attention would be bestowed, especially where plain church glazing is treated. Joints of lead are then soldered, and the unity is complete. To increase solidity of panel, as also water-tight properties, work is rubbed over with preparation of white lead and oil. After this operation the glass should lie flat at least for one month before fixing it in its intended perpendicular position, otherwise cement is easily beaten out by exposure to weather. Copper wire ties are now added for tying to saddlebars, which, fixed firmly in stone, support window in position; and most important it is that those saddlebars should not be too far apart. Mediæval Architects increased their strength by running upright rods through them, similar to this example.

JUBILEE COIN.

"Just a few remarks now," Mr. Stephen Adam urges, "on things that pertain to contemporary Decoration—its utility, and its capabilities as regards our comfort and pleasure. If we of modern times honestly try to emulate the pure truthful feeling of past work, Decorative Art can yet become a noble, a Fine Art indeed; but if we continue to go on deluding people by graining natural wood, imitating choice marbles, making in the style of flowers brackets intended to emit gas, pottery-ware like wicker baskets, stained glass like painted canvas, we tell lies—decided material lies, that do not pass away, but stare us in the face, year after year in our homes—yes, and even in that abode where Truth should exist, our Church. If we continue thus we unconsciously degrade our Art and ourselves.

"The majority, I fear, labour under the impression that the secret desire of Art is to rob them of all comfort. Were Art to prosper, they say, farewell to fireproof, shapeless slippers, which bask like salamanders in the hottest blaze, farewell to shooting coats cut at elbows, patched dressing-gowns and hair-cloth sofas, nothing now but full-dress varnished boots, spider-legged chairs, velvet doormats, and scrapers of silver and gold. It is astonishing how many people think a thing cannot be comfortable if beautiful. But let our conceptions be true to Nature, not in slavish fashion, but as the plants grow in obedience to natural law, so should our design—close imitation and copying is not desirable. We find limits in the material we work on or with, but I say let us guide our work on her true principles until, as William Morris puts it, 'The web, the cup, or the knife look as lovely as the green field, the river bank, or the mountain flint.' Then, and then only, can we aspire to be leaders in Art, to gain as individuals that enviable glorious position which would exempt us from the necessity of pandering to the vulgar caprice (sometimes called Taste) of the uneducated in Art. Do those people tell their minister what he should preach? They dare not. Why then should the trained Architect and decorative Artist be trammelled and dictated to by an incompetent rabble or Committee?

"Primarily a living room says to the decorator—'Don't abuse my form or arrangement as the Architect has left me. Survey me well; my position, size, and amount of available daylight—all suggest my proper embellishment. If the Art plasterer has overdone my cornice and centre ceiling flower with cheap stock patterns, tone them down in soft neutral tints, or better still, remove them. Keep my sweetly and naturally-veined wood fittings as the joiner or cabinet-maker

The Three Kings, Le Mans, XIth Century.

has left them. I don't object to a little waxing or polishing whereby my natural beauties are made more evident, but don't smear me with unnatural paint, making me look expensive oak or satin wood, when you know I am only pitch-pine. Though cheap, don't make me a hypocrite. If my windows admit cold and cheerless light from north or east in judicious colouring of walls and ceiling you have a remedy.'

"There is great comfort in colour tastefully applied; a well-decorated house is already a half-furnished one. In a room of cold exposure use warm and ruddy colour, subdued reds, orange, and tawny gold. If your fireplace is in a dark corner, do not fear to use burnished copper brass in grate and fireirons, even gold Mosaics in your over-mantel. Stained glass, and the lovely curtains now easily had, also enrich and warm light; so, artistically, you separate yourself from the chilly outside world. Entrance halls, especially in our cold Scottish climate, should welcome you in this warm and cheerful manner. On the other hand when apartments face south or west, with light strong and aggressive, we should have cool, greenish-stained wood effects of blue and grey on wall. Dutch tiles of blue and white in your fireplace give cool and refreshing repose. In such rooms etchings and engravings are the fitting decorations for the wall, not heavy oil paintings. Ceilings as well as walls demand modified enrichment. If made flat keep it flat, don't festoon it. The Romans did that in their decline. In furniture see that you separate structural from mere decorative principles. Where possible, furniture should be made for its position. As to choice of carpets, think of the bloomy, soft feeling of Eastern productions, but go to Nature for advice, to the hill-side in spring, and the woods in autumn—in spring when the wild hyacinth, primrose, and modest gowan lie embedded in the velvety grass—in late autumn when the path is strewn with richer harmonies of amber, purple, and gold, a beauteous Mosaic. With all your love of colour, and the pleasure it gives, yet the tone of walls and wood should distinctly be subsidiary to the living creations that adorn your home. Your wife and children, and that great bouquet of eloquent flowers fresh from the country must be the primary, the daintiest, as it will be the truest embellishment you can have.

"Of late there has been a vexing tendency towards complete colour negation in decoration. Some seem to fancy that the weaker, more insipid, skim-milky the tints in a room the more cultured the Art. White painted wood everywhere, a timid, half-apologetic grey on wall, raw cabbage-green doors, and so on, may be cult, but is only an ephemeral fad. Tame and spiritless as this manner of decoration is, it is safe, very safe, and much to be preferred to extravagant use of stencilled patterns. Stencilling is sometimes helpful, but repetition and constant use are hurtful. The tempting facilities which stencils and certain classes of wall papers offer retard original design and individual effort, keeping us back from Nature and truth. We may as well expect to pluck growing grapes from a bed-post as to extract classic or Mediæval ornament from the average nineteenth century decorator. We have not the picturesque Mediæval streets, and the half-barbaric grandeur of those times, and why regret it? There is still abundance of incentive to original design." With these views we were in entire agreement.

Window in Chartres, XIIth Century.

THE CHURCH OF THE HOLY CROSS.

The Architecture of Waltham Abbey.

By Chas. Lynam, F.R.I.B.A.*

To attempt the architectural description of the Church of the Holy Cross at what is now known as Waltham Abbey (the name of the town itself being that of the great Monastic House once existing here), is not by any means the act of "flogging a dead horse," but rather that of venturing to stride a very dangerous steed for round this famous building there has for many years past raged fierce battles of dates and styles, and these particular subjects have for the most part engaged the keen wits of critics, not to the exclusion of, but to the overshadowing of the great merits of the structure itself to a considerable extent. On this occasion it is proposed, first of all, to endeavour to realise in some degree what passed through the mind of the designer of this famous building as he conceived its plan, its sectional parts, and the veiling of its walls, piers, and arches as he intended them to be viewed by his compeers and by all who should hereafter use them for the sacred purposes they were intended to facilitate, or for the future generations which might see them. But little did the designer think of the doubts and difficulties which his work would entail upon the learned historian, the professional Architect, and of some members of the British Archæological Association, all living at the end of the nineteenth century. He had in his mind only the permanence,

German Glass, XVIth Century.

grandeur, and utility of what he was about to erect. In the Churchyard to the south of the Church there stands a fine elm tree of enormous growth; its trunk measures no less than 21 ft. 8 in. in circumference, just below the start of the lowest branch; its foliage now spreads to a diameter of 63 ft., and it is said at one time it was double this width across. Its roots must date back for many centuries, and it presents, in its dimensions, form, and beauty, a great work of natural growth. Cut through its grand trunk a few feet from the ground and cast away all belonging to it, save its wide-spread roots and the stump of its trunk, and a fair representation of what now remains of Waltham Abbey would present itself to view.

What now stands as Waltham Abbey Church is but a limb of the great Conventual Establishment, which.

* Read at the Church, at a meeting of the Congress of the British Archæological Association, on September 28th, 1896.

in former years, covered the surrounding site. The Head, the Arms, the Body, are gone, and what is seen now, is, as it were, but the lower extremity of a growth, rooted at a time of one of England's changeful gasps, revived under a new and Foreign Rule, nurtured by the powers of the highest in the land through succeeding centuries, but at last reduced to an appalling ruin. Nay, the very inward spirit which had sustained its long life is now wiped out, that part only which appertained to the Church at large is left to us. This dismemberment of a great whole may well account for the disappointment which must happen to those who know anything of the history of Holy Cross Abbey and see it for the first time. But even in the fragment which remains there is, indeed, material for the exercise of keen wit, reasonings on long experiences, and admiration for the Art of true and genuine Architecture. "*Rude in its character*" is it said? Well, if in its great masses, its broad spaces, and its simplicity of treatment, it may, in the taste of an age 800 years its younger, appear of a masculine type, a study of its details will, be assured, reveal science in its construction, delicacies of proportion, refinements of design, and beauties of ornamentation which the most cultured of the lovers of Art must appreciate and admire. Turning to the general subject more in detail, let us in the first place dwell upon what remains to us of the Abbey and its surroundings, and first of the latter. For its situation, choice was made of the valley of the River Lea, and within some 200 yards from its banks, and on the eastern side, the buildings were placed.

ABBEYS WERE USUALLY SELF-CONTAINED

and the first essential in such an establishment was the means for grinding corn both for man and beast, and possibly some trade was added to the work for "The House" by using the mill for neighbouring farmers and others. As steam power—now at a ripe age—was not then amongst the many lights with which the Middle Ages were blest, the Monks most wisely availed themselves of that power which a bountiful Providence had provided in the weight and force of the running stream, which had its course along this fruitful valley. The bed of the River Lea being of a flat gradient, and the damming of the river probably difficult of execution, it was necessary, in order to obtain power on the mill wheel, to form a "Race" of considerable length, not less than about a mile. Such mill stream, or race, was formed, which brought the water power from the river to the mill, and this was placed between the Abbey Church and the Gateway. Then in times of flood it was necessary that a "Waste" should be formed from the "Mill Stream" before it reached the wheel. This also was carried out. Then, of course, after the water had served the mill it had to be conveyed again to the river, and this was done by what is known as the "Mill Tail." All these three watercourses still remain, namely: the "Mill Stream." taken from the river far up to the north; the "Waste," running from the stream to the tail; and, lastly, the "Tail," taking the spent water from the mill to the river again. The mill stream was further made use of for providing another essential of an Abbey establishment, namely, the means of breeding and cultivating fish, which formed so large a part of the diet of the Monks. The remains of the fish stews are still to be seen to the west of the mill stream in the field to the north-west of what is known as Harold's Bridge. This bridge would serve as the approach to the fish ponds from the Abbey precincts for other purposes. It is recorded that the mill was given by the first wife of Henry II. No part of the original mill building appears to remain, but the present mill occupies its site. The Abbey precincts had to be enclosed according to custom, and for this purpose a wall was built; probably the north and east walls ran along the lines of the present walls fencing the gardens which now occupy the Abbey precincts. On the west it may be that the boundary followed the mill stream and tail—a portion of an ancient wall still exists by the side of the mill stream between the Church and the Gateway—and on the south that rear line of Sun Street and Church Street marks the line of boundary. To this large enclosure the Abbey Gate placed on the mill stream, just north of the mill, gave entrance, and herein was contained the Parish Church, the Monks' Church with its Cloister and its surrounding buildings, the Abbot's dwelling, the Infirmary buildings and probably their Cloister, the gardens, and the burial places of both Monks and Parishioners. Happily, part of the Church is still remaining; that is, the portion used as the Parish Church, the Gateway, and a small vaulted building to the north of the Monks' Church. Excavations made by Mr. E. Littler have disclosed that east of the present Church the central Tower with its Transepts and Presbytery extended to a considerable length. To turn now to the present Church. It is necessary, in the first place, shortly to define the terms which are made use of in these remarks. When referring to the "Norman period," the years assigned to it are those first given by Rickman as from 1066 to 1190—and the other periods used by him are also followed here, being those usually, but not universally, adopted by those writing on the subject.

AS WE SEE IT NOW,

the Church consists on plan (speaking generally) of the Nave and Aisles of the Norman Church, the two eastern bays being used as a Chancel. A Chapel on the south side, its east end lining with the east end of the Nave, and a western Tower, together with a Vestry and its Offices, built about 1870. Beneath the south Chapel for its full size is a Crypt separately entered from the west end. The main entrance to the Church is by a doorway in the west wall of the Tower. There is also a large south doorway in the middle bay of the Aisle and a north doorway in the second bay from the west end, not now commonly used, as well as another doorway not often used at the west end of the south Aisle. At the east end of the north Aisle is also a small doorway entered from the land of the enclosed adjoining gardens. At the time of the erection of the Vestry a doorway was made in the wall of the north Aisle for access between the two, and an outer doorway formed from the Vicarage garden. The south Chapel is entered from the Churchyard *only*, by a doorway in its west wall near the angle buttress at its south-west corner, approached by a flight of steps rendered necessary by the floor level of the Chapel being raised above the floor of the Nave, so as to allow height for the Crypt below the Chapel. At the west end of the north Aisle there is a doorway next the Aisle to an internal circular stair, which now leads to the Ringing Room in the Tower and to the roofs. There is also a small doorway just east of the south entrance which is said to have led to a room over a south Porch, but there is doubt as to the accuracy of this suggestion. It is hardly necessary to mention the big folding doors near to the last-mentioned one, the purpose of which seems to be to aid the action of the heating apparatus which now (unfortunately from an architectural point of view) occupies the whole of a spacious, well-lighted, and vaulted Crypt.

THE DIMENSIONS OF THE PLAN

are as follows, namely:—Length from east to west within the walls, 108 ft.; the clear space of bays, 10 ft. 3 in.; width of Nave, 23 ft. 8 in.; diameter of circular piers, 4 ft. 7 in.; width of north Aisle, 9 ft. 7 in., of the south Aisle, 9 ft. 10 in., measured from wall to circular piers. The Tower is 15 ft. 11 in. east and west, and 15 ft. 5 in. north and south. The south Chapel, called the Lady Chapel, is 41 ft. 7 in. long and 21 ft. wide. In cross section the Nave is of three stages in height, having an Arcade between it and the Aisles, and a Triforium and Clerestory with low-pitched modern but substantial roof, covered with slates, and a flat ceiling inside. The Aisle has a sharp-pitched lean-to roof, covered with slates, and with a curved boarded ceiling to the inside. The height of the Nave from the floor to the flat ceiling is 52 ft., and of the Aisles, 30 ft. 7 in. from floor to wall-plate. The height from the floor to the springing of the arches of the Arcade is 15 ft. 8 in., and from the floor to the springing of the Triforium arches 29 ft. 4 in., and to the springing of the Clerestory arches 43 ft. The Nave walls are 4 ft. 6 in. thick, and the Aisle walls 3 ft. 6 in. The original lighting was by single-light windows in the Aisles and Clerestory, and probably a great central window in the west end, and a single-light west window to each Aisle. The circular windows in the Aisle walls lighted the Triforium storey. Many of the shallow external buttresses still remain to the Aisles. The bays of the main Arcade are not treated as a repeat of a single bay, but are grouped into pairs, with a main and a minor pier to each pair, and each main pier has a semi-shaft next the Nave running from floor to roof, but the corresponding shaft over the smaller piers starts at the level of the sill string to the Triforium storey. As at present seen the Triforium stage has only a single arch, the inner ring of which is wanting. There can be but little doubt that this wide opening was subdivided, it may be into two, three, or four smaller openings. The Clerestory stage has a wide, central opening, and a small one on each side of it. The walls in all probability carried a massive open-timbered roof, which would certainly form an appropriate crown to this magnificent Nave. The gaunt Aisles as now seen, it must be said, have lost their first proportions, for they were assuredly spanned by appropriate vaulting, or what means the shafting on the Aisle side of the Nave piers? And for what reason do the strings under the Aisle windows appear with gaps, and what else but vaulting shafts account for the present appearance of the Aisle walls, where the inner quoins of the vaulting shafts still appear? And what do the arched lines in the upper part of these walls mean, except as indicating the lines of former vaulting? Above all, who that has studied Norman Art does not shun the idea that the original designer of this building omitted the vaulting of these Aisles, both on the score of proportion and utility? Excepting that when these Aisles were encumbered with great Galleries, the real condition of things could not be seen, it would be hard to conceive that any practical man could for a moment think that they were

ORIGINALLY VOID OF VAULTING.

It will be seen that the two western piers of the Arcades are not only of differing shape, but also of much larger dimensions than the other piers, and on the exterior it is also to be seen that the Aisle walls have strengthening projections opposite to those piers, and the walls themselves are increased in thickness. The late Professor Freeman, it is said, first pointed out that these special provisions were designed in reference to two western Towers which originally occupied this position. Beyond the above-named points there are now no further indication that such Towers were actually executed, except that in the western bay no Clerestory was provided. On the other hand, there is nothing to suggest that Towers at these points did not form part of the original western façade. The first material change affecting the design of this Church was the removal of its west wall and the substitution of the present one. What the original of the Norman west front was, there seems to be no clue to; it was taken down and wholly rebuilt. But it must be safe to say that the western front of Rochester Cathedral (which we saw under the able guidance of the Rev. Mr. Livett on September 24th last) represents the probable characteristics of the original Waltham front. Or it may be that Waltham went beyond this Cathedral in dignity and elaboration, equalling the west front of the Priory Church of Tutbury, in Staffordshire, of which a drawing was shown, and to which, with other drawings of this Church, further allusion will be made when the question of dates is reached. It may be asked: What reason could there be for pulling down such a fine front so completely in harmony with the other parts of the Church? Answer to this may be made: First, that for aught we know, structural difficulties may have arisen, and then the motives of men living under circumstances now remote, are not easy to be discerned. And again, then, as now, *fashion* had its changes, architectural styles succeeded one another, and in those days, at least, the past fashions were scarcely ever followed by a succeeding age, and above all *ambition* was deeply seated in the hearts of men then, as now, and out of such ambition and change of views then, as now, came novel performances, it may be, to the advantage or disadvantage of succeeding ages. In the case of the

RE-BUILDING OF THIS FRONT,

if a *great* work was taken down *another* was substituted, if out of harmony with the building at large yet in itself of exceeding beauty and boldness. Of this the great western doorway, with its adjacent Arcadings, the slight remains of the windows above the doorway, and the circular windows and pinnacles and buttresses

to the Aisles sufficiently testify. Recent excavations seem to disclose a part of the foundation of the original line of the west front. The Triforium floor and the gutters of the roofs were in all probability approached by stairs in this west wall, one on each side, with a passage running across the west end connecting them. An approximation to this arrangement is still in existence. The other principal alterations in the Church consist of the pointed arch work in the Clerestories; the attempt to abandon the Triforium storey and to make the Church of only two stages in height, as seen in the second bay from the west end; to provide for the erection of the Lady Chapel on the south side; and the insertion in the north Aisle of a three-light window early in the fourteenth century, and of a four-light window late in the fifteenth century. Everyone (who cares for such things) must thankfully rejoice that the bad taste which started to re-model the Church as seen at the west end, so as to destroy its Norman character, was frustrated in its attempt, either by abhorrence of its own performances or from the fear that their Church would come to the ground ere they had completed the hideous change. To this same sad taste the removal of the vaulting of the Aisles is probably attributable. The remains of ancient fittings are extremely small, but there is a screen across the north Aisle at the second pier from the east, of plain but excellent design, of early fourteenth century date. The monumental remains in the Church have been exhaustively dealt with by Mr. Frederick Chancellor in his great work on this branch of ecclesiology in relation to the county of Essex. Of the work done within recent years only a few words will be expected. The name of the late Mr. William Burges, who was engaged as Architect, is at least a guarantee that true architectural design prevails in it. The question of the style of treatment was perhaps more fitly his prerogative than that of anyone else. He chose not to attempt to work in harmony with the Norman designer's detail, but to trust to his own knowledge and skill in the style he most favoured, namely, French Gothic, of the thirteenth century. Criticism now is hardly admissible, but this, at least it may be permitted to say, namely, that if at first a discordance strikes the eye in relation to the east end, further reflection and study bring to light the fact, that, though in another style, Mr. Burges's additions bear the marks of his own genius in the solidity, breadth, and artistic treatment of his work. This may be specially noticed in his large arch nearly under the ancient western arch of the Nave. Before leaving notice of this fine interior, dwell for a moment or two on its superlative fitness of design, noting, first of all, the proportion of the relation of solids to voids, then the exquisite relation of height to width and length, also the proportion of the several stages in height, and, last of all, the effectiveness of its decorative details. Then, in the mind's eye, lift the flat ceiling—not to any great height of roof—but enough to properly harmonise with the walls, and to put into it sufficient of the mystery of dimness which its great total height must have secured, and say whether in the Norman Church of Holy Cross at Waltham, when its eastern length formed part of it, there was not a building here whose architectural effect could hardly be surpassed? "*Rude* in its design," does anyone think? Well, to the flourishing Queen-Anneish taste of this day it may be so, but having regard to the great architectural productions of the wide world, surely not so. This brings us to the very important addition known as

The Ladye Chapel,

on the south side of the Church. This is a building of fourteenth century design of the dimensions before given, and is of two pairs of bays, having on the south side two great end buttresses and one central one, with two lesser ones between the centre and the ends. The first point which demands attention is that the east end is without any window, but its wall was decorated by a painting in colours representing what is known as "The Doom." Its treatment has been fairly made out, and there are particulars of it in the Vestry. This east wall of the Chapel was the west wall of the south Transept, and its face next the Transept is still preserved with its windows, panels, and strings. The determination to glaze the south and west sides to the utmost is fully expressed by the four three-light windows in the flank and that of six lights in the Gable. The motive in providing this excess of window surface was probably to compensate, not only for the blocking up (occasioned by the erection of this Chapel) of the south Transept windows, but also of three windows in the south Aisle, thereby involving that three bays of the east end of the Church on this side should be lighted only by the Chapel windows through the arched opening between it and the south Aisle. It is probable also that this reduction in the lighting of this part of the Church gave rise to the insertion of the two large windows on the north side. The large arch on the north side of the Chapel was formed by breaking through the south Aisle wall, and its treatment is of the plainest character. There is no direct connection between this Chapel and the Church, and it would seem to have been intended for separate services under parochial and not monastic control. It was furnished, of course, with its own Altar, Piscina, and Sedilia. The windows and doorway in this Chapel are of more elaborate design than any other part of the Church, and the treatment of the large west window, with its second face of tracery on the internal line of the wall, exhibits the artistic resources of the mediæval designer in a remarkable manner. Having the southern windows and having determined to employ a large square-headed window in the Gable, how could this have been of better design? The Crypt beneath this Chapel with its groined roof, characteristic windows, and doorway was worthy of the superstructure and was probably a repository for famous relics, but is now put to a purely utilitarian use and is not easy of detailed examination. The western Tower only now remains for our notice. If Mr. Burges's opinion be correct (and there is no reason to doubt it), that the erection of this Tower saved the Church from falling, we may indeed bless the unintentional service which its builders in the seventeenth century rendered, not only to Waltham Abbey, but to the country at large, by the preservation of this historic Church. The main features of the Tower, its doorway, west window, and the materials of its walls, have mostly been quarried, as it were, from the ruins of the eastern portion of the Abbey Church. It still serves the useful purpose of accommodating a ring of eight bells, cast by Bryan, of Hertford, in 1806, but it must be confessed that it forms a very disappointing feature on a first view of the Church from its main approach, and the archæologist yearns for the presence of the great front which adorned the west end of the Norman Church, or even for that which the ambition or other motive of the early fourteenth century improvers erected in its stead. This general view of our subject could hardly close without a word or two on the

Exterior of the Building.

The east end is to the archæologist perhaps the most interesting part, as it discloses the west arch of the great central Tower, with the abuttals of its north and south sides, and the wall within the west arch partitioning the parish from the monastic Church with two doorways for communication. Also the east arch to the south Aisle, and the fact that there was not a corresponding arch on the north side, together with the internal faces of the Transepts, and the abuttal of the south wall of the south, Transept. From this point also, by the aid of Mr. Littler's plan, the extent of the monastic part of the Church, and of the domestic buildings, can be best appreciated, and the approach to the only remaining fragment on this side can be made, and the Abbey gate and "Harold's bridge" visited. Both the north and south flanks follow on the lines of what is seen of them in the interior. The north doorway is simple in its design, but that on the south side is of fine dimensions and of elaborate treatment. We have now reviewed as briefly as the subject would allow, and only in a general way, what is known as Waltham Abbey Church, and it may well be asked (notwithstanding the loss of so much) whether the abiding feeling which should remain with us should not be a sense of gratitude that this town possesses so much of the noble architecture of the Norman builders, and that at a difficult crisis the talent of the late Mr. Burges was employed in the preservation of the ancient remains and in its restoration for the decency of Divine worship according to current ideas. The almost total absence of perpendicular work may also be gratifying to many of us. Finally, and let it be said *briefly*, we come to the vexed question *of dates;* and, first of all, let us try distinctly to understand what are the actual differences in opinion

With Respect to Dates.

All who have written on the subject are agreed that the remaining early Church is of *Norman design.* Mr. Arthur Ashpitel, a learned member of the British Archæological Association, in an early volume of its "Transactions," expresses a sort of wish that though of Norman design it should have been built by Harold, our last Saxon monarch. The late Professor Freeman writes in the "Transactions of the Essex Archæological Society":—"A large portion of the *original interior* remains untouched; an interior deserving attentive study as one of the noblest specimens of Northern *Romanesque.*" And again: "Is the existing building really the work of Harold?" (1041–1066). And further: "After most carefully weighing all the evidence, I have come, *though not without doubt and hesitation,* to the conclusion that the balance of evidence inclines to the opinion that the Romanesque portions of the present Church are really portions of the original Church built by King Harold. . . . The consecration of Harold's Church is fixed at the latest at 1060. . . . *Harold's erection might have been replaced by another.* . . . The time when we most naturally look for such a change would be when Henry II. (1177) entirely remodelled the foundation, substituting *Monks* for *Secular Canons* established by Harold. . . . But if the Architecture looks too much advanced for 1066, it does not look advanced enough for 1177. . . . By whomsoever built, Waltham Abbey is undoubtedly a Norman building." This, in Mr. Freeman's nomenclature, does not necessarily mean a post-Conquest building. In 1861 the late Mr. Burges published a statement of the dates and other matters relating to the Church in which the Nave is included, as of the time of Harold. At a later date Mr. Edward H. Buckler published a book entitled "Historical and Architectural Notes on Waltham Abbey," in which he expresses his opinion as follows:—"The progress of our knowledge of early Norman Architecture has been so considerable of late years, as to justify our belief that there is *no sign* of any very early work at Waltham Abbey." Again: "We have evidence that the work has been built *from the east,* westwards, thus following the system of which there are so goodly a number of examples." As late as the year 1890, Mr. J. Arthur Reeve read a paper at a meeting of St. Paul's Ecclesiological Society in the Abbey, which contains the following expressions of opinion:—"The theory which, as I believe, accounts for all the phenomena which we find here is simply this: That from the west wall up to and including the second pier from the east end on both sides of the Nave, we have *Harold's work*—perfect on the south side and perfect on the north side up to the string course below the Clerestory: that the two eastern bays, together with the western Arch of the original Central Tower and the remains of the south Transept, were erected by Henry I. during the lifetime of his first wife, and that the Clerestory in the western bays on the north side of the Church was probably reconstructed by him after his second marriage." These are the deliberate opinions

Of Archæologists and Architects

who have given very diligent study to the question of dates in this building. *Think* what presumption it would be for a stranger to come here and after a comparatively cursory view of the subject to pronounce on the conclusions above recited. That is not what was undertaken on this occasion. But Mr. Freeman advises comparison of one building with another, and many examples might have been brought forward in this respect, but it happens that some details of the Priory Church of Tutbury, in Staffordshire, are at hand and are here produced. This Church was begun, as Sir Oswald Mosley relates, in 1080, and the founder, Henry de Ferrers, was interred in it before 1090. The Charter states that the foundation was (amongst other good intentions) "for the souls of King William and Queen Matilda." It will be seen that this Church is not unlike, in its general expression, the Abbey Church now under discussion, and that its details favour an earlier character than

Waltham Holy Cross. Then the Norman part of Rochester Cathedral is fresh in the memory of those present, and above all, the early part of St. Alban's Cathedral is well within our recollection. It is hardly within the scope of this paper to criticise the reasons for the conclusions others have come to as to those dates, but it may well be asked *that the effect on the minds* of those who hold to the Saxon theory, by reason of the belief that Harold built a Church here, should be borne in mind, and also that Mr. Freeman himself emphatically says that the example is unique. What in my humble view is significant, is the fact that not a single mark of Saxon design or workmanship as commonly understood is present, except, possibly, in the lower part of the eastern face of the south Transept west wall, and the external rubble facings in the south Aisle. But on the contrary, the design and the workmanship and the ornamentation are all essentially Norman, and in all probability Norman oversight controlled the work.

A FAMOUS IRISH POTTERY.

VIEWED in the light of its possibilities, the pottery output in Ireland, whether in actual quantity or artistic work, is lamentably inadequate. It is not yet 40 years since the Belleek Pottery Factory was started in the pretty village on the north-west border of Fermanagh. To a London Architect, Mr. Armstrong, belongs the credit of at least the artistic fame of the Belleek products. He was a man of wide culture and a high artistic ideal. "He resolved that Belleek should be known and famed for the excellence of its products, in material, form, and decoration. At any cost a high standard should be maintained; and nothing vulgar, nothing inferior, should be allowed to leave the works." To this end he employed a staff of the best skilled workers, to whom he paid liberal wages, chief among them being a designer, a modeller, and an engraver. If an expert in any branch could be secured, Mr. Armstrong engaged him for a time, regardless of expense, and thus kept himself acquainted with every new process or method that might be introduced. Two distinct branches of manufacture were carried on at Belleek—parian or "ivory" china and common delft. The former was the speciality of the factory. To-day this "egg-shell parian," with its peculiar lustre and iridescent sheen, is known and appreciated everywhere. In the early years of the factory there was an immense

VARIETY OF CHASTE DESIGNS

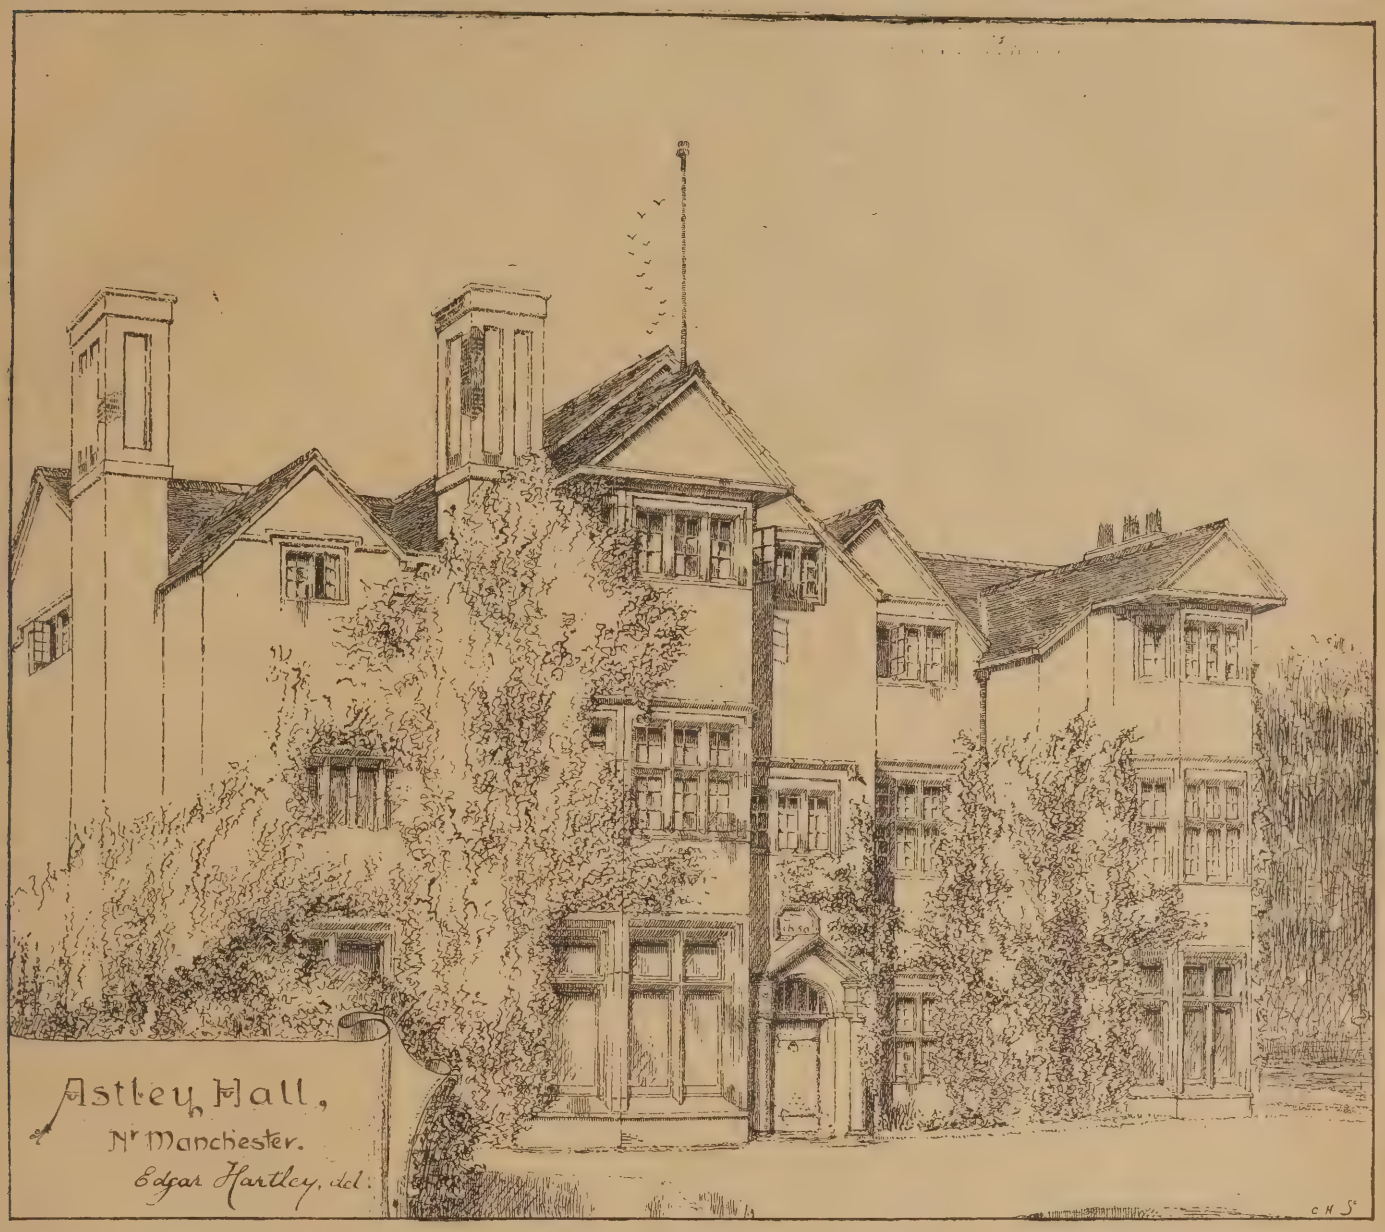
in artistic tea and dessert services, vases, ornaments, and even statuettes from the antique as well as from original designs. In 1884 the factory was offered for sale as a going concern. A limited company was formed with commendable enterprise in the locality, and the works were purchased for the sum of £5,500. Under the new regime, a policy of unwise retrenchment was, we are informed, begun, with the result that, "as soon as young workers give proof of ability, and reach that stage when their services are really valuable, they usually emigrate; and, with the exception of a few superior workmen, who are bound there by circumstances, Belleek is left to depend on less capable hands, made up largely of apprentices. The natural result of this is a lowering of the standard of production, both in quantity and quality. In further pursuance of this policy, the company dispensed with both

DECORATIVE DESIGNER AND ENGRAVER.

Were it not for a clever modeller on the works, who is constantly bringing out something new, Art would be poorly provided for. Decoration does not show progress—merely some slight, plain gilding and flat tinting on the finer goods, and the use of old, worn-out prints on the common delft." The Parian product of the factory continues good. New shapes are being added from time to time, many of which, in beauty of design, compare favourably with those of any other period. In several places throughout the country clays suitable for pottery are to be found, and the industry should certainly be extended, and if it should strike out on two special lines—superior earthenware, and fine white china, for which there is a large sale in this country—it would not clash very seriously with the interests of Belleek.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
October 7th, 1896.



"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

AN important restoration is about to be made on an old ecclesiastical edifice, the Church of the Greyfriars, Elgin, by the Marquis of Bute, and the ruin was recently inspected by Mr. Kinross, Architect, on behalf of the Marquis, with the view of preparing suitable plans. A few years ago, Major Leslie, the proprietor, sold Greyfriars House and grounds to the nuns at Elgin, and so the old Church, after three centuries, came back to the Roman Catholics. At present the ruin consists simply of two roofless walls and gables, and in that condition it has probably remained for centuries. The building is believed to have been erected by Bishop John Innes in 1409, and was the centre of a monastery. The monks were of the order of Franciscans called Observantines, and were introduced into Scotland by King James I. from Cologne, and had nine convents in Scotland, Elgin being the eighth in the list. This monastery is stated to have drawn certain revenues out of the land of Kirdels, Over and Nether Manbeen, and the barony of Aberchirder. The buildings at the Reformation fell to the Crown, but afterwards passed into private hands, and all that remains now are the ruins of the Church. This Church appears to have been long used as a place of meeting for criminal courts.

DURING the middle ages, drinking and other water for London had to be fetched from wells and rivers which were by no means too clean. In the reign of Henry III. a new source of supply, to meet the increasing need, was tapped in the fields of Bayswater. One Gilbert Sanfort, in 1236, granted a fresh spring, near the modern Craven Hill, to the citizens of London. Leaden pipes were cast in Holland, and were imported here to be laid underground from the Bayswater spring to Cheapside. A conduit house was erected by Sanfort at Craven Hill, and remained, in an altered and rebuilt form, till 1820. At various places between Bayswater and the City there were wells and conduits. A conduit was erected in Cheapside opposite Honey Lane, and this remained standing until the latter part of the seventeenth century. The Bayswater conduit bore the City arms and the date 1632, and it is believed that the bed of the stream thence to the City is in reality Corporation property. This watercourse was formerly noted by stones above ground, and in the burying ground of St. George's, Hanover Square, there used to be a brick well and several stones marked with the City arms, and the date 1773. Opposite 254, Oxford Street there was once a well having the City arms and the date 1772. One of the conduits which has been preserved formerly stood at the corner of South Molton Street, Oxford Street. It bears the City arms and the date 1627. Beneath the shield is a hole, probably once circular, but now much broken away; and this aperture, together with the stonework beneath it, bears evidence of the action of the water which once flowed therefrom. There were at first nine distinct conduits supplied by the Bayswater spring, and as time went on the number, including the smaller cocks or bosses, was increased to 20. These were under the jurisdiction of the Lord Mayor and Aldermen, who made an annual inspection of them, about September 18th. The visitation was carried out on horseback, and was completed at the Craven Hill Conduit House, where a banquet, followed by a hare hunt, brought the ceremony to a close. The Serpentine now receives part of this City spring, and the rest flows into the sewers.

IN consequence of the amalgamation of the parishes of St. Michael, Wood Street, and St. Mary Staining with that of St. Alban, Wood Street, the Church of St. Michael is to be pulled down, and the site, materials, furniture, and fittings are to be sold by the Charity Commissioners. The Church of St. Michael, Wood Street, occupies a site at the corner of Gresham Street and Wood Street, the south wall of the Church being situated in Huggin Lane. The body of the Church was destroyed in the Great Fire, but the Tower was not entirely burnt down. The Church was rebuilt by Wren in 1675, and the Tower was repaired. The present building is a plain edifice without Aisles, measuring 63 ft. in length by 42 ft. in breadth, and was erected at a cost of less than £2,600. There are three large windows in the east, and four in the south wall, but the north wall contains no apertures. The walls are panelled to the height of about 8 ft., and the handsome oak altar-piece is surmounted by the Royal arms fixed at the centre of a broken pediment. The old Pulpit is also a fine example of carved oak. The Organ, which was originally in the western Gallery, was removed in 1888 to the body of the Church, and now occupies a position in the north-west corner. The old high pews were also removed at the same time, and replaced by open benches. The Font is located in the south corner, and is noticeable for its fine carved wooden cover. The east front of the Church contains four Ionic pilasters supporting a pediment, with three circular-headed windows between the columns. The Tower consists of three storeys, crowned with a parapet, from which rises a lead-covered Spire, the height of the vane surmounting the Spire being 130 ft. from the pavement. It is also stated that a portion of the wall of the old Church was built into the west wall of the present Church.

A BRIEF outline of the History of the Royal Exchange may be gathered from the foundation stone of the present building. From this inscription one learns that Sir Thomas Gresham, Knight, erected at his own charge a building and colonnade, adding thereto, for the relief of indigence and for the advance of literature and science, an almshouse and a college of lecturers, Queen Elizabeth performing the opening ceremony in person. Having been reduced to ashes, together with almost the entire City, by a widely-spreading conflagration, they were rebuilt in a more splendid form by the City of London and the ancient Company of Mercers, King Charles II. commencing the building on October 23rd, 1667, and when they had been again destroyed by fire on January 10th, 1838, the same bodies undertaking the work, determined to restore them at their own cost, on an enlarged and more ornamental plan, Parliament providing the means of extending the site and of widening the approaches and crooked streets in every direction. His Royal Highness Prince Albert laid the first stone on January 17th, 1842, the Architect being William Tite, F.R.S. With regard to the statues which adorned these Royal Exchanges, it is noteworthy that the figure of Sir Thomas Gresham escaped the first fire, although, according to one authority, it succumbed to the second. In the second building stood statues of the Kings and Queens of England from Edward the Confessor to Charles II., and some of these survived the second fire in 1838, amongst them being those of Queen Elizabeth, Charles II., Queen Anne, George II., and George III. Busts of the Virgin Queen, and figures of Europe, Asia, Africa, and America also escaped, together with the copper-gilt weather-vane. Of these remnants from the seventeenth century Exchange the statue of Charles II. is in the present building, and the old weather-vane, in the form of Gresham's crest, the Grasshopper, still indicates which way the wind blows on 'Change. The head of the stone statue of Edward VI. has also survived, being now in the Guildhall Collection, to which it was presented by Mr. John Kelsey, a member of the Corporation, 1863–5. Most of the statues in the 1667 Exchange were carved by Cibber, hence their interest.

The Committee of the Swansea Centre of the University Extension Scheme has arranged for a course of lectures on English Painters from Mr. J. E. Phythian, of Manchester, and inasmuch as the continuation of University Extension in Swansea depends upon the support given to the lectures, it is to be hoped that they will be well attended. This course will be delivered on Thursday afternoons in the schoolroom of the Presbyterian Church, St. Helen's Road, and commenced on Thursday. Mr. Phythian, who is a competent Art critic, will survey the history of the English School of Painting, noted for its individuals, its varied and isolated methods, rather than for the single speciality that constitutes the foreign "schools." The first lecture was on Sir Joshua Reynolds, who gave to portraiture the charm of character. The second lecture will be on J. M. W. Turner, in whose landscapes Nature and Art were reconciled and blended into harmony. The third lecture will be on Dante Gabriel Rossetti, and the fourth on Holman Hunt. In these reference to pre-Raphaelitism, the most interesting Art movement of the century, is inevitable: to that interesting trio Rossetti, Hunt, and Millais, who, with Ruskin as literary champion, constituted the fancy the intellect, and the muscle of a much-abused and unfortunate, if well-meaning development. From pre-Raphaelitism, the lecturer goes to Sir E. Burne-Jones, the compromiser of realism and idealism, and eventually to G F. Watts, one of the greatest poet-painters of the century, striving, not without success, to teach great truths and suggest great thoughts by the silent eloquence of the crayon and the brush. From Reynolds to Watts: a range of Art history in which prominent individuals and unique methods are involved; in which English painting acquired a vigour and a moral force almost equal to those of the Old Masters. Mr. Phythian is also delivering a course of evening lectures, on "Architecture in relation to English History" at the Royal Institution.

There may be two opinions on the merits of tenement dwellings, but in the meantime it is clear that the poor unhoused by city improvements must be housed in some way, and this, says the Manchester Guardian, is precisely what the Manchester Corporation has not done in Hulme. Sufficient testimony to the distress that has been caused by the unhousing was offered at the recent meeting. The whole trouble is due to the vacillations of the Sanitary Committee's policy. First came the Oldham Road clearance and the erection of a huge tenement block. This was not ideal, but was at least better than nothing. Then came the Chester Street clearance, and an experiment in cottage dwellings—in Miles Platting. And now, after the Pott Street clearance, we have the lodging-house scheme. It is not that the Corporation has done nothing, but that it has tried every scheme in the wrong fashion. It seems to have been made out that the Corporation has not complied with the conditions laid down by the Local Government Board, which is omnipotent in such matters. Not only has the Corporation, contrary to those conditions, proceeded to a second demolition before providing for those dispossessed by the prior clearance, but it has not yet proposed a satisfactory scheme of rehousing. A lodging-house is excellent, but it cannot be said to provide for the accommodation of the dispossessed families.

The fine old historic ruins of the Rock of Dunamace were the subject of a lecture recently given by the Rev. W. Mercer. The position of the moat, though partially filled up, can easily be traced, as can also the place of the drawbridge. The external walls still remain in great part a wonderful display of the engineering ability of the Normans, and their art of erecting solid masonry, which was so peculiar to them. Immense blocks of masonry are strewed over the rock, of enormous thickness, composed of small stones, and bonded together by a mortar which now equals the stone itself, for tenacity and hardness. The selection of the site upon which the fortress was erected could scarcely have been better, as it was practically unassailable from any point before the use of cannon. It is built on an isolated rock which rises precipitously in the midst of an extensive plain, except on one side where the Grange Hills confront it, from which position Cromwell's General played upon the fortress with deadly effect. The inner portion of the walls is more complete than the external, and the ruins of the "keep" can still be seen. The lecturer showed how some parts of the building had been repaired within the last century, and traced the history of the old ruins from the earliest period, but he considered the remaining structure was rebuilt about the year 1216. He also dwelt particularly upon the period immediately preceding the rebellion of 1641, when the fortress was held by the celebrated Owen Roe O'Neill. In 1650 it was dismantled by Colonel Hewson and Colonel Reynolds, which effectually prevented it from being used afterwards as a fortification.

IT is said that the laying out of Leeds City Square is going to prove a rather more costly undertaking than was originally anticipated, and at the next meeting of the Council the Corporate Property Committee will have to request a further grant of money for the purpose. The Committee recently held a special meeting in order to examine and make recommendations concerning the 40 tenders that had been received for carrying out the work. At the July meeting of the City Council, a resolution was passed adopting the scheme submitted by Alderman Harding, and authorising the Committee to at once make arrangements for the work to be done, with the exception of the central figure and bronze ornaments on the balustrade. The resolution also gave power to the Committee to expend £5,000 upon this very desirable improvement. The lapse of two months sufficed to convince the Committee that £5,000 would not be sufficient, and accordingly they applied to the Council a few weeks ago for an extra £1,000, which was readily granted. But still more will be required, for the tenders which the Committee has resolved to recommend the Council to accept amount to £7,084 17*s.*, or £1,084 more than they have been authorised to spend.

AT the first University Extension Lecture in Ipswich, on Thursday, in the Lecture Hall, Mr. E. J. Garwood, of Trinity College, Cambridge, chose as his subject "The story of our continents and oceans, told by the valleys, rivers, and rocks." Having remarked that in his first lectures he would deal with subaërial denudation, Mr. Garwood explained that denudation was the disintegration of the crust and the removal of the fragments to levels under the influence of various denuding agents assisted by gravity. The denuding agents could be divided into two classes—subaërial and marine. The subaërial agents included those which acted in wet and dry weather, and while lightning, wind, plants, and animals acted in dry weather, the atmosphere, rain, moving and running waters, and partly animals and plants acted as agents when the weather was wet. In illustrating his remarks, Mr. Garwood depicted on a screen the ruins of an old building, and pointed out that the stones, which were originally square, had their edges rounded by the action of some agent. The action on old buildings was caused by the atmosphere, which contained certain gases, and they acted chemically in corroding the stones. The wet weather agents acted both chemically and mechanically, but the dry ones only mechanically. In the neighbourhood of towns the air was charged with sulphuric acid, and that helped enormously the corrosion of buildings. As to animals as denuding agents, he said it had been estimated that an earth-worm lifted up 10 tons of mineral in an acre of ground in one year. Rain also acted as a chemical and mechanical agent, and its chemical action was seen in a marked degree on rocks, while in limestone districts pyramids and obelisks were formed by its action. Rain acted in two ways—chemically by dissolving soluble salts, and mechanically by washing away loose material and transforming it into rocks.

FROM Paris we learn that the Hotel de Ville has obtained £48,000 for the reception of the Czar. A temporary stairs has been run up to enable the Imperial visitors to take in at a glance the internal decorations of the grand galleries. The horseshoe staircase is magnificent, but it does not please the city Architect. It was intended to have a silk vellum over the Avenue Victoria to shelter their Majesties from the eyes of sightseers in the upper stories, but it was found that this would interfere with the view of the hotel.

IT is, says a correspondent, interesting to find that at last some attempt is being made by the Admiralty to improve the plant of Portsmouth Dockyard, on which money is spent in a far too grudging spirit. A machine for bending nickel plates of three or four inches in thickness has recently been erected and is working admirably, but when the foundations of the machine cease to be a swimming bath, and when other machinery and a roof have been added, we may reasonably look for some progress. Some few years ago the Admiralty came to the conclusion that several more powerful cranes were required, and they granted them in a fairly generous spirit, but stopped exactly at the point where they should have continued the movement. At the present moment the yard possesses only one set of sheer legs where weights of from 80 to 100 tons can be lifted, and these are placed at the uttermost limits of the yard. These sheer legs have become venerable by their antiquity, awkward by being in the wrong place, and a source of anxiety, because, in case of accident, the whole work of the yard may be dislocated.

A VERY neat pamphlet entitled "A Cathedral for Belfast: A Statement and Appeal" has been issued by the Building Committee, illustrated with views of the proposed Cathedral. It gives a very concise history of the movement, and states that:—"Owing to its recent growth, Belfast has little to boast of in the way of churches or ecclesiastical buildings; these, though very numerous, are, with a few exceptions, poor and unpretentious; especially is this the case with regard to those belonging to the Church of Ireland, some of which are of a very humble and even temporary character. There is no Church in Belfast in a central position capable of accommodating large congregations. The scheme was first suggested in 1895 and was subsequently approved, and a Committee appointed at a public meeting to take steps for raising funds to meet the preliminary expenses connected with the project, and to select an Architect, or Architects, who would report upon the work and supply designs. The Committee, after much deliberation and several meetings, nominated Mr. Drew, of Dublin, and Mr. Lynn, of Belfast, joint Architects to the proposed Cathedral. Mr. Lynn subsequently, however, while expressing his willingness to continue to advise generally in the matter, elected to leave the more responsible duty of preparing the design for the building in the hands of Mr. Drew; having done this, he particularly requested, as a point of professional etiquette, that Mr. Drew's name alone should appear in connection with the drawings and report; hence the omission of Mr. Lynn's name. The Architect's suggestions, if carried out, will give, as the first instalment of the work, the Nave with north and south Aisles; this, with the lower portion of the central Tower, which can be roofed in so as to form a temporary Chancel or Choir, will serve as a commodious Parish Church, and also supply to a great extent the more elaborate wants of a Cathedral. At a future time, when funds are available, the Transepts, Chancel, and other requisite buildings can be added; all which, it is to be hoped, will be in accordance with the general lines indicated on the plan. Accommodation will thus be provided for a congregation of 2,500, for complete Cathedral services, and a full Cathedral establishment. Meanwhile, by completing the first part of the work as proposed, the people of the diocese and the citizens of Belfast will have the use of a building, erected entirely on Church property, as large as the Ulster Hall, and of a character very similar to the Nave and side Aisles of St. Patrick's, Dublin, or of one of the smaller English Cathedrals. The cost of this instalment Mr. Drew estimates at from £25,000 to £30,000, exclusive of foundations."

ACCORDING to a report which a committee of experts in the United States has presented to the National Association of Fire Engineers, the overhead single trolley system of working street tramways is a menace to the water and gas systems in consequence of the decomposition caused by the action of the electricity. If electrical energy is to be used for working tramways in populous places, where gas and water pipes are laid under the streets, the committee thinks the only way to prevent the rapid destruction of the pipes is to discontinue the use of the rail and ground as part of the electric circuit, and substitute an electric metallic current with no ground connection.

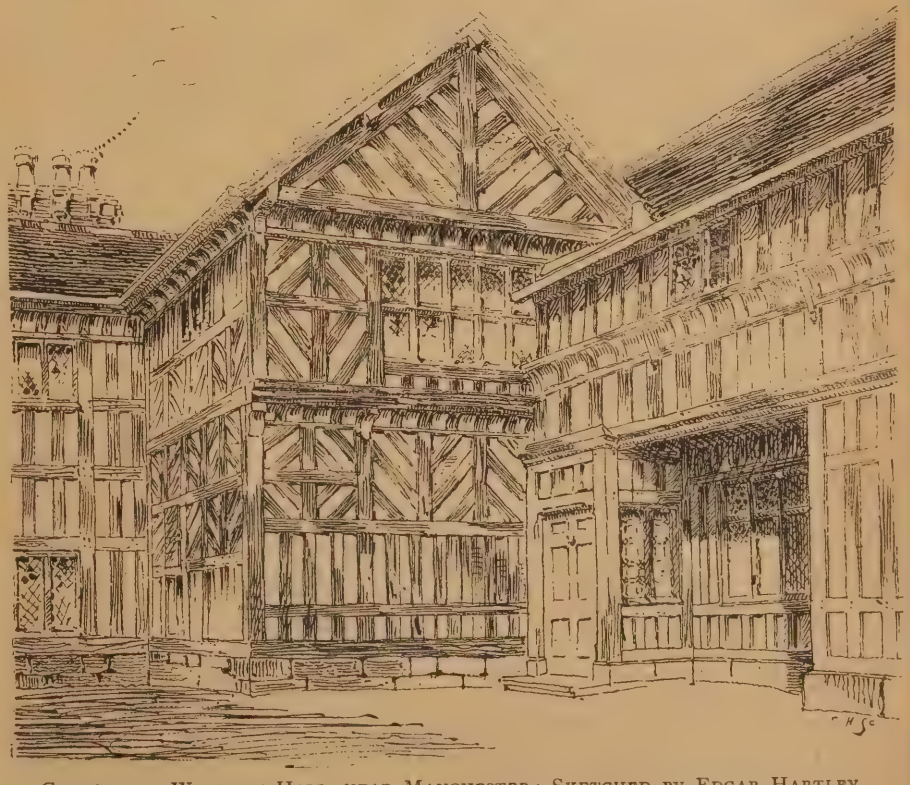
THE Society of Scottish Artists, which has been driven out of public view for a season or two by adverse circumstances—chiefly by the difficulty of procuring a suitable place of exhibition at a suitable time—now reappears, but with somewhat diminished lustre. The galleries on the Mound, where it made so successful a beginning four years ago, being no longer available, the Society has had to content itself with the limited accommodation afforded by the two rooms of the French Gallery in Hanover Street. The chief aim of the Society is to stimulate the younger artists to produce original and important works by giving them better opportunities of submitting their pictures to the public than those afforded by the exhibitions of the Royal Scottish Academy. The present exhibition enables the Society to realise their aims to a very partial extent. The limited wall space has made it necessary to confine the exhibits, with a few exceptions, to those of the members of the Society, to limit the number of these, and to exclude all large canvases. In spite of these conditions, the exhibition, which includes about 250 works of Art in oil, water-colour, and sculpture, is both interesting and creditable, and it serves at least the useful purpose of keeping the Society before the public as an active organisation.

IN McKean County, Pennsylvania, there exists a number of wood alcohol factories, the spirit being produced by dry distillation simply. The ordinary factory is built with from 6 to 14 pairs of cast-iron or steel retorts of from 1 to 1½ cords' capacity to the pair, and the wood, after being hermetically sealed in the retort, is charred by a baking process, the fumes of which are condensed and precipitated by lime and other chemicals. This fluid is drawn off and redistilled, and shipped to refiners for the final treatment, after which it is ready for the market. Only hard wood of the best quality is supposed to be used—the better the quality of the wood the purer the quality of the liquor. The wood—beech, birch, and maple—yields on an average some 6 gallons to the cord, a good deal depending on the age and quality of the wood, and the best results are obtained when the retorts are well packed.

MR. F. J. LESLIE, F.R.G.S., President of the Liverpool Philomathic Society, in delivering an address on "The Influence of Cities on Human Progress," remarked that the original conception of the city came, as so many other potent factors in the world's progress had come, from the East. In Europe, Greece first felt the influence of Eastern civilisation, and the wondrous cities of Greece, with Athens at their head, came into being. There was much in those Greek cities that we, for all our boasted progress, might look upon with admiring envy. Cleanliness and sanitation were a religious duty. To have had within the city an ill-cleansed street, a polluted stream, an impure water supply, a dirty or ill-ventilated house, or a collection of refuse, an offensive smell, a drunken or indecent person, would have been to an ancient Greek a personal horror of the most revolting kind. The influence of Greece passed on to Italy, and Rome arose, and grew to be as perfect a sample of civic organisation and control as that of the Greeks, but also much more than that. It was the model upon which the Roman was prepared to shape, carefully and intelligently, the government of the semi-barbarous people whom his legions conquered, and it is to Rome we owe the inception of the political government and municipal constitutions of the cities of mediæval and modern Europe. But Rome grew greedy, tyrannical, luxurious, and corrupt, and at length she fell a victim to too much civilisation centred in a single city. The empire was swallowed up in the city. Her fate illustrated the danger of city worship. The centralisation of a great nation's political and social power in a single city was a source of weakness, and might have disastrous results all unsuspected until too late. The prosperity of a city and of a people consisted less in the multiplication than in the conservation of the individuals of whom it was composed, and the problem which faced the social reformer of to-day was how best to deal with the difficulties besetting this unwieldy growth of cities, and how to prolong the duration and brighten the prospects of a city life.

IT is an age of demolition, and we all know we must not set our affections upon anything in the shape of bricks and mortar, and No. 10, Downing Street is among the latest of the doomed buildings. Certainly, it is not a very imposing building, though it has been tenanted time after time by the men who "make history." The unpretentious-looking street, which has for so long been the political centre of the Empire, takes its name from Sir George Downing, who served under Cromwell. After a time it passed to the Crown, and George I. gave Walpole's house to the Hanoverian Minister, and Sir Robert removed

Chimney Stack, Wardley Hall, near Manchester: Sketched by E. Hartley.



to Downing Street, who stipulated that No. 10 should be annexed to the post of the First Lord of the Treasury.

The Trocadero Restaurant, which has been erected on the site of the old Argyll Rooms and the Trocadero Music Hall, Piccadilly Circus, has been opened. The entrance hall, with its marble pillars and bronze capitals, is surmounted by a frieze, executed by pupils of the Royal Academy, illustrating the legend of King Arthur. The grill-room is in the French Renaissance style, with Cippolina marble, and a frieze in old copper. The two principal chambers of the establishment are the great central hall forming the restaurant and balcony, and the ball-room or banqueting-hall. The ball-room is decorated in the Empire fashion, and will accommodate about 200 people. In addition to these halls, there are Masonic lodge rooms, number of small dining-rooms decorated in Louis XIV. style, smoking, reading, and billiard-rooms. The electric light has been installed throughout. The New Conduit system of wiring has been used, the whole of the cables and wires being drawn into specially-prepared wrought-iron tubes insulated inside and provided with inspection-tubes as convenience dictates. The work has been carried out by Messrs. Strode and Co., and this is one of the largest buildings in London fitted with the system. Mr. W. J. Ancell has been the Architect, Mr. Martin F. Roberts the engineer, and Mr. C. W. Oatley the decorative artist and designer.

Does any serious thought for the old clock ever, one wonders, enter the mind of the restorer while at work on our ancient Churches? Why should the clock, which has done such great service for years past, not only, but of course mainly, as timekeeper, but also in being a decided feature to the Architecture of the fabric of which it, may we not truly say, forms a part—for do not an old tower and an old clock seem to have grown up together—why, then, should the clock be ignominiously pulled down when the work of restoration is going on, perhaps to make room for a modern timepiece, having possibly four staring dials, all quite and perfectly out of keeping with the style of work in which they are placed? As an instance of this we will take the fine old Norman Transitional Church of St. Mary, New Shoreham, Sussex, the Tower of which, a right noble specimen of the style, has recently been restored, and the work seemingly has been carried out in the most careful manner possible, as much of the old material as could be, having been used. So far so good! Now for the clock which has held its position for years on the south side of the Tower, the dial of which was perfectly plain, slightly curved on face, and possessing one long hand only, with which to point the time, a veritable relic of by-gone days. All this has been taken down, and the place where it formerly was, filled in, and rumours are abroad of substituting for it a clock with dials facing north, south, east, and west. Now, if old clocks must be removed, for we know that the works even of a clock must sooner or later be placed *hors de combat* in the great fight with time, surely this can be accomplished without removing the original dial; but, again, even supposing it be necessary to have an entirely new clock, one feels it should, at least, hold the exact position of its predecessor, and not have its faces distributed round the Tower as if to say, "Clocks are cheap nowaday, very!" Perhaps it is we want our church timepiece to do service as a town clock; if this be so, would it not be far better to have it with its ringing chimes, too often we fear a doubtful ornament, placed in some such building as our Town Hall; while our Church clock ticks silently and unpretentiously in teaching us, if we will but learn, as we feel it has ever striven to teach those who have long since gone, how that the night is fast spending, and day comes ever nearer and nearer to hand. And what clock can best teach this lesson but the Clock of Years!

Referring to our recent note on the Towers of Westminster Abbey, a correspondent calls attention to the fact that the late Mr. Wyatt Papworth, in a communication to Notes and Queries (4th S., viii., 127), supposes that the lower portions only of these Towers were executed during the years 1713–22 under Wren's direction, and that the upper portions, after Wren's death in 1723, were entrusted to his pupil, Nicholas Hawksmoor, who directed the works of the Abbey up to 1735. The Towers are said not to have been completed until 1745. The division in style of that which may be considered to have been executed under Wren's superintendence and that executed under Hawksmoor is clearly distinguishable about halfway up the Towers. As Towers they may be considered to have been from Wren's design, but their execution was left to the inferior supervision of the surveyors under and after Wren. Whatever may be the deficiencies in these Towers, and their shortcomings have been frequently canvassed, it must be conceded that, viewed as a whole, they impress one favourably by their proportion, simplicity, and massive treatment. They certainly compare favourably with the classic western end of, say, Milan Cathedral. The editor of Weale's "London and its Vicinity," published in 1851, in a short biographical sketch of Wren, p. 211, observes: "From the age of 13 to that of 86, we searched his memoirs in vain for any interval of time devoted to self, and even now from his retirement at Hampton Court, the helpless old man was carried to see and superintend his last and only unsuccessful work, the west front of Westminster Abbey, of which it is too often forgotten that he did *not* live to direct the upper and more objectionable parts."

The North-Eastern Railway Company has laid before the Hull Corporation details of a scheme of dock improvement at Hull, to cost nearly three-quarters of a million of money, which it is proposed to proceed with as soon as Parliamentary powers can be obtained. A new river-wall, nearly two miles in length, is to be built, and new dock and deep-water entrances to existing docks, which will be kept at spring-tide depth by pumping, are also provided for.

Courtyard, Wardley Hall, near Manchester: Sketched by Edgar Hartley.

STRAY NOTES ON SOME CHURCHES IN BELGIUM AND NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

IV.

THE position of the entrance to the Crypts beneath German Churches—many of them noble specimens of Romanesque architecture—varies. At Neuss you pass down into the Crypt by a flight of steps, one on either side that conducting up into the Choir. At Gladbach, Bonn, and Essen, this arrangement is reversed, there being one flight of steps down into the Crypt lying between the two leading up to the Choir. At Paderborn (where the Crypt is most extensive), Naumburg, and Hildesheim, the entrance is from either Transept. St. Patroclus, at Soëst, has a very small Crypt, lying just to the east of the southern arm from which it is approached. The capitals of the small columns in these Crypts are often carved in a very bold and effective manner, and deserve the closest study. This can always be effected, since the Crypts in German Churches are rarely, if ever, shut up, being fitted with an Altar, benches, and other instrumenta of public worship. At Paderborn, as well as at Herford, the Choir is square ended. And here I may take the opportunity of observing that the rectangular termination is by no means so insular a feature as is popularly supposed.* The aisleless pentagonal Apse, with its tall, sometimes transomed windows, has always been looked upon as a feature so peculiarly Teutonic,† that whenever a compromising arrangement occurs, as in the east end of St. Victor, at Xanten, it is generally

TRACEABLE TO FRENCH INFLUENCE.

Germany and England were both *very* strict regarding the orientation of their Altars; and this could not be rigidly adhered to in Chapels radiating from a procession path. Hence the almost universal adoption by the Germans of the aisleless, parallel-triapsidal plan. But as at Paderborn, at Herford, and pretty frequently in other Westphalian and Thuringian cities, we find the rectangular eastern termination. Paderborn presents it in the Cathedral, the Busdorf Kirche, and the Gau Kirche; at Herford we find it in the Münster and in St. Mary-on-the-Hill; at Osnabrück, in the Cathedral and St. John's; and at Erfurt several very English-looking examples of square ends lighted by triplets of lancets occur in the Churches which so richly bestrew that grand old city. The Osnabrück Churches are similarly fenestrated, while those in the Paderborn and Herford district have, generally speaking, had their Choirs lengthened in late Decorated times, and furnished with the geometrical or flowing traceried windows that grace that period. Reverting to Apses, those belonging to the numerous Churches of one of the most delightful of old North German cities—Soëst—perhaps offer the greatest variety of styles. Few towns in this part of Europe have retained their ancient circumvallations—now converted into agreeable walks—more completely than Soëst. The first view of it from the railway, with the massive Tower and metal Spire of St. Patroclus dominating the whole, is decidedly prepossessing, and it is very pleasant, immediately upon emerging from the station, to find yourself meandering through tortuous streets of timbered houses, without the intervention of a dreary "Station Road" (*Rue de la Gare*, or, *Eisen Bahn Strasse*) to fatigue you before entering upon the scene of enjoyment. There is no town whatever outside the walls, so little has Soëst grown. Beyond them stretches a flat tract of country, through which the great north road to the Baltic cleaves its way. Inside them, Spires, Towers, Apses, and red-tiled houses, with steep, thoroughly German roofs, are mixed up with old-fashioned gardens, orchards, streams, and mill-ponds, in a manner perfectly distracting to the artistic mind. The simple Apse terminating the vast rude Romanesque basilica of St. Patroclus as well as the one opening from the eastern side of its north Transept, are Soëst's earliest examples of the parallel-triapsidal arrangement. In the single pentagonal Apse of St. Maria im Hohe—a partly Romanesque Church having a western gabled Tower and slate Spire curiously inclining to the west—the earliest adumbration of tracery is observable in its two-light windows, both unfoliated, as is the circle in the head.

Of Early Middle Pointed Work, the deep, aisleless, grandly buttressed apsidal Chancel of the Thomas Kirche with its tall elegant windows of four lights, each geometrically traceried, and the less dignified but more constructionally interesting one of the Petri-Kirche, present excellent specimens. Flowing Decorated is represented in the Apse of the Paulus Kirche, a Church having a western Tower, with quadrilateral Spire of metal, and the distinction between Nave, Chancel, and Sanctuary marked by gradual diminution in breadth. These windows retain their original glazing, as do all those in the Wiesen Kirche (St. Mary-in-the-Meadows), whose parallel triapsidal eastern terminations afford a good specimen of that attenuation to which the fourteenth century German architects loved to carry their work. All these Churches—except St. Patroclus and St. Peter, are "hall" Churches, destitute of Clerestory. Looked at from a constructional point of view the Apse of the Petri-Kirche is the most interesting in Soëst. The proximity of this Church to St. Patroclus is very remarkable, a carriage way alone intervening between the Decorated Apse of the one and the Romanesque Porch of the other. Indeed, viewed from a little distance to the north-east, the two Churches appear to constitute one huge pile. Prior to the thirteenth century, the Petri-Kirche was, doubtless, a parallel triapsidal Romanesque Church like its opposite neighbour, St. Patroclus. During the

COMPLETE GOTHIC PERIOD

many an old simple round German Apse disappeared, to give way to a more lightsome structure, among them that belonging to the Church in question. Now, there was very little room between the two Churches for an architect to add a Choir to the Romanesque transept of the Petri-Kirche, of the *élancé* character presented by that of St. Thomas. Constrained therefore to make his Decorated Apse cover the same ground as that occupied by the Romanesque one, he was driven to adopt, for its shape, five sides of a dodecagon, providing each with a beautifully traceried window of two trefoliated lights. This Apse spreads out to the whole width of the old Romanesque eastern limb, and is joined on to the Transepts without any rectangular bay. The old transeptal Apses have been replaced by lofty hexagonal ones, with their inner sides cut off, and their outer ones canted to meet the principal faces of the Romanesque Transepts, the whole of whose eastern side these quasi-Apses occupy. Such an interesting piece of work demands study. It is not uncommon, especially in Westphalia, to find one of these lofty, lantern-like Choirs of the Middle and Late Pointed periods tacked on, so to speak, to a Romanesque or Transitional Nave and Transepts, or, as is more generally the case, a Nave alone. Such additions most probably owe their existence to incendiary causes, or to a desire for rebuilding this, the most sacred portion of the building, on a more grandiose scale. Besides the example just referred to at Soëst, we have it in St. Mary and St. Reinhold at Dortmund; in the great Churches of St. Mauritius at Münster, and St Mary at Lippstadt, both of which present several features in common, *i.e.*, the group of three Steeples—a massive one at the west end of the Nave, and a slimmer pair flanking the commencement of the Choir. St. Ludger at Münster has had a Late Middle Pointed Choir built on to its Romanesque Nave and Transept, while in Rhenish Prussia the Minster at Gladbach, St. Andrew at Cologne, and the Liebfrau-Kirche at Coblentz have received Choirs in a later and more *élancé* style. At Aix-la-Chapelle, the present Choir—"a stupendous lantern all of glass"—was fitted on to Charlemagne's old octagon in the fourteenth century, and at Essen, earlier in the same period, a poor Middle Pointed "hall" Nave was sandwiched, so to speak, between three remaining sides of a similar octagon, and two Romanesque bays, still to be seen over the Crypt. This Minster at Essen is a most curious building. It consists of (1) a Baptistery; (2) the Atrium; (3) the Church proper. The Baptistery has long since lost its characteristic Romanesque features, and is now a very mediocre Pointed Church of three bays with its windows gutted of their tracery. It has passed into Lutheran hands, but still retains its original dedication to the Forerunner of Our Saviour. The Atrium has an Arcade of four round arches on cylindrical pillars with cubical capitals. The Nave is *ouvert au jour*. The Aisles have wooden lean-to roofs. The Minster itself (Catholic) underwent an almost complete rebuilding in the fourteenth century, the only Romanesque portions left being, as I have just said, the three western sides of the octagon and the two bays standing over the Crypt, all of

VERY RUDE ARCHITECTURE.

The Church has been well restored, and its internal ensemble, despite the clumsiness of the Nave, is imposing from the presence of a raised Choir, rendered so by the Crypt. At the top of the steps leading to the Choir is one of those seven-branched candlesticks, so often met with in the German Churches, and dating from the last years of the tenth century. Although the solitary apsidal and parallel-triapsidal plan was generally followed throughout Germany, it is not unusual to find transverse-triapsidal Churches, *i.e.*, those having circular or hexagonally-ended Transepts. Such a trefoil headed plan, however, seems almost exclusively confined to the Rhine Provinces,* where it is first encountered in St. Quirinus at Neuss, a grand early thirteenth century Church exhibiting that mingling of Romanesque and Pointed which the Architects of that district knew so well how to illustrate, and which they persisted in retaining until the magnificence of Amiens, Beauvais, and Westminster stirred them to emulation in the Choir of Cologne, and the less aspiring, but assuredly more appealing Liebfrau-Kirche at Trèves; in St. Elizabeth at Marburg, and in the Cistercian Church of Altenberg, all of which, however, had the start of Cologne, and may be taken as exceptionally early instances of the Complete Gothic in Germany. St. Cunibert's at Cologne presents us with the best idea of this lengthy retention of earlier forms, completed as it was only in 1248, the year that witnessed the commencement of the Dom. Although the pointed Arch appears in the vaulting, and in the windows lighting its western Transept, St. Cunibert's is essentially a Romanesque building, following very closely the lines of the three great transverse-triapsidal Cologne Churches, viz., St. Maria in Capitolio, Gross St. Martin, and the Holy Apostles.† Although the core of many of these vast Romanesque Churches of the Rhine Provinces is of tenth and eleventh century date, the magnificent external appearance of such Basilicas as the Cologne group, Bonn, Andernach, Laach, Sinzig, and others, is due to a later period, *i.e.*, that of the Emperor Frederic Barbarossa, 1152–1190, and also to the earlier part of the thirteenth century. Additional embellishments were then made to them, and, in many cases, total rebuilding had perforce to be resorted to, to repair the damage inflicted under the War of Succession, which devastated the Rhine Provinces on the death of Barbarossa at the close of the preceding century, and laid many of the Rhenish towns in ruins. To the desire, then, of their Architects to rebuild them in their former style, we must attribute that strong Romanesque element which everywhere pervades such Churches as Bonn, Andernach, Sinzig, Coblenz, Limburg, Bamberg, and Gelnhausen all of which belong principally to the first half of the thirteenth century, but which, to an English eye, have much more the appearance of twelfth century buildings. Of this group, Limburg Cathedral, standing with its noble group of seven Towers above the Lahn, is perhaps the purest, and comes nearest to our idea of First Pointed; but to find a Church of this style in Germany comparable either in size or purity of detail with Worcester, Lincoln, Salisbury,

* In certain districts of France the Churches have square-ended Chancels. They abound chiefly in the villages of La Beauce, between Etampes and Orleans; also in the Touraine. St. Martin, at Tours, is a noble example. Laon Cathedral is square-ended, as are several Churches in the vicinity of that city. Creil Parish Church, Nogent les Vierges, and several others on the line from Beauvais to Paris are similarly planned.

† Of this type of Choir the grandest specimen I can call to mind is that of the Dom, at Erfurt.

* In the north-eastern districts of France we occasionally meet with the transverse-triapsidal plan. The vast Cathedral of Tournai, and the elegant transitional one of Noyon, have Apses to Transepts as well as Choir. The long connection between the Sees of Tournai and Noyon may probably account for the existence of such an arrangement. Soissons Cathedral has an apsidal south Transept, and the opposite one, before its geometrical rectangular termination was introduced, doubtless took the same shape.

† These western transeptal narthexes of the Cologne Churches of St. Cunibert and the Holy Apostles play no small part in investing their interiors with more than ordinary dignity. Mr. Butterfield seems to have had them in his mind when planning St. Alban's, Holborn.

Auxerre, Troyes, or any of that wonderful galaxy in the old Domaine Royale, is impossible. For, while in France and England the Romanesque gradually faded away before the Pointed, Germany, and especially the Rhenish districts, clung to it far on into the thirteenth century, abandoning it only then with great reluctance, to embrace a style which she never thoroughly understood, and too frequently made sad blunders in. One of our most enthusiastic ecclesiologists—Rev. J. L. Petit—in his "Church Architecture," one of those fascinating books which, once in hand, can only be laid aside with reluctance, has thus expressed himself on this interesting point: "It was as if that mighty river that bore the tide of Roman civilisation into the heart of Europe, had infused into the nations through which it flowed a veneration of Roman memorials, with a wish to preserve and perpetuate them, by establishing, according to the principles of their construction, a kindred and lasting style of their own."

MORE USEFUL THAN ORNAMENTAL!

NOTHING has done so much to mar and destroy the beauty of the country as the use of corrugated iron for roofing and building purposes. Its employment seems to be becoming more and more general, and one's feelings are continually being harassed by the discovery of some fresh spot whose rustic grace and beauty have been completely destroyed by the intrusion of this hideous, staring abomination; on whose ugliness, moreover, time has no ameliorating effect. The crude colour of new brick-and-tile soon disappears under the beautiful touch of Nature, the growth of lichens and mosses gradually producing a variety of pleasing and harmonious tints. Even slate after a time, and in favourable situations, falls more or less under Nature's kindly influence, and its cold, monotonous hue becomes varied and enlivened by patches of yellow lichen; but neither time nor anything else can ever convert corrugated iron into a thing of beauty. Into scenes of otherwise perfect harmony it introduces a screaming discord. Vegetation in general seems to have a strong antipathy for iron, and carefully avoids contact with it. No moss or lichen will have anything to do with these widely-used "galvanised roofing sheets," nor can the hope be entertained that ivy or any other creeping plant will ever spread a mantle of greenery over their glaring ugliness.

THE SUBSTITUTION OF IRON

for wood, brick, or stone has in other directions done much to deface the appearance of the country. In the case of "dead" fences alone, how far more fit and pleasing to look upon where the old riven oak palings, once so general, than the obtrusive stretches of iron fencing which have so largely supplanted them, and which now deface so many English parks and meadows. Their harsh, rigid, and assertive lines serve to draw away the eye from those subtle curves and undulations of surface, which a rough post and rail fence would in many cases enhance and accentuate. The varied greenish grey tints of oak palings or rough hewn wood fences of all sorts, always harmonise perfectly with their surroundings; tree trunks, foliage, masonry, or whatever else they may be; whereas these formal iron fences, though no doubt useful for protecting a growing fence, always tend to destroy that natural rustic simplicity which is perhaps the principal charm of the country.

THIS IRONWORK

has nothing in common with the surrounding trees and hedges, but suggests town ways and usages; and one can hardly help feeling that it is entirely out of keeping with blooming cottage gardens, wayside meadows, and grazing cows. Fences made of wood, on the contrary, seem thoroughly to belong to such scenes, and, like many old cottages, barns, and other buildings, acquire in time the appearance of having grown up there in company with the neighbouring trees. They are, as it were, a mere adaptation of the surrounding stems and branches to a particular purpose. But ugly and objectionable as iron fences certainly are, they are quite insignificant as destroyers of beauty when compared with the great dreary expanses of cold, unsympathetic metal which now thrust themselves on our unwilling gaze wherever we go, and when one sees these glaring sheets of iron replacing in all directions the warm, ruddy hues of tiles, or the exquisite greys of reed or straw thatch (at once the most beautiful and most comfortable of all roof coverings), one shrinks from imagining what the appearance of the country will be a generation or two hence.

A MODEL DESTRUCTOR.

MUNICIPAL AND COUNTY ENGINEERS AT BRISTOL.

A LARGE number of Civil Engineers recently visited Bristol to attend the Western Counties District Meeting of the Incorporated Association of Municipal and County Engineers. The gathering took place at the Guildhall, and was under the presidency of Mr. F. J. C. May, Borough Engineer of Brighton. Mr. T. H. Yabbicom, Bristol City Engineer, read a paper descriptive of the Corporation destructor and depôt at St. Philip's. In the course of his contribution Mr. Yabbicom said: The depôt comprises a refuse destructor, stable, and workshops, and occupies an area of 5 acres in the south-east of the municipal area, bounded on one side by the tidal River Avon, across which a girder bridge of 100 ft. span was constructed to give access from the part on the west side of the river, and approach roads with easy gradients laid out on embankments. Previous to 1892 the collection of house refuse in Bristol was made by one or more contractors, who were allowed to tip whatever found its way to the carts on land within the borough boundary. In 1891 the author was directed by the Sanitary Committee to visit several of the great towns, and ascertain the various plans adopted by their local authorities for the collection and disposal of house refuse, and for the cleansing and watering of the public streets. The report resulted in the Sanitary Committee recommending the Council to take into their own hands the collection of the house refuse, the cleansing and watering of the streets, and to put a stop to tipping refuse on sites within the borough. It was decided to build a destructor capable of treating about one-half of the estimated collection of house refuse, and wait the result before proceeding to construct sufficient cells to deal with the whole; low-lying land adjacent to the river outside the borough boundary being rented to receive the surplus. Although the fires were lighted in November, 1892, the heat was applied very gently at first, and it was not until June, 1893, that the cells were worked to their full capacity, when it was found that by damping down on Sunday, about 560 tons could be passed through in the six working days, and that by working all seven days the amount specified in the contract with Messrs. Manlove and Alliott, namely 640 tons, could be just reached; but the clinker was of a soft, inferior character, through the fires being drawn too rapidly. In the autumn of 1893 the author had a steam blast applied to eight cells on the south side, with the result that there was a considerable increase in the consumption of refuse, and a much higher temperature in the cells on that side, together with an improved clinker. For the past two years the average amount burnt, from twelve o'clock on Sunday night until noon on the following Saturday, has been 650 tons, which averages about 7½ tons per cell during twenty-four hours. The actual figures for the year ended March 31st, 1895, were 33,169 tons burnt, and during that period six holidays of one day each were allowed to the workmen. The firemen or stokers are 18 in number, divided into three shifts of eight hours each, half an hour's rest and meal-time being allowed during each shift, and, as already stated, no work is done on Saturday afternoon or Sunday; but it is doubful whether it is good for the destructor building to allow the periodic expansion and contraction to take place which result from working at high pressure for six days and cooling down on the seventh, and whether the cracks and fissures generally found in destructors after a few years' work are not due to this cause. The residue after burning amounts, on the year's average, to a fraction over 34 per cent., but varies considerably from day to day, according as the refuse is drawn from the richer or poorer districts of the city; in fact, some from the east end comes in the form of almost unburnable dust. Of the 11,500 tons of residue, 9,667 were sold or put to some useful purpose, instead of being removed to a tip, which would have entailed a further cost of about £725. A vertical engine of 20 horse-power, by Tangye, utilises the steam from the boiler, and drives two mortar pans and a stone-breaker. The ground mortar is used on Corporation works, and any surplus made finds a ready sale. The rough clinker is an excellent ballast for new roads and footpaths; the finer is useful for tar paving, and with Portland cement forms good artificial stone, either in the form of flagging, steps, window-sills, door-heads, sink drips, pillar blocks, and a great variety of purposes. Recently, the author has covered the sides and bottom of one of the swimming baths belonging to the Corporation with a layer compound of the residue, Portland cement, and chalk, forming a clean, bright, and impervious lining, easily cleansed. During the twelve months ending March 31st last, the following residues were used:—Fine ashes, 96 tons; breeze, 540 tons; screened ashes, 3,491 tons; rough ashes, 12 tons; clinkers, 2,734 tons; ditto used in ground mortar, 2,736 tons; flue dust, 58 tons; total, 9,667 tons. A total of £11,418 was expended before commencing work, and since then £1,442 has been spent on the engine, mortar pans, and shedding. The outlay during the year ended March 31st last, for wages of all persons directly or indirectly connected with the work, repairs, and all other charges, not including interest on first cost, amounted to £3,600, and the credit by the sale of residual products to £1,522, leaving a balance of expenses of £2,078; about 1s. 3d. per ton on the amount of refuse burnt. A range of stables, provided with 70 stalls, four loose boxes, and two isolation stalls, has been constructed at a depôt in another part of the city. The stables, cart sheds, and all buildings connected with them cost £13,650, and were constructed by day labour without the intervention of a contractor. After taking over the work and carrying it out, it soon became evident that it was necessary to have premises near the depôt, where repairs could be readily and quickly made, and the Corporation secured a site adjoining and parallel to the range of stables at Albert Road, and there workshops were erected as well as offices and stores. Like the stables, these buildings have been constructed by day labour under the direction of Mr. W. H. Baker, and the cost has been met by a loan of £6,100 for construction and furnishing. The author claims no originality in employing the residue clinker to make artificial flagging, but at the same time it has convinced him that a clean, durable material, of pleasing appearance, can be prepared at a much less cost than that of stone.

IT is proposed to restore the chancel of Lacock Church, Wiltshire, as a memorial to Dr. W. H. Fox Talbot, the inventor of photography. A committee has been appointed to carry out the work of restoration according to the plans of Mr. Harold Brakspear, architect.

WHAT is said to be the smallest electric light installation in the world is to be found in the village of Bremen, near Dormbach, Thuringia. It comprises a single arc lamp installed in a church, the lamp being operated by a small dynamo driven by the wheel of the village mill.

BATTERSEA VESTRY has resolved to erect Municipal Workshops at the rear of the Municipal Buildings, Lavender Hill, in order to enable the Vestry to carry out the whole of their works without the intervention of a contractor. It is proposed to erect the necessary buildings at an estimated cost of £3,508.

BY an unfortunate accident, Mr. James Brown, Architect, of 104, Rooden Lane, Heaton Park, Manchester, was killed while entering a train at Prestwich Station, when he fell between the carriages and the platform. Before the train could be brought to a standstill he was badly injured, and was conveyed to the Royal Infirmary, Manchester, where death took place shortly after admission.

THE Glasgow Corporation has bought the tramways in Govan, which is an independent burgh of 60,000 inhabitants. The unity of the municipal service for a population of over 700,000 will now be obtained, as the Glasgow Corporation will in future serve the burghs of Kinning Park, Partick, and Govan. Although the overhead trolley system of electric traction was recommended for the Glasgow tramways, it has not been adopted, and a deputation has been sent to America to inquire into the latest methods of electric or mechanical traction.

Professional Items.

TUNBRIDGE WELLS.—In connection with the new Parochial School being erected for the east end parish of St. Barnabas, the foundation stone was laid last week. The Schools are being built from designs by Mr. H. Cronk, to cost over £5,000, and are situate in the Quarry Road, near the Grosvenor Bridge.

DUNFERMLINE.—The new Church elected at Kelty was formally opened last week. The Church, built from plans prepared by Mr. Houston, Dunfermline, is crucifix in form, with Nave, Transepts, and a Gallery. The building accommodates 500 persons. It cost £1,600, to which the late Earl of Moray contributed £1,000.

TARLETON.—The memorial stone of the new Church of England Schools at Tarleton, between Southport and Preston, was recently laid by Lady Lilford, the scheme being estimated to cost £3,000, and including a residence for the head teacher. The site is adjacent to the Church, founded 10 years ago.

HASLEMERE.—Shottermill Church is to be reseated and the floor removed and laid with wood blocks, and the spire repaired and other repairs carried out. Messrs. Brown and Barrow, of Amberley House, Norfolk Street, Strand, are the Architects, and the estimate of Messrs. Harding Brothers, of Shottermill, has been accepted for carrying out the work.

BURBAGE.—A new Co-operative Hall has been opened. The building is situate in the centre of the village, and comprises for business purposes, grocery, butchers', bakers', and drapery departments, ample accommodation being afforded for each, the public hall extending over the entire length of the shops below. Mr. J. Ball, of Hinckley, was the Architect; Messrs. Graves and Farmer, Hinckley, contractors; and Messrs. Paul, Haddon, and Parsons, sub-contractors.

BOOTLE.—The Baptists of Bootle have erected, at a cost of about £2,800, a new Chapel in Stanley Road. The Chapel is built in the Romanesque style of Architecture, of grey brick, with terra-cotta dressings. Inside, including the gallery, there is seating accommodation for some 500 persons, with room for an additional 30 in the choir stalls. At the rear of the Chapel there is an iron schoolroom, which it is intended to replace by a more substantial brick building.

CHESTERFIELD.—The Chapel in Elder Yard, off Saltergate, Chesterfield, enjoys the distinction of being the oldest Nonconformist building in the town. It is now undergoing restoration under the direction of Messrs. Flockton and Gibbs, of Sheffield. Messrs. R. Wragge and Sons have in hand the masonry; Mr. Charles Rollinson the wood work; Mr. Goodwin the painting; Mr. F. Hill the plastering; and Mr. Mitchell the plumbing. A new heating apparatus is being supplied by Messrs. Newton, Chambers, and Co., and the organ is being rebuilt by Keats, of Sheffield.

MARKET HARBOROUGH.—New public swimming baths were opened last week by Mr. J. W. Logan, M.P. The site is near the Little Bowden Police-station. The contractor for the work was Mr. E. Fox, of Leicester, his tender being £1,499. The building is from the design of Mr. H. G. Coales, surveyor to the Council, and consists principally of red brick, with caps of Park Spring stone to the gables, and insertions of Debyshire gritstone. The swimming bath is 75 ft. long and 25 ft. broad, and varies from 7 ft. to 3 ft. 6 in. in depth. There are also four private slipper baths, with 24 dressing-rooms, with gallery above.

DUNDEE.—St. John's Episcopal Church has just undergone a thorough renovation, several important improvements, both internal and external, having been made on the edifice. The Chancel has been enriched by an oil painting framed in deep gilded oak and placed above the Altar. The subject is the Crucifixion, after the well-known Albert Dürer in the Dresden Gallery. The floor is laid with red mosaic tiling. Messrs. J. Mackay and Son, Castle Street, executed the painting and decoration; R. Sheach was the builder of the porch; the wood fittings were by Messrs. D. P. How and Son; and the plaster and mosaic work were carried out by Mr. Alexander M'Ritchie, Dundee.

PAIGNTON.—Paignton School Board will shortly open a new Girls' School. The plan and arrangement of the school are much in advance of many of the old buildings still doing duty in larger towns in the west. The designs are by Messrs. Norman G. Bridgman, A.R.I.B.A., and W. H. Bridgman; and it has been built by Mr. H. P. Rabbich, of Paignton. It is of Gothic style, faced with local limestone and Monk's Parkstone dressings. The main entrance is in the centre of the front. The central hall is approached from the lobby, and the six class-rooms surround the hall, and are spacious and well fitted. Including the central hall accommodation is provided for 500 children.

HEATON.—On Thursday last the new Baptist Chapel was opened. Stone for the building has been obtained by quarrying upon the site of the old Chapel, and a commodious structure in an adaptation of the Gothic style of Architecture has arisen. The Chapel is entered from Highgate by a flight of steps which leads to a large Vestibule. On either side of the Vestibule staircases give access to a gallery above capable of holding about 100 persons, and also to the basement floor below. The seats on the floor of the Chapel are of varnished pitch pine, and are semi-circular in plan. The Chapel, including the gallery, holds about 500 persons. In the basement of the building are an assembly-room, seating about 250 persons, class-rooms, and various rooms for meetings. The total cost of the building, which was designed by Mr. John Jackson, of Bradford, has been rather under £4,000.

LAUNCESTON.—Foundation stones of a new Chapel, in course of erection in Tower Street, adjoining the old premises, were laid last week. It will be in the Early English style of Architecture, with a frontage of 38 ft., and a length of 67 ft. The main entrance contains a Vestibule inlaid with mosaic tiles, the walls being of pitch pine. Behind the rostrum at the north is to be a raised Organ Loft with accommodation for the Choir, and there will be Vestries at the east and west ends, together with an entrance for the ministers and choir. The walls are being built of stone from Yealm Bridge, Lifton Park, Polyphant, and Plymouth, and Delabole slate will be largely used in the roofing. There will be seating room for 270. The contractors, Messrs. Broad and Werrin, are working to the designs of Messrs. Wise, Architects.

NEWTON-LE-WILLOWS.—Extensive improvements have been made in the Chapel at Aysgarth School, Newton-le-Willows. The Chapel forms a portion of the school buildings, and will seat comfortably 150 worshippers. The panelled roof and seatings, which are of pitch pine varnished, harmonise with the extensive and elaborate decorations. The new work in the Chancel consists of a carved oak Super-Altar, the three panels of the Reredos are lined with olive-green silk. The roof of the Chancel is panelled in pitch pine. All the carving is an innovation of thirteenth century work. The east window is of stained glass, and is an allegorical representation of simplicity and purity. The re-decorating work has been executed by Messrs. Bennett and Sons, of Manchester.

EDINBURGH.—Newington Parish Church has been reopened after having been entirely redecorated and fitted up with the electric light. The large flat ceiling has been effectively treated in creamy white, soft yellows, and subdued blue; the walls above the gallery are painted yellow, enriched with an arrangement of horizontal and vertical bands in a deeper yellow, with ornamentation in a soft red at intervals; while the walls below the gallery are done in rich red, also relieved by cream-coloured bands. The pulpit and the front of the gallery have been stained in dark colour, relieved by lines of gilding, and the ornamental columns which support the gallery have been treated in blue-grey. The work of decoration was executed by Messrs. G. Dobie and Son, George Street.

BROOMHEDGE, IRELAND.—In one of the most prosperous and attractive districts of South Antrim a successful beginning has been made in the provision of a new Methodist Church, being erected at a cost of about £600. The builder is Mr. Walter Law, of Moita, who is carrying out the work from the plans and under the superintendence of Messrs. J. J. Phillips and Son, Architects, Royal Avenue, Belfast. When completed the edifice will occupy an elevated position on the county road from Maze station to Broomhedge. The new building will form an open quadrangle. In the centre of this is the manse, the two wings being formed by the new Church on the one side and the old Church, now to be altered into schoolroom, on the other. The main gable, with the entrance porch, will face the road. The Church will be built of brick, with stone dressings in the front, and the architectural treatment will be simple in style, with chaste dignity, free from expensive ornament. Seating accommodation will be provided for 200 persons.

GOVAN.—The foundation stone of St. Bride's Church, Partick, the first of a new series of Churches which are being erected in outlying districts of the parish of Govan, was recently laid. The new Church, which is situated at the south end of Rosevale Street, Partick, is being built of dressed stone of a red colour, with roof of open timber and it will accommodate 800 persons. In addition to the Church proper, there will be a hall capable of accommodating 300 persons, and it is hoped that eventually a manse will be attached to the Church. The interior of the building will be made up of a large open Nave, free from galleries, a single side Aisle separated from the Nave by an arcade of four arches and with a gallery, a deep Chancel for the Choir and the Communion table, a side Chapel, an organ chamber, and a font recess. Church and hall together are estimated to cost £4,000.

ABERDARE.—The Intermediate School building, which is situate on a plot of ground near the lower entrance to the Public Park and adjoining the Park Board School, has been opened. The school is a neat stone building, with a central hall and a number of class-rooms, the central hall being large enough to hold the whole number of the children. There is also a cooking class-room provided, while a workshop and laboratory are erected detached from the main building, and a space provided for a gymnasium. The building, which cost some £5,000, was built by Mr. David Jenkins, of Swansea, the Architect being Mr. John H. Phillips, St. John's Chambers, Swansea, whose plans were selected in open competition by the assessor, Mr. Euan Christian, F.R.I.B.A., Surveyor to the Charity Commissioners, London. A master's house is now in course of erection upon the site, the contractor being Mr. John Morgan, Aberdare, and the Architect Mr. J. H. Phillips.

LAVENHAM.—New Schools have been built, and opened by Mr. Cuthbert Quilter. An excellent site was found at the junction of Barn Street and Bolton Street, close to the Market Place and the famous old Guildhall, and not far from the ancient house which was formerly Lavenham Grammar School. The Architect engaged was Mr. J. S. Corder, of Ipswich, and his plans show a "mixed" school, of which the main room measures 90 ft. by 26 ft. the height to the ceiling being 16 ft. 6 in. At the west end there are separate departments for infants and babies, the seats here being in the usual gallery form. Large cloak-rooms are provided for the different sections, and on the first floor an apartment is reserved as board-room and teachers' sitting-room. The important feature of proper ventilation has been duly regarded, while the warming is carried out by means of Marlborough stoves, which have a movable canopy by which the heat and the consumption of fuel may be regulated as required. The building contract was carried out by Messrs. Grimwood and Sons, of Sudbury and Ipswich.

GATESHEAD.—The enterprise of Mr. Weldon Watts has provided Gateshead with a handsome new Theatre. The Metropole Theatre, which was recently opened, takes the place of the Queen's Theatre in High Street. Both the theatre and hotel attached are faced with red-pressed bricks, with elaborate stone dressings. The theatre is capable of accommodating about 2,500 persons.

The pit is 60 ft. wide and 60 ft. long from curtain to back wall. The depth of the stage from the curtain line to the back wall is 38 ft., and the width 60 ft., thus giving room for the production of most complete scenic effects. The pit and gallery entrances are in High Street, and those to the dress circle and stalls are in Jackson Street. The buildings will be heated by hot-water pipes and lighted by electricity. Mr. Wm. Hope, of Newcastle-on-Tyne, is the Architect, and Mr. S. F. Davidson, of Heaton, the contractor for the whole of the buildings. The decorating and furnishing have been done by Messrs. Dean, of Birmingham, the electric installation by Messrs. Rowland Barnett, and the heating by Messrs. Dinning and Cooke.

Barry.—The Barry Urban District Council has for some time past been actively engaged in considering the question of the erection of municipal buildings. A site in the centre of the town, at Barry Dock, was secured some years ago. The new buildings will face Holton-road and the new road leading to Cadoxton, at a spot nearly opposite the present Free Library and Reading-rooms. Competitive designs are to be advertised for without delay, the premiums fixed being £100 and £50 respectively for first and second. The estimated cost is not to exceed £10,000, inclusive of fittings, which do not necessarily comprise furniture. In all, 43 rooms will be required, besides the usual lavatory accommodation, &c.; the public library to be provided with reference library, reading-room, magazine-room, ladies' reading-room, committee-room librarian's office, and museum. In the public offices will be provided ample accommodation for the clerk, surveyor, inspector of nuisances, and their various clerks and officials; and provision will also be made for the accommodation of the officials of the gas and water department.

Dundee.—Since the introduction into Dundee of electricity as an illuminating power, surprise and dissatisfaction have frequently been expressed at the backwardness of the Town Council in prosecuting the work of lighting the principal streets within the area by means of the arc lamp. In Edinburgh, Glasgow, and Aberdeen within the past two or three years the progress of electricity as a street-lighting agent has been rapid and extensive; but in Dundee, provided though it is with a splendid electrical station, nothing has been done in this direction beyond the erection of the four lamps in High Street. A report, however, has recently been prepared by Mr. Tittensor, the Electrical Engineer, showing projected extensions of the system upon a large and comprehensive scale. It is understood that the scheme makes provision for the erection of 60 arc lamps for the lighting of the central streets of the city, including Reform Street, Nethergate (as far as South Tay Street), South Tay Street, Overgate, Murraygate, Cowgate, Commercial Street, Dock Street, and Union Street. The lamps suggested are similar to those in use at Brighton, consisting of a spherical globe, with a canopy to throw the light upon the street below.

Bramhope.—The new Wesleyan Church is a great improvement upon the old Chapel erected in the year 1837. It is built in the decorated Gothic style, and consists of Nave, Transepts, Chancel, and Organ Recess. The windows are richly traceried and varied in design, and there is a Tower with Spire rising to a height of 75 ft. The interior has an open roof of pitch pine. The seating is also done in pitch pine, with the exception of the Choir Stalls, which are of polished oak with carved ends. The walls are built of stone from the neighbourhood of Apperley Bridge and Bradford. Mr. W. J. Morley, of Bradford and Harrogate, is the Architect, and the contract has been carried out by the following:—Masonry, Mr. T. Lawrence, Horsforth; joinery, Mr. S. Kaye, Pool; plumbing, Messrs. Suttle and Son, Otley; plastering, Mr. A. Taylor, Eccleshill; slating, Mr. W. Walker, Otley; painting and decorating, Messrs. Couldwell and Son. The carving of the pulpit and font has been done by Mr. R. Boys, of Bradford; the marble work by the Leeds Slate and Marble Company; the brasswork by Messrs. W. McGeoch and Co., of Birmingham; and the wood carving by Mr. R. Breckin, of Bradford. The total cost is put at about £2,500.

Kirbymoorside.—Foundation stones of a new Roman Catholic Church at Kirbymoorside were recently laid. The new Church is from plans by Mr. Bernard Smith, F.R.I.B.A., of London, and when completed will seat 120. It is to be built in the Early English style, and is designed to consist of Sanctuary, 16 ft. by 16 ft. internal dimensions, and 29 ft. to ridge; Nave, 40 ft. 4 in. by 20 ft., and 30 ft. to ridge, with Priests' Sacristy 13 ft. by 11 ft., and Boys' Sacristy 9 ft. by 9 ft., with heating chamber underneath on the north side, and a south Porch 9 ft. 6 in. by 7 ft. The exterior is faced with a local stone from Sleighholmedale and lined with bricks. The east window is of three lights. There is also a three-light window in the south side of the Sanctuary, with piscina under. There are five lancet windows in the Nave, and at the west end there is a three-light window. The west Gable is surmounted with an ornamental bell gablet to correspond with the buttresses. There are three steps from the Nave to the altar with Carrara marble. The whole work is being carried out by Mr. Anthony Lyons, contractor, of Norton, Malton.

Edinburgh.—A new Branch Public Library, Reading Room, and Recreation Hall, are being erected at the corner of Murdoch Terrace and Dundee Terrace, Dalry. The site, which measures about 75 ft. square, stands at the upper end of the Telfer Subway. The principal elevation, which is towards Dundee Terrace, shows two storeys, with large mullioned and transomed windows, and a wide doorway, to which ornamental character has been given by flanking pilasters having carved capitals, and by an artistically carved frieze. On the street level are the entrance corridors and borrowing department, on the upper floor are a small hall, and staff and committee rooms, and in the attics is a caretaker's house. From the corridors backwards the building is but one storey high. On the west is the Nelson Hall, while on the east are the reading-room and library. The Nelson Hall, which is cut off from the rest of the building by a series of arches that are to be filled in with glass, presents a handsome appearance internally—the roof, 35 ft. high at the apex, and pierced by numerous lights, being carried on open timbers, upon which some ornamentation has been bestowed. The reading-room and library are separated from each other by iron columns which carry an open timber roof over both at a height of 31 ft. Together the reading-room and library measure 55 ft. by 36 ft. in area.

Balsall Heath.—The new Church which has been provided for the Roman Catholics of the Balsall Heath district was opened last week. The new building will consist, when complete, of a Nave 8 ft. long by 22 ft. wide, and two Aisles 11 ft. wide, a Sanctuary with Apsidal end 22 ft. by 22 ft., two side Chapels, a Baptistery, and priest's house and Choir Sacristies. The whole of this, except the Sacristies and a portion of one of the Aisles, has been erected. When complete the seating will accommodate 450 persons. The exterior is of red brick and Doulting stone, and is of Romanesque character. The interior of the walls, and the Nave and Sanctuary piers, are finished in plaster, to allow of future coloured decoration, with enriched string and niches for statuary over the piers. A number of these have already been filled with figures of saints. The ceiling is of wood, with pitch-pine panels. The organ gallery is over the front porches. The design was originally entrusted to Mr. Albert Vicars, of London, but, owing to his long illness and ultimate decease, the drawings were prepared and the work carried out under the supervision of Mr. Ernest Avern, of London. The high altar and the two side altars, dedicated respectively to "The Sacred Heart" and "Our Blessed Lady," have been executed from the Architect's designs by Messrs. Boulton and Sons, of Cheltenham, who have also supplied the statue of St. John on the exterior of front, the statues in the niches of the sanctuary and the font. The contractors are Messrs. Harley and Son, of Smethwick.

Birkenhead.—The new Church of St. Michael and All Angels, Carlton Road, Oxton, of which the foundation stones were recently laid, when completed will provide seating accommodation for 800 persons, and the building will be of a plain design in the early pointed style of Gothic. The plan is for a wide Nave, with north and south Aisles and Transepts and a spacious Choir and Chancel. The rooms on the basement floor include a large room for meetings. The floor of the Church will be of solid wood blocks for the Nave, Aisles, and Transepts; the Choir and Chancel will be laid with tiles of plain design in suitable colours; the roofs, seats, screens, &c., will be of pitch pine stained, and the arches to the Nave, Chancel, and Transepts will be finished in red terra-cotta. Externally, the walls will be faced with grey brick, the gable copings, sills, and buttress weatherings being of red stone, the windows and doorheads, tracery, &c., and the string course and dressings being of red terra-cotta. The roofs will have Welsh slates and red ridges, and a lofty bell turret rising from the east side of the south Transept will have an oak shingled roof, with iron vane and a teakwood belfry on a stone base, with gable buttresses and corbels. The Architects are Messrs. Francis and George Holme, whose designs were selected in competition. The general contractor is Mr. William Hall, of Liverpool, whose estimate for the portion of the Church now to be erected amounts to the sum of £3,700. The heating apparatus will be supplied by Mr. J. Bramham, of Liverpool, and the terra-cotta work by Messrs. Clark and Rea, of Wrexham.

Midleton.—The new Catholic Church, which replaces the existing decayed structure, was consecrated on Sunday last. The Church stands on a very suitable site on the Midleton Gardens, Chapel Road, and is noticeable for simplicity of design and solidity of structure. The building is in the style of the thirteenth century, of a simple and severe type. Nearly all the windows are lancets, tracery being only introduced in the Façade and Chancel, and in the windows of the Clerestory. The length of the building is 168 ft. 6 in. and breadth of 72 ft.; the Clerestory walls are 42 ft., and the Aisle walls 20 ft. high, and the Tower and Spire 178 ft.; the Façade presents an imposing appearance, the gable of the Nave being flanked on one side by the Tower, and on the other by an octagonal Turret 82 ft. high. The Gable is enriched by traceried windows, and by a canopied niche, containing a statue of the patron saint of the Church, 9 ft. high. The entrance to the Nave is by an arched doorway, 8 ft. wide, leading to a spacious Porch under the Organ Gallery, which is reached by a special staircase in the Turret. There are also entrances in the Aisles on one side through the Tower, and on the other through a Porch projecting from the side of the Church. The Baptistery is placed at the end of this Aisle. There is a large rose window in the centre Gable, surmounted by a cross rising to the height of 75 ft. over the ground, with chiselled dressings and bands of darker stone. All the internal walls are lined with brick, built into a cavity to ensure dryness. The Nave arcade has columns with limestone caps and bases and shafts of red polished granite, and the Nave arches are of dressed Bath stone, which stone is also used for the carved caps of the Church windows and shafts supporting the roof principals. The Architect is Mr. J. C. Ashlin, and the builder, Mr. J. J. Coffey, Midleton. The total cost, including site, will be about £19,000.

Belfast.—The Broadway Presbyterian Church was opened last week. Occupying a prominent position adjacent to Broadway, the Church faces the Falls Road. A lofty Tower, crowned with a copper-covered Spire, placed at the north-west angle of the front façade, forms an important feature of the design, for which a simple treatment of thirteenth century Gothic has been adopted. Red brick walling, with some red sandstone dressings, has been used at the principal doors and windows with good effect. As close on 1,000 sittings were required, the plan was arranged with Nave and Aisles, with shallow Transepts occupying a space of about 90 ft. by 60 ft. A Session Room, heating chamber, &c., are placed at the rear, where it is intended shortly to erect Lecture Hall and Church Rooms. Three large arched doorways, resting on grey granite shafts, afford access to the Church and to the gallery staircases, which are placed in the Tower and in a projection off the Vestibule. Cutstone gablets, rising from a carved string-course, are placed above the doorways. An imposing tracery window of five lights, with moulded jambs

and arch, occupies the centre of the main Gable, which terminates at a height of 56 ft. in a bold finish. Under the coping are placed terra cotta enrichments, which also extend along the gable of projecting staircase. A range of boldly-projecting buttresses, between which are lancet windows, extend along each side of the building, which is further relieved by the Transept, each with a three-light window and arcading below. Above the tall belfry windows, which are filled with louvres, rises a Spire, resting on a stone cornice, and terminating in a gilt vane at a height of 120 ft. The heating is effected by Messrs. Musgrave's high-pressure small-pipe system, the lighting by Messrs. George Jones, Great George's Street. Mr. Thomas M'Millan is the contractor for the entire works, and the Architects are Messrs. Young and Mackenzie.

WORCESTER'S NEW INSTITUTE.

As a memorial of the Jubilee of the Queen's reign, the Victoria Institute at Worcester has been opened at a suitable time. The foundation stone was laid by the Duke of York, on April 3rd, 1894. The institute has cost some £45,000, and will serve as an educational centre for the county. A technical school, comprising an organised day school of science and evening classes, the old-established school of Art, the free public library, a picture gallery, and the important collection of the natural history museum named after Sir Charles Hastings, have been brought together under one roof. The nucleus of the institute fund was furnished by £660, granted from the Worcestershire Exhibition surplus. When the scheme began to assume its wider aspects the Corporation of Worcester devoted to it £7,000 from the enfranchisement funds of the Bridge Street rents. A central site was secured

ADJOINING THE SHIRE HALL,

and bounded on the other three sides by Foregate Street, Taylor's Lane, and Sansome Walk. Plans prepared by Messrs. J. W. Simpson and E. J. Milner-Aller were selected, and as the estimates showed that the cost of the scheme would be even greater than had been anticipated, the Council was prevailed upon to make a further grant of £5,000. The institute occupies an area of 2,330 square yards, in two blocks, the library block fronting Foregate Street and the schools block fronting Sansome Walk, and both blocks having entrances from Taylor's Lane, which thoroughfare has been widened and improved. The effect of the elevation has been much discussed—probably because of its strong contrast with the sober regularity of the adjoining private buildings and the classical sombreness of the Shire Hall. The design is in

QUEEN ANNE STYLE,

with some Italian modifications. The exterior is of red brick, with buff terra-cotta ornament. Over the principal entrance, which is in Foregate Street, are the Royal Arms in terra-cotta, over the principal gable is an emblematic figure. In the library block the central entrance leads directly from Foregate Street into the ante-vestibule, an open gallery on the first floor, with seats in the recesses of the balustrade and giving greater dignity to the ground floor by increasing the height, and at the same time improving the light and ventilation. A staircase of marble and mosaic leads to the museum and Art galleries on the first floor. On the ground floor the reference library, 41 ft. by 20 ft., is next to the Shire Hall. The news room, which is 84 ft. by 22 ft., with end bays, is situated in Taylor's Lane, and has a separate entrance from that street. Throughout the floors are of wood blocks, and the wood fittings of walnut. Direct access is provided to the basement floor, which is 10 ft. high and of considerable dimensions. On the first floor there are five museums and three Art galleries. The former are on the Shire Hall side, and the Art galleries are over the news room. The central and largest museum gallery is 45½ ft. by 22 ft., and the central Art gallery is of the same dimensions. At the corner of Foregate Street and Taylor's Lane is a circular tower, with a staircase to the roof. Between this block and the schools block is an open space which will allow of future extension of the building. The schools block accommodates the Art, science, and technical schools. The science school on the ground floor provides a commodious lecture theatre, stores, photographic dark room, &c., well-arranged cloak-rooms, laboratory, balance-room, and preparation-room. Beneath these rooms are a long range of north-lighted workshops for the technical classes, with cooking, plumbing, and other apparatus, and lavatories. The first floor is devoted to the Art school. The elementary room, which has a top light, is 50 ft. by 22 ft., and on the other side is an antique room 60 ft. by 21 ft. On this floor are also a painting-room, modelling-room, designing-room, master's-room, cloak-rooms, and conservatory. The two blocks are connected by a subway. The work has been carried out by Messrs. Joseph Wood and Sons.

Correspondence.

"MERE TOIL AND DRUDGERY."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In the *Builders' Journal* for September 23rd, there appears an article on "Wrought-iron Work," in which I was greatly interested, and in which occurs the following:—"But in one thing we fall lamentably below the work of our forefathers. We do not seem able to set up a beautiful screen or gate. . . . Nothing is so remarkable in the older work as the chasteness of the design, and. . . . These (extinct Sussex ironworks—from which came beautiful gates and screens) were chiefly conducted on. . . . a very small scale, and by very old-fashioned methods, but this order of things is that which is most favourable to true artistic work." (I entirely agree—the curse of to-day is the insane endeavour to *produce*—no matter what! so long as it sells! Hence our giant factories and subdivisions of trades.)

Now, Sir, it chances that a short time ago I sent a letter to a certain weekly paper, on a subject to which the above quotations are pertinent: the letter was occasioned by a member of the staff (as I suppose) writing thus—I quote from memory: "Pleasure in one's work is the greatest of all earthly blessings and one of the greatest of earthly joys, and this is a fact which all classes ought to keep constantly in view. . . Working men are in the habit of looking upon their work as mere toil and drudgery. If they would only pursue their work with the same ardour as when pursuing their pleasure," and so on. He also states that of course "untimely hours," "too long hours," and "mistakes in selection of calling," would militate against a man's finding pleasure in his daily occupation.

In my letter I stated convictions which I strongly hold, that, with few exceptions, work *is* to the artisan (and other working men) most decidedly *mere toil* and *drudgery*: that the employer's main object is to get the utmost fraction of result in the shortest possible time: that the workman's one aim is to "get through" (no time for "pleasure"—no time for loving labours or any of that "d——d foolishness")—yes, "get through" as much as will be accepted (grudgingly) by the employer as a day's work, or passed over by the foreman without remark. (There is no such word as "encouragement" in the artisan's dictionary! All he can hope for—and he thinks himself "well in" with even such a miserable pittance—is to escape censure!) I also stated that he has hurled at him such words as "soulless," "mechanical," "wooden," "sordid," "unthinking block," &c., and, also, that he would not have been worthy to tie the latchets of the sandals of the old-world artisan who reared the monasteries, for instance, or who wrought their teeming fancies into the chaste and graceful curves of the old wrought-iron work.

I contended—and I strongly hold that the workman of to-day is but what his employer requires him to be—if he is mechanical, he is but what the *deus ex machina* pays him to be—that he dare not deviate one inch from what is "laid" down for him; that any little characteristic touches, anything of himself, put into his work, would be an unheard-of innovation to be utterly frowned down (to say the least!) but, that he is as capable of undertaking works of love and loveliness as ever man was, able to do anything that has been done of men. His capabilities in this connection may be latent—but that word does not express the truth—his powers are latent only in the sense that they are not called upon to operate; they *are* there, all the same. If grown a little rusty—it is the employer who has left them uncared for, for reasons not altogether unconnected with the health of his (the employer's, of course) pocket! I also said:—"What would the monkish workman—labouring with an infinitude of pains, and wreathing his very soul into the lovely creations of his hands—what would he have thought of the brutal hint, so delicately expressed, that his work 'needed some salt!'—and this is only one of the stereotyped phrases *pour le encourageur* of the modern 'drudge.' And that if his (the monk's) quaint personality could be set down in a shipyard, studio, shop, or building to-day, his employer would not 'keep him' a single hour, but would gruffly tell him to take himself off as a useless 'waster!'"

Now, Sir, would it be too much to ask you to give your readers the benefit of your views—yea, more—your convictions *re* these matters—as it is a subject of general interest?

And perhaps readers themselves will contribute their quota to so pertinent a subject.

And now, Sir, as we Northumbrians say:—"Wishin' yor pyepor ivvory success, hinney!"

I beg to sign myself,

"GEORDIE."

RICHARD CARPENTER'S FIRST CHURCH.

To the Editor of THE BUILDERS' JOURNAL.

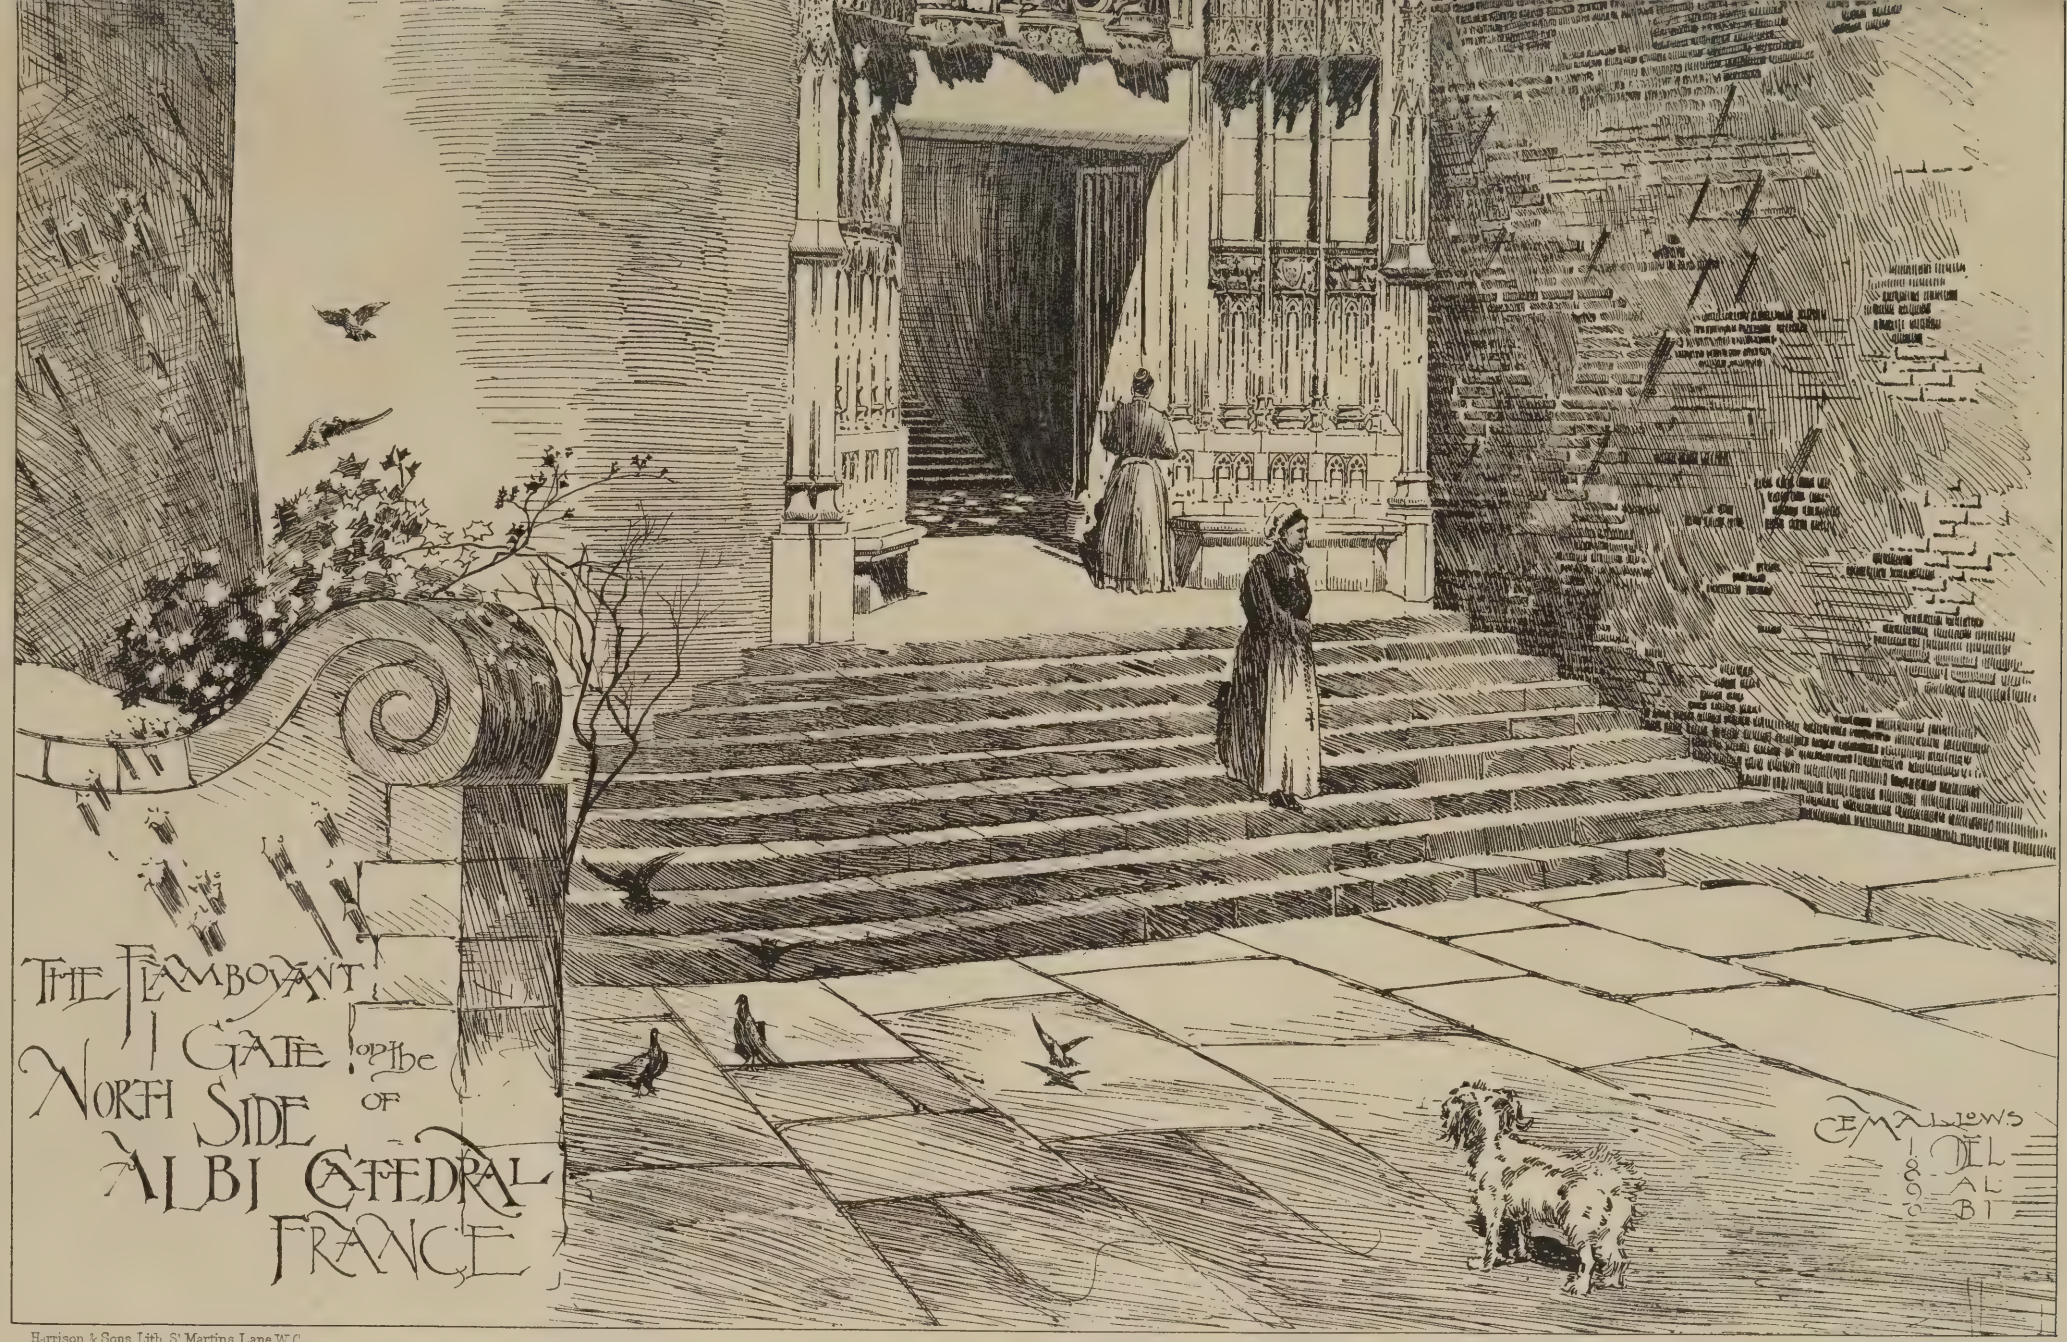
SIR,—Your issue of September 23rd contains an interesting notice of the repairs effected recently at St. Stephen's, Birmingham, but in the account the name of the Church's Architect is not given. May I be permitted to remark that St. Stephen's was the first Church built by one who may be truly called the regenerator of old English Church Architecture—Richard Carpenter, whose death in 1855 at the comparatively early age of 43, deprived the Church of England of one of her most enthusiastic ecclesiologists? Unfortunately, we Londoners can only point to one Church from the designs of this very remarkable man—St. Mary Magdalen, Munster Square, a structure on the "motif" of the great Augustinian Church near Broad Street and evincing in its every detail the impress of an Architect who thoroughly understood the grammar of his Art. For the period of its erection (1839-1841) St. Stephen's, Birmingham, is a marvellous production; indeed, if we except St Giles's, Camberwell, which was in hand from Scott's plans about the same time, certainly nothing so good as this was raised contemporaneously in the kingdom, for sobriety of treatment and truthfulness of design. Another, and somewhat later Birmingham Church (St. Andrew's), is also from Carpenter's designs, and, as do all his works, exhibits a thorough acquaintance with, and a desire to emulate, our old English parochial Architecture of the Midland Counties—notably Northants and Rutland.

The well-known Church of St. Paul, Brighton, and All Saints, in the same town, are Carpenter's, besides a host of others in various towns and villages of the kingdom; St. Nicholas College, Lancing, and St. John's College, Hurstpierpoint, being among his most extensive works. Whether Carpenter would have developed a taste for those foreign forms which set in shortly after his death it is not possible to say; certainly his works give no such indications. He was eminently English, in which respect his name stands side by side with that of an Architect who has but lately passed away from us—another early ecclesiologist, and labourer in the same field—Henry Woodyer.

With apologies for the length of this communication.

Yours, &c.,

THE AUTHOR OF "LONDON CHURCHES," &c.



MR. SIDNEY À COURT has removed from 19, Old Queen Street, S.W., to Artillery Mansions, 75, Victoria Street, S.W., to which building he is Consulting Engineer.

AT Worcester a new Railway Mission Hall was recently opened in East Street Arboretum, by Miss Benyon. The building has been erected at a cost of £1,000, and is arranged to seat 450 persons.

THE memorial stone of St. David's Episcopal Church, Govanhill, Glasgow, has been laid by Mr. Gavin Stewart. The building, which is situated in Aitkenhead Road, will accommodate about 300 presons.

Influences. Elsewhere, representatives of this Journal have noticed in detail several of the more noteworthy or pleasing exhibits among the Arts and Crafts on view at the New Gallery. But when we consider that close upon 700 exhibits attract (or distract) attention, exclusive of the drawings and pictures (also on view) of the late Ford Madox Brown, it will be obvious that the bulk of so much work cannot be of the highest grade. The average is better, undoubtedly; of fuller promise, of ampler suggestion. The field is wide enough, ranging, decoratively, from the mansion to the wayside cottage; from the swinging signs of country hostelries (which we hope to see revived: the signs as well as the hostelries!) to the candelabra of the open-roofed homes the *nouveaux riche* are tardily affecting. But with all due deference to Influences we do not pretend to admiration for Schools, and there is, we think, too much disposition shown for the paths Morris and Crane have securely trod. The Influence of Sir Edward Burne-Jones the more openly produces the negative result, though the growth of the Burne-Jones Type is one of the most remarkable of Renascences. Everywhere, it has been remarked, you see Burne-Jones women. And, whereas, a decade ago they seemed the very mythology of our dreams, now they appear to us—almost any day in Bond Street, *outside* the Galleries—in flesh and blood. The development is singular, but to be accounted for, we believe, as much on the ground of the penetration of the poetry of Design to the better class homes of the land as on the direct appeal of Sir Edward Burne-Jones's pictures. The realisation of the expected is to be the lot of life, even in Art, and even from such men as the three we have mentioned. Morris is the Morris of the earlier Arts and Crafts at the present Exhibition, and, once again, we must confess to some sense of disappointment at the product of the Kelmscott Press. The type is still grey, lacking in boldness and force. Mr. Crane's quaint and chivalrous drawings for the "Faerie Queen" demonstrate the ever-evident facility of his Celtic temperament and the same sureness of hand, the same element of Romance, and yet, somehow, they lack the subtler poetry of the poem itself; if anything they are too "mailed" and "girdled." Sir Edward's cartoons but prove conclusively the lankier treatment of his imitators, who get his sparseness of drawing and subduedness of colour without his Arthurian atmosphere and beauty of sentiment. There are sudden and somewhat anti-climacteric juxtapositions, moreover, which at once amuse and annoy, as when one passes from pictures to bed-spreads. The exhibits require more isolation and freer space, and it is their misfortune that they cannot be surrounded by the right environment. Pictures are painted to be hung, but fenders are a contradiction—to use a homely simile—where there is no fire. But if you range with a love for such things through these exhibits you are certain to strike many bits of Design which charm, of Craft which captivate. It is the finest and most encouraging factor in the progress of Art that nothing is now considered too mean, too modest, or too simple for the expression of beauty. One may gaze up, still, at the rose, but not forget the violet underfoot. The penetration of Domestic England has commenced, and when and where it will cease no one can tell. Perhaps it will never relinquish its persistence until, at last, the firesides of the humblest have had cast around them the curling incenses of simple, sincere, and sanctified homes. There are many Butts which spell nothing; but the gradual growth of little things towards Beauty is as possible and as certain—given the right Influences—as the green grass of every spring. Whatever we are upon in Architecture, Sculpture, Painting, we are once again in the springtime of Craft—a recrudescence in land long lain fallow.

DRAWN BY W. EATON, A.R.I.B.A.

OVERPOPULATED!

WANT OF ARTISANS' DWELLINGS AT COVENTRY.

ACCORDING to the Medical Officer (Dr. Fenton), there are upwards of 3,000 insanitary houses in Coventry. Within the last week or two meetings have been held calling the attention of the authorities to the need for house accommodation for the working classes. The Medical Officer, who has long been alive to the gravity of the situation, has from time to time presented reports pointing out unhealthy overcrowding, and suggesting remedies, but until last week nothing has been done. The Corporation has now entered into a contract to sell a piece of land in Red Lane, at £400 per acre, for the erection of workmen's dwellings, and also referred to a Committee the question of providing a scheme for building tenements in blocks, to be let to those tenants who, for sanitary reasons, are rendered homeless by the action of the Council. On behalf of the Corporation it has been urged that they are not called upon to provide houses out of the rates for men who are in full employment and obtaining high wages. Until other houses have been provided there are members of the City Council who have declared that they would not vote for the demolition of the condemned property. The situation, therefore, is unique and interesting; it is to be hoped that it may not have a serious development.

THE OLD PART OF THE TOWN

is the insanitary part. There are, according to Dr. Fenton, at least 3,000 houses which are unwholesome, for the reason that light and air cannot be admitted to them. They are crowded together, the ceilings are low, the too small doors and windows are situated on one side of the house only, and, besides, many of the houses are so sub-divided, in order to increase the sleeping accommodation, that some of the rooms have neither windows, fireplaces, nor other mode of ventilation, and at night are "like closed boxes." Owing to the surrounding conditions improvement is generally impossible, while to close any number of them in the absence of better would only be to increase the trouble. Since March last plans have been passed for the erection of 350 houses suitable for artisans, and another 100 applications are being considered, but at the present rate of progress some time must elapse before any impression is made. In the opinion of the Borough Surveyor there is land available for an increase in the population of 7,500, assuming prices could be arranged, and the various sites built upon. Not only is the town overcrowded at present, but in every direction

NEW FACTORIES ARE BEING BUILT

and others extended to provide employment for additional men. Close to the station the New Beeston Company is erecting a building covering 7 acres, which, it is stated, will find employment for about a thousand hands. Other new buildings are either in progress or contemplated by J. K. Starley and Company (which, when finished, will probably be the largest in the district), Allard and Company, the Triumph Cycle Company, and extensions of existing premises are being made by the Humber Company, the Rudge-Whitworth, Coventry Machinist Company, and the Sparkbrook Machinist Company, besides premises for several new motor-car companies that have been formed. Unless prompt measures are taken, therefore, the last state of Coventry bids fair to be worse than the first. Coventry is the Mecca of bricklayers and carpenters. Large as is the army of these artisans already in the city, many others could be found employment, and one reason for the lull in house-building operations is said to be that the necessary workmen cannot be obtained. But if they could, they could not be guaranteed lodging accommodation. The average growth of houses during the past four years, after accounting for those demolished, is about 150 per annum, so that it would take nearly seven years for the erection of 1,000 houses. Private enterprise is not likely to be able to overtake the difficulty, and the Corporation have refused to put into force the provisions of the

ARTISANS' DWELLINGS ACTS.

According to the Borough Surveyor, there is plenty of land available for building purposes, but he sees no reason why one section of the community should live at the expense of the other. The working men, who could well afford to pay 6*s.* or 7*s.* a week, are demanding houses at rents as low as 3*s.* 6*d.* and 4*s.* There are about 12,300 inhabited houses in Coventry, and the population is upwards of 60,000. At midsummer last year it was 56,000, in 1894 55,300, 1893 54,700, 1892 54,000, and 1891 52,720. The rateable value is £184,000; in 1891 it was £151,646, in 1886 £125,592, and in 1881 £122,914. Amongst the other difficulties incident to the extraordinary increase in the population is the inadequacy of the gas supply. The consumption has increased by 35,703,000 cubic feet during the half-year ended September 30 last as compared with the corresponding half of the previous year. In consequence of the increase it is proposed to lay down a water-gas plant, at a cost of £7,000. There has already been secured a second source of water for the public supply; and a scheme for dealing with the sewage of the city, which will involve a cost of about £100,000, is awaiting the assent of the Local Government Board.

KEYSTONES.

BOLTON is about to spend £30,000 on the extension of its electric-light works and plant.

THE foundation stone of a new fire station in Kirkley was recently laid on the site on Colville-road. The builder is Mr. G. W. Beckett.

IT is stated that the fortune left by Sir John Millais will approach a quarter of a million, and that the average sum received by him for the 300 pictures he painted was £1,000.

THE Hoylake and West Kirby District Council is in the happy position of having more money than it knows how to spend, and so it has resolved to make application for powers to light the district by electricity.

THE site recommended for the new Edinburgh Town Hall is in Castle Terrace, in an area embraced within Castle Terrace, Spittal Street, Grindlay Street, and Cornwall Street. It is expected to cost £60,000.

AT a recent meeting of the Barnsley School Board, Mr. R. D. Maddison presiding, reports were confirmed approving loans to the amount of £7,324 for school enlargement and alteration, and the purchase of property for offices and evening schools.

MESSRS. CRISP, OATLEY, AND SKINNER, Architects, of 31, Clare Street, Bristol, have been awarded the first premium in the open competition plans for the Asylum at Warlingham, for the Borough of Croydon. Designs were received from 18 competitors.

HALE Magna Church, near Sleaford, is approaching completion, and will be reopened by the Bishop of the diocese on November 19th. Nearly £1,500 has already been raised towards the work of restoration, and about another £200 is required to complete it.

PLANS are being prepared for the construction of a new street in the heart of Bradford, namely, from Market Street, at a point near the bottom of Russell Street, to Square Road. The new thoroughfare will enter the square at a point near the Old Assembly Rooms and the adjoining wool warehouse, and will be a great improvement on Woolshops as a route to and from the railway station.

ARTISTIC talent is highly appreciated at the Abyssinian Court. Those Italian prisoners who can use pencil or camera are very much better off than their less gifted comrades, as the Queen gives them her patronage. She is employing numerous officers and soldiers to paint the walls of her new palace, where they live in luxury. There are still 1,500 Italians in Menelek's power, and the lot of the unskilled men is wretched enough.

AT Trieste, in 1811, a terrible explosion took place in the harbour, the causes of which have never been explained. Much loss of life and property was caused, and the "Danae," a French frigate, was sunk. The divers soon ascertained the position of the hull, but all efforts to raise it have since been vain. The vessel contains £120,000 in gold, and the valuable jewels of a French prince s. The divers have succeeded in laying bare a part of the ship's skeleton, and they hope to raise it with a crane.

In consequence of the unprecedented demand for Specimens the Publisher regrets they are now out of print, and he would be obliged if all Architects possessing copies, and having thus been enabled to see the Specimen, would return such as may be spared. The postage will be refunded.

The Premier and Authoritative Architectural Magazine.

The Architectural Review.

THIS MONTH. PRICE SIXPENCE.

Superbly Illustrated for the Architect, Artist, and Craftsman.

The Editors announce the following contents of the first number:

THE WORK OF JOHN L. PEARSON, R.A., with reproductions of some Twenty Drawings, Designs, and Photographs. Mr. PEARSON has actively collaborated in the selection of the Illustrations. The Article will, therefore, be of a most comprehensive and complete character. The Letterpress by JOHN E. NEWBERRY, with Portrait of Mr. PEARSON, as a frontispiece.

LONDON CITY HALLS—STATIONERS' HALL.—By special arrangement the whole of Mr. JOSEPH PENNELL'S Pen and Ink Drawings illustrating the City Halls—never before published—will be reproduced as a Series of Articles. No. 1, Stationers' Hall.

GARGOYLES AND GROTESQUES. A Series of Articles, fully Illustrated, dealing with this most fascinating subject. Sketches for the Series by REGINALD BLOMFIELD, M.A., ARNOLD B. MITCHELL, F.R.I.B.A., JOSEPH PENNELL, G. C. HAITÉ, FRANCIS HOOPER, ANDREW N. PRENTICE, C. E. MALLOWS, and others. The letterpress by C. E. MALLOWS.

THE OLDEST CHURCH IN LONDON — ST. BARTHOLOMEW THE GREAT: Its Restoration. By ASTON WEBB, F.S.A., F.R.I.B.A., illustrated by Mr. ASTON WEBB'S original Drawings and Plans, showing the Restoration, with Mr. ASTON WEBB'S own Notes.

THE WORK OF NELSON AND EDITH DAWSON, Designers, Ironworkers, and Enamellers: Illustrated by themselves.

THE SCHLOSS MARIENBURG: ITS RESTORATION. Completely illustrated, with Notes by Mr. C. FITZROY DOLL.

"LEADED LIGHTS AND OPEN VIEWS." A Series of Editorial Articles and Notes, contributed by a staff of leading Architects and Designers who will regularly contribute to this feature.

The Magazine will have all the Powerful Financial, Literary, and Artistic Resources of "The Builders' Journal and Architectural Review," at disposal for its fullest development.

Amongst the contributors to the first and early numbers will be:—

BELCHER, JOHN, F.R.I.B.A.
BELL, E. INGRESS, F.R.I.B.A.
BLOMFIELD, REGINALD, F.R.I.B.A.
BRYDON, J. M., F.R.I.B.A.
CAROE, W. D., M.A., F.R.I.B.A.
COLCUTT, T. E., F.R.I.B.A.
HOOPER, FRANCIS.
JACKSON, T. G., A.R.A.
MITCHELL, ARNOLD B.
NEWBERRY, JOHN E.
PATERSON, ALEX. N., M.A.
PEARSON, JOHN L., R.A.
PRENTICE, A. N.
SCHULTZ, ROBT. WEIR.
STANNUS, HUGH H., F.R.I.B.A.
STOKES, LEONARD, F.R.I.B.A.
WEBB, ASTON, F.R.I.B.A.
WILSON, H.

CRANE, WALTER.
GILBERT, A., R.A.
HAITÉ, GEO. C., R.B.A.
MALLOWS, C. E.
PENNELL, JOSEPH.
PENNELL, MRS.
WHISTLER, J. MCNEILL.

AUMONIER, W.
DAWSON, NELSON.
DAWSON, EDITH.
VOYSEY, C. F. A.

ANDERSON, WM., BRITISH MUSEUM.
DUNN, WILLIAM.
HORDER, MORLEY.
INCE, HOWARD.
MEYNELL, ALICE.
STRANGE, EDWARD F., SOUTH KENSINGTON MUSEUM.

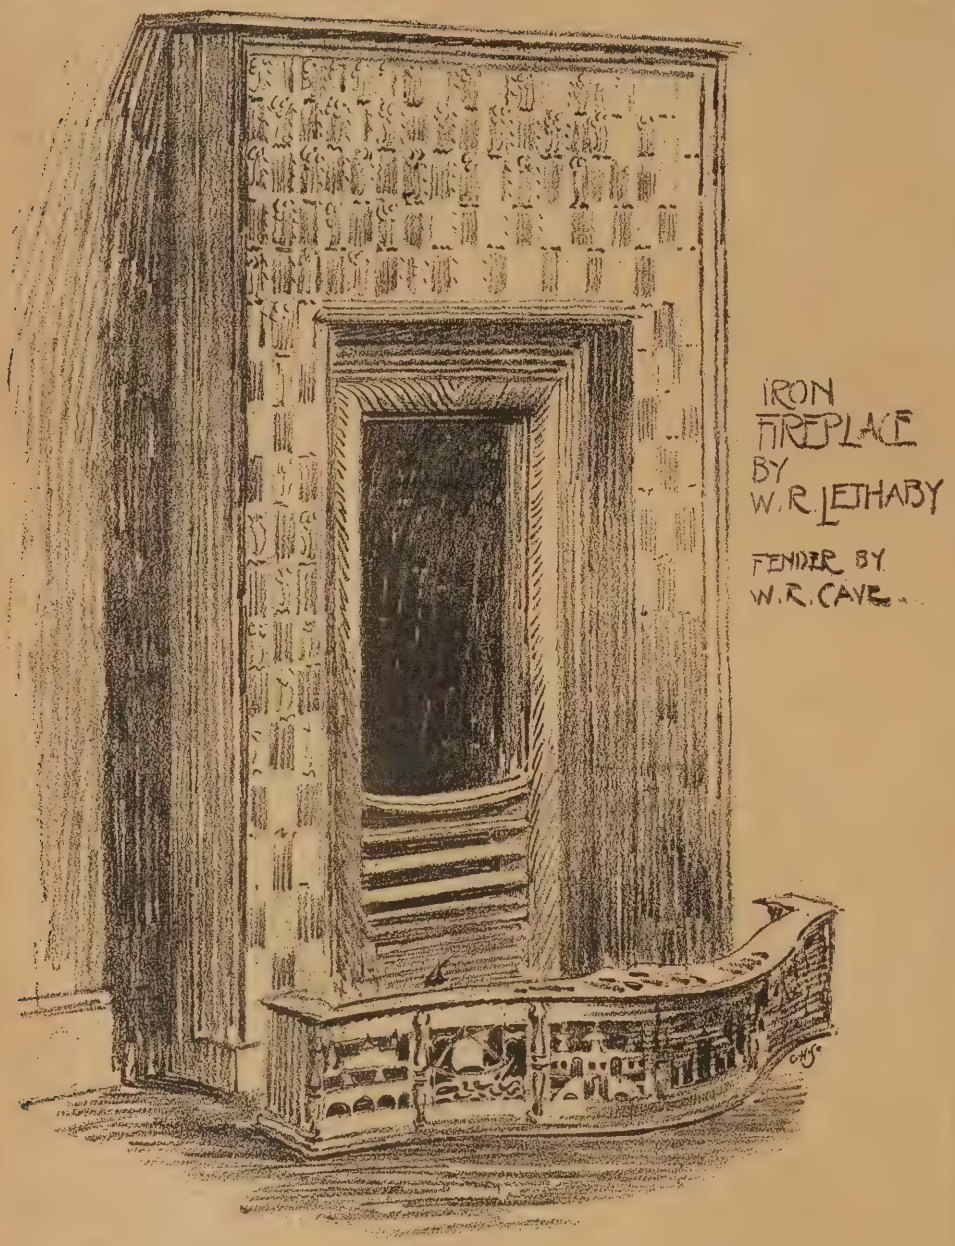
It is requested that orders be given early at any of Messrs. W. H. Smith and Son's Bookstalls throughout the country, or to Local Newsagents, in view of the enormous demand for the Magazine.

TALBOT HOUSE, ARUNDEL STREET, STRAND.

ARTS AND CRAFTS
AT THE
NEW GALLERY.

[BY OUR SPECIAL REPRESENTATIVE.]

WITH SKETCHES BY E. A. RICKARDS.



FIRST NOTICE.

IF, as Mr. Lethaby told us in his Lecture at Bolt Court last October, our designers should "throw away the burden of the thousand years dead palmettes, eggs and tongues, and mouldings, all the trappings of the styles improperly called revived," the authors of the majority of the exhibits at the Fifth Arts and Crafts Exhibition have this element of success, at least, in their efforts, especially as regards the larger and more Architectural of the works now to be seen at the New Gallery. We are not far from the mark in saying that there is scarcely a traditional feature or moulding evident in the four or five fireplaces and other larger pieces of furniture there. If this had led to results equal to the two principal exhibits of Mr. Lethaby, *i.e.*, the larger fireplace at the end of the West Gallery and the smaller, in one corner of the Central Hall, such a maxim might well serve, but except in these two instances the results are hardly inspiring. Yet they are not always discouraging, for one returns, after a preliminary run round, which may have resulted in much disappointment, only to discover that, after all, an original idea, in some cases, still in embryo, has been underlying an apparent absurdity. An occasional visitor to the Gallery cannot fail to notice the difficulty that the "ordinary person" (we mean the uninitiated) has in recognising various articles of a useful nature which they have always associated with some more or less definite form. This in itself goes for little enough, in view of the many abortions in the shape of household furniture we have, most of us, become almost reconciled to; but a piano, for instance, made to open in tryptich fashion has some possibilities of humour, in spite of its undeniably decorative and interesting effect. A too ardent swain might find himself suddenly precipitated if placing much reliance on the support of one of its opening leaves; or, again, a lectern branching into two great serpentining arms, each bearing a very thick and stunted candle, is apt to inspire any emotion other than the rightful one. The affectation of archaic forms displayed in inlay and fretwork has its ridiculous side, even to those of us who have not come upon it suddenly and for the first time.

Another school of designers, who have relied upon the extreme simplicity of their conceptions coupled with the most exquisite and reverent workmanship, do not by any means escape ridicule when they happen to be noticed at all by visitors of an unsympathetic turn. No doubt to these persons the words of the late President, so often quoted during the past week, will occur, and to their intelligence with perfect fitness:

"Dream of dreams, born out of my due time,"

but, to our thinking, these examples of restraint are far from being an anachronism, and rather suggest a real awakening to the possibilities of our own age and its facilities.

The fireplaces of Mr. Lethaby's, made by Farmer and Brindley, of which we have been privileged to give illustrations, are exactly what he has led us to expect by his designs in former exhibitions. We venture to think, however, he has surpassed even himself in the larger one of the two. At the first glance one is rather inclined to disagree with the juxtaposition of the dark green marble and the onyx, but, in reality, the balance given by the two spots of darker colour above the shelf is sufficient to justify such contrasts. The accessories, if playful, are thoroughly in keeping. Mr. Lethaby has evidently allowed himself a little license in these. The two mock parrots above the firedogs, of copper and coloured enamels, are the nearest approach to realism we remember to have seen of his. They are pleasant notes of colour quite helpful to the general scheme. The fender by Mr. Cobden-Sanderson might be owned by the same author, so fitting is its character.

The smaller (474) fireplace or grate exhibited by the Portland Metal Works is of much the same character as the grate to the larger work, its principal decoration being the diagonal flutings in small reversed lengths. The fender here is equally, or perhaps more so, in keeping. It is by Mr. Walter Cave.

There are two fireplaces in the North Gallery, one by Mr. Harrison Townsend, remarkable as being about the largest exhibit in the rooms. It has a decided suggestion of the Indian Courts at South Kensington, in spite of Mr. Frampton's carving, which is everywhere grouped into flat surfaces above considerable undercutting. The carving above the grate is so hidden from light at present that one can hardly gauge its effect. A note explains that in the position of the fireplace eventually, considerable side light will be thrown upon this. As far as one can judge at present, it looks terribly out of scale with the rest. The seats are rather a new departure, but being entirely open at the backs, are suggestive of draughts; certainly they do not look cosy. To our mind this is the least successful of the chimney-pieces, though the effect may be very different if it be at any time contained between two side walls and a ceiling. That of Mr. Voysey's, executed by the Portland Metal Works, hardly shows him at his best, though the proportions are exceedingly restful. The four grouped spindle-like balusters between the side posts and overhanging cornice have a decidedly unstable effect. The more so as the posts under are quite unattached.

The bedroom chair (237) close by, of which we give a sketch, is exceedingly quaint. There is an air of the sick-room about it. The side, unbroken by panels of any kind, is hardly a wood treatment. The enamelling also suggests metal.

The extremely Architectural character of Mr. Frampton's screen (293), executed by himself, rather emphasises the lack of this quality in Mr. Townsend's fireplace. Indeed, more than in any picture exhibition do the various objects react on one another, and this, in spite of the well-meant and directed efforts of the Committee to give each its best place and most realistic position. We can imagine a group, though, formed of Mr. Lethaby's fireplace, Mr. Frampton's screen, Mr. Begg's music commode (291) in Italian walnut, and one or two other pieces of the more restrained order.

The carving of Mr. H. Wilson's choir-stalls (251), executed by Charles Lask and Company, takes the critic by storm, but upon further study of these bench ends, there seems to be a lack of Architectural feeling that should be the foundation of all good work of this kind. This will be more apparent when they are fixed in their ultimate position, we imagine. However, it would be difficult to light upon anything more fertile in invention than these carvings, and we trust that little of their effect will be lost in their future resting-place. Mr. Ernest Barnsley's music chest and work-box (203) as a specimen of modern workmanship is second to none in the exhibition. The design is of the severest kind. Mr. Charles Spooner's small mahogany cabinet (197) and oak table (196), Mr. Ashbee's music cabinet (261), although evidently at once the work of different men, come within the same category. They are models of simple furniture, and could all be lived with; even Mr. Voysey himself in his simplicity is sometimes affected, witness his delightful bedroom chair; but work like the above never disturbs.

There is a simple and inviting-looking chair in this room by Mr. Walter Cave (296), but that by Mr. W. Jarvis close by would certainly have to be taken to pieces before being easily dusted, which would be hardly convenient. A book-case cabinet in oak (308) by Mr. G. Jack, both repels and attracts. The glazing bars are thick and curiously ungainly; but one is captivated by the exceedingly beautiful detail and carving in most of its parts, the lower portion especially. It is moulded in the manner of Mr. Philip Webb.

An oak chest (328) designed and exhibited by Mr. R. S. Lorimer, of Edinburgh, with the quaint panel formed by wood inlays of colours, varying from pink to nearly black, is a marvel of ingenuity. The drawing is wonderful when one thinks of the material, and much care must have been expended on the selection of the different woods.

The bronze lectern (554), designed by Mr. H. Wilson, and executed by himself with Mr. F. W. Pomeroy, is of saddle-back pattern with a figure of the Virgin between the book-rest and square base, to which are kneeling two figures. We wish the small figures at the angles of the base had been replaced by some other feature. The difference in their scale is slightly disturbing. It is exceedingly graceful though, on the whole, and beautifully modelled. One cannot help comparing its effect with that by Mr. Bainbridge Reynolds in the North Gallery. Whatever merit in detail this possesses is lost in a distant view, the line of the arms being awkward and ungainly. The arms coming out of the centre of the cup bearing the candle above, gives the cup the appearance of sliding off. The comparatively small wood lectern by Mr. Ashbee in the Central Hall, though a trifle primitive in appearance, is of a quaint

outline. The gilding of the balls at the feet gives a tinsel-like effect.

Occupying a considerable amount of wall-space in the Central Hall are the iron gates made by Mr. Thomas Elsley and designed by Mr. Reginald T. Blomfield. The design is late seventeenth century in style and a trifle ornate. Excellent the workmanship undoubtedly is. The circular balusters in the gates, the pilasters, and the classic caps are of forged iron, while the lamps are of hammered copper. The central gates only are exhibited, but the total width of the gates will be 27 ft. and the height 18 ft. The illustration is too small to do justice to the work.

There are several pieces of furniture in the West Gallery, though the walls are principally hung with cartoons for stained glass. In a rather out-of-the-way corner there is to be seen an extremely interesting exhibit, consisting of a model and photographs from the finished work of a private Chapel, Douglas Castle, Isle of Man. Mr. H. Wilson is the Architect. Close by are Mr. C. Whall's studies for the detail of decoration to the ceiling. In the photos the suddenness between the blank wall and elaborate frieze and ceiling has a rather harsh effect. The benches are evidently not the work of Mr. Wilson. A similar exhibit is to be found in the Entrance Hall, illustrating the decoration of the Apse to the Lady Chapel of St. Agatha, Portsmouth, Mr. Henry Ball, Architect. Mr. Heywood Sumner is responsible for the decoration. The effect in the photograph is most religious, and the colour scheme can be guessed from the large cartoon of the tympanum of the Chancel Arch which covers the wall of the side of the gallery above.

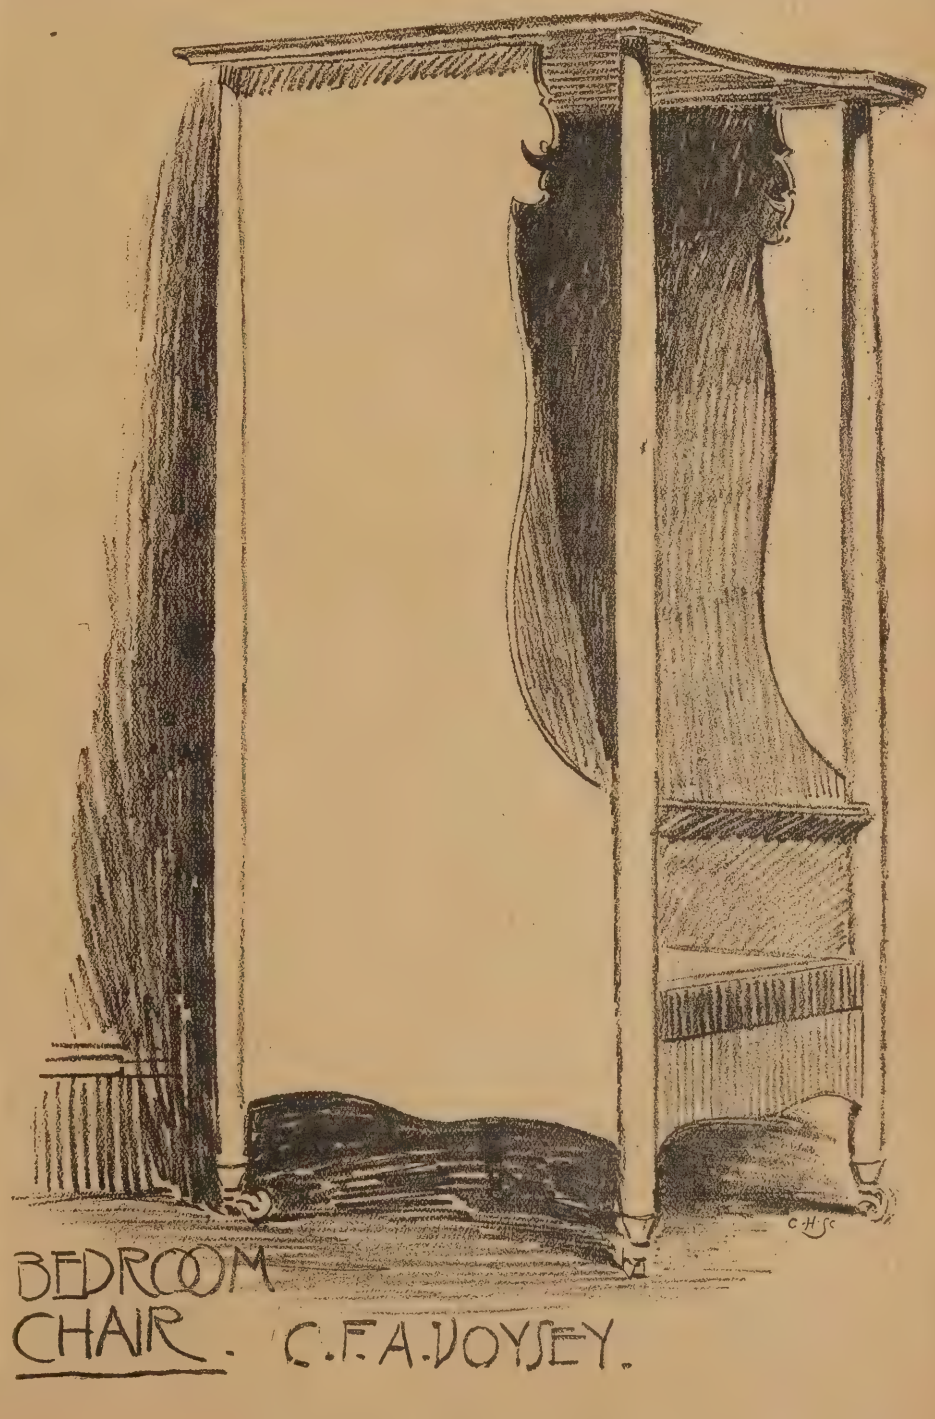
Mr. G. St. Morris cabinet (129), although perhaps over moulded, is quaint without being archaic; the treatment of the angles and feet is reminiscent of some of the best French work of the eighteenth century, although perhaps the author would hardly admit it. It is made by E. S. Ratcliffe and J. Verney, of Barnstaple.

In our further article next week, we hope to publish other sketches, necessarily crowded out for want of space in this number, together with some notices of the many interesting specimens of metal work, &c., wall-papers, and hangings.

(To be continued.)

THE JUBILEE OF THE ARCHITECTURAL ASSOCIATION.

The President's Opening Address.



IN opening the fiftieth session, Mr. Beresford Pite, the President, said:—"All expression of Architecture is attained in a co-operation of workers in building and decoration, and though its Art is imaginative, and consists in the conception by a mind of some hitherto unrevealed harmony, its ideals, dreams though they be, and mere castles in the air, cannot become facts, embodied in diagram, and erected upon the earth, until crystallised, moulded, and chastened by contact and friction with many other ideas, precedents, and workers, sometimes encouraging to the development of the original idea, but more often difficult—though helpful—and the Architect learns how dependent his Art is upon association for existence and life. Within the legitimate Arts it does not appear possible that the higher character suffers by association with the lower. There is a mutual recognition of artistic power and a magnetism in harmonious beauty that, to some extent at least, attracts and elevates imagination and encourages development. To those conscious of some measure of attainment and power the Association says unite; contact with your fellows cannot harm or dissipate your talents, it may perchance affect it with some beneficent emulation, and closer acquaintance increase esteem of your brethren, surely an end not to be despised in itself, while the light of your genius may give, as to tinder, a spark of living motive and Art to many associated in the earnest wish to obtain advancement in their Art, such as is in your power to give. Far from suffering, you will gain a magnanimous enthusiasm for the

Advancement of Architecture

at the hands of all her professors. It is, therefore, in the general interest of the Art of our time that these sessions are held, and that the fellowship of our members should be maintained with the widest possible freedom of entry and union, and jealously guarded against the accretion of any other qualification than that of the simple desire to exercise the Art of Architecture. May it thus continue to be increasingly recognised that this society welcomes all Architects, both students and masters, as members. It is a meeting place for the young and inexperienced, with the matured and well practised professor, for the designer of ideal beauty, with the surveyor of patient humdrum building, without selection, without distinctions, even without qualifications. The maintenance of this universal character in our membership happily ensures freedom from electoral or professional controversy. A constitution which would include all Architects cannot adopt any policy which tends to divide them against themselves, and unavoidable though differences of opinion may be, and necessary as are principle and discipline both in theory and practice, inevitably and of necessity they must not disturb us, who exist apart from all relations which would affect and injure our primal object of mutual advantage and friendship, in the pursuit of our Art. Leaving obvious and necessary professional regulation to those charged with such interests, our own course and functions will undoubtedly lead to the more important and practical issue of a continually elevated standard of artistic and scientific attainment, and a warmer and more natural sense of

Brotherhood within our Ranks.

Let us determine that nothing shall alter our character, narrow our sympathies towards our fellows, or detract from the useful influence that this brotherly association of Architects of all views and attainments has exercised upon our Art. The energies of University and of King's College, the kindly feeling of whose Professors we are not slow to recognise, in their classes and arrangements for Architectural students are developing yearly, renewing their youth after our pattern, but aided by substantial resources and financial aid from the Carpenters' Company, Architectural classes and drawing schools in con-

nexion with polytechnics and technical institutes also increase and obtain shares of the large sum placed by the Government at the disposal of the London County Council for the furtherance of technical education. Towards all who join any of these bodies with the intention of fitting themselves for Architectural practice, we extend a welcoming but not competing hand. We are now enabled to add to the educational forces at the disposal of the Architectural student in London the programmes of the Art Students' Guild and of the London County Council Central School of Arts and Crafts—both of which should be heartily welcomed by all members of the Association, offering original and definite advantages not to be otherwise attained, and indicating the direction of an advance to new and

More thorough Training

in real Architectural Design. It is a matter of sincere congratulation that a student is no longer bound to the mere pedantry of archæological revivals for new motives in design, and that there are not lacking leaders and teachers having insight into the value of the decorative crafts to the higher and decorative crafts upon an admirable plan. The Art Students' Guild is equally a sign of the same movement, and will afford a limited number of students, in the various crafts that comprise the Art Workers' Guild, facilities for meeting, discussing, exhibiting, and working together, in much the same way as their seniors; but we will not predict that the vitality of the elder will suffer by its maintenance of the younger branch, as we have observed in similar bodies. An important suggestion is made in the programme of the School of Arts and Crafts as to the provision of a special course of lectures in the mechanics of construction, including the application of iron and steel to builder's work – mainly addressed at first to the eye and general reason, avoiding mathematics until main principles are fairly understood, evidently contemplating a much broader treatment of the constructive elements of building than has yet been attempted. Of all such privileges the Architectural student should take full advantage; they deal with the essence of his constructive Art, and at some time or other in his course, and not too late, they should be seriously attempted. Again, remember

AT THE ARTS AND CRAFTS EXHIBITION: IRON GATES DESIGNED BY REGINALD BLOMFIELD, MADE BY T. ELSLEY.

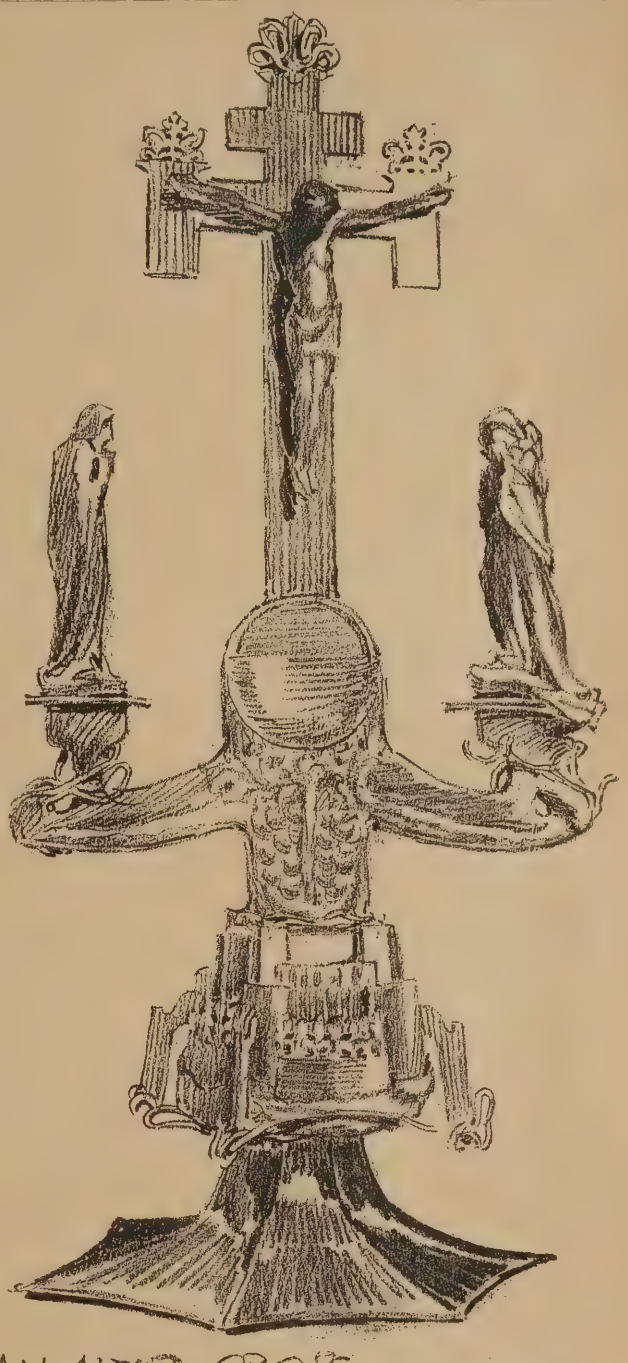
Architect, and enthusiastic as to the influence which he can exercise for good upon all workers in building materials as their Master Draughtsman. The County Council School of Arts and Crafts, which has become actual under the hands of Mr. W. R. Lethaby and Mr. G. Frampton, is the more important institution, and its programme includes practical instruction by craftsmen of proved capacity in stained glass textiles, wall-papers, and furniture, silversmith's work, moulding and casting in metals, with general modelling, drawing, and designing. Sculpture and ornament as applied to Architecture will be under the guidance of Mr. Roscoe Mullins, and Architecture under Mr. Halsey Ricardo. The advantage to the Architect of studying the crafts, which he usually in ignorance directs, is obvious enough, perhaps too obvious to be considered a necessary part of his scheme of education. This want has been felt in the classes of the Association for some time past, and steps have been recently taken in our School of Design and Handicraft to meet some portion of the need by obtaining access to works, as well as to workshop classes, for our members, and the new school, we agree, corresponds to the requirements of the Architectural student, and deals with the that the Architectural Association desires and urges its members to avail themselves unequivocally of every opportunity for improvement in Architectural perception and facility in execution, but ever and only with the broader and nobler end in view, that all such delightful spoil be brought home to the Association for the more widely extended benefit of its fellows. Passing from our relations to other educational bodies to the consideration of our own activities in the sessional programme and work of our classes, and taking the latter first, we find no apology necessary for the existence of any part of our course of study, each having a place among either the necessary or desirable equipments of an Architect. As to this there cannot well be any difference of view, and we are entitled to go further in declaring that all the studies upon which an Architectural student should enter, and the means of their profitable exercise in practical design, are afforded by the Association in its classes, studios, and

School of Design and Handicraft.

The Association classes provide, in the first place, for the subjects in which it is essential that an Architect should be proficient. These are the nature of building materials, building construction, elementary physics, geometry, hygiene, specifications, estimates, professional practice, and drawing. In the second place our classes provide for subjects which are desirable additions to an Architect's education, but which cannot be considered as essential to it. Generally speaking, indeed, as in a more logical sense, they are non-essential. These are the history of Architecture in several stages, land surveying, the history of features, mouldings, and ornament, quantity-surveying, modelling, water-colour drawing, ornament, sketching and measuring, and perspective. It is, however, impossible to regard a real Architectural education and training as capable of acquisition in classes and at lectures, and it may be suggested that the term education, in connection with Architecture in its current use, does not apply to the Art of Architecture at all, but to those subjects upon which reading and lecturing are required. Such of these as can be described as essential will be found to have relation to public health and order, and not to Architecture as a Fine Art, education in which having a different and, as yet, imperfectly understood character. Training in Architecture as a Fine Art is, so far as possible, undertaken in the practice of our studio, and more completely in our School of Design, which requires actual Architecture upon paper from the student, and submits it to the detailed criticism of recognised masters, as well as of fellow students. To this training the workshop demonstrations, the sketching and measuring, modelling, and many of the classes that we have described as "non-essential" properly and necessarily belong, as well as very much else, such as our organised visits to ancient and modern buildings and to works in progress, our sessional meetings, and other facilities for the culture, by observation and mutual criticism, of a sound enthusiasm for

Healthy Architecture.

This training cannot be stereotyped in a curriculum confined to one set of accomplished teachers, or summed up in an examination, and though an ideal training in the art of Architecture may not yet have been attained, we may claim as an association of earnest workers to have found and marked out an approach to this by no means Utopian goal, and to have made it available for all students



who desire to enter upon an Architectural course. This reversal of natural growth has produced, as might be expected, many solecisms and some more serious results. Among these are manifestly the dissociation of the teachers from the examiners, in the unsatisfactory conclusion of the class work to the former, and in the difficulties of the latter through inexperience as instructors. We may therefore be permitted to point out to the Council of the Institute, that the inclusion of some of our instructors as assistants to the Board of Examiners is desirable in the interests of sound education. We make this suggestion encouraged by the result of the representation we made last year to the Institute, when the dates of the examination were considerately rearranged to coincide with the conclusion of our courses of lectures and session. The connexion of the educational work of the Association with the Institute examinations is of necessity a close one, and good will result from the connexion becoming more definite and less inferential. A healthy mutual policy of thorough education in those subjects which the interests of the community as well as of the profession demand, must form the basis of an Architect's qualification to erect buildings for the use of his fellow-creatures, and cannot but be welcomed as reasonable by all Architects. This Association, with its past record and present work of Architectural training, has a wider scope of view than that of qualification for candidature of the senior body, but we cannot be unconscious of the tendeney that exists to use our membership and classes only as a means to the Institute Qualification. To make the examination a goal instead of an introduction to paths of Architectural knowledge, is an idea which has always been rightly and fully deprecated by the Institute as mischievous, and this needs not only additional emphasis, but some readjustment of the examination programme to deal effectively with the evil in the future. It will be manifestly impossible, even without discussing its propriety, to distend the scope of the examination in order to include the whole Art of Architecture as its subject, but nothing short of this will effect the inclusion of everything desired, within the focus of either the parent earnest for his son's diploma qualification, or of the individual or collective crammer. The alternative which I would venture to urge very earnestly, is to concentrate the examination upon those subjects, as to the essential character of which all Architects are unanimous, and which the voice of public opinion will acclaim as in the interest of the community, and to eliminate those other subjects which, however desirable as additions to a Designer's general knowledge and acquirements, are not of any public importance as necessary to a satisfactory discharge of an Architect's duties in erecting good building. It should be observed that, in the subjects that are indispensable, it is possible to obtain a satisfactory test of complete knowledge, as each is definite as to the point of qualification to be attained, while the omission of the non-essential portions will remove the practically illimitable and indefinite subjects of Architectural history, ornament and design upon which only a wide general reading and cultivated observation can afford any useful breadth of view. A hurried and incomplete study of any branch of knowledge is to be avoided, and especially of subjects universal in range, as Architectural history, or indefinite in measure, as the inventive and imaginative quality of design; while the mechanical practice of confining the student to one period or one subject, solely to achieve examination by sample, is unhealthy for the mind, and highly to be deprecated in the interests of an enlightened study of Architecture.

Examination

in the power of design of course can be achieved if undertaken under proper conditions, as also in the power of expressing ideas of design in drawings, but such conditions do not exist in the present programme of the Institute, and power of design cannot possibly be brought at all to a test apart from a freedom of mind and wide access to authorities; and is most alien to the atmosphere of an examination hall which indisposes and freezes the imagination, rather than aids it to warmth and vigour. We cannot agree, and may I add the personal opinion that the body of members of the Institute and of Architects at large, do not consent to anybody claiming the right of marking by examination the natural constitution of a mind as sufficiently imaginative and usefully inventive, to qualify the person mentioned to act as an Architect. This assumption has but to be stated to be condemned, and should be dismissed from the examinations, the limits of which should be reduced to a useful concentration upon the needful work of qualification for the proper direction of building works; and the Institute will then be in a position to attain to that wider representation of Architects to which it rightly aspires. The proper test of powers of design, however, is a subject not of any great complexity, apart from the examination question, as the continuous success of the Institute students' prize competitions and of the classes of design of this Association will show, in both of which cases every liberty and stimulating encouragement is given to the student to produce evidence of his best powers. The work of our educational classes, which is distinct from the general scheme of the Association, involves heavy expense beyond the receipts from the students' fees, which fees practically balance with the payments to the lecturers and instructors, the special educational and premises fund being charged with the cost of maintenance. It is to this purpose that the contribution of the general body of the Institute is applied, and without which the efficient working of the classes would be greatly hindered. Our members should realise that their ordinary subscriptions to the Association afford no help to its educational work, which is dependent, as already stated, upon

Special Contributions.

The spirit in which the instructors and lecturers have met the Committee in reducing the cost of the classes to the lowest possible limits deserves our heartiest appreciation, in addition to the special consideration due to our honorary lecturers of last session, Mr. Statham and Mr. Hart. The Association has a greater influence to exercise than that over the education and training of those about to practise Architecture. The greater part, by far, of its members do not belong to its classes, and are precluded from sharing in the benefits of its studio. In the exercise of its more ordinary and greater usefulness, the sessional meetings have a large share, all our members, through the assistance of the professional journals, can profit by the valuable information given, and by the interesting discussions at our meetings, the character of which has not only been maintained, but has risen during recent sessions. We may well be proud of providing the occasion for the wide publication of the large quantity of Architectural knowledge that a review of our sessional papers for past years displays, and as providing a platform for the expression of current Architectural thought we claim the support of all members of the profession. There is another function of considerable importance fulfilled in, what for want of a better phrase may be called, the social side of the Association's work. The benefits of pleasant intercourse with colleagues and brethren would not exist for London, and representatively for British Architects, but for the annual gatherings of our conversazione, soiree, and dinner, while the annual country excursion and the facilities that occur for smaller social gatherings in lyric and other clubs make up an important sum of really useful influences which we alone afford to Architects as fraternally united.

AT THE ARTS AND CRAFTS EXHIBITION.

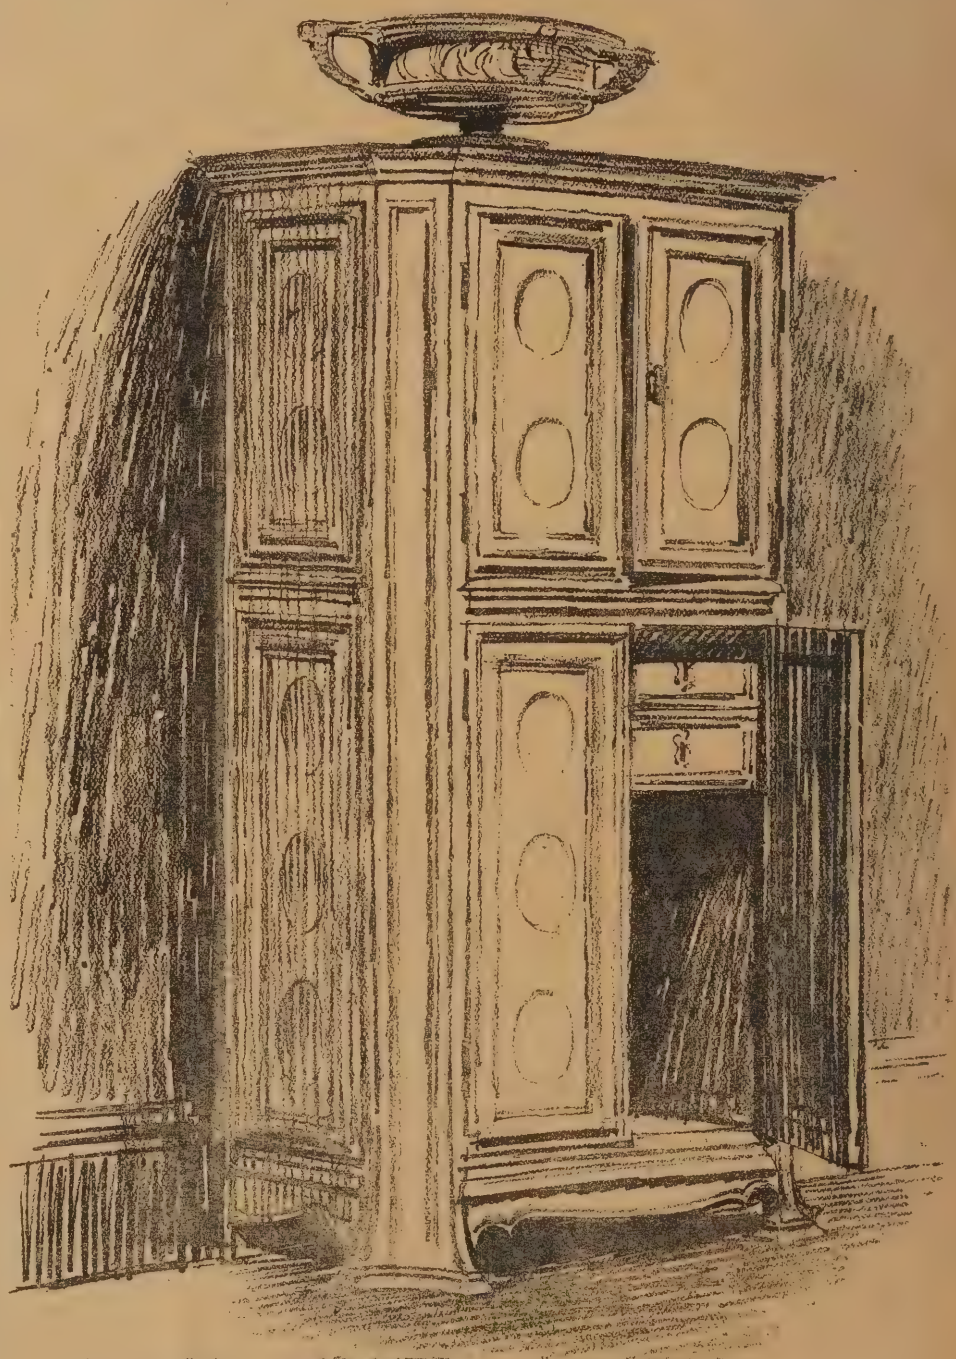
A Suitable House

for all our labours we still hope for, but having now learnt how to wait and survive disappointment from within and without, we watch the more eagerly for the opportunity which shall embody our hopes of a proper and useful centre for our now rather disjointed machinery, assured that certain growth in all our branches will attend a transplanting from our now sadly pot-bound condition. As a means of awakening interest in Architecture, and, perhaps, as more readily accessible to the uninitiated, the perusal of biographies of Archi-

tects is to be recommended; the greater the hero and the wider his Art the better. The sympathetic interest of narrative may assist you to comprehend the existence of the esoteric fire which makes the artist fervent. Enthusiasm is itself highly infectious, and the memorials of such a man as Augustus Wilby Pugin, or of Sir George Gilbert Scott, are in their measure inspiring—while the study of the lives of the giants, of Wren, Inigo Jones, and the masters of the Renaissance, should provide an irresistible contagion. Avoid as unworthy the affectation that copies and simulates greatness; which sees only the mannerisms or insignificances of the artist, and knows little or nothing of that Art which has real life. This passing caution is a needful one, forgetfulness of it has already, in the course of a few years, led Architecture into dry-as-dust archæology, and promises yet to plunge us into an antithesis of affected nakedness. From mouldering old age to simpering idiocy seems as short a step in the passing fashions of day as in the decay of physical existence."

Mr. Aston Webb, in proposing the vote of thanks, said, in referring to the ability of the President, that many of the senior members would recollect a certain competition medal some years ago which was distinguished for its boldness of design and draughtsmanship, to the great surprise of the Association. Perhaps this surprise was somewhat increased when it was found that no less a one than Mr. Ewan Christian was amongst the competitors, and when it was inquired of him how it was that he was entirely in accord with the award, he explained that it was a thoroughly *practical* design, and would work. He said you might build it. And he was sure all present had benefited by the address. But there were one or two points in connexion with the Association which he should like to mention:—"We have been told to-night that there was a considerable *deficit* at the close of our last financial year, but I do not think that this matter is so very serious. I have not the least doubt that this Association will speedily wipe off the debt, and that the next balance sheet will show a surplus. With regard to the *premises* which you have also mentioned, I venture to say that you and your committee have adopted a very wise course in remaining where you are, even though you are, of course, greatly inconvenienced and hampered by the present arrangements. The time must come when a better building will be provided, possibly by the Association, possibly by both parties. I trust that the Association will persevere in their educational work, and that all those who are at present preparing themselves for an Architectural career will go on attending classes either here or elsewhere. It is my firm opinion that the funds should come more from the subscriptions than from the fees paid for the classes. The character of the discussions, &c., has considerably improved during the last session, and the attendance generally was greater than the year before. I venture to say that it seems to me most important that the lectures of the Architectural Association should be attended. For one thing, it seems hardly courteous not to attend, considering the great amount of trouble which has to be incurred by the lecturers in the preparation of their addresses, and besides, there are so few who do not derive *some* benefit and light from these lectures. In addition, the great advantages to be derived by a young man who is an earnest student cannot be underestimated, as he is enabled to meet in speech with others and discourse on subjects of interest before his fellow-students."

Mr. W. D. Caröe seconded the vote of thanks, and said it was absolutely necessary and essential for every President to deal with the subject of examinations, and he sincerely hoped that the time would come when it would no longer be necessary to deal with that subject. As one who had been in the throes of examinations for his whole life he could but feel the justice of the remarks on this subject, and he also hoped that the members would carefully read and mark what had been said upon the subject of co-operation, not only as far as the classes were concerned. One really felt more and more that almost a prime mover in all successful work and successful design was Enthusiasm. The late Mr. Ewan Christian took a keen interest in his work up to his eighty-second year of age, and his enthusiasm for the best work was as great at the end of his career as it was in his eighteenth year. That virtue, which is hidden, is vaster than that which appears upon the surface, and therefore it follows that no building is really a great building which has not something to hold behind for the observant and educated few, and he hoped that students would always pay attention to such details which may have something to tell to competent observers in the future.



Mr. E. W. Mountford said he wished to add a few remarks. It seemed to him that nowadays students had far greater facilities to work up for examinations, but whether they were of any use to them or not, the future only could show. The amount of work one had to get through was simply appalling, and it had always been a surprise to him that students were not all bald-headed. The President had also referred to the Commercial Architect, who was well sat upon generally, and he thought that the Architectural student, who claimed to be artistic, rather neglected Commercial work. Of course, churches and Government buildings were not required to be made to pay. But most other buildings were required to be made to pay.

Mr. Lane and Mr. W. H. Seth-Smith also supported the vote of thanks.

THE VALUE OF TIMBER.

TIMBER YARDS OF NEW YORK.

IN one single lumber yard in New York it is no uncommon thing to see a stock of rare and costly woods, some from the countries of the Equator, others cut from American forests, that is valued at 50,000 dollars, or more. In one block near the East River front there is often a million dollars' worth piled up in the open air or under the cover of rough sheds. The veining and mottling of a log and the veneers that are made from it fix its value. While all these special woods of commerce are costly, prices three and four times the average are paid for unusual patterns of rosewood, mahogany, and black walnut. There are several hundred varieties of fine woods brought each year into New York, but of these only a few are known to commerce to any extent. Mahogany, French burl, rosewood, curly ash, American quartered oak, figured birch, black walnut, Circassian walnut, and satinwood are the fancy timber varieties that sell the best, their price

AT THE ARTS AND CRAFTS EXHIBITION.

running from 3 to 10 cents a foot for veneers. These figures give no adequate conception of values until they are examined carefully. But the calculation is a simple one. Thirty veneers are allowed to each board of an inch thickness, the boards of these costly woods running about 2 ft. in width. As a rule these boards are 8 to 10 ft. long, and thus a single veneer of mahogany 2 ft. wide and 10 in length is worth, by itself, from 50 cents to a dollar. A double row of these veneers piled up 5 ft. high, is worth easily 2,000 dollars. In the log, mahogany sells at New York at a dollar to a dollar and a half a foot, board measurement. It comes from Mexico and Cuba, and, brought to this city in logs, it is sold in veneers. These veneers, stacked up in piles in the sheds, are so brittle, that the only way of shipping them to the furniture and piano manufacturers is to pack them in cases. A case usually holds 500 sheets, or from 300 dollars to 500 dollars' worth, and is so heavy that the strength of from four to six men, with rollers, is necessary to get it upon a truck. A case is known in the trade as a "flitch." Even unvarnished and unpolished as these rare woods are in the rough, the patterns are easily visible and the designs and veining are very beautiful. Nearly all these woods are sold in veneers, for two reasons —first, they are too costly to use solidly, and secondly, they all have a tendency to warp. Next in popularity to mahogany comes American figured walnut, from Kentucky, West Virginia, Tennessee, and the western ports of North Carolina. The finest logs of this timber are to be found on the slopes of the Blue Ridge and Cumberland Mountains. So important is it to get

WOODS OF FINE PATTERNS

that the leading walnut-dealers inspect the trees themselves before they are cut down. They employ experienced woodsmen to search over the whole region where the best walnut lies for months at a time, and then, the finest trees having been marked, the dealers leave the city and travel through the woods on horseback themselves, selecting the most valuable trees, afterwards buying them from the farmers or the owners of the land. These precautions amply repay the trouble, for the reason that at times American walnut sells for 20 cents a foot in veneers, and a single log 6 ft. long has been known to yield as much as 525 dollars. From Bahia comes the finest rosewood of the world, its veneers selling at 6 cents a foot. It is not sold, however, in any great quantity, as rosewood is no longer the fashionable material it was in the days of our grandmothers. White mahogany from the west coast of Mexico and satinwood from San Domingo of a pale yellow tint and of dainty pattern, the finest qualities of which have sold for 60 cents in veneers and the poorest veneer less than 10 cents, are still in great demand.

ONE OF THE MOST CURIOUS

of the rare woods is Amboy, reddish-brown, veined irregularly, and used mainly for inlaying. It comes from Africa, and is sold at 20 cents a pound. Two of the finest foreign woods are French burl, from Persia, and the Circassian walnut that is cut around the shores of the Black Sea. French burl costs 15 cents a pound, and its grain is a most curious thing. It is really a walnut wood, the "burl" being a wart, or knot, that forms on the side of the tree while it is young, thus twisting the course of the sap vessels, and forming strange patterns and odd combinations of lines. At times these burls are extremely valuable. A single log has sold for as much as 2,500 dollars. The features of Circassian walnut are the high polish to which it can be brought and its vivid stripes of dark brown and black. Some other expensive native woods are figured curly ash, figured North Carolina birch, which has a reddish tinge; poplar and American quartered oak, used mainly for house work. All of these fetch from 3 to 5 cents a foot in veneers. Ebony sold at 70 dollars a ton, cocobolo, somewhat resembling rosewood, and granadilla, heavy and black, are much in use for knife handles. San Domingo lignum vitæ is perhaps the heaviest wood that is to be found. A stick 18 in. in diameter, and 3 to 4 ft. long, weighs from 500 lb. to 600 lb. Spanish cedar and snake-wood, the latter so called because its grain is like the markings of some serpents, are used for many purposes. Turkish boxwood goes to New York in rather large quantities, and has long been the popular material for wood engraving.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
October 14th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN connection with the extension of the Public Record Office, the work going on at the present time comprises the laying of the foundations for the portion joining together the old building in Fetter Lane and the handsome new structure which fronts Chancery Lane. The existing gap has been produced by the regrettable demolition of the ancient Rolls Chapel and the Rolls House, and when this site is again covered—it is estimated in about 18 months—the old and new buildings will form two unbroken sides of a parallelogram. Another fresh structural line, making the third side of the figure, will then be commenced; and the entire scheme of enlargement is expected to occupy altogether about five more years. The section now in hand is designed to include a museum, in which will be preserved many valuable memorials and relics from the Rolls Chapel and the Rolls House, these objects of interest having been carefully removed when their former homes were pulled down.

ONE of the oldest and most characteristic houses in Morpeth has been rased to the ground. It was the only remaining example, save one, in Morpeth of the first floor overhanging the ground story in the manner that prevails in old Chester, in Shakespeare's country, in the old towns on the south coast, such as the old Mermaid Inn at Rye, and in some of the smaller towns in Devonshire. The house in Bridge Street, Morpeth, was pulled down under the superintendence of Mr. T. W. Middlemiss, the borough surveyor. The masonry in it was composed of stones obtained from the ruined Abbey of Newminster, about half a mile west of the Market Place. The abbey had been a convenient quarry where stones were got at a cheap rate The thickness of the walls and the capacity of the chimneys were quite wonderful in their way. Many of the stones were carved, and these were invariably built with the carvings concealed in the wall, a plan which saved redressing them. The front of the house was supported on beams or battens. Along the top of these stretched a very heavy beam of oak, which supported the beams for the first floor; these latter projected over the oak beam about 15 or 18 in., and thus the projecting upper storey was sustained. Newminster Abbey was dissolved in 1535, and most of it appears to have been destroyed shortly after. The house which has just disappeared cannot have been much less than 350 years old.

SHREWSBURY, which was the chosen place for the holding of the Church Congress this year, possesses unrivalled specimens of ecclesiastic and domestic Architecture. The old red sandstone castle, which was erected to guard the only part of the town not protected by water, was built by Roger de Montgomery in 1070, and was last used as such by Charles I. Opposite the castle is the old Grammar School, now owned by the Corporation, and used as a free library and museum. On either side of the main entrance are quaintly-carved figures of a schoolboy and a graduate in seventeenth century costumes, and above them, gaily emblazoned, the armorial bearings of Charles I. The old Elizabethan Market Hall, in the centre of the Market Place, with its arcade, curious carvings, and mullioned windows, is another object of admiration. A figure of a knight in armour in a tabernacled niche in the north gable is said to be that of Richard, Duke of York, father of Edward IV. Of the Churches perhaps the massive Norman Abbey Church deserves mention, as this formed the Church of the famous Abbey of St. Peter and St. Paul, which was founded in 1083. Only a few straggling walls and broken arches remain to show the proportions of the Abbey, but a graceful Gothic stone Pulpit, which is now, alas! situated in a potter's yard, marks the site of the Refectory. St. Mary's Church is well known as being one of the best examples in the kingdom for illustrating the growth of mediæval Architecture, possessing as it does specimens of almost every style, from Norman upwards. There are also in the Church some beautiful and historic stained-glass windows. St. Giles's is said to have been the resting-place for a short time of the remains of St. Wenefrada previously to their interment in the Abbey. St. Alkmond's and St. Chad's are, comparatively speaking, new, but the latter is interesting on account of the novelty of its design. There are a number of quaint half-timbered houses in the town. The gateway to the Council House, with its carved oak pillars, massive gates, and intricate woodwork; Ireland's mansion in the High Street, and the building "erected by Richard Owen, the elder," opposite, are unique specimens of this style of work. But one finds old houses of this description at every turn, and oak floors, oak panelling, and Elizabethan staircases are anything but uncommon in Shrewsbury. By the banks of the Severn one will come across the New Grammar School, the old watch tower, the watergate, and the old tower in the town walls—the last one left of twenty which were erected in Henry III.'s reign.

AT a recent meeting of the South Wales Art Society held to inaugurate the opening of the ninth annual autumn exhibition of pictures at the society's gallery, Queen Street, Cardiff, Lord Windsor said:—They had heard hard things of Welsh Art, and he would not say they were altogether untrue, but some people had ventured too far in their criticism of it. It was hardly possible to imagine that artists born and bred in Wales should take their position as Welsh artists, under the position they had to hold. It was not the fault of the artists; it was the fault of the public. Taking some of the larger towns of England and Scotland, they found there a great, appreciative public who knew what it was to honour an artist who lived in their midst, and showed their appreciation of him by the ordinary method of purchasing his work. But how could a young artist establish himself in a village near Cardiff, say, in the delightful village of St. Fagan's, and make a name for himself? If such a one existed, he naturally went to London, where he had the possibility of making himself known and appreciated. That was their difficulty. They had got the population, commercial position, and education, but he hoped in the future Art would not be forgotten. There were possibilities of the Government giving them assistance that would be invaluable; but if they prepared the way, if they gave proper facilities, if they had a proper gallery, they would find their friends in Wales would come forward, and there would be in Cardiff appreciation of Art equal to that in the other large centres in England and Scotland.

TWELVE months since the City Council acquired a site of about 4,030 square yards in Milk Street by an improvement scheme for the better housing of the working classes. The ground was at once cleared of the insanitary buildings that formerly occupied it, and it was offered to private builders for the erection of improved dwellings. The Improvement Committee obtained authority from the City Council in May last to formulate a scheme for carrying out the provisions of the Act of Parliament on its own account, and it is felt that the time has arrived to take action, and it is intended to recommend to the Council the erection of 68 dwellings, at an estimated cost of £6,500. Designs for the proposed buildings have been prepared by Mr. Addie, somewhat similar, although improved in some details, to buildings of the class that have been erected in Liverpool. The suggested dwellings are in two storeys, the upper floor consisting of distinct dwellings to those on the ground floor. The latter are entered from the level of the street or terrace, while the doors of the former open on to

an external balcony at the back. Each dwelling consists of a living-room and two bedrooms, a scullery and closet being provided in a detached building at the rear. These tenements Mr. Addie describes as "labourers' dwellings" rather than artisans' dwellings, and estimates that they may be let at rentals as low as 3*s.* 9*d.* to 4*s.* 3*d.* per week. They are not correctly described as "flats," as each dwelling has its separate entrance and is self-contained, but the plan to a certain extent would embody the advantage of the flat system, of being able to place more than one dwelling upon land that otherwise would be monopolised by a single house, and so reducing the cost.

IN a very able and pertinent letter to the Irish Times Mr. Thomas Drew, president of the Royal Society of Architects, protests against the wholesale obliteration of old street names in Dublin. One would have thought that in a city where patriotism is supposed to have its highest manifestation, and a large element of it is regard for antiquity, there would be a desire to preserve and not destroy old landmarks and historic reminiscences. Instead of this, the "powers that be" are apparently always ready, at the suggestion of anybody, to alter the name of a locality, creating confusion where questions of identification arise, and absolutely cancelling many incidents which were usefully kept in recollection by the title of a thoroughfare. Mr. Drew gives instances of the perfectly causeless and indefensible meddling, the latest instance being the substitution of the fancy and inapplicable name of Chancery Street for the former well-known Pill Lane. Why not change every street by one sweep, so that the present humour may be satisfied, and Dublin become a perfectly fresh place, on an entirely new nomenclature? There are people, doubtless, who would desire this. They would not care what outrage it proved to sentiment, what offence it was to dramatic instinct, or what damage to business, if it gratified a selfish whim. The tendency is not only ruinous historically, but reflects a temper that is not in any sense commendable. Mr. Drew explains that only ignorance of the significance objects to the word familiar in one case. Mullinahack, on the other hand, was a strong, well-sounding term, and gave offence to nobody. Elephant Lane and Tucker's Row are older changes of highways from Sackville Street. But why even those alterations were made, nobody can tell.

LATE years have seen several monuments erected in the City churches to notable men whose place of burial had for centuries been suffered to remain unnotified. Thus Milton has now a monument at St. Giles's, Cripplegate, Samuel Pepys a tablet at St. Olave, Hart Street, Sir John Gayer a brass at St. Katherine Cree, and John Hemming and Henry Condell are memorialised in a splendid monument at St. Mary-the-Virgin, Aldermanbury. The practice should surely be extended to other City great ones whose burial places have at present nothing to indicate them, says the City Press. For instance, St. Benet, Paul's Wharf, received, in 1653, the remains of Inigo Jones, whose influence on City Architecture, fostered by his still standing Church of St. Katherine Cree, and transmitted by Sir Christopher Wren, still stamps the City ecclesiastical and much of the City commercial Architecture to-day. And yet St. Benet's contains nothing to note that it was there that he, Inigo Jones, was buried. It is true that St. Benet's did not always bear this reproach, for before the Great Fire it contained a monument to his memory. After the Fire nothing was done to tell the generations that come after "Here lie the ashes of Inigo Jones," but it is time that this should be remedied. Will not the Rev. W. J. Loftie, whose appreciation of both Inigo Jones and Wren is so well known and so enthusiastic, set the matter afoot? A simple stone or brass would not cost much, and it is surely worth the doing.

A SMALL collection of drawings by Sir Edward Burne-Jones is to be seen at the Goupil Gallery in Regent Street, which are described as "painted in a new method." About the method there does not seem to be much that is new, though the result is pretty and decorative enough. The compositions, single figures or groups, or studies of heads, in the well-known manner of the artist —are delicately pencilled with the brush, chiefly in various shades of gold, on a groundwork of flat colour. This flat groundwork, of a pronounced but rather low tone—blue or brown, purple or pink—resembles the body colour preparation with which the Italian masters covered their paper before drawing in silver-point. There exist drawings by Ghirlandajo and Lorenzo di Credi on paper of strange dyes. The effect is perhaps rather odd than pleasing, as the ground colour is purely arbitrary, and does not serve any purpose of suggestion. Some draughtsmen, it is true, have so used the colour of their paper as to produce a charming and discreet hint of natural effect; but, as a rule, the more quietly this is done the better. A strong tone would defeat its own object. With regard to the present series, some persons will feel that the drawings are most satisfactory where there is least colour, and least so where the colour is most pronounced.

AT the inaugural meeting of the Chester Guild of Arts and Crafts, Dr. Darby defined Art as an endeavour to give the highest ideal of beauty in all its forms. That in itself certainly demanded at the hands of those who worked in Art considerable self-government, considerable control, lest their ideas should become fantastic. When one looked at the history and realisation of Art he might sometimes have been struck by skill running somewhat wild. Then Art did not become perhaps quite as healthy and wholesome as could be wished, but when any endeavour requiring at our hands self-government, self-restraint, and also the highest possible endeavour to reach the summit of the ideal was spoken of one knew that then a very great work was going on. And if, as he supposed, all had felt, more or less, that no colour that skill could discover in the wonderful combinations here given to us by the study of chemistry and so forth, reached the natural beauty of the rainbow, or the colours we saw in the clouds, the flowers, and the sea in the sunlight, that did not proclaim the uselessness of Art. Far from it. Perhaps it might be that the highest endeavour of Art, as it had lately been said of the highest endeavour of philosophy, only permitted a half vision of transcendent truth. It did not send one away in despair, but stimulated to a still greater endeavour to reach the highest conceivable ideal.

ON the Place de la Concorde, Paris, the statue of Strasburg is a species of thermometer of the national feeling of the Parisians. Since the loss of the Rhine provinces by the Franco-German war, that statue has been distinguished from its sister statues in truly French fashion. It has been covered with wreaths and immortelles, as though the statue were a sepulchral monument. English visitors to the French metropolis have wondered that a nation could so wear its heart upon its sleeve, and spoil the finest open space in the city with a memento of defeat and disaster. That is one of the things they do ill in France. To the French Strasburg is dead, and they proclaim the fact to the world by tinsel emblems of mourning.

THE newly-organised Society of Designers holds its first general meeting at the end of this month. This meeting will be important, as it will chiefly be devoted to the consideration of the rules and constitution of the Society, and to the making of careful provision for its smooth and efficient working. The objects of this association of Designers are stated to be "to support the dignity of the profession, and for friendly and social intercourse"; and the qualification for membership is the possession of a recognised position as "a professional designer for applied Art." Already many men of standing have joined the Society, of which Mr. G. C. Haité is president, and Mr. L. P. Butterfield is hon. secretary. There seems every probability that it will prove able to safeguard and advance the interests of design, a branch of art practice which has hitherto been rather obviously in want of organisation, and we wish it all success.

ACCORDING to the New York World, Mr. Joseph M. Huston, a Philadelphia Architect, has designed the largest office building in the United States for construction in New York city. Mr. Huston states that the plan consists of an enormous arcade like that of the Victor Emanuel in Milan, the arch of which should be 30 ft. high. On either side of the arcade will be stores with a frontage of 50 ft., and 85 ft. deep, which would make 16 stores in all. Flanked at each corner of the block will be four square buildings, 70 ft. by 70 ft., and 15 storeys high, with a clubhouse on the top floor, covered by a immense roof garden. The clubhouse is intended to be used as the United Clubs of Paris are, giving each small club a separate room with a buffet, all to be supplied from a central restaurant. The remaining 14 floors will be devoted to offices, about 150 on each floor. A theatre and concert hall will be erected on the ground floor, each of which will have a seating capacity of about 3,500 persons. On one side, running parallel with the arcade, will be a large hotel 20 ft. by 100 ft., containing about 500 rooms. On the side opposite to the hotel, the arcade side entrances will be located. The cost of the building will be about 5,000,000 dollars.

SIR W. B. FORWOOD, at the meeting of the Liverpool Corporation last week, in moving "that the committee be authorised to instruct Mr. Mountford to prepare working plans and specification to carry out his premiated design for the extension of the Museum Buildings and new Technical Schools, at an estimated cost of not exceeding £92,000, subject to such modifications as may be determined upon by the committee, and that the committee be authorised to engage a quantity surveyor to take out the quantities," said that the buildings would be erected without asking the ratepayers for any additional rates, and out of the present resources of the committee. Reports received from the inspector showed that the present school in Islington was insanitary and entirely unsuitable for the present purposes. Other premises of the School of Science were equally bad, and had been condemned by the Government inspector. It was overcrowded with students. He quoted figures to show that Manchester had spent £132,000 upon a central school, and that other towns in Lancashire had provided schools for a similar purpose at great cost. In the county boroughs of Lancashire no less than £424,000 had been spent in erecting schools for technical instruction. The new buildings would provide accommodation for the extension of the museum. The present galleries would run into the new buildings, leading to great convenience to visitors. This extension would make it one of the finest in the world, and there were now collections stowed away in the cellars for want of room to display them. A great deal more room was required for the better display of the scientific specimens. The cost of the museum had been entirely defrayed by the liberality of the late Sir William Brown, so that the present outlay in its extension was the first sum of money which the Corporation had been asked to spend.

ASTLEY HALL (originally "Dam House") is situate about 11 miles from Manchester. It bears the date of 1650, when it was erected by the Mort family, from whom it passed to the Wetherals. It now serves as an Infectious Hospital for Leigh and district. The walls externally are rough cast, stone dressings only to the windows; the latter on the ground floor of the bays have been modernised, the original studded oak door remains. Wardley Hall, near Worsley, Lancs., is a fine old place dating from the time of Edward VI. The property has often changed hands, and is now owned by the Earl of Ellesmere. In a small locked recess a skull was preserved, said by some to have been the head of Roger Downes; the Downes family were once possessors of the estate. In our last issue we published sketches by Mr. Edgar Hartley, on pages 137 and 139.

A GOLD casket is to be presented to Princess Charles of Denmark by the City Corporation, and is a good specimen of the modern goldsmith's craft, designed and carried out by Messrs. Elkington. The casket, in gold *repousée*, is oblong, with the corners taken off. On the large front panel are the arms of the City of London, the corresponding space at the back bearing a beautiful little representation in enamel of an ancient Danish war vessel. Other spaces are filled with cupid and flowers. The lid in front bears shields—linked by floral emblems and supported by figures symbolising s rength and wisdom—on which are enamelled, in proper heraldic colouring, the arms of England and Denmark; while surmounting the whole is a figure representing Peace and Abundance.

An attempt has been made in the gallery at South Kensington occupied by the Raphael cartoons, to secure a quality of lighting which will be harmless to delicate colour, and is said to be so successful that further experiments with the same object are to be made in some of the other galleries in the Museum. The principle which these experiments are intended to prove is that an effect of white light can be best produced by glazing the skylights of the galleries with a proper combination of coloured glass, and that the illumination so produced is preferable to ordinary daylight. This may be quite correct in theory, but in practice there is, under such conditions of glazing, a very marked diminution in the amount of light in the room. It is quite open to question whether this loss of quantity is not too great a price to pay for the gain in the quality of the light.

A meeting was recently held in support of the movement which has been set on foot to establish a museum for the County of Hertfordshire at St. Albans. A Provisional Committee has already been appointed for the purpose of dealing, amongst other questions, with that of a site, and in a report which was presented the Committee stated that Earl Spencer had offered a site in St. Albans adequate to the erection of a museum directly it could be shown that a representative body of the county and of St. Albans were favourable to the erection of a museum in St. Albans, and could provide sufficient funds to erect and maintain it. The scheme put forward by the Committee contemplates the raising of a sum of about £5,000, about £3,000 of which should be expended upon a building and fittings, and the remainder be invested as an endowment fund. It is suggested that when completed, in order to secure perpetuity to the museum, it should be vested in the hands of the County Council, and its management given to a Committee chosen from representatives from the County Council, the Hertfordshire Natural History Society, and the St. Albans Architectural and Archæological Society, and others interested in the Arts, Sciences, and Archæology of the county.

At the Birmingham Museum and Art Gallery is being held a Loan Exhibition of Works by William James Muller, which comprises nearly 200 paintings, water-colour drawings and sketches, and pencil studies. In looking round the Exhibition one cannot help being astonished at the amount of work Muller accomplished in his short life, especially when it is remembered that a great many big canvases and water-colour sketches, not shown here, are held by private collectors. Muller was an English artist who owed little or nothing to any master. He certainly studied for a short time under J. B. Pyne, but he gained little from him, and the latter's influence can hardly be traced in his work. His only master was Nature, and Nature always found him a student of ceaseless energy and keen observation. To a certain extent he was influenced by some of the old masters, as may be seen in some of the pictures exhibited, where the influence of Hobbema or Ruysdael is easily traced. In his freakish moods he would dash off an imitation of Poussin or Van Ostade, and he studied with keen pleasure the works of the "Norfolk" School, Cotman, Crome, and Constable, more especially after a visit he paid to the counties in which they painted; but in spite of these tendencies, which may be pointed out in his earlier work, he soon made for himself a style of his own. Those who only know the dash and colour and power of his Eastern and Egyptian pictures will be surprised as well as pleased with his work with the lead-pencil. A number of pencil-studies of Old Bristol, lent by Mr. J. W. Arrowsmith, which he produced when he was only eighteen, were most of them made in company with Skinner Prout, who was at work on a series of drawings for a book of Bristol antiquities. Muller's drawings made at this time (1830–31) show great keenness of observation, coupled with vigorous and accurate draughtsmanship, and while they contain a decided suggestion of the style of the elder Prout, they in many ways equal him upon his own ground, and it is a great pity they have never been reproduced and published, both for antiquarian and artistic reasons. There is also a series of pencil-drawings, made a few years later, when Muller first visited the Continent with George Fripp in 1834.

THE ATTITUDE IN THE PROVINCES TO THE INSTITUTE.

Of What Benefit is it to Affiliated Societies?

A Criticism by George Bradbury,
President of the Liverpool Architectural Society.

Breaking through a precedent which has always been followed ever since 1889, when the Society was allied with the Institute, the Liverpool Architectural Society has elected one of their members, Mr. George Bradbury, as their President for this Session, who is not a member of the R.I.B.A. This also applies to the Vice-President, the Secretary, and Treasurer, none of whom are members of the Institute. Mr. Bradbury, in his Presidential Address on Wednesday last, said:—The proceedings, the Charter, and the management of that body has been a subject of great interest to the whole of the Architectural Societies throughout the United Kingdom, and therefore I think you will excuse me if, instead of addressing you upon Art and Architecture, we come down to a subject of very grave importance and practical utility, and consider for a short time what may be said for and against the Institute. "Your Society has seen fit to enter into alliance with the Institute, under which it becomes the accredited centre of a district and the agent of that district, in its relations with the heart of this system in London." These are the words used by the Institute's President in his address at the opening of the Session 1893–4. Further, you have agreed that "the constitutional rules or bye-laws of allied Societies shall be subject to the approval of the Council, and that no addition thereto, or variation thereof, shall be made without previous notice to and approval by the Council." If your President happens to be a member of the Institute, then he has a right to attend the meetings of the Council of the Institute. This appears to me a very advisable and proper alliance for your Society to have adopted. I think everyone will admit that in these days of great competition it is exceedingly advisable that there should be a central authority in London. That should look after and guide the education of those who intend to follow our profession. That should collect and purchase books, and establish a Library for the attainment of knowledge. That should call meetings, and arrange to have papers read on subjects of interest to their members. That should publish their proceedings in a journal, and take note of everything relating to legal decisions and other matters useful to the Architectural profession. Now all this the R.I. has done in the past and is doing in the present. Its system of education through the Architectural Association is probably as fair a one as can be devised for London. In Liverpool there are many members of our profession who think the mode of examination capable of

Very Great Improvements.

Mere cramming the mind with a large number of facts, dates, and names of celebrated Architects of past ages will never produce an Architect, but it may make a good Historical Architectural writer or Archæologist, but this knowledge, although of a certain amount of benefit, will never teach him to design plans suitable for modern requirements. The whole system of education at the present time throughout the kingdom, even in our Board Schools, Colleges, and Universities, is undergoing a change. The professors and teachers, instead of cramming their pupils with a vast store of book knowledge which is probably forgotten as soon as the examination is over. They are now endeavouring to find the strong points and the individual abilities of their pupils, and to encourage them to work and to think out for themselves problems in life which may be presented to them. In this connection I should particularly like to repeat the words addressed by Sir Joseph Lister at the British Association meeting recently held in Liverpool. He had been exceedingly pleased to find that here in Liverpool there was what in London they were still, he trusted not hopelessly, striving after, a true teaching university, having not only men of high eminence as professors and every appliance for effective education, but professors who took part, although not an undue part, in the examination of their pupils. Considering the complexity of subjects it was surely unjust to a student to be taken before examiners, strangers to the course he had gone through, not to mention his personal character, who, in the course of a few minutes, had to decide whether he was a creditable student or a sluggard. That seemed to him a grievous injustice. Infinitely worse was the effect of such a system on the student's career. He agreed with what was said the other day by the President of the Mathematical and Physical Section, that what they wanted was not to cram a student with a large amount of knowledge which he would soon lose, but to educate him in habits of observation, reflection, and judgment. But if taught by one set of teachers and examined by another, he was driven from legitimate work to the grinding mill. He rejoiced, therefore, that this great city and centre of education enjoyed the inestimable advantage of a teaching university. With all these advantages, is it not strange that out of about 78 members of your Society only 24 are subscribing members to the Institute? To obtain, further enlightenment I attended with Mr. Culshaw the late President, the Manchester Conference held on May 20th, when an address was read by Mr. Henry Salomons touching the "mutual relations between the local affiliated Societies and the parent body in London." The great point of that address was the "most important benefits resulting from the relationship of more frequent personal intercourse between non-metropolitan Societies and the Royal Institute, whereby provincials got their views enlarged by the experience of those at the head of the profession, and thus improved the standard of our own work." A great deal was to be gained by social intercourse and such a gathering as that at which we are now assisting. It was to myself a very great pleasure to meet Mr. Alfred Waterhouse and many others too numerous to mention. But I cannot see where the benefit is derived by your Society as a body in sending your President, whoever he may be, to Manchester or London to eat a dinner. You may say that the President, attending the meeting of the Council in London and meeting those from allied Societies, brings back information which would be of value to the whole of his professional brethren; but this is not so, for I read in the address delivered by Mr. William Henman, the President of the Birmingham Architectural Society, that he attended three meetings of the Council of the R.I.B.A., yet on none of these occasions, he said, "have I met any of the representatives of a provincial Society, although there are eight who are members of the Council, and there are 15 Societies in alliance with the Institute." It was remarked at Manchester that people asked what benefit they would derive by becoming Fellows of the Institute, although there were many highly interesting addresses delivered as to why all the Architects in the provinces should become members. I am sorry to say they only appear to me to be

Fellows on Sentimental Grounds.

The president of the Manchester Society said that "it seemed to him that Architects must follow all other professions or businesses in one thing." "There must be co-operation, or 'trade unionism,'" as Mr. Golthart had called it. Now with these words I cordially agree, that is, to make the R.I.B.A. in profession and in practice a "trade union." You may not like the words but alter them to any other you prefer, but let the union of self-protection and advancement in knowledge and in brotherly feeling be the watchwords. All the great and learned professions have some system of union. Medical men have to obtain certain degrees and pass certain examinations before they are allowed to administer even the simplest form of medicine to a patient. The Solicitors have to pay a high premium and serve five years, and pass an examination before they are allowed to practise. Even the Accountants have had to amalgamate, and now use the word "Chartered." There is not a single artisan that is employed to carry out our works that does not belong to one trade union or another, even down to the lowest-paid labourer. To bring this about there will have to be great changes in the Institute. For the admission of a student an exceedingly moderate fee per annum should be demanded, and he should be supplied with all the printed matter issued from the Institute; even if it caused a slight loss, he should, in my opinion, be registered as an Associate when he has completed

a certain number of years of study either at a recognised Art School or College, and after passing an examination of a not too severe character, and more of a practical nature than of mere historical knowledge. The Associate's subscription should not be for the provinces, more than £1 1s. It should, in my opinion, be the aim of the Institute to enrol the whole of the Architectural draughtsmen. The election of Fellows should be entirely in the hands of the Council, and all Fellows of Provincial Societies should be elected as Fellows of the Institute on making the ordinary and requisite declarations. Their subscription should not be more than £2 2s., and I think if you wished the "trade union" idea to be carried out the entrance fees should be done away with. This question of election was in the minds of the Congress in Manchester, and it was remarked that there were many outside the Institute who ought to belong to it. Mr. Holden said that he could quite understand that a gentleman who had been in practice 20 or 30 years would say, "I would sooner remain as I am than place myself in a position of being voted upon by gentlemen who have passed through my office and some of whom may be in my office now," no doubt referring to the Associates who now have considerable power in the election. Mr. Slater said he felt very strongly on the subject, and if there were a possibility of a repetition of what had occurred a year or two ago, when some very admirable and eligible men were black-balled for no fault of their own by people who, he believed, knew nothing about them, then the Council, he said, ought to take steps to alter the bye-laws, and limit the election of Fellows to Fellows themselves. If these are the views of the Fellows in the Institute, what must be the views of those outside? On the financial view of the question I should like to give you a few facts. The contributions of the members of the allied Societies of the Institute in 1895 were, I believe, about £800. The Institute returned to the allied Societies one-fourth of the subscriptions, say £200; what benefit, I should like to ask, have the allied Societies gained by giving the £600 to the Institute? Or, taking our Liverpool Society, 15 Fellows at £4 4s. each, and 10 Associates at £2 2s. each, gives a total of £84, of which one-fourth (£21) was returned to the Society; what benefit does the Liverpool Society or the Architectural profession reap from this expenditure of £63? In London, it may be said, you can obtain the advantages of the Institute examinations, but I am not sure if we cannot boast of having in Liverpool a School of Architecture established at the University that gives to our students a superior system of education than that given by the Association or the Institute in London. I think and hope, in years to come, that the Certificate granted by the College will count as high as any that has ever been given in London. The total number of students attending all the various classes in Architectural drawing, modelling, handicrafts, is very large, and I have no doubt you will be pleased to know that I have the authority of Professor Simpson to say that the school is now in a very flourishing and satisfactory condition. The College has a small but Architectural Library, and a very considerable sum of money is now being expended upon Architectural casts. We have in the Public Library one of the finest collections of Architectural books in the kingdom; so extensive is the number of the books that a special catalogue has been issued, which contains the names of 1,070 volumes devoted to Architecture alone. There is a similar catalogue issued on Building Construction, making a total of about 1,453 volumes appertaining to our profession alone. The Journal of the Institute we can all read in the Free Public Library. My view, therefore, is that until the Institute have amended their Charter and bye-laws, so as to make it possible for every practising Architect and those associated with him to become members, it is useless for us to look to London for guidance in our profession, but rather that our efforts, energies, and—what is not of so much importance—our money should be devoted to helping forward and encouraging all our local efforts, which I feel you will all agree with me are now, and will be in the future, second to none in the Kingdom. If this idea of

PROFESSIONAL UNIONISM

can be brought about in the next 10 or 15 years an absolute and visible effect will be seen. I feel we shall have done very much towards doing away with that great incubus of our profession, I mean the competitive system. What can be more lowering to the dignity of a profession, whose members have to construct homes in which the lives of its citizens must be passed, and in the schools of which the young are taught, than to find an advertisement like that of the Bootle School Board, inviting competitive plans from the Architectural profession without offering any premium whatever for any of the designs sent in? But, on the other hand, the Committee who has charge of the education of the district demand from every Architect who wishes even to know what the conditions will be, a fee of £2 2s. A charge of 1s. would have been ample for such particulars, and would more than have paid for the cost of printing. They desire not only to pick your brains but your pockets as well. Are there no Architects in this neighbourhood fit to design and honestly capable of erecting a Board School without entering upon this wretched competitive system, which is neither satisfactory to the Architect or the proprietor, as it nearly always leads to misunderstandings on such matters as cost? Another growing evil, and a great danger to our profession, is that large firms and limited liability companies now undertake the erection and the furnishing, including the whole of the plans, of houses, mansions, and public buildings. There are instances known in our profession where furniture removers have offered to supply designs for additions, and stables and other outbuildings, free of cost, and even where there was an Architect already employed upon the work. I need not further enlarge to you by further illustration what a great benefit the Institute could become

IF WORKED ON THE LINES

I have suggested. The total number of members in all classes in 1885 belonging to the Institute was 2,504; this is probably a mere fraction of those calling themselves Architects, probably not more than one-tenth. If the Professional Union could enrol one-half of those calling themselves Architects throughout the United Kingdom I feel sure they would have a body of at least 10,000 members. They then could pass a bye-law that all competitions shall be carried out under the Rules of the Institute or the members of the Institute decline to compete; they could pass the resolution that the members of the Institute would decline to receive contracts from building contractors, decorators, furniture removers, who supply plans and carry out Architectural works on their own account. There are many other similar regulations which they could enforce of vast benefit, in my opinion, to the Profession. I must apologise for having detained you so long on this subject, but it is a legacy left over to me by your former President. I had no idea, when accepting this position, of the mass of correspondence and the literature I would have to peruse on this subject, and I have felt compelled to ask you to take the matter into your serious consideration, and that all the members of the Council of the Liverpool Architectural Association, or Fellows and Associates in Liverpool of the R.I.B.A., will do their utmost to attend a meeting to take into consideration letters and correspondence with the Institute on the question of the election of Fellows. The reply from your Society is requested to be received by the Institute before the 12th instant. The Birmingham Society has very kindly and with the utmost courtesy sent us their views on the Interim Report on the subject. For the present I particularly desire you to consider the views I have expressed this evening as entirely my own; I cannot hope or think that they all will be approved or even adopted by your own members as a Society, but, with your permission, I will read you a few words addressed by Mr. Alfred Waterhouse, R.A., Gold Medallist and President, 1888–91, who said at Manchester that he believed that members of the Institute might very safely agree not to take part in competitions except among themselves. He thought the Institute must make a great change in the mode of election of Fellows, and concluded by giving the reasons which should induce Architects to become members of the Institute. It was not merely a question of whether they were to derive individually certain advantages by becoming members of the Institute, but whether by joining the Institute they could advance their Art and the profession to which it was an honour to belong. There are other subjects upon which I should have liked to have addressed you. We have had three excursions during the vacation. One to that splendid specimen of half-timber Cheshire Architecture, Mr. Hudson's house at Oxton, so beautifully and magnificently carried out in the true spirit of the old work, designed by members of your Society, Messrs. Grayson and Ould. Another excursion was to the large new model works and model villages of Port Sunlight, also carried out by Messrs. Grayson and Ould, Mr. Owing, of Warrington, and others. You will readily call to mind a third excursion was to Stockport, to visit one of the most magnificent Churches of modern times, by Messrs. Faily and Austin. We had hoped to have visited another very celebrated work by another local Architect; "Dorpeel," the residence of Mr. Ismay, and designed by Mr. C. Francis Doyle. For the organising of their excursions, the Society is indebted to Mr. Pearce Edwards, Secretary of your Excursions Committee. I would have liked to have spoken at length on the alterations that it is proposed to make in the Liverpool bye-laws. To some of these your Sub-Committee made amendments which have been approved and adopted by the Corporation Committee and the City Council. Another bye-law which the Corporation Committee passed and sent for confirmation of the City Council, was rejected, mainly, I believe, through the energetic action taken by the Council of the Liverpool Architectural Association. In the consideration of these alterations to the bye-laws we had the able assistance, and were able to work most harmoniously with the Master Builders' Association and the House and Land Owners' Association. These two Societies contain a much greater number of members than your own, and yet I think you will take it as a compliment that the President of the Architectural Society for the time being was Chairman at all their meetings. I would like to have addressed you upon a competition exhibited in Liverpool just about the time of our last meeting, I mean the Royal Insurance Company Competition, of which Mr. Francis Doyle was awarded the first premium. In the competition of the new Technical Schools, although a local Architect was not successful in obtaining the first premium, I think we have every reason to be proud of the drawings and designs submitted by our local brethren. There is another subject of vast local interest upon which I should like to have addressed you, and which I think every Architect in the city should take into careful consideration and support to the utmost of his power. I refer to the High-Level Bridge scheme over the old Haymarket. The late Henry Sumners, who for so many years took such a great interest in your Society, and now, alas! is no more among us, was, if not the original suggestor of that scheme, very intimately associated with it. It was he who a few years ago exhibited in the Autumn Exhibition of Pictures a plan with sketches of the roads and high-level bridge; and whatever scheme may in the future be carried out, that plan of Mr. Sumners's deserves most careful consideration.

A NEW Weavers' Institute, which has been erected at Burnley, at a cost of £7,000, was recently opened by Lady Dilke.

DURING the past week a memorial window has been placed in St. Michael-le-Belfrey, York. The window is the work of Mr. J. W. Knowles, of Stonegate.

WHAT is anticipated will be the finest mausoleum in the country is to be erected in Greenwood Cemetery, New York, over the grave of Mr. J. W. Mackay's son. It will cost about 400,000 dollars.

WHILST excavating for the main sewer at Langton Road, Norton, Malton, the men in the employ of Mr. Anthony Lyons came across an old Roman road, and found the perfect skeleton of a man and other human bones, old coins, and broken urns. The place is supposed at one time to have been a Roman camp.

A NEW development has taken place on the technical side of the People's Palace. The governors have set apart a large portion of the buildings to a school of engineering, which is now equipped with a fine workshop and laboratory. The laboratory is especially valuable, as it is provided with testing apparatus of the latest kind, and is adapted to the most advanced teaching in engineering science.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

Presidential Address.

ADDRESSING the members at the opening meeting, the President, Mr. C. Hadfield, said:—The closing years of the century will necessarily look upon a very different Sheffield to that graphically described by the historian of Hallamshire in its early decades; and much as we may regret it, beauties of landscape have to give way as the years go on to the needs and requirements of commerce and the expansion of population. In Continental cities and towns where the exigencies of rapidly-growing populations have had to be met, the authorities generally manage to compensate for the loss of natural beauty by the stateliness of their streets and squares, and the general formation of well-arranged building blocks. A street is planned so as to line with some public building or monument seen at its termination. Not infrequently such streets start from a well-devised centre, planted and adorned with statuary or the like, and the gradients of the roadways are well engineered, and convenient for man and beast. Heights of buildings are regulated on clearly defined principles, owners of property being thereby restrained from abusing their rights, and shocking an educated public taste for what is seemly and beautiful. It will be a happy state of things in this city, if it should ever come to pass, when a projected building about to occupy a public position, which is either badly designed, or palpably out of harmony with its surroundings, shall invoke the expenditure of some, at least, of that fund of municipal zeal which is at present concentrated largely on the study of traps and gullies, and the various details of sanitary lore! But I fear such an idea is too Utopian. In plain truth the

Traditions of British Officialism

seem to be invariably fatal to aught that advances the Architect's craft, or to giving a helping hand when there is question of æsthetic considerations. There are cities and towns in Great Britain which give renewed pleasure to anyone endowed with artistic sympathies each time they are visited. From personal knowledge, I instance Aberdeen, Edinburgh, Newcastle-on-Tyne, Liverpool, and Leicester. I saw the latter the other day, after 20 years' absence. During that interval the centre of the town had been practically reconstructed, and I was struck by the prevalence of interesting buildings, the direct outcome of well-laid-out streets and main thoroughfares, which give Leicester the smartness of many a Continental town. In Sheffield, on the other hand, the lines of a large proportion of modern roads and streets have been laid down not quite in accordance with Hogarth's "Line of Beauty." Valleys and hills alike are traversed by distorted paths, steeply graded, with ugly and dangerous junctions, and consequent waste of land, rendering it a well nigh hopeless task to build with beauty or economy on plots thus created. Of late years, I speak from an Architect's standpoint after observation, there have been few important buildings erected in this city that have not suffered in a greater or less degree from the distorted alignment of their sites and approaches, and the fact that new thoroughfares have, with one or two exceptions, been persistently laid out without thought of a leading idea in the arrangement of building spaces, and a disregard of interesting terminations, or vistas, which existed in some of the older streets. Most of us regret the lost view up Norfolk Street closed by the exquisite cupola of St. Paul's, which formed a subject for Blore's facile pencil, and for one of Godfrey Sykes's happiest efforts

The Typical Fashionable Villa,

reared like a packing-case on end on a miniature railway embankment, presenting its front above a distorted, ill built boundary wall, is the direct outcome of this system of laying out building estates, a system which came into vogue with railways and the so-called Gothic revival. I must own to a passing regret, call it sentimental if you wish, at the passing away of old High Street. Its foundations had called for no studied effort, but it was not without merits of its own, and there was a harmony in its general aspect which the new street, in spite of the amount of study and contention it has evoked, does not at present seem likely to attain. The new Town Hall site is an instance of the loss of a grand opportunity to form a striking central point of departure for new Sheffield, the city and building alike having lost dignity and interest thereby in a marked degree. The two main façades have northerly and westerly aspects, while Leopold Street is not in line with the grand entrance, but has apparently the Jubilee obelisk as its point of departure. New Pinstone Street is all awry with St. Paul's Church, on which, and on the spacious churchyard, the new structure turns its back. Matters are not mended by the clumsy wall and railing erected at the time the street was formed. Looking up from Fargate the Young Men's Christian Association and Bank Buildings block out what might otherwise have been a fine view of the tower, and the whole group and an interesting vista from the Church gate's side. Having said so much in a critical spirit, I gladly acknowledge, on the other hand, that our municipal authorities, by their enlightenment and forethought in securing Weston Park, Meersbrook Park, Endcliffe Woods, and other breathing spaces and recreation grounds, have for some years past deserved well of their fellow citizens, as also for the earnest attempts to improve the sanitary well-being of the community. May we entertain a hope that at no distant date the crusade in the Press against

The Smoke Fiend

will receive the hearty support of all thinking men, and result in the end aimed at—an end that can undoubtedly be attained by scientific efforts, without commercial loss. Last year I addressed a few words to the younger members of the society on the subject of culture and self-improvement, and inculcated the desirability of the student of Architecture availing himself of every advantage as a sure road to success. I urged the necessity of the study and measurement of old buildings, their furniture, decoration, and the like, as a means to attain originality and power in design. During the past spring the programme of the Sheffield and District Architectural Sketch Book appealing for subscribers, was issued as the outcome of those remarks. Up to the present time the subscribers' list is not full, and the promoters cannot safely undertake the responsibility of publication until the number is completed. To-night, by the kindness of the Department of Science and Art; of Mr. Percival Hoole, of the Green Lane Works; of the Council and Head Master of the School of Art; of Mr. John Fowler, and of Mrs. Mitchell, we have been able to exhibit a number of the works of the late Alfred Stevens. These illustrate him in his threefold aspect as Painter, Sculptor, and Architect, and are, I venture to think, an address in themselves to students, needing but few words from me. The first publication, by Hugh H. Stannus, "Alfred Stevens and his Work," which lies on the table to-night, and may be consulted at the library of the Sheffield School of Art, should be perused and taken to heart by every

Earnest Architectural Student

in the city. Stannus exhaustively sums up Stevens's life and works in his closing sentences in this wise: "The unity of all Art and the universality of his own is demonstrated by the illustrations in this book. From them it will be seen that all Art is one; and that the division into branches arises in practice only from the difference in the things given and the things required. Further will it be seen that the master was not Architect only; nor only sculptor, painter, or ornamentalist, but possessed that combination of balanced mastery over all which makes a man—an Artist. As Architecture is nobler with the aid of sculpture, sculpture is stronger by reason of such curb as the chief Art brings, while each is richer by union with the other sisters—pictorial work and ornamentation. So herein was the master's work noble, strong, rich, and herein will it seem to say, and say with increasing power, to students yet to come, in these words, chosen by himself: 'I know but of one Art.'" Sheffield is the richer by its association with Stevens, who, on the recommendation of his friend, Young Mitchell, then head master of the School of Art, was employed as designer at the Green Lane Works in the years 1850–51 by the late Henry Elliott Hoole. The City Corporation at Meersbrook has earned the gratitude of Art students the world over by finding a resting-place for the treasures enshrined in the Ruskin Art Museum. I urge strongly the desirability of bringing together the master's works, while those who knew him, and were associated with his work during life, are here to see that the collection is made worthy of the artist.

Alfred Stevens's Life

should be the best of object-lessons to the young Architect who is in earnest. His long exile, over seven years, from his own country, which he left in early youth, at the age of 16, for Italy, there to receive in that historic land his first impressions; his perseverance and hard work under all kinds of difficulties, journeying from place to place, and eking out his slender means by drawing portraits or copying pictures; his studies at Naples, Florence, Rome, Sienna, Venice, and elsewhere, and his return and final landing at Southampton with an empty purse, but with a richly-stored and cultured intellect, are an oft-told tale. Then, as the years went on, he put his hands to all kinds of work, the illustration of books, designing of metal and woodwork, painting, mosaic, sculpture, and Architecture; taking infinite pains that all he did should be of his best, and all this in the face of disappointment, neglect, and difficulties that would have broken down many an ordinary man. Dying at the comparatively early age of 58, he has left us the Wellington Memorial, in St. Paul's, what Stannus justly styles "A new inspiration. There had been executed before this more important groups of sculpture, much larger works of Architecture on the Continent and elsewhere, but in no one work were all so perfectly combined, and he may be said to have in this work reunited the mantle, and to have brought back the sceptre of Art, one and indivisible, to England." Let students of Architecture try in all reverence to follow this master's footprints, and let them remember there is no greater obstacle to a man acquiring Architectural proficiency than the neglect of small things. Buildings of an ordinary everyday kind do not pay unless cast in a commonplace mould, and are not, therefore, worth trouble, and will, if pandered to, prevent an Architect from rising to even respectable mediocrity. He may, ere the evening of life overtakes him, attain to a flourishing practice, and succeed in acquiring a goodly store of this world's goods, but he will have one day to leave all behind, with little claim on the gratitude of contemporaries or recognition by posterity."

The Spire of Holy Trinity Church, Swansea, was, in a recent gale, blown down.

The great improvements resulting from the application of science to sub-aqueous tunnelling is shown by the fact that whilst the Thames Tunnel cost £1,150 per lineal yard, the Blackwall Tunnel, consisting of iron lined with concrete, and of 25 ft. internal diameter, has, by means of Greathead's shield and grouting machine, been driven from shaft to shaft, a distance of 754 yards, for £375 per yard.

A bust of Thomas Carlyle was recently placed in the house in Ecclefechan in which he was born. The house now belongs to Mr. Alexander Carlyle, a nephew, who married the favourite niece and amanuensis of the "Sage of Chelsea." The bust, executed by Mrs. D. O. Hill in white marble, is an admirable representation of Carlyle, and was presented by Dr. Gunning, of London.

Sir Arthur Blomfield recently paid a visit to Salisbury Cathedral, and expressed his complete satisfaction with the work of strengthening the foundations of the Tower. The work is being paid for as executed, and on Sir Arthur's certificate the sum of £3,500 has been handed to the contractor. The report shows some progress in the matter of funds. One £10,000 has been subscribed, but much more is still required.

Henry King, a steeplejack of Leeds, recently brought an action under the Employers' Liability Act at Leeds County Court against Thomas Kidney, a chimney-builder, to recover £300, damages sustained in consequence of an accident at the New Wortley Gasworks. King was engaged in renewing the lining of a chimney at the gasworks, when the rope which supported the seat on which the plaintiff was sitting suddenly snapped, and he was precipitated to the ground, a distance of about 60 ft. He received very serious injuries. It was contended that the rope was defective. A verdict was given for the plaintiff for £125.

Professional Items.

COCKERMOUTH.—Mr. J. Dale Oliver, of Carlisle, is the Architect for new banking premises for the Carlisle and Cumberland Bank, whose business has for some time been carried on in temporary premises in Main Street.

ASHBURTON.—Erected in 1835, the Wesleyan Chapel has recently undergone renovation at a cost of £300, the work having been effected by Mr. Lear and Mr. H. Boon, builder and painter respectively, to plans prepared by Mr. Sidney Endacott.

REDRUTH.—Mr. Sampson Hill, Architect, has presented to the Board of Guardians his estimate for the new Infirmary at the Workhouse. The total estimate was £2,679. The special kind of sanitary appliances required by the Local Government Board had increased the amount.

SWANSEA.—A new Operating Theatre is about to be built at the Swansea General Hospital. The cost of same will be borne by Mr. Benj. Evans, J.P., of Swansea, he having made this generous offer to the committee to do so some weeks ago. The Architects are Messrs. Wilson and Moxham, of Swansea.

HALIFAX.—The foundation stone of a new Church Mission Room and Sunday School was recently laid at Plough Croft, in All Souls' Parish. The building, which has been erected from plans designed by Messrs. Jackson and Fox, is to cost, exclusive of the site, about £1,600. Accommodation is to be provided for 500 persons.

STOCKPORT.—Colonel Dixon, Chairman of the Cheshire County Council, on Friday opened the Agricultural and Horticultural School at Holmes Chapel. The school has been established by the County Council for combining sound technical instruction with practical knowledge of agricultural and horticultural work. The College has cost £10,000.

DUBLIN.—The Artisans' Dwellings which have been erected in St. Joseph's Place—formerly White's Lane—adjacent to Upper Dorset Street, Blackhall Place, and North King Street were formally opened last week. The buildings have been erected under the superintendence of the City Architect, Mr. C. J. M'Carthy, and the City Engineer, Mr. Spencer Harty; and the contractors were Messrs. Connolly and Son, of Dominick Street.

LEVEN (FIFE).—A large Hotel is proposed to be built near the station for the convenience of golfers and commercial men. It comprises dining-rooms, drawing-rooms, smoking and billiard rooms, and has 30 bedrooms. The street front has been designed in a classic style, and has a tower rising to about 90 ft. The buildings will be lighted by electricity. The estimated cost is between £8,000 and £9,000. The Architects are Messrs. Swanston and Legge, Kirkcaldy.

ISLEWORTH.—The Bishop of Marlborough has laid the foundation stone of the new permanent Church of St. Margaret. The iron Church proved too small, and a committee, with Earl Percy as president, has been formed to carry out the work of building a permanent place of worship. At present it is intended to erect the Nave and Aisles, with Baptistery, Vestry, &c., at a cost of £4,972. Messrs. W. Pattinson and Sons, of Whitehall, are the contractors, and Mr. Edward Monson, jun., the Architect.

ASHINGTON.—The Miners' Hall is to be opened on the 17th inst. Originally it had been intended to erect a building at a cost of about £1,000, but subsequently the scheme adopted embraced an outlay estimated to reach £6,000. It is a stone and brick building, with internal arrangements adapted for special requirements, one of the prominent features being a properly equipped theatre, which can also be utilised as a lecture hall. There is seating accommodation for 2,000 persons. The section immediately above the main entrance is apportioned for the transaction of routine business in connection with the local branch of the Miners' Association. The hall has been built from plans by Messrs. Boolds and Hardy, of Morpeth.

CRAIGNEUK, N.B.—The Free Church building, the memorial stone of which was recently laid, is situated on the north side of the road leading from Motherwell to Wishaw, and is to take the place of an old wooden erection. The new Church provides accommodation for over 500, with Hall and Vestry in the rear to seat 150. The style of architecture is a type of Gothic, similar to some of the early Scottish Churches. The roof will be of steel, encased in wood. This novel construction allows the introduction of a vaulted ceiling, which gives much value to the effect. The interior will be plain but comfortably finished. The Church will be heated throughout with hot water. The total cost, including furnishings and fees, will not exceed £2,150.

WEST BRIDGFORD.—The old Parish Church, dating from the thirteenth century, is now totally inadequate to the large population that has arisen round it, and a larger building has, therefore, become an imperious necessity, and strenuous efforts have been made during the past two years to raise funds for its erection. These have resulted in the accumulation of some £2,000. But at least £3,000 more will be required to cover the cost of the Nave and Chancel alone, which are all it is proposed to build at present; while the complete Church will cost not less than £9,000. The accommodation in the first instance will be for about 700 persons, but ultimately it is intended to provide seats for about 1,000. Doubtless a cheaper edifice might be erected if built of brick instead of stone, but this would make the incorporation of the ancient fabric in the new Church artistically impossible; and on antiquarian grounds alone it is most desirable that the old time-honoured sanctuary should be retained. The foundation stone of the new Nave and Chancel will be laid on the 28th by Lady Byron, of Thrumpton Hall. The Architect is Mr. Naylor, of Derby.

LLANDILO.—On Thursday an Intermediate School for Boys was opened at Llandilo. The building has been erected on a prominent site in the north-east of Rhosmaen Street, and overlooks the Vale of Towy, the Architect being Mr. David Jenkins, and the contractor Mr. David Evans, New Road, both of Llandilo. The walls are of local stone, with Box ground stone dressings. The assembly hall measures 45 ft. by 27 ft., which is capable of being divided into class-rooms 27 ft. by 22 ft. 6 in. Adjoining are two class-rooms 21 ft. by 120 ft., one of which is a chemical demonstration room, and on the first floor is a chemical laboratory 24 ft. by 20 ft., and a corresponding room of similar dimensions for the technical instruction. On the ground floor, under the above rooms, are the head-master's and assistant-master's rooms and offices, with space for future extension if needed. The school is at present arranged as for boys only, but there are convenient entrances and class-rooms on each side of the hall which will answer the purpose of a dual school. The playgrounds cover about an acre of land, which is enclosed by boundary walls. The accommodation afforded is for 130 pupils.

HARROGATE.—The new building in Cambridge Road and Chapel Street, Harrogate, which is being erected for post office purposes, and is rapidly approaching completion, was commenced in October, 1894, and it is estimated that the total cost, including the furnishing, will be over £9,000. The style of Architecture is Perpendicular. The building is constructed of Pateley stone dressings, and wall stones from Heaton Park, near Bradford. On the ground floor is the sorting office, 52 ft. by 43 ft.; adjoining is the postmaster's private office, and the public entrance for postal, telegraph, and other departments of office work is at the corner. Behind the public office is the telephone room. The whole of the first floor is set apart for clerks, operators, and others, and the arrangements for these are excellent. Nearly all the floors are laid with wood blocks, on concrete, and are practically fire-proof. Other rooms and apartments are provided with Edwards's adamantine tiles. The beams throughout the building are of steel from Messrs. Dorman, Long, and Co., Middlesborough. The inside of the public office is lined with silver stone paving from Messrs. J. Brooks and Sons, Hipperholme, as also the staircase and corridors where stone paving is laid. The plans have been prepared by Mr. Henry Tanner, of Her Majesty's Office of Works, Whitehall, and the principal contractors are:—For plastering, Messrs. W. Rule, Sunderland; slating, Messrs. Baines, Ripon; concreting, the Granolithic Company, Limehouse, London; wood blocking, Mr. R. Lowe, Farnworth; masons', bricklayers', and joiners' work, Messrs. Ives, of Shipley; painting, Mr. Hutton, Shipley; and plumbing, Messrs. Braithwaite, Leeds.

EDINBURGH.—The proposal of Mr. Cameron to acquire and include in the proposed City Chambers extension the area of the property situated in Cockburn Street, and at the corner of Warriston Close, at present occupied as licensed premises and stock-rooms of the Cockburn Hotel, has been adopted by the Committee of the Town Council. The new scheme has the merit of much better and more simple arrangement of the different departments and the public rooms, giving them more direct access, by means of the central hall, grand staircase, and main corridor. There are also more efficient arrangements for service staircases and passenger lifts. In the west wing of the building there is grouped the Council Chamber, a suite of rooms for the Lord Provost, and a large room for members of Council, with retiring-rooms. In the east wing, five large committee-rooms are placed. The Town Clerk's suite is placed facing the quadrangle, and his position is central to the Council Chamber, Lord Provost's room, and committee-room. The corridors are well lighted by means of open areas. The external Architectural treatment of the new buildings—the north front—is divided up so as to have a projecting central colonnade, with pediment central with present quadrangle, and this central feature is balanced in a symmetrical manner by two corner campaniles, while rising over the centre of the building is a well-designed dome. The north-west corner, which is occupied by the Council Chamber, is cleverly treated by itself, forming a striking part of the design, but at the same time not competing with the well-balanced side towers and central dome.

THE CASTLES OF THE THAMES.

WITH the solitary exceptions of Windsor and the Tower of London, the Thames-side castles have more utterly disappeared than even their neighbours the Thames-side monasteries. The reason for this loss is not far to seek, says Mr. Grant Allen in an interesting article in the Daily News. A castle was not so much a domestic residence as a military stronghold, the predecessor of the fort; and when once it was taken by a successful enemy, it was levelled lest it should again be used in the hostile interest. An abbey, on the other hand, was merely a "superstitious and foolish" monument, which might be stripped of its roof for the sake of the lead, and deprived of its sculptures and other "idolatrous" images in the interests of the weaker brother, while the mere shell might well be left standing as a quarry of building stone for more practical purposes, or converted by Inigo Jones into a gentleman's house for its grantee or purchaser. Most of our castles suffered severely in this way at four different periods. First, after the disorderly troubles of Stephen's reign, they were vigorously battered down by that strong asserter of monarchical right against feudal independence, Henry II.; then, during the Wars of the Roses, they were alternately destroyed by Yorkist or Lancastrian; next, when Henry VII. composed at last that long dynastic quarrel, the King's artillery enabled him to bombard the few belated assertors of half independent sentiments; finally, during the great Civil War, Cromwell's soldiers dismantled almost every castle that was held by Cavaliers in the Royalist interest. But during the greater part of the Middle Ages, the traveller who followed the river route from the Midlands to London beheld a long

SUCCESSION OF CASTLES

and fortified towns guarding everywhere the fords and bridges over the Thames. Taken in conjunction with the still more frequent monastic

buildings, these defensive works must have made up a constant architectural panorama for whose like we must go nowadays to Germany or Italy. It is difficult for us to remember at the present time that every important English town had once its range of walls set round with bastions and towers, like Lucerne or Boppard; difficult to recollect that castles scarcely inferior to Windsor, Warwick, Kenilworth, and Carnarvon, formed the nucleus of almost every important borough. The late mediæval traveller who approached Oxford from the north, leaving behind him the soaring pinnacles of Godstow Nunnery and the twin campaniles of Osney Abbey, saw facing him the walled city of Oxford, with its bastions of the pattern still preserved in New College Gardens, and its gateway of which Bocardo is now the sole existing truncated representative. In the foreground rose the stately keep and spacious courtyard of

Oxford Castle,

built by Robert D'Oiley in the reign of William Rufus, and celebrated as the refuge of the Empress Maud when besieged by Stephen. Every important ford or confluence of the river was guarded by such a fortress, and, as in the case of Oxford, each town has the word "ford" as a component part of its name to the present day. Nothing now remains of Oxford Castle, however, save a single tower, a portion of the crypt under the great hall, and the mound which supported the keep or stronghold. Proceeding Londonwards, by the side of Oxford, with its numerous monasteries, a traveller would pass the nunnery at Littlemore and the Preceptory of the Templars (or afterwards of the Hospitallers) at Sandford; after which he would look up at the woods of Nuneham, with the castellated manor-house which almost certainly preceded the existing mansion. A little later the towers of Abingdon Abbey would come into view. Gliding beneath the bridge, built in 1416, and catching a glimpse of its picturesque neighbour, Christ's Hospital, he would go on towards the conical earthworks of Sinodun Hill, and come in view of the great

Abbey of Dorchester.

Some way beyond Bensington he would behold in front of him the massive ramparts of Wallingford, another important ford over the river, guarded accordingly by its strong castle. Of this mighty fortress—comparable in its day to Arundel or Alnwick—nothing now remains save a tree-grown mound; but it was once a stronghold of great strength, and even in ruins moved the admiration of Camden. Wallingford is nowadays so sleepy and unimportant a place that we can hardly restore mentally the old walled town with its fourteen churches, enumerated by Leland, and its magnificent towers; yet the Conqueror thought it so valuable a post that he marched upon it at once before attempting to attack London, and was met here in submission by Archbishop Stigand and the chief thanes of Southern England. It was not till the period of the Parliamentary wars that the great fort was finally slighted. During the early Middle Ages, Wallington Castle had a rival just over the river at Crowmarsh—like the Cat and the Mouse of the Rhineland barons. When the Empress Maud, hard pressed by Stephen in Oxford Castle, let herself down from the walls by sheets and fled through the snow southward, she took refuge in the great keep at Wallingford with Robert D'Oiley's son-in-law, Brian Fitzcount. Stephen followed her up and built an opposition fortress just across the river at a place called Crowmarsh. No trace of it now remains, but the little Norman Church of the village belongs in its Architecture to the same period. Below Wallingford for a while the interest of the river was mainly ecclesiastical, as befitted the neighbourhood of a great abbey such as Reading. The nunnery at Goring and the manor houses of the abbots at Pangbourne and elsewhere, were the principal objects of interest on the banks till the picturesque old bridge at Caversham is reached with its central Chapel of the Blessed Virgin, like the one still standing to this day on the middle of the bridge at Wakefield, in Yorkshire. Thence is seen the abbey at Reading, the old town walls, and the Norman castle which held the junction of the Thames and Kennet. This

Castle of Reading

must clearly have been one of the strongest on the river, but the name of Castle Street is now unhappily its sole memorial. Below Reading, again, is the wealthy episcopal palace at Sonning, once itself the seat of a bishopric, and long the residence of the Bishops of Salisbury. Not a stone now remains of this splendid building, which Elizabeth coveted, and took "in exchange" after the Tudor fashion. The Pilgrimage Chapel of St. Sarac, at the same spot, is gone too, with many other ecclesiastical monuments of Sonning. Though Henley boasts itself "the oldest place in Oxfordshire"—whatever that may mean—it has no records of a castle; but no doubt it was surrounded by embattled mansions occupying the sites now usurped by Fawley Court and other similar riverside houses. But on the hills behind it rose the noble castle of the Greys, now greatly shrunken to the modern country house of Grey's Court. A few relics of this magnificent fortress still remain; the ground-plan can even now for the most part be traced, and shows it to have been a large square castle with corner towers, occupying the summit of a considerable hill. The next few reaches of the river are more remarkable for ecclesiastical than for military Architecture; they run past Medmenham and Bisham Abbeys, which must, in the height of their prosperity, have been graced with noble churches and girt round on every side with cloistered courtyards. More than one feudal hall, however, with crenellated battlements, more than one moated monastic grange, must doubtless have stood along the overhanging chalk ridge about Hedsor and Cliveden; while at Bray would be caught distant glimpses of the massive outline of the Round Tower of

Edward III.'s Magnificent Palace.

Between Windsor and Eton are almost the only two great architectural ornaments of the river which still remain to us tolerably intact—the one because it chanced to retain favour as a Royal residence; the other because, being a place of education, it escaped, like the Oxford Colleges, the deluge of barbarism which overthrew in its course the monastic establishments. The rest of the route Londonwards would include many other interesting objects especially at the period just before the Dissolution of the Monasteries — among them King John's half-apocryphal residence at Staines, the church and towers of the great Abbey at Chertsey, Wolsey's new Palace at Hampton Court, the ruins at least of Kingston Castle, the Carthusian Monastery at Sheen (as it was then called), and Henry VII.'s country Palace of Richmond. Finally, the traveller would see rising before him the towers and conventual buildings of Westminster Abbey, the old Palace of Westminster with Lambeth facing it, and, behind all, the walled City of London, capped by the turrets of old St. Paul's, and backed up at last by the Tower of London.

A new drinking fountain has been placed in Hyde Park, at the north-east corner of the Serpentine. The new fountain is of rather elaborate design, and has been executed for the Commissioners of Works by the sculptor, Mr. W. R. Colton.

Rich goldfields are said to have been discovered in Asiatic Russia. The expedition for the exploration of Kamchatka, under MM. Bogdandvitch and Lemiakin, has made a thorough survey of the district between Chumikan and Ayan, discovering some rich goldfields of considerable extent. Gold of a remarkably good quality has been discovered in 14 places in the volcanic strata on the banks of the River Aikashra.

The Queen's Hotel, Leeds, belonging to the Midland Railway Company is about to be considerably enlarged and improved. The plans are now completed. The enlargement will mainly be effected by erecting a new wing of four stories on the ground now occupied by the warehouse adjoining in Bishopgate Street. This portion will have an entrance on a level with New Station Street, and on the ground floor will be a large grill-room, stock and baggage rooms, lavatory and hair-dressing room. On the second, third, and fourth floors will be a number of sitting rooms and 42 bedrooms, with baths, &c. The interior of the existing hotel is to undergo great alteration. The entrance hall will be made larger, the commercial room will be extended, and the coffee-room will be made more commodious by including the adjoining corridor.

SOCIETY MEETINGS.

The Edinburgh Architectural Society.—The first meeting of the winter session was held in Dowell's Rooms, the President, Mr. A. R. Scott, in the chair; there was a large attendance. Mr. J. A. Morris, F.R.I.B.A., Ayr, delivered a lecture entitled "History and Art—A Florentine Outline," the first portion of which will be given next week. The lecture is said to have been one of the most brilliant and scholarly that has been listened to by the members of this Society, and was illustrated by a series of lime-light views of Florence. The Vice-President moved a hearty vote of thanks, which was seconded by Mr. J. N. Scott. At the close of the meeting the lecturer was elected the first Honorary Member of the Society.

The Glasgow Architectural Association.—A meeting of this Association took place in the rooms, 187, Pitt Street, on the 6th instant, Mr. William Tait Conner in the chair. Mr. Wm. Vickers read a paper on Architectural Sculpture, which we purpose giving at length in our next issue. He confined his paper entirely to Stone Carving, and made some introductory remarks showing the training necessary to make a successful stone carver. The indiscriminate mixing up of the different styles of Gothic was much condemned. The essayist thought that a judicious mixture of Gothic and Classic in sculpture work was a good thing. This was done in many parts of England, and drawings were hung round the wall showing where this had been successfully carried out in Sheffield Municipal Buildings. At the conclusion a hearty vote of thanks was accorded to the essayist.

Liverpool Architectural Society.—The first meeting of the present session of the Liverpool Architectural Society was held last Wednesday, in the Law Library, Union Court, Liverpool. Mr. G. Bradbury (president) delivered the opening address, which we are enabled to give at length in this issue.

Sheffield Society of Architects and Surveyors.—The members of this Society opened their winter session on Wednesday last with a conversazione in the Cutlers' Hall. Mr. C. Hadfield, the President, gave his Annual Address, which will be found in another column, and a very interesting exhibition was held of the works of Alfred Stevens as a designer and painter. Among those present were Professor Aitchison, President of the Royal Institute of British Architects, Messrs. R. W. Fowler, J. Fowler, C. J. Innocent, H. W. Lockwood, J. Smith, T. Winder, W. F. Hemsoll, W. C. Fenton, and Professor Habershon.

The Sanitary Inspectors' Association.—The Annual General Meeting of this Association was recently held at Carpenters' Hall, London Wall, Mr. H. Thomas (Bermondsey) presiding. The report of the Council referred to the work carried on during the past year, special allusion being made to the formation of several provincial branches. The membership, it was stated, was increasing, the number having risen from 295 last year to 525 at the end of the period under review. It was hoped in the course of time to enrol every Sanitary Inspector and Inspector of Nuisances in the United Kingdom as members of the Association. Then, and only then, would they be able to command the attention of the Government, and demand their just rights—namely, security of tenure of offices, fair salaries, and superannuation when incapacitated through old age and infirmities. During the evening, 23 additional members and two associates were elected, and Mr. W. W. West (Walthamstow) was chosen the Chairman of the Council for the ensuing year.

A better system of flushing the trough-closets in Leeds is felt to be necessary, and with a view to seeing an improved method in working order a deputation from the Sanitary Committee recently visited Sheffield. The trough-closets in that city are flushed three times a day, and the work is done automatically. In Leeds there is only one flushing daily, and a large number of men are employed to let off the water. In Sheffield, also, the lighting and ventilation are excellent.

Trade and Craft.

FOR EMPTYING CESSPOOLS.

In places where the cesspool system of drainage is in use, the work of emptying the receptacles for sewage is troublesome, while the cost is considerable. A new apparatus just constructed by Messrs. Merryweather, the London fire-engine makers, for the emptying of cesspools, gets over the difficulties in a novel fashion. A steel van is driven round and a suction pipe being dropped into the cesspools, the sewage is automatically forced into the tank by atmospheric pressure. This is done by first exhausting the tank by means of a special portable vacuum pump, and the work is performed quickly and cleanly, and at a cost about 75 per cent. less than that of the old system.

CONTRACTS FOR AUSTRALIA.

It is stated that the various contracts in connection with the construction of the works for giving a water supply to the Coolgardie Goldfields, West Australia, will be given out about the middle of October, and that nearly all the piping and steel girder supports for the aqueducts will have to be obtained from England. The cost of the works is estimated at £2,500,000, that being the amount which the Legislative Council of the colony has sanctioned, and the construction will probably take just over two years.

LIQUID FUEL.

Large reservoirs holding over 100,000 gallons have already been erected at Wilhelmshaven, and similar arrangements will be—if they are not already—made at Kiel and Dantzig, a credit of nearly £9,000 having been provided for this purpose in the last Budget, besides something like £4,500 for pumping plant in connection with the basins. After various trials, the authorities have decided to fit all existing large men-of-war with apparatus for heating their boilers partly with oil, and the use of liquid fuel will be provided for in all new constructions. The oil to be used in the German navy is a product of distillation of lignite, a lignite tar oil, called "masut," being a dark brown fluid of an oily nature. It will be stored on board in special tanks, from which it is conducted to the furnaces by pipes. It is ejected in a spray by steam, and yields a bright flame without smoke. Its heating power is superior to that of coal, it is more economical, and facilitates and simplifies the stokers' duties. Its effect is almost instantaneous, and the highest steam pressure can be immediately obtained. This is a great consideration on a man-of-war, and the absence of smoke is also a great advantage, more especially in torpedo-boats. A drawback is that the "masut" is very inflammable, and if a projectile should set fire to a tank the danger would be great; but it is considered that the advantages are such as to outweigh this objection.

MOTOR CARS.

The third annual international competition of motor carriages in France excited a great deal of interest. The number of entries for the first series was 27 for vehicles of two, three, and four seats, and in the other classes 13, comprising omnibuses and motor cycles. Steam was only used in one case, and electricity as a motive power was conspicuous by its absence, while in 32 cases the patents were the property of the British Motor Company. At the last competition, from Paris to Bordeaux and back, the petroleum car patents won all the prizes. It is quite evident from the entries that the French nation is settling down to petroleum as the motive power of the future.

PAVING CARDIFF STREETS.

A deputation from the Cardiff Shipowners' Association and the Chamber of Commerce attended at the meeting of the Cardiff Public Works Committee recently, to seek an abatement of the noise and dirt nuisance in Mount Stuart Square by paving the square and its approaches with wood or asphalte. The borough engineer (Mr. W. Harpur) said the cost of the work would be—for asphalte, £3,350; ordinary deal, £2,400; Australian hard wood, £3,600. After many expressions of opinion as to which was the best kind of pavement to use, it was eventually decided to put down asphalte.

NEW LIGHT RAILWAY.

The East Riding of Yorkshire is taking up the question of light railways. Kelham, a populous village near Driffield, intends to second the efforts of the Parish Council to obtain for the district a light railway, which it is proposed should be constructed, taking in along its route several villages from Nafferton to Filey, and making the line coterminus with those two places, which have stations on the Hull and Scarborough branch of the North-Eastern Railway. The Parish Council has already passed resolutions in favour of the scheme, and all the Parish Councils in the district and the Filey Urban District Council are to be asked to give their official support to the scheme.

WATERWORKS EXTENSION.

At a meeting of Bo'ness Town Council on Thursday, Mr. Thorburn, burgh engineer, submitted a report regarding a scheme for augmenting the water supply. The scheme includes the impounding of the water of the Kipps and Wardlaw burns to the south of Lochcote Mansion House, and about four miles to the south-west of Linlithgow. It is also proposed to construct a reservoir capable of holding 130 million gallons, and to lead a 10-in. pipe from this reservoir to join the present main pipe to Bo'ness at Carribber reservoir. The new reservoir will cover 28 acres of ground, and have an average depth of 20 ft., and the greatest depth will be 45 ft. The cost of the scheme is estimated at £11,000, irrespective of land claims and way leaves. The Council unanimously agreed to proceed with the scheme, and to make application to the Secretary for Scotland for a Provisional Order to carry out the work.

GLASGOW'S GAS SUPPLY.

The members of the Incorporated Institution of Gas Engineers during their autumn meeting in Glasgow had an opportunity of hearing a brief sketch of the history and extent of the gas supply of Glasgow. Gas was first supplied to Glasgow in 1819 by the Glasgow Gas Light Company, but no record of the quantity manufactured was kept until 1878, when meters were first introduced, and in that year the total quantity made was about 80,000,000 cubic ft. In 1843 this had increased to 217,000,000 cubic ft., and in that year the works of the City and Suburban Gas Company were erected. Both companies continued to supply gas in competition within the same area until the year 1869, when the Corporation acquired the works. In 1855 the quantity of gas manufactured was 593,181,000 cubic ft., the price per 1,000 cubic feet 4*s.* 7*d.*, and the total revenue £111,760; while this year (1896) the quantity manufactured was 4,811,884,500 cubic ft., the price per 1,000 cubic ft. 2*s.* 4*d.*, and the total revenue £605,794. The Corporation now supply an area 15 miles in extreme length and 9 miles in extreme breadth. The number of consumers is 171,628, and the price charged is the same over the whole area, 2*s.* 2*d.* per 1,000 cubic ft., while no meter rent is charged. There are five works within the area of supply—two small suburban works and three large works. The works now have a manufacturing capacity of 10,000,000 cubic ft. per day. One of the features of the works, of special interest to the visitors, was the huge gas-holder now being constructed, with a capacity of 5,000,000 cubic ft.

THE EXHIBITION AT THE CHURCH CONGRESS, SHREWSBURY.

Much of the space at the Exhibition of Ecclesiastical and Educational Art at Shrewsbury was taken up with books, &c., and still more with vestments and so forth. Unquestionably the best display, both in point of size and artistic importance, was that of Messrs. Jones and Willis, who showed stained glass windows and every variety of internal Church furniture and decoration. The catalogue issued by this firm is most comprehensive, and every taste can be suitably met, from the simplest to the most elaborate. "The sound of the church-going bell," though mellower and softer than is the rule, came often from the fine exhibit of Messrs. Harrington, Latham, and Co., of Coventry, whose patent tubular bells are coming into such wide use. Mural and other monuments, altar pieces, and stained glass form the subject of Mr. A. L. Moore's stall, and excellent photographs are given of some of the work done in his Southampton Row studios. Messrs. T. Thomason and Co., of Birmingham, have a large show of similar subjects, together with pulpits and lecterns, &c. Nearly opposite this exhibit, and very close to a fine model of Dr. Barnardo's village at Ilford, is the stand of Messrs. Hart, Son, Peard, and Co. of Birmingham and London, with some interesting specimens of art metal work. School and mission room furniture is shown by Messrs. H. Addison and Co., of Wellington, whose excellent catalogue is full of useful information. Messrs. W. and T. May, of Sheffield, and Messrs. West and Collier, of Hambledon, also exhibited school furniture, and Messrs. G. M. Hammer and Co. have a display of Church furniture and sundries.

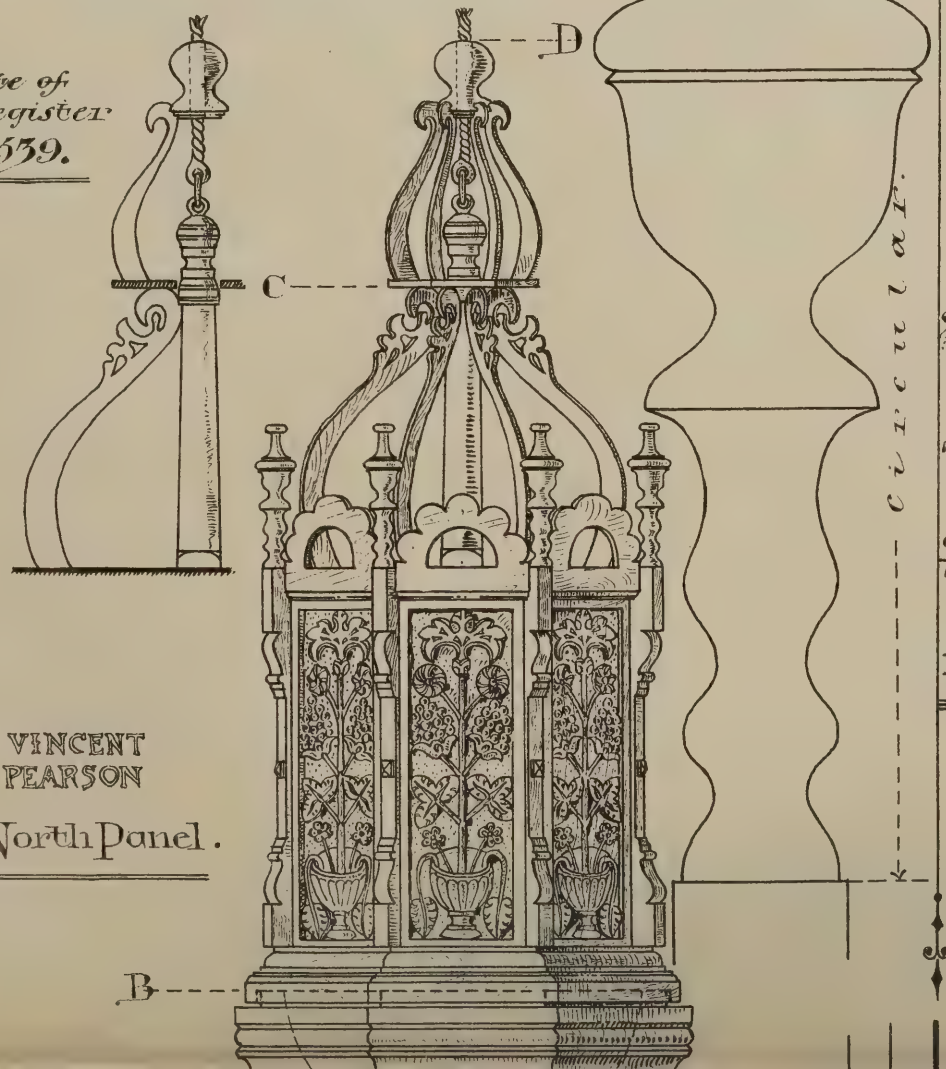
BUILDING IN ABERDEEN.

The plans of the following new buildings have been sanctioned:—Additions in connection with Beechgrove House, for Mr. John Fyfe, per Messrs. Brown and Watt, Architects; dwelling-house on the south side of Walker Road, Torry, for Mr. James Massie, per Mr. A. Winchester, jun., draughtsman; alterations in connection with No. 136, Union Street, for Professor J. Campbell Brown, Liverpool, per Messrs. Matthews and Mackenzie, Architects; dwelling-house with shops, on the west side of Holborn Street, for Mr. George Bruce, per Mr. John Cameron, 45, Braemar Place; alterations and additions at No. 234, King Street, for Mr. John M'Rae, per Mr. John Rust, Architect; alterations at No. 30, Union Street, per Messrs. Ellis and Wilson, Architects; dwelling-house at University Road, Old Aberdeen, for Mr. James Anderson, per Mr. James Thomson, Belmont Street; two dwelling-houses on the east side of Hammerfield Avenue, for Mr. George F. Milne, Architect.

MESSRS. WEBB AND COMPANY'S TILES.

Modern taste for decorative treatment on an elaborate scale is exemplified in the recent internal rearrangement and ornamentation of the King Lud Hotel, Ludgate Circus. We find a considerable amount of good work scattered about the place, but unfortunately it *is* scattered. There is a painful want of repose; an evident lack of a properly thought-out scheme of general effect. The tile work and mosaics are quite satisfactory in themselves, having been carried out by Webb and Company, of Euston Road, under the personal supervision of Mr. H. D. Hibberdine. The tiles, however, good as they are in colour and design, suffer in effect from the novel mouldings of aluminium, which are intended to separate them from the large plate-glass panels forming an important feature of the decorations. The juxtaposition of glass, bright aluminium, and highly glazed tiles is artistically fatal. We think the Architect would have shown better judgment had he introduced mouldings in dark wood or darker velvet. As it is, we repeat, we came away with the impression of much admirable workmanship applied to an unsatisfactory result. The mosaic panels are particularly good in both design and execution—but the general effect of the decorative treatment is patchy and restless. We have too much gilt, too much glass, and more than enough of glare.

THE new Rustington Convalescent Home for the working classes of north-west London is now completed, and will be opened for patients in a few weeks. It has been erected by Mr. Henry Harben, Chairman of the Hampstead Vestry, at a cost, exclusive of land, of £30,000. The building, which faces the sea, will contain accommodation for 40 patients, most of them having separate rooms.



AT Berwick, the railway station stands on the site of the chief buildings of Berwick's once famous Castle, and a considerable part of the ruins of the great Border fortress are still to be seen close to the station itself. Some of the buildings near the station have recently been altered, and in the course of excavation there was found a prisoner's leg-iron. At one end is an 8-in. stout screw bolt for fixing to the wall. Attached to the bolt is a strong chain a foot and a half in length, and at the end of the chain is a heavy locked iron ring some 9 in. in circumference.

Ruthless Destruction and Rustic Rights.

By a curious coincidence there reached us last week two appeals, at first sight apparently quite dissimilar, and having no connection whatever with one another, but on being more closely compared, revealed a curious and striking parallel. Both of them are sent from a Cathedral city, and both are directly connected with questions of moment to all Artists. The first, the one with which we are more especially concerned, relates to the proposed destruction—it is called restoration—of a portion of Canterbury Cathedral. No words of ours are necessary to interest all Artists in THAT. The second appeal, asking for help for the protection of Rustic Rights, comes from Winchester, and points out, in suitable language which we feel sure requires no endorsing, a new danger which not only threatens the loveliness of the lanes, but will alter the whole aspect of the beautiful country around that city. The parallel just mentioned, we need hardly point out, consists in the great affinity between the lopping and destroying of trees, and the lopping and destroying of Churches. The same unreasoning lust—the lust of destroying the beautiful—which is Vandalism, is apparent in both and in nearly an equal measure. We say nearly, because of the two Vandals, the unlettered man of the District Council—surely an eminent butcher!—intent on restoring his country lanes from their natural shaded state to the glare and dust of daylight, and the rapacious restorer of Churches, intent on producing something which shall chiefly glorify himself and swell his 5 per cent. Of the two, we say the former is possibly the least unpleasant. He, at all events, is acting honestly, and for what he thinks, in his blind and fatuous way, is for the public good. The other man—well, we will not waste words on the other man; but that respectable butcher of the Local Council, with his tidying up, cleansing and chopping ideas, is an almost exact counterpart of his more "cultured" brother at the Church. Beyond his chopper and his block he is unconcerned with the sights around him—to him they are not pictures, they are nuisances to be removed, something indeed, to be reduced to chips The trembling shadows of the tree branches on the roadside, varying with the wind, are nothing to him, nor is he troubled with any such ridiculou considerations of sentiment, on which one correspondent so foolishly dwells Such a thing as the relief, shelter, and shade these trees afford to the weary traveller, never occurs to his practical and businesslike mind, which is intent only on aping town ways. Argument is out of the question. If he were told, as perhaps our correspondent has already told him, that the cultivation of rural pleasures, which he is so anxious to curtail, may be helpful to the rustic's mental health, it would only have the result of opening his mouth the wider. Reason, therefore, we repeat, is of no use, force only must be used; to the beginning of the application of that force will be the formation of such a society as is indicated on another page, and which we cordially invite our readers to join. One word more with regard to the restorer. Personally, as we have said, he is not worth any, but the

SACRISTY OF S. M. NOVELLA, FLORENCE: A FRONTISPIECE BY GIOVANNI DELLA ROBBIA.

destruction he proposes is worth many a column, if it will have the effect of staying it. It is such things as historical associations, stones, eloquent with living memories of bygone days, the quaint outline of a building against a grey old tower, and the silhouettes of evening time, for which all artists care, and for which we write. But Vandalism brushes them away without a word or passing thought, and leaves nothing behind but the sighs and the somethings stranger—the curses of those he shocks. If, then, we are wholly in sympathy with our correspondent's energetic defence of Rustic Rights, we are equally as willing to pillory this last specimen of Ruthless Destruction, and to invite the aid of the Society for the Preservation of Ancient Buildings to crush it at the start.

DEATH OF MR. WILLIAM H. WHITE.

[SECRETARY OF THE R.I.B.A.]

WORD has reached us, at the moment of going to Press, of the death of Mr. WILLIAM H. WHITE, for a long time Secretary of the Royal Institute of British Architects. We were aware that Mr. White had been in failing health for some considerable period, indeed, a letter from him a while ago suggested to us that this illness might be the beginning of the end. Professor Aitchison held out little hope of his old friend's ultimate recovery some weeks back, but it was Mr. White's wish that little should be bruited abroad. Mr. White became a Fellow of the Institute in 1868. For eighteen years he had acted as its Secretary, and while there were points upon which professional men controverted his views, no one would question his conscientiousness or his love for Architecture—especially in its Archæological aspects, and the blade of professional controversy may well be sheathed at the graves' mouth. We would add our deep regret to the many expressions of sorrow which Mr. White's death will evoke. The funeral will take place at Nunhead Cemetery, on Thursday next, at 12.30 p.m.

TEMPLE CHURCH AND THE CHAPELS OF THE INNS.

WHILE the Halls of the Inns have been called their hearts, the Chapels have been described as their souls. More than seven hundred years have passed since the Knights Templars built their "Round Church" in the form of the Temple near the Holy Sepulchre at Jerusalem, from which they derived their name. There are only four other Round Churches in the country, viz., at Cambridge, Northampton, Ludlow Castle, and Little Maplestead. The mail-clad effigies in the Temple Church tell most eloquently, perhaps, its ancient tale. A peculiarity of six of the figures is that their legs are crossed. This is supposed to indicate that these Templars had taken part in the crusades. One of these figures is supposed to represent the great Earl of Pembroke, who, with his two sons, was buried in the Round. Among the famous men who found their last resting place within the precints of the Church in later times were John Selden, Edmund Plowden, the "Judicious Hooker" (at one time Master of the Temple), and Oliver Goldsmith. The Temple Church became the property of the lawyers about 550 years ago. The grant to the two Societies is kept in an old oak chest under the Communion Table. Each of the Treasurers has a key, and only in the presence of both can the chest be opened. Early in its history the Church was made a depository for jewels and other valuables.

IT WAS PLUNDERED

both by Wat Tyler and Jack Cade. The historians of the Temple owe the former rebel a special grudge, for he burned the records of the students, which were kept in hutches in the Church. One half the building belongs to the Middle Temple, the other to the Inner Temple, and each Inn has been careful to proclaim this dual ownership by a liberal display of arms on its own side of the Church. By the side of each Treasurer's seat is a long verger's staff, which is draped with crape whenever a Bencher dies. The staff of the Middle Temple is surmounted by a gilt lamb, that of the Inner Temple by a silver Pegasus. The Master of the Temple is appointed by Letters Patent, the Templar having been exempted from Episcopal jurisdiction by a Papal Bull, and this exemption has continued to the present day. The Reader, who is a kind of curate, is appointed by the Benchers of the two Societies alternately. The organ, which has undergone a thorough repairing since the beginning of the Long Vacation, was built in 1688 by the famous Father Smith. "The Battle of the Organs" is a familiar incident in the history of the Church. An organ by Harris, as well as Father Smith's, was placed in the Church on trial, and fierce and long was the dispute among the Benchers as to which was the better instrument. It was eventually referred to the notorious Jeffries, whose choice fell on Father Smith's organ, for which the Bencher's gave £1,000. Prior to 1842, when the Church was restored, the beautiful columns and shafts of Purbeck marble were covered with plaster, the Round was battlemented, and the north side of the porch was walled up. This was a restoration indeed as well as in name, for the present conical roof is more in accordance with the Norman style than the old battlemented Round. Neither of the other Chapels of the Inns can be compared with the Temple Church, but they are by no means devoid of interest.

LINCOLN'S INN CHAPEL,

which was erected 273 years ago on the site of an old Chapel built by the Bishops of Chichester some 300 years earlier, was designed by Inigo Jones. Its chief peculiarity is its elevation on a crypt—a style of Architecture of which few specimens remain in the country. The crypt, with its beautifully groined roof, is now railed in, but in the days of Butler it was used by lawyers as a parade, as was the Round in the Temple. A reference to the same custom is made by Pepys, who writes, "To Lincoln' Inn, to see the new garden which they are making, which will be very pretty, and go to walk under the chapel by agreement." Among the celebrated men whose gravestones lie in the crypt are John Thurloe, who lived in Old Square while he was Secretary of State to Cromweli, and William Prynne, to whose industry in preserving many public records history itself is indebted. In the porch are tablets to the memory of the Right Honourable Spencer Perceval, Miss Eleanor Louisa Brougham, and the late Lord Bowen. The Latin inscription on the tablet in memory of the late Law Lord was written by the Right Honourable George Denman, who was eminent as a Latinist no less than as a lawyer. Not even in the Temple Church are the stained glass windows more beautiful than those in Lincoln's Inn Chapel.

GRAY'S INN CHAPEL,

which is the smallest of the sacred edifices of the Inns, is adorned by no Architectural graces. Only the three stained windows, given to the Society by a grateful Bencher some thirty-five years ago, relieve it from the simplicity of a little village church. The exact origin of the building is unknown, but that it existed in the time of Henry VIII. is clear from an order of the Benchers for the removal of a painting of Becket in one of the windows. Not far from the present chapel is the site of the little chapel in which the ancient family of the Greys worshipped.

In consequence of the unprecedented demand for Specimens the Publisher regrets they are now out of print, and he would be obliged if all Architects possessing copies, and having thus been enabled to see the Specimen, would return such as may be spared. The postage will be refunded.

The Premier and Authoritative Architectural Magazine.

The Architectural Review.

THIS MONTH. PRICE SIXPENCE.

Superbly Illustrated for the Architect, Artist, and Craftsman.

The Editors announce the following contents of the first number:

THE WORK OF JOHN L. PEARSON, R.A., with reproductions of some Twenty Drawings, Designs, and Photographs. Mr. PEARSON has actively collaborated in the selection of the Illustrations. The Article will, therefore, be of a most comprehensive and complete character. The Letterpress by JOHN E. NEWBERRY, with Portrait of Mr. PEARSON, as a frontispiece.

LONDON CITY HALLS—STATIONERS' HALL.—By special arrangement the whole of Mr. JOSEPH PENNELL'S Pen and Ink Drawings illustrating the City Halls—never before published—will be reproduced as a Series of Articles. No. 1, Stationers' Hall.

GARGOYLES AND GROTESQUES. A Series of Articles, fully Illustrated, dealing with this most fascinating subject. Sketches for the Series by REGINALD BLOMFIELD, M.A., ARNOLD B. MITCHELL, F.R.I.B.A., JOSEPH PENNELL, G. C. HAITÉ, FRANCIS HOOPER, ANDREW N. PRENTICE, C. E. MALLOWS, and others. The letterpress by C. E. MALLOWS.

THE OLDEST CHURCH IN LONDON — ST. BARTHOLOMEW THE GREAT: Its Restoration. By ASTON WEBB, F.S.A., F.R.I.B.A., illustrated by Mr. ASTON WEBB'S original Drawings and Plans, showing the Restoration, with Mr. ASTON WEBB'S own Notes.

THE WORK OF NELSON AND EDITH DAWSON, Designers, Ironworkers, and Enamellers: Illustrated by themselves.

THE SCHLOSS MARIENBURG: ITS RESTORATION. Completely illustrated, with Notes by Mr. C. FITZROY DOLL.

"LEADED LIGHTS AND OPEN VIEWS." A Series of Editorial Articles and Notes, contributed by a staff of leading Architects and Designers who will regularly contribute to this feature.

The Magazine will have all the Powerful Financial, Literary, and Artistic Resources of "The Builders' Journal and Architectural Review," at disposal for its fullest development.

Amongst the contributors to the first and early numbers will be:—

BELCHER, JOHN, F.R.I.B.A.
BELL, E. INGRESS, F.R.I.B.A.
BRYDON, J. M., F.R.I.B.A.
CARÖE, W. D., M.A., F.R.I.B.A.
COLCUTT, T. E., F.R.I.B.A.
HOOPER, FRANCIS.
JACKSON, T. G., A.R.A.
MITCHELL, ARNOLD B.

NEWBERRY, JOHN E.
PATERSON, ALEX. N., M.A.
PEARSON, JOHN L., R.A.
PRENTICE, A. N.
SCHULTZ, ROBT. WEIR.
STANNUS, HUGH H., F.R.I.B.A.
STOKES, LEONARD, F.R.I.B.A.
WEBB, ASTON, F.R.I.B.A.
WILSON, H.

CRANE, WALTER.
GILBERT, A., R.A.
HAITÉ, GEO. C., R.B.A.
MALLOWS, C. E.
PENNELL, JOSEPH.
PENNELL, MRS.
WHISTLER, J. McNEILL.

AUMONIER, W.
DAWSON, NELSON.
DAWSON, EDITH.
VOYSEY, C. F. A.

ANDERSON, WM., BRITISH MUSEUM.
DUNN, WILLIAM.
HORDER, MORLEY.
INCE, HOWARD.
MEYNELL, ALICE.
STRANGE, EDWARD F., SOUTH KENSINGTON MUSEUM.

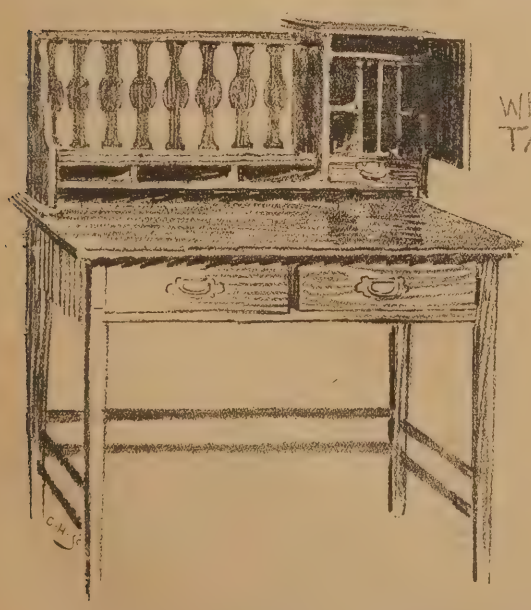
It is requested that orders be given early at any of Messrs. W. H. Smith and Son's Bookstalls throughout the country, or to Local Newsagents, in view of the enormous demand for the Magazine.

TALBOT HOUSE, ARUNDEL STREET, STRAND.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

ARTS AND CRAFTS

AT THE



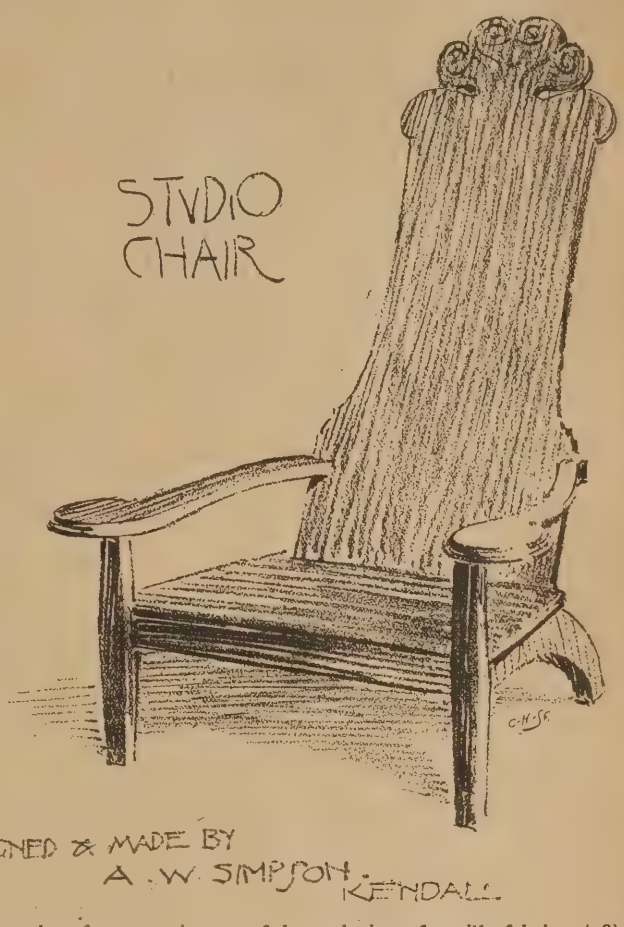
NEW GALLERY.

[BY OUR SPECIAL REPRESENTATIVE.]

WITH SKETCHES BY E. A. RICKARDS.

SECOND NOTICE.

A SECOND Visit to the New Gallery affords the mere Architect an opportunity for studying the more pictorial and decorative of the exhibits; but if he should wish to exhaust the list of things literally Architectural, he must needs mount to the gallery. If we mistake not, this will prove to him sufficient excuse for putting off, for an hour in the "Architectural Room" of the New Gallery, his critical inspection of Mr. Walter Crane, Mr. Voysey, and others, as represented in their many designs for wall-papers, hangings, stained glass, and other appurtenances. We think he will find it as interesting as that at Burlington House, though some sizes smaller, and wanting in examples of the perspective draughtmen so well known to him, who have become, since the days of the "Architectural Illustration Society," the only spectacles through which he has viewed his contemporaries. He must be hard to please indeed, if he be not compensated for these, by the very interesting examples to hand. Since when has Mr. Lethaby been evident at the Academy? Mr. Ernest Newton and Mr. Spooner, it is true, have shown us, by drawings hung there, some of the work they have now completed, and here illustrate by photographs; but would not the Academy gain somewhat in interest by admitting these very frames, and even such examples as the series of photographs of furniture by Mr. Arthur Simpson, of Kendal, or the wrought-iron screens by Mr. F. A. Walker, subjects that could scarcely be explained by the cleverest of draughtsmen.



DESIGNED AND MADE BY A. W. SIMPSON, KENDAL.

Descending again, and passing to another class of work, first in order and importance is the South Gallery, containing the loan collection of Cartoons, and other decorative work, by the late Ford Madox Brown, including the famous "Work." To our modern notions, the small oil painting of the Death of King Lear, will perhaps be the first to appeal. To have given such an opportunity of studying chronologically the work of a man who was indirectly a pioneer of their present movement, is worthy of the promoters of this Exhibition. Certainly no more suitable occasion for showing these pictures could have been found. The centre of the room is occupied by cases of books and choice editions, notably from the Kelmscott Press, including several editions of the late poet's own works, Malory's "Morte D'Arthur," and the Kelmscott "Chaucer." These have already been issued, but for the sake of comparison are useful here. The "Altar Book," with illustrations by Anning Bell, and borders by Bertram G. Goodhue, exhibited by the Merrymount Press, Boston, coming after these seems almost incongruous in the matter of its several designs. We have grown to associate the illustration of Sir E Burne-Jones so intimately with William Morris' borders, that the more modern though equally decorative manner of Mr. Anning Bell, seems out of character with the accessories, which are in the 13th century style of those from the Kelmscott Press.

In the same case with this, the Chiswick Press show their edition of Spencer's Faërie Queen, with Mr. Walter Crane's illustrations. Some of the original drawings for these are at hand in the West Gallery and Balcony.

In the West Room, Mr. Crane predominates with his various cartoons for stained glass. He is distinctly at his happiest in No. 107, the Translation of Elijah, a companion window to the Translation of Enoch. Of this, we have unfortunately to guess the colour. Sir E. Burne-Jones in his four beautiful figures, Joshua, David, Esther, and Ruth, cartoons for glass, at Albion Church, Ashton-under-Lyne, is hardly fairly treated in the matter of hanging. Surely, in the treatment of single-figure subjects, he is still unapproachable. The figure of Ruth seems to us a perfect embodiment of the character. In 8 and 38, Messrs. Alex. Morton & Co. exhibit two of Mr. Voysey's designs for tapestry, of which we prefer No. 8, both in colour and form, the other, with its arbitrary lines of yellow doves, being in his most affected manner; but

in one of three designs for silk fabrics (98), he makes amends for anything.

The Needlework, by J. D. Batten, 'Psyche before Persephone" (No. 2), is among the gems of its kind here. The faces of the figures are formed with ivory, enhancing in a wonderful way the colours of the silk and the drawing for needlework is wonderful. Mr. Anning Bell has two of his delightful coloured Bas-reliefs in 47 and 40A, the latter consisting of three cherubs' heads in his well-known manner. On the opposite wall, Mr. Frampton's panel of "Music" should be noticed, though, in the matter of colour, it scarcely equals Mr. Bell's.

In the North Gallery, Mr. Voysey is again in his best vein, in his design for an Axminster Carpet, shown by Tompkinson & Adam, but in his panel for quilt (233), we cannot follow him in his intricacy. The end wall is entirely filled with three Tapestries, by Morris & Co. Two from the designs of Sir E. Burne-Jones, and one after Boticelli.

Mr. Walter Crane's Fig and Peacock wall paper and frieze is shewn in two printings, by Jeffery & Co., and well ensures his position as our leading designer of such patterns. Indeed, in all his work on this occasion, including his designs for damask, etc., his invention is undiminished.

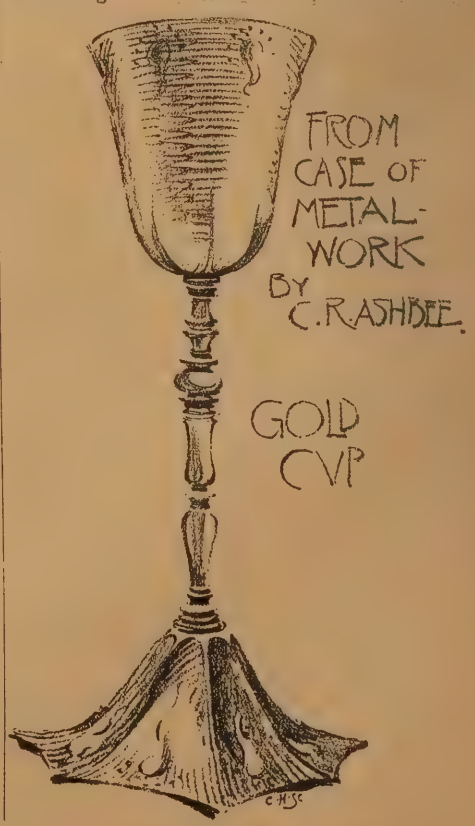
Mr. Leon V. Solon is amongst the newer generation of his kind, but in his panels of Barbotine and Cloisonnée glazes (520, 515, 516) he makes a considerable bid for notice, that of "Le Printemps" being perhaps the most exquisite in colour and design; the flesh tints and conventional leaved drapery should be specially noted for its colour. The value of such panels as these, in combination with wood-work might be great, and suggest many delightful combinations. Mr. Leon V. Solon is another product of South Kensington, which this year is well enough represented by a trio of young ladies, whose work we noticed lately at the National Competition; Miss Eleanor Mercer who exhibits her model for a silver punch-bowl, Miss Florence Steele and Miss Lilian Simpson in

their designs for caskets. We were allowed to illustrate all these in our article on the National Competition.

These ladies fairly hold their own in this more important exhibition of maturer talent; what more can we say? Mr. Ashbee shews two large cases of metal work from designs by himself, executed by the Guild of Handicraft, Whitechapel; the objects vary from the smallest of brooches to a pewter pot, and no object that could have lent itself to his design seems to have escaped him. His best is exemplified in the gold and silver cups, and one or two of the smaller articles. No description is attached to the separate designs, and it says something for Mr. Ashbee's work that one has no difficulty in recognizing the nature of any single object. Of the other metal work to be seen, we notice many charming examples of Mr. Nelson Dawson and Edith Dawson, Miss Esther Moore, etc., on which we could dilate, did space permit. Indeed, this branch of Art, of all others, seems to flourish at the Arts and Crafts, and enough work of the best kind can be found to interest the student for days before he has exhausted its wonders.

We are enabled, by kind permission of its author, to publish this week a sketch of Mr. W. R. Colton's fountain, recently erected in Hyde Park, taken from the model in the Exhibition. We have little to add to the complimentary notices Mr. Colton has already received of his work. It has been said that it lacks an Architectural note, not even a moulding of any kind being present We think that some people have misjudged the apparent size and scale of the work. To our mind, Mr. Colton has relied on the conventional treatment of the basin and base under with its voluptuous yet enclosed lines to supply this, and taking into consideration the realistic half-length figure above, this is as near to an Architectural treatment as he could have well gone.

On page 166, we give an illustration of one of the beautiful designs for tiles exhibited by the Pilkington Tile and Pottery Company, Limited. Most of these designs are by well known men, and have considerable merit, more particularly that of Mr. C. F. A. Voysey.



BY C. R. ASHBEE.

ARCHITECTURAL SCULPTURE.

By WM. VICKERS, SCULPTOR, GLASGOW.

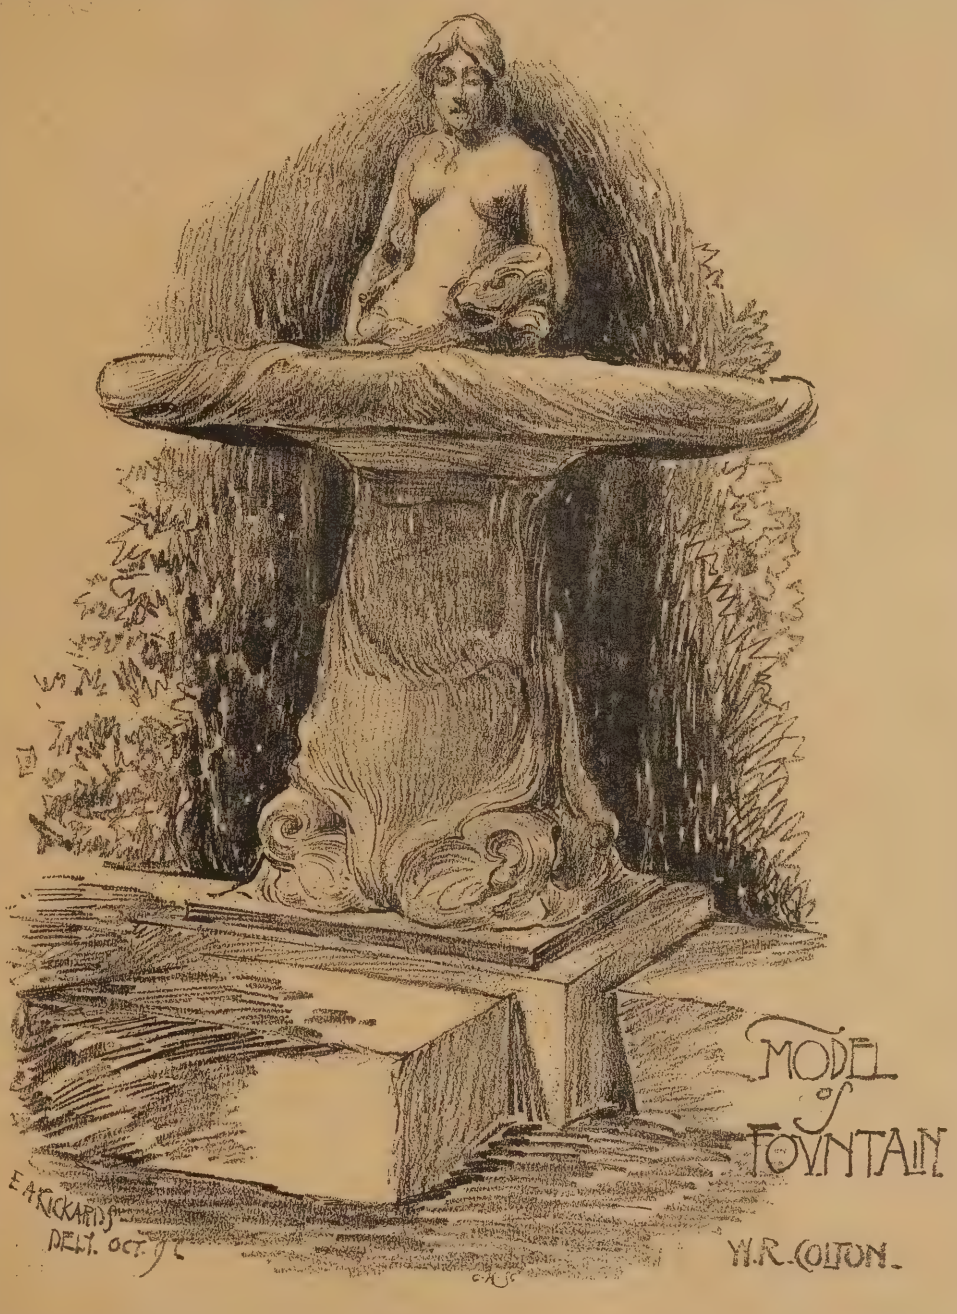
ARCHITECTURAL Sculpture does not necessarily mean that class of work that relates to the human figure alone, but all manner of decorative carving, and as I am referring to stone principally, I use the term "Stone Carving," it being the most commonly applied term. Sculpture is really no better name, for it is used by many people, for the most insignificant work. The French do not usually apply the term Sculptor to the man who works entirely upon the figure, but *Artiste* or *Statuaire*, whereas all who work upon the ornament are called Sculptors; even Plasterers and Moulders, in that country have this distinction, so that the term of Stone Carving is not out of place. In explaining what should constitute a "Stone Carver," and how he should be educated, it is most essential he should have some Artistic taste. He must then undergo, what I am sorry to say is much neglected in this country, a thorough apprenticeship, five years at the very least. During this period the best use of his time should be made not only in Stone Carving, but in taking advantage of the admirable Art Schools that are now to be found in most of our large cities, firstly, in becoming thoroughly efficient in Drawing, and secondly, equally so in Modelling.

From my own experience, I contend that drawing must be acquired to make Carving a success, and to enable the Carver to read and understand an Architect's drawing, and so apply a sketch, if need be, to suit his decorative work to the

ARCHITECTURAL INTENTION.

Modelling is required to put in relief, and in the round, and so work out parts that drawing only would fail to convey. There are some people who deprecate so much modelling, I must say that I do not entirely agree with them, for, if it is anything that is required to be new or original, both in the application of figure and ornament, it is not only necessary for the Carver and Architect, but the safest and most successful way of executing work. In fact, I would go further and suggest a small scale, say an inch and a half to the foot, as a preliminary to the full-size model for important work. I think this method comes so much nearer the scale usually employed by Architects, that it would be a valuable assistance to them in judging scale in the work they were contemplating.

TO BECOME PROFICIENT



he must be an earnest student of Nature, for as life-studies are so necessary for working at the figure, so is natural foliage for ornamentation. There are the five orders, and the ornamentation that relates to each of them, and all the different phases of Renaissance springing therefrom. These are very numerous, French, Italian, Flemish, German and English, without taking into consideration the different Architects' views on the matter, for they very widely differ as to what is the particular treatment.

Take again the Norman period, though that is not called into question so much, but it is all-important to know what preceded that style of Architecture and Carving that made such an important era in English and also in Scotch work, namely Gothic. How much that name covers from the Norman up to the sixteenth century, and with what changes and variations! How is it when the question is to put to many Carvers, "What style is that building"? they answer "Gothic." They cannot discriminate between one period and another, and yet it is so necessary, if it is an Early-English building to apply Early work to it, and if it is Perpendicular Gothic to put that period of carving. It is not only the periods of Gothic that must be studied from old examples,

BUT PROPORTION AND ADAPTATION.

It is a very prevalent custom to leave plenty of rough stone for the Carver, and quite a common thing to see upon Architects' drawings "Rough for Carver," and the very observant Mason hails this with delight, as it is much easier to him to do this than work mouldings, or clean up the Ashlar. This is very good in its way to have plenty of material, but, do all Carvers know when they have too much? I fear not. I have seen label blocks left 9 or 10 in. square, and carved that size, where 5 or 6 in. would have been ample for the label mould, and finials double the size they should have been, and, when carved, out of all proportion, and many other features I might mention to show the necessity of study.

Lastly, a Stone Carver's study is never completely ended. Besides having a good insight into all the subjects mentioned, he must keep in touch with all the new developments that are continually cropping up, and sometimes emanating from Architects' offices, mostly new and original ideas,—what one Architect may like another will not favour. In reference to styles and the treatment of Stone Carving, it is not necessary to go into the Five Orders, but the Renaissance work and the infinite varieties, do call for a few remarks. I should certainly recommend that the work be of a much broader kind as being more suited to the stone that is used for building purposes; what I observe upon many buildings is the mistake of trying to copy work which looks well in marble where it originated, but looks very out of place upon sandstone, the details are much too small. If it is for inside work, and marble is the material used and low relief required, then by all means let all the beautiful specimens in Italy, or, if French, the period of Francois I. be followed, but for outside work these are not suitable. There is some very excellent work upon some buildings, and I think the most successful in Glasgow is that upon the Sun Insurance, by Mr. Lieper.

Of Gothic I cannot say that I am well pleased with the treatment the carvings get. Possibly I am a little too rigid in my views, but I must emphasize my resentment to mixing Early Gothic Carving and the Ball Flower ornament upon the same doorway or cornice. Late Decorative Crochets upon an Ogee label and an Early-English boss terminating this same label. These discrepancies should not occur in good Architecture, and it either arises from a want of knowledge or utter carelessness. In the case of Church Furniture or fittings, such as stalls, pulpits, or reading desks, that is another matter: I do not mind seeing these of another period, providing they also are pure and *unmixed*. It seems to me that want of a little more knowledge on the part of the Scotch Carvers into the details of Gothic work is much against themselves. This state of things could be remedied by making the mediæval work, not only the carvings, but also the

MOULDINGS A STUDY.

In England there is more elaborate work in the Cathedrals, Abbeys, and Churches than in Scotland. In Glasgow Cathedral there is some very excellent work. In the Chapel of Holyrood Palace I have noticed some very good work, resembling very much some of the English, and of the same period as the Cathedrals of England. I will mention York, Salisbury, Wells, and Lichfield for this purpose. I suppose it is not generally known that there is a great variety of treatment in the modelling of this work, each Cathedral having quite a distinct character, so much so that I have heard Architects say what particular type must be carved upon their buildings. Some prefer that of Salisbury, others Wells, and so on. The former is about as small as any I know, and the latter one of the broadest in treatment. I must mention here some Early English ornament that will be familiar to most Art Students, namely, the Stone Church spandrils, which are the finest that I know. These spandrils are continued in different designs all round the apex end.

Of transitional work in England, the finest is Bishop Bridport Monument, Salisbury Cathedral, South Hayling Church, and the Chapter House, York Cathedral. Some of this work is very interesting, showing the gradual change from the Early English leaf to the Early Decorated or Natural leaf, and yet having some of the character of both.

The finest examples in England of the Early Decorated period are at Southwell Minster, but there is also good work of this period at York, Selby and Lincoln. The Perpendicular Gothic is also very remarkable in England for its fine carvings — Henry VIIth's Chapel, Westminster, Oxford and Cambridge Universities, and numerous other places. One little gem I should mention is Bishop Alcock's Chapel, Ely Cathedral.

Following the Perpendicular period we have the Debased style, which has proved also to be a very interesting one to Architects and Carvers, also one

which has contributed a very great deal to what Architects have been trying to discover for many years—a new style. There is very good illustration of this mixture of Classic and Gothic of the late period in many parts of England.

There is another source with a foreign element in it, which I like, and it gives great scope to the Carver—this is the blending of the Flamboyant and Classic. The best of this that I have seen is at Chartres Cathedral and Rouen; it has not been worked upon much in Scotland. Mr. Washington Browne has favoured it a little, though it has been used in England very freely.

There is one point I must not overlook, and that is what I will call the Accidental; I do not mean by this when a Carver, making a slip, destroys his work, but what very often has become a feature discovered by pure accident. One instance of this relates to one of the great Architects of this century, the late George Edmund Street, in respect to the carvings in the New Law Courts. It appears that while Mr. Street was inspecting some model of Early English ornament, he pressed his thumb upon one of the rounded parts of the leaf, making a distinct indentation or hollow, quite different to anything else ever seen upon this ornament. The result evidently pleased him, for throughout the building this feature was adhered to, and had the name amongst the Carvers as the "thumb mark." Another case was at Mount Stuart House. Some three parts of the marble capitals in the large hall were carved, and on each of the four sides were depicted scenes from Æsop's Fables, hunting scenes, and all kinds of games. All this was suddenly stopped, and in the end an attempt was made to turn these subjects into natural foliage out of the material that was left. The result in most instances was wonderful; there were effects in the different massing obtained that could never have been thought of or arrived at if the capitals in their first stage had been started with the object of putting natural foliage alone.

[A paper read before the Glasgow Architectural Society.—ED.]

HISTORY AND ART.—A FLORENTINE OUTLINE.

BY JAMES A. MORRIS.

A KNOWLEDGE of history, like a knowledge of heredity, is one of those silent factors in the world's life, one of those iron keys which opens massive doors into still chambers; wherein strong men may look, and wise men learn. Real history is the comprehensive and impartial record of the past, and the knowledge of a nation's antecedents is as essential to a right understanding of the present or future, as is a knowledge of heredity to the well-being of the family life; and possessed of that knowledge one can the better understand the recurrence or development of hereditary traits, in the national or family life, whether of good or ill. Now the influence of heredity, is, I think, discernible also in the Arts; and in a measure goes so far towards the explanation of those recurrent Art periods, which seem so puzzling to the historian, but are they not puzzling just because so many histories are not comprehensive, in the sense that they unfortunately ignore Art, or if it be recognised at all, it is with scant courtesy, and much ignorance. The futility of this procedure is made further manifest, when one considers how much historical documents vary in detail, or present only one side of a matter, according as they have been penned by partisans or others: and in seeking justly to apportion these, it is worth while to remember how little we can assure ourselves of the real facts of political or social life, even of to-day; and if this be so, how much less are we able accurately to discriminate between the true and the false, in the more uncertain records of the past. Yet historians seem sometimes willing to rest content with such evidence, presumably for want of better; and all the while they have ready to hand, and disregard, incontrovertible facts in Architecture, Painting, and Sculpture, which, rightly interpreted, show more of the real life of a people, and of their faith, than all the accredited records and dogmas that ever were formulated. Let an artist study, for instance, the Elgin marbles, and in the end he will learn from them more of the spirit and culture with which Greek literature is pregnant, and of the Greek himself, than he will ever learn from written history; and it is surely as suicidal to exclude from the pages of history

ALL RECORD OF ART,

as it would be to exclude all literature. And further, all the material creations and surroundings of a people, down even to the meanest kitchen utensil, are of value, as showing how in simple fashion even the simplest of them lived. But the history of a nation, even as it is written, is not without use to the student of Art; for, interwoven with the rugged prose of the record of its life, he may discern the golden thread of beauty, and if he be only simple enough to hear and see the divine in common life, he may weave of the thread a gorgeous garment, transmute the dead bones into living flesh, and enrich his creation with the golden glow of a glorious sunshine, by the alchemy of his divine Art. Now while history, truly written, can record and punctuate the development of Art, and register and imprint artistic facts, it is yet but a truism

DESIGN FOR TILES BY MESSRS. PILKINGTON & CO., AT THE ARTS AND CRAFTS EXHIBITION.

to say, that history cannot create or even teach Art; for Art, like thought, cometh not with observation, nor at the will of man. None the less Art students may surely learn what history can teach; for while it is true that Art is beyond the call of man, it yet at many points touches man's inmost life, and is in turn influenced by it; and sometimes even, as with the Etruscans, it remains the most articulate voice of a people, long after the people themselves have passed away. In this sense Art surely then shows kinship to history, and history with Art has at least this in common, that the sub-structure upon which they both build is "Truth"; for without truth, history is but fable, and Art cannot be. If all this be so, wherein then can history be of use to, or become the exponent of Art? History is not, and never can be in any real sense, the exponent of Art; but history can tell us of the welding together of the different peoples out of which a nation is formed; it can show us something of its remote source, of its different strains of blood, and something too, hereditary or superadded, of the faith, thought, life, and work of a people. And while these in themselves will not enable us to know the individual artist, they will yet show us something of his race, temperament, and possibly thereby help us to get the closer to the individual man himself, and to the better understanding of his work. These things I can only imperfectly suggest. I cannot, of course, for a moment presume to teach. All I seek is to encourage any among you who may so desire, to dig with me in rich ground, each for himself, but in the spirit of real comradeship also, each helping the other. I wish, if I may, to suggest to you lines of thought, which you may afterwards, if you so choose, follow for yourselves, rather than to go again with you over the well-known paths. Rather would I, by personal inclination at least, seek to branch off into those pleasant little by-ways which lead from every road, for there, I think, one finds the sweetest flowers, and there, at least, one is more alone: and it is good sometimes to be apart from one's fellows, if only—as George Eliot makes gruff old Piero de Cosimo put it—that "we be not choked with other men's thoughts." Following then the lines of this general introduction, and applying them broadly to the inception and development of Florentine Art, we soon reach the incontrovertible fact, that the

GREATEST OF ALL ITALIAN ART IS TUSCAN;

and the crowning glory of Tuscan Art, the mother and sweet matron of it all is Florence, "the fair city of lilies." To know a little then of Florence and of its people, I propose that we first listen to history, for neither Florence nor her Art are of to-day, both are of the past, and Florence is a Mediæval city, and a city of the Renaissance. But long before even Mediæval days, Florence was a place of note. Situated at the confluence of the Arno and Mugnone, enclosed on either side of the long valley by fair hills, and born in a plain of white lilies, she rose like an Aphrodite from a sea of white foam; and although lying somewhat in the northern part of classic Etruria, she was yet cradled upon its only river of importance, and all the pure blood of the vernal Art of Etruria pulsed hotly in her veins; and ancient Fiesole, looking downward from her mountain height, but 3 miles distant, heard the birth-cry of the new city, and was the Etruscan sponsor of the child. After the Roman conquest came the deluge of Teuton blood, fierce, determined, strong, and heroic in its denial of defeat, and to my thinking the influence of Etruscan refinement, stimulated by the inherent energy and fierce capricious will of the Teuton, moulded and impelled the spirit of Tuscan Art. And note this further, that where Etruscan life and northern blood were strongest, there, too, in after days was purest and strongest Italian Art; and without the boundaries of these two united influences Italian Art was in comparison unknown. Beyond the boundaries of old Etruria there is Rome; but is not Roman Art, early perhaps as well as late, Roman only by virtue of its strength and power? From Umbria came Perugino and Raphael, but both were Florentine artists before Roman. All others of note she called from Florence.

HER CHURCHES WERE BUILT

and decorated by Florentine artists; her pictures were painted by them, and her buildings enriched with their sculpture. The Architects of Rome's greatest Church were almost wholly Florentine and wholly Tuscan; that is, if we except Raphael, who was only semi-Florentine, but who, after all, had really little to do with the building before Maderno, its first Roman Architect, had perpetrated his Nave, and so ruined Bramante and Michael Angelo's great design. Neither have Venetian or Lombardic Art the dignity and power of Florentine Art, and the former is redolent more of the East than of the West. Giorgione and Titian are sumptuous painters, but different is their Art from the serious sweetness of Giotto, the superhuman force and irresistible magnificence of Dante, the solemnity of Michael Angelo's Last Judgment, or the pictured sufferings of the damned. But although Tuscan Art is the most serious of all Italian Art, and in this may be again discerned its Etruscan heritage of gloomy religion and solemn awe, it is yet serious only in its deep joy, for its joy, like all lasting joy, is abstruse and grave. Classic dignity and refinement ever became Florence, and one is inclined to think that the

source of much of that dignity and refinement is also to be found not remote from its Etruscan origin. The very name of Tuscany itself is but the continuance of Tusci or Etrusci; the old word still lingers in the land, and with it much else besides that is of value, more even than we perhaps surmise. Etruscan power was greatest in the sixth century B.C., but in the third century B.C. it became subject to Rome, and Signor Melani holds that the "Architecture of Rome itself was grafted upon Etruscan work, and had acquired a character of its own prior to the

EXERCISE OF GREEK INFLUENCE."

If this opinion be well established, and it seems a reasonable one, then it is a statement to be remembered. But Etruscan influence is not the only influence apparent in the moulding of Florentine Art, for it must be remembered that Florence lay also immediately on the direct road from the north to Rome, and as by this road from the passes in the Carnic Alps, surged in succession those waves of barbaric invaders, whose hosts for centuries overran the land; so in this influx of Teutonic ancestry we find the second, as I think, of the two great influences apparent in the moulding of Tuscan Art; for the impress of the Teutonic mind and character is marked most unmistakably in the Tuscan people. And in those terrible centuries of coalescence, for the "Italian people" it has been well said "is made up of the people of every nation Rome ever conquered, or that ever conquered Rome"; in those grim centuries of Roman decay and rottenness, of alternate craft and fighting, when war, pestilence, desolation, and famine, walked with the Goth rampant in the land, the unrecorded history of Florence must have been eventful enough. One destruction of the city at least we know of, that by Totila during his wars with Justinian's generals, and then it was "embellished with those sure indications of Roman wealth and luxury, baths, theatres, and aqueducts." But long before Totilas's time, the Teutons had crossed the Alps and seen for themselves the beauty of the Cisalpine plains. As early indeed as A.D. 180 they had measured swords with the Empire and been worsted, but on August 9th, 378, the old and the young world again tried their strength, and this time the young world prevailed. But Italy was not theirs, nor yet to be, till Alaric had fought and been defeated, and fought again and conquered, in his famous campaigns of 400–415, and then for the first time the fair land was laid at the foot of the Goth, and the unflinching hand of the hardy northern race crushed even Rome itself in its terrible grasp. Meanwhile, during Alaric's wars, we get a glimpse of Florence, for another hero, Radagast by name, trying for Rome like Alaric, and by the same road, sat down in 405 before its walls, and there with his 200,000 German followers wholly perished. Attila, whose barbaric boast it was that "grass never again grew where his horses' feet had trodden," had his share in the terrible drama. Then Odoacer, the giant Herule, followed only by his brother, went into Italy, and in 476 became its first German king. Then came Theodoric, the mighty Ostrogoth, and fought with Odoacer for the kingdom. It reads like a saga, how that great Amal had at Constantinople been granted, with much craftiness and ceremony, the kingdom—if he could but take it for himself—and how he gathered his heroes from many tribes, and marched and fought and conquered, he and his heroes; while with them as with all Teuton hosts, just as with our own colonial pioneers, went "their wives and their little ones, and all that they had." We read how they crossed the Alps by the old passes, white with snow and bleached bones, "while icicles hung upon their beards, and their clothes cracked with frost"; and then down they went into the sunny plains. And we are told how on the morning of his great battle, Theodoric asked his mother, who had been with him in all his wanderings, to bring him a bright mantle she had embroidered for him, and put it on over his armour, so that all men may see "how he goes gayer into the fight than ever he did into feast"; and that she, his mother, may see "whether she have brought a man-child into the world, or no." Now you must not think that all Goths were wanton

DESTROYERS OF EVERYTHING BEAUTIFUL.

Far from it; but war is a rough mistress, as many an old world city has often found. Theodoric was a wise ruler, a just man, and a great builder. Venice, Ferrara, and Siena were amongst the cities founded by him, whilst Florence, besides many others, were enlarged; and this Goth not only built, but he set his face hard also against all destruction and laboured to preserve such ancient monuments as remained in the land. Kingsley, whose book you should all read, regards him as the founder of Byzantine Architecture in Western Europe. I wish time allowed me to tell you of all the succeeding mighty northern fighters who had their try for the land. How Tiea fought and died hard; and Alboin, then a young princeling seeking adventures, and not much caring with whom he fights so long as they fight stoutly and well, fought against Tiea. But the day came when this Lombard prince himself now become a great leader, entered once again the land, and this time at the head of a great host. Not as before came he to blindly fight brother against brother, and so work the Romans' will. This time he comes to conquer the land for himself, and so once again and for the last time are Roman and Teuton face to face. Duplicity of some kind there was, but whether sent for or no the Lombards came. Through the old passes they poured into the war-worn land, where there were none now strong enough to say them nay; and so on Easter Tuesday in the year 568 the land was invaded by the old foe, and for the last time; for the incomers went not away again, but stayed, and gave to the northern plains their own name. And now but one story more, and I have done with history. Alboin, the mighty warrior and fierce prince, the final founder of the Italian people, died by his own sin. In a fit of drunken revelry, he forced his wife, the daughter of Cunimund, his old foe, whom he had made his bride, to drink before all a draught of wine from a goblet made of her father's skull. Fierce and barbaric was the deed, and fierce and foul was the revenge; for by the sin of her own body she achieved her lord's murder, and so herself also passed unto a wicked end. Now, do we the better understand the seven devils of the Goth, and their desire also to do great deeds and encompass great ends? Or do we, in a few centuries afterwards, recognise in a modified form, with chastened temper and controlled will, the spirit which animated the Free Republic cities of Italy? Although with at first a mania for destruction, the Lombards in the end became great builders, but they brought no complete Architecture with them from their northern home, and whatever knowledge of building they possessed paled before the work they found in the land, but the gloom of the northern forests, and the weird myths of its shades, they worked into their fantastic ornamentation, and its stern spirit into the Architecture which afterwards bore their name. Florence must have been again destroyed, for Charlemagne is its reputed rebuilder; and thereafter she began to recover something of her lost prosperity. Before the ninth century she was permitted to surround herself with walls and fortifications, and when Otho I. was in 962 crowned king of Italy, she, for the first time, received the rights of municipal government.

(*To be continued.*)

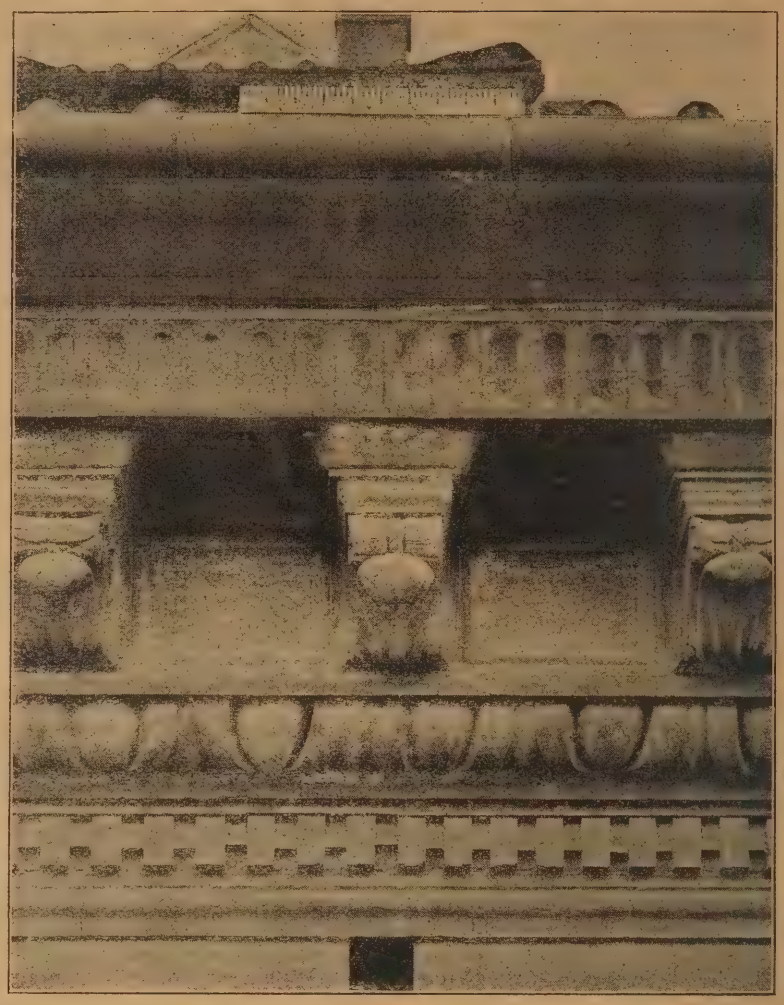
LOGGIA OF THE BIGALLO PALACE, FLORENCE. ARCHITECT UNKNOWN. ERECTED ABOUT 1351.

MESSRS Christie are again adding to their premises, and are now occupied in rebuilding the house to the eastward of their portico in King Street.

AT a recent meeting of the Birkenhead Town Council a resolution of a sub-committee to purchase the Wirral Waterworks Company's undertaking for the sum of £260,000 was defeated by 38 votes to 6.

AN inquiry was recently held by the Local Government Board at the Town Hall, Newport, as to an application by the Newport Corporation to borrow £2,150 for paving public footpaths and carrying out other improvements.

MR. R. A. EASDALE, A.R.I.B.A. (head assistant to Mr. Arthur Hartley, C.C., Architect, Carlton Chambers), has gained the silver medal and a prize of five guineas offered by the Leeds and Yorkshire Architectural Society for the best set of measured drawings of any building erected anterior to the seventeenth century. Mr. Easdale selected the interesting Norman Church at Birkin, situated about three miles east of Ferrybridge.



Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
October 21st, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

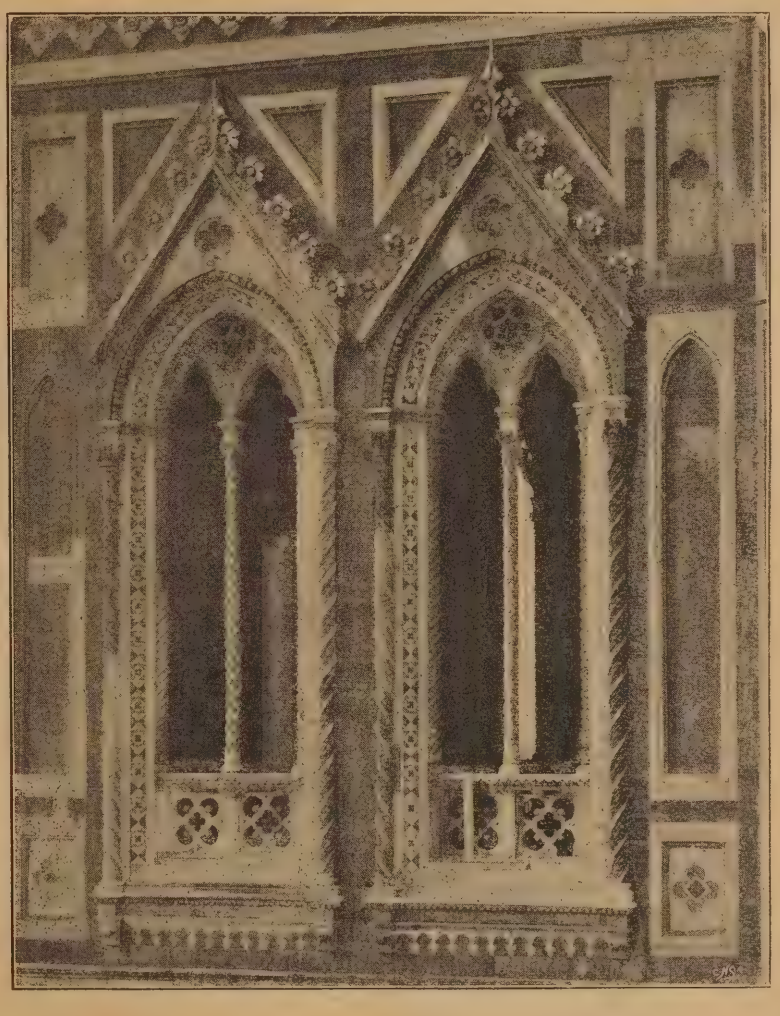
MR. HOLMAN HUNT'S paper delivered at the Church Congress, on "Christian Art," is somewhat disappointing. What he said was very good in its way, but it was not new. His quotation from Dean Stanley criticising the trivial decoration of Roman altars on the Continent is not fresher than his story of how the Bishop of London, in 1774, refused the offer of Sir Joshua Reynolds and Sir James Barrie, of their gratuitous services for the decoration of St. Paul's. Decoration, said this Episcopal Philistine, meant desecration. So St. Paul's had to wait nearly a century and a quarter for the introduction of colour into its too cold, grey interior. Neither is it a very striking observation that for Churches, Gothic has superseded all other forms of Architecture, It is true, but it is trite. What we wanted from Mr. Holman Hunt, some of whose pictures already decorate our Churches—his "Light of the World" hangs in Keble College Chapel, at Oxford—was as to the best lines upon which to proceed, whether in regard to mere decoration or the exhibition of pictures. His eighteenth-century Bishop of London still represents a large amount of Puritan feeling in the Church. There is the old story, newly told, of the supporter of the revival of ecclesiastical Art, who asked an ultra-Protestant "Surely you admit that Art is the handmaid of Religion?" "Of course I do," was the reply, "but I want Religion to give Art a month's notice." Yet Art can suggest ideas and provoke high emotions as well as literature, and more abiding often than the literature of the pulpit. Are they not "placarding moral posters" in Paris? That is making Art the handmaid of Ethics. A Mosaic, inspired by Mr. Watts' "Time, Death, and Judgment," is exhibited in front of one of the most famous Churches in the East End of London. The question of the employment of Art in both Church and school is a somewhat difficult one, and the only dominant idea we discover in Mr. Holman Hunt's paper is that Art in Churches should be controlled by artists, which was aforetime a paradox, but is now an axiom.

TWO of the most unique works of art in the whole of South America, if not in the world, have been destroyed by the great fire at Guayaquil. They were a couple of large frescoes flanking the altar in the principal Church. On one side was shown the Return of the Prodigal Son. The Prodigal was attired in the tattered remnants of a full-dress suit of the days of the Regency, gilt-buttoned dress-coat, black satin breeches, silk stockings, frilled shirt, and chapeau Bolivar. He was being welcomed by his father in like array, and by his mother and sisters in short-waisted, short-skirted gowns of embroidered muslin and sandalled slippers, to a mansion richly furnished in Empire style. The subject on the opposite side was the Sacrifice of Isaac, who was garbed as a mediæval page, whilst Abraham, in a furred gown and plumed hat, was preparing to take his life, not with a sacrificial knife, but with a gigantic blunderbuss, a genuine trabuco. It is to be hoped that photography has preserved the memory of these matchless art treasures, which, notwithstanding their eccentricity, were by no means badly drawn, though somewhat crudely coloured.

FLORENCE: DETAILS OF CORNICE OF THE RICCARDI PALACE BY MICHELOZZI.

AT the Leeds Art Gallery, the Winter Exhibition, is this year confined to the works of J. M. W. Turner, R.A. Mr. H. Bendelack Hewetson's collection of engravings, mezzotints, &c., from the artist's works, provides the principal part of the exhibits and consists of nearly a thousand prints. The trustees of the National Gallery have loaned about fifty water-colour drawings and two or three oil-paintings. The committee are also under obligation to Sir Donald Currie, who has lent a series of vignette water-colour drawings. Turner lived in an ideal world, seeing things as in a dream; he was a poet, and his work will be admired till the paint fades, and even when that unhappy time comes the translations which the etchers and engravers have made from his drawings will perpetuate his memory. Some of his painting has already lost its brilliancy, and this unfortunate circumstance makes the prints so valuable. The pictures from the National Gallery have been selected by Mr. Wm. White, of the Ruskin Museum, Sheffield, with the view of showing the maturing of the artist's powers. In his youth, Turner used to put in backgrounds to architectural drawings for architects, and the first drawing of the series, "Radley College, near Bedford," was apparently executed in this way. One of the most pleasing drawings in the collection is that of the "Glacier, with fir trees, Mont Blanc," which gives some idea of the vigour which characterised a good deal of Turner's work. "Abbey Ruins (Kirkstall Abbey)" will, no doubt, prove of great interest, but how different are the surroundings of the Abbey now. This is a small sketch, but it well repays examination. Turner was ever an idealist, and the two drawings of Lake Lucerne show him in this light. There is in them exquisite harmony of colour, and they are otherwise charming. The same may be said of the "Landscape with River," a sweet little sketch in oils, perfect in tone. The burning of the Houses of Parliament was a subject which afforded Turner scope for the exercise of his powers as a colourist. A drawing of the scene is in the collection, and it is one of the most pleasing. The flames from the burning pile are shooting upwards, illuminating the dense mass of the people in the foreground, and the adjoining buildings. Turner was happiest when dealing with atmospheric effects, and there are a number of such drawings in the collection.

LAMBETH will soon possess the largest single swimming bath in Europe. This will form part of the structure which the vestry proposes to erect in Kennington Road, of which the foundation stone was recently laid. The new building will be the chief of the series proposed to be erected in various parts of the parish. The superficial area of the site amounts to 33,330 ft., and the total estimated cost is £55,000. The structure itself will cost £33,747, and the general accommodation will be a first-class men's swimming bath, 142 ft. by 56 ft., men's second-class swimming bath, 98 ft. by 42 ft., women's swimming bath, 64 ft. by 40 ft., 65 men's private baths, 30 women's private baths, and public wash-houses for 64 washers. The first-class swimming tank, which will hold some 250,000 gallons, has been specially adapted for letting, during the winter months, for purposes of entertainment, and the hall, when thus arranged, will be entirely shut off from every other portion of the establishment, affording seating accommodation for 1,522 persons.



MANY suggestions are put forward by members of the City Corporation to celebrate the completion of the sixtieth year of the Queen's reign. An address will naturally be presented, and possibly a commission will be granted for the preparation of a suitable gold casket to contain the parchments. One suggests a substantial sum for the building of an Art Gallery worthy of the City. A site on the Embankment might be chosen, he thinks, and a building erected upon it fit to hold not only the works of Art the City now possesses, but those that it is certain will be offered when a gallery deserving of the name is a matter of fact. A second suggestion is that an effort should be made to complete the frescoes in

the Royal Exchange. Several additions have already been promised, so that the completion of the work would not involve a very heavy expenditure. A third suggestion is that the Court should establish a certain number of "Royal" scholarships in connexion with their various schools, more especially the Girls' School and the Freemen's Orphan School.

MR. HOWARD CARTER, the Artist of the Egypt Exploration Fund, has gone to Cairo, whence he will proceed to Thebes, to resume his work of copying the scenes and inscriptions found on the ruins of the Temple of Deir el Bahari, for the illustrations in the publication of the Fund. Mr. Carter hopes to finish this work in two more seasons. Professor Flinders Petrie, who is going to Egypt later on, returns this winter to the Fund, which he left in 1885, and will have the conduct of the excavations on its behalf in place of M. Naville, who has for so many years been the director of the explorations. It is intended, during the forthcoming winter, to roof those parts of the ancient temple which are exposed. The work will be done under the supervision of Mr. Somers Clarke, the Fund's Architect, especially with a view to the preservation of the brilliant colouring of many of the scenes, which, if left as at present, would undoubtedly be bleached by the action of the sun.

AT a special meeting of the Liverpool Vestry, held last week, the question of workhouse accommodation was discussed, and Mr. Hagger, the clerk, read reports and exhibited plans which had been sent in by three Liverpool Architects, Messrs. Edmund Kirby, Henry Hartley, and W. E. Willink. In his report Mr. Kirby submitted three alternative schemes for the adaptation of Brownlow Hill Workhouse as a hospital. The first left the buildings in outline exactly as at present. The interior was similarly treated. Under this scheme, however, accommodation for the numbers asked for could not be reached. The estimated cost of this scheme would be £12,000 to £15,000. The same Architect's second scheme, which was estimated to cost about £45,000, provided for considerable alterations to the existing building, new pavilions, and other additions. His third scheme provided for the removal of the 600 sick infirm inmates to Kirkdale, leaving the Brownlow Hill buildings, when altered very extensively, as a hospital pure and simple, except for the parish and relief offices retained there. The cost of this scheme would be about £15,000. Mr. Hartley, in drawing up his report and deciding upon his plans, had kept in mind the utilisation to the fullest possible extent of the buildings existing, adding such other structures as might be necessary. The present workhouse could be so arranged as to accommodate 1,724 sick, and 400 healthy inmates, and, in fact, become a huge hospital. Besides removing the third floors of the buildings so as to give increased ventilation and light to the surgical wards, and affecting other alterations, he proposed to erect new pavilions. £25,000 would approximately enable the Vestry to effectually carry out the work included in his report. Mr. Willink's report suggested the entire removal of the parish offices in Brownlow Hill to another situation, probably near other public offices in the city. Considerable alterations and additions to existing buildings were also proposed by this gentleman. One important feature of this scheme was the proposal to include the erection of a maternity hospital, in which there would be 57 beds. The total cost the Architect estimated at between £53,000 and £54,000. It was resolved that the reports be printed and distributed to the members, and sent to the Local Government Board for them to decide. The further consideration of the reports and plans was adjourned to a future date.

IN reference to the new county offices now in course of erection at Wakefield the General Purposes Committee recently made a report to the Council. The committee having learnt that the architects did not consider that certain of the provisional sums specified in the contract for the purpose of stone carving, decorative marble, fibrous plaster, and other work of similar character were sufficient to carry out the scheme in a thoroughly satisfactory manner, and in conformity with the style of building, requested them to furnish an explicit statement showing what further expenditure they deemed desirable under each head. The committee had carefully considered the details of all the proposed works with a view to ascertaining what reductions were practicable in the figures submitted by the architects. The bulk of the work was in the nature of decoration, and if it was to be done at all the committee thought it essential that the quality should be of a high class, and that an artistic character should be preserved throughout. Any reductions therefore must be by way of omitting altogether elaborate ornamentation in certain portions of the building rather than in introducing any inferior work. The committee recommended that the Council should sanction various "increases of provisional sums" and "other additional expenditure" amounting to £4,705, and also an expenditure of £800 on the decoration of the ceilings and walls of the Council Chamber and the ante room (not provided for by the contract), making a total additional outlay of £5,505; the total expenditure in respect of the buildings is expected to be £89,364. The following matters still remain to be provided for:—Internal decoration, including painting, paperhanging, boiler house and buildings connected therewith, and furnishing, including the seating of the Council Chamber, for which estimates have not yet been prepared.

FLORENCE: WINDOWS OF THE CATHEDRAL BY GIOTTO.

AT the meeting of the Improvement Committee of the Birmingham Corporation, last week, plans were submitted and approved for the erection of 64 "dual houses," to utilise the space known as the Milk Street area, of a type new to Birmingham, but one which has already been adopted by the Liverpool Corporation, and favourably considered by other municipalities. The plans, which have been prepared by Mr. P. Addie, the secretary and manager of the Improvement Department, will now go forward to the City Council, and on their adoption by that body will be submitted to the Local Government Board for approval and the consequent authority to borrow money to erect the proposed dwellings. The "dual" plan is a modification of the tenement system, giving greater privacy and larger accommodation, and appears admirably adapted both to the needs of the position and the character of the district in which the dwellings are to be placed. The cleared site presented considerable obstacles, especially in regard to the acute angle on the Little Ann Street side of the land, but these have been overcome, and the ground will, if the scheme is approved in its entirety, be well covered, while leaving abundant air space. The main elevation resembles that of an ordinary terrace of small two-storeyed houses, but internally each floor will be a complete dwelling, consisting of a living room and two bedrooms, with respective areas of 12 ft. 9 in. by 10 ft. 6 in., 11 ft. by 9 ft. 6 in., and 11 ft. 4½ in. by 8 ft., and a scullery 9 ft. 6 in. by 8 ft. on the other side of a corridor running behind the living and sleeping rooms. Adjoining the sculleries will be separate sanitary offices for each dwelling. The entrance to the ground-floor houses will be by an ordinary doorway on the street level, and to the upper dwellings, which are identical in area and accommodation, by way of an enclosed external iron staircase and gallery, which is continued round the ends of the blocks to the upper corridor. The sculleries and sanitary offices will occupy only half the lineal area of the living and sleeping rooms, and the intervening spaces will be left open to secure ample ventilation, though the whole area will be under cover. The site contains 4,040 square yards, and the buildings will cover about two-thirds of this, leaving a very considerable space for yards, which will be beld in common for clothes-drying and recreation. It is proposed to let the upper dwellings at 3*s.* 9*d.* per week, and the lower at 4*s.* 3*d.*, and it has been found, after careful examination and consideration, impossible to erect any other class of property which would at these or approximate rentals pay its way.

MR. C. B. FOWLER, of Cardiff, writes that whilst a hole was being dug to erect a scaffold for restoring the roof of the south chapel of

Llanblethian Church, there was brought to light a large sepulchral slab turned top face downwards, which on being removed disclosed a stone-built grave containing the remains of (without doubt) one of the early priests of the parish, for on examining the walling of the grave a small square recess was found on the south side, about six inches square, and standing in same was a pewter chalice. This chalice is of the Romanesque or Norman type, 3¾ in. in height, the bowl being 4 in. in diameter. This type of chalice was used, for burials only, up to the end of the fourteenth century, and they were generally placed on the right-hand side of the body, near the shoulder. The early chalices were very small, with shallow bowls, whilst those of later date were larger and more conical in form, leading us by a definite step to what may be termed the Gothic type, from about the end of the fourteenth to the early part of the sixteenth century, or the end of the reign of Henry VII., many of them showing features of great beauty. During the time of Henry VIII. the chalices lost their Gothic feeling by a complicated foot with flowing outline being added to them, also highly elaborate stems, with bowls of hemispherical form. The chalice found at Llanblethian must be of fourteenth-century date, for the South Chapel, where the grave lies, was built during this period, and several portions of early thirteenth-century sepulchral slabs have been made use of in building up this addition to the original church. It is of pewter, but from its great age little of the metal remains, and unless very carefully handled it would fall to pieces. A similar one was found at Hereford some years past in the grave of Gilbert de Swinegield, chancellor of the choir, A.D. 1297. Strange to relate, the slab covering the grave at Llanblethian is to the memory of a woman, the inscription being in French, of Norman date, the word FEMME being clearly traceable, so that this stone must have been taken from the nave to cover the priest buried in the chapel. This grave is close to the entrance to the crypt.

A CHARACTERISTIC bit of Old London is likely soon to disappear in Cloth Fair, the network of narrow lanes and alleys clustering round St. Bartholomew's Church, Smithfield, and standing on the ground once occupied by the precincts of Rahere's Priory. The Cloth Fair was held from 1133 in the Priory Churchyard, when the woollen merchants and drapers sold their wares in booths. Barthelemy Fair went on after the dissolution of the Priory in 1544, but the cloth merchants had moved from the churchyard booths into substantial houses and there flourished, nor has the trade altogether deserted the neighbourhood to this day. In the principal street and its nest of courts, as well as in Middle Street and East Passage, there are gabled fronts, projecting windows, and here and there some bits of old carved timber, though houses of later date have intruded considerably. These latter, however, are now old-fashioned and inconvenient, so that Cloth Fair is doomed to give way to modern warehouses, and those who want to look upon one of the last remaining features of bygone London, and an historic spot, will do well to visit it.

BY a strange coincidence, one of the most interesting memorials of Molière, to whom the Church refused burial, is hidden away in the garden of a Dominican convent. It is a classical temple in the taste of the last century, and was built by the Duc de Praslin, the pre-Revolutionary Foreign Minister. Little is left of the original structure save an elegant but decaying peristyle, with an entablature bearing the words:—"Ici fut la Maison de Molière." Scarcely 50 yards away, in the Rue Théophile-Gautier, another house has an inscription, stating that it was the suburban abode of the dramatist, about 1667. Probably no evidence exists upon which to determine between these rival claims, but it seems a pity that the Duc de Praslin's monument should be allowed to perish for want of a few francs. Molière, indeed, has been rather unfortunate as regards the identification of his dwelling-places. A mural tablet in the Passage Hulot still, we believe, misleads the world as to his ordinary domicile. He really lived over a tailor's shop in the Rue Richelieu, facing the Rue Villedo, his host being one Baudelet, but not a vestige of the old building remains.

GRADUAL, though extensive, alterations are in progress at the Middle Temple. Some of the old courts of the Inn are being rebuilt, the Treasury offices of the Inn are being greatly enlarged, and more of the old courts will very soon be pulled down to make way for fresh structures. By this gradual and piecemeal process the rebuilding is being accomplished with a minimum of disturbance. For some years one of the most striking architectural features of the Embankment has been the beautiful hall and library which were recently built facing the river. One defect in it was the want of access from the Embankment. But this inconvenience has now been removed by the erection of a gateway and entrance.

THE idea that the greater the height of a chimney for a boiler plant the greater will be its draught-producing power, is responsible for the existence of many stacks of imposing size and unnecessary costliness. A very tall chimney, well-proportioned and gracefully outlined, may be a striking Architectural feature, but it is one that costs a considerable amount of money, without doing any proportionately increased amount of good. Where chimneys are intended to carry off noxious fumes from chemical or other works, there is of course, some reason for the increased height. The draught-producing capacities of chimneys having flues of the same size are in proportion to the square roots of their heights, so that if one chimney were to have double the power of another, it would have to be four times as high, and not merely twice as high, as many suppose. A height of 150 ft. may be considered, on good authority, as the maximum necessary in any case for producing the requisite draught, providing, of course, that the area of the flue has been properly proportioned. This latter should be made to bear a direct ratio to the combined areas of the boiler flues connected with it. A chimney-stack much beyond 150 ft. is generally suggestive of misspent money.

IN Sixth Avenue, Eighteenth and Nineteenth Streets, New York, is to be erected the largest business establishment yet undertaken. It will cover some 18 acres of ground, be six stories high, and a tower 200 ft. high will rise from the middle of the building. The construction of the whole is as fire-proof as money can make it, and there is an elaborate "sprinkler" system. On the vast roof there will be a mammoth conservatory in which all kinds of flowers and plants will be raised and sold, and there will also be a large photographic studio. To ascend to the roof or various floors there will be 10 passenger lifts, and an equal number for goods, one of these—the furniture lift—being large enough to take a pair-horse van. In the basement there will be fitted an expensive electric plant, whose power is used wholly in one building. All through the building, everything moveable will go by electricity, elevators, clocks, fans, carriers, ventilators, fountains, cooking appliances, lights, signs, and a complete house telephone system. There will be nearly 100 electric clocks at convenient intervals throughout the building, and a total of 6,500 incandescent and 800 arc lights will be used for general and special illuminating purposes. Three thousand of these lights are for external use. In the centre of the main floor is a circular marble basin, 70 ft. in diameter. From the centre of this basin rises the heroic bronze statue of the Republic, executed by French, the sculptor. Surrounding the base of the statue are four electric fountains.

APPLICATION has been made by the Town Council for a further loan for the purpose of completing the Montpellier Baths, Harrogate, which are now in course of erection. At the Local Government Board inquiry, held in the Council Chamber, at Harrogate, and amongst those present were Mr. Stead (Borough Surveyor) and Mr. Baggallay (Architect), of London, the Town Clerk said that in 1891 the original estimate for the erection of the baths, which was submitted to the Local Government Board, put the total cost at £45,678, and sanction was obtained for the borrowing of £50,000. Between 1891 and 1894, however, when the contracts were let, a good deal of trouble was experienced in connection with the foundations. It was found that the strata in which the mineral water was to be had underlaid the foundations, and it was consequently decided to raise the building in consequence some two feet. It was estimated that the extra cost of that work would be about £3,000. The extras on the building contract were estimated at £1,325, but that, it was considered, was more than balanced by an anticipated saving from the contingent allowance. On the smith's, plumber's, and glazier's work—the contract for which was £14,500—the extras would be about £2,036. This increase was mainly due to the provision of further bath-rooms. Other items were increased as follows:—Joiners' and carpenters', £1,618; slating, £180; plastering £289; painting, £50; steam boiler, £310. In all the cost was now estimated at about £70,000, while fees, law charges, commissions, and various incidental expenses were estimated at about £12,000. The total amount which it was proposed to borrow was £34,000, of which £32,000 would be required for the purpose of completing the baths.—Mr. Baggallay, the Architect, stated that the estimate in 1891 was made up as follows:—Main building, £34,429; winter garden, £9,191; pump room, £2,058; total. £45,678. This had been altered so that the winter garden was estimated to cost £26,380, while the cost of the pump room was reckoned as a saving, inasmuch as it had been omitted as a separate building. The excess over the original estimate was due to three principal causes—(1) the unusual character of the building; (2) difficulties with the site and foundation; (3) important alterations of the plans. The unusual character of the building caused the estimate based on the cost of other public buildings in the neighbourhood to be altogether fallacious; the character of the site and the possible risk of interference with the mineral springs necessitated considerable extra expenditure. The dressing-room accommodation was also being increased, as well as the number of needle baths. The electric light had also been adopted, and there were other minor additions to the cost.

EMBRUN possesses a venerable and interesting Cathedral, dating from the eleventh century. One of its most beautiful features is the north porch, in Romanesque style with red marble pillars, the two outer ones resting on lions, the other two consisting each of four slender columns interlacing with one another, and resting on the shoulders of a crouching dwarf-like figure. The Cathedral possesses an organ presented to it by Louis XI., who for 21 years, from 1440 to 1461, while he was Dauphin, resided in the province from which the oldest sons of the Kings of France derived their title. The organ is on the north side of the western end of the nave, and is supported by a marble pillar, from the capital of which is a fan-like projection spreading around the organ's base, to which it distributes the pillar's support. The pillar is placed against one of the columns of the nave, into which the organ projects from the clerestory wall. The organ is approached by a gallery suspended across the lowest arch of the nave, and ascended to by a tourelle built up against the west wall. Louis XI. thought much of the inspiring counsels of Notre Dame d'Embrun, now represented in the Cathedral, in a large chapel on its south side, by what seems to be a last-century statue of the Virgin and Child. But in former days the representation of the Virgin, with which was associated the local devotion rendered to her, was in the beautiful porch. Near to the Cathedral the Brown Tower, as it is called, stands prominently, as it has done for 700 years, and now shows upon its walls the marks of time.

THAT the strike in the Nottingham plumbing trade is at an end and that the threatened lock-out in the building trade has, therefore, been averted, is cause for congratulation. The strike in the plumbing trade has caused great inconvenience and not a little loss, but if the stoppage of work had been extended to all the branches of the building trade the consequences to the town would have been disastrous. There is more building going on at the present time than for many years, and much more is impending. It is not too much to say that a large portion of the centre of the town is being rebuilt, while in the outlying districts building operations of extensive character are being carried on. It is well known also that several very expensive building schemes are to be commenced shortly, and if all this had been stopped, as seemed likely a few days ago, by a trade union dispute, the public would have had good reasons for serious complaint. For a long period building was almost suspended.

During the past week the British Iron Trade Association has collected and published the statistics of the production of steel in the United Kingdom for the first half of the present year. The figures show an almost unprecedented increase of output, which is a specially interesting fact in view of the discussion that has been going on for the last year or more as to the alleged superiority of German methods and the success of Continental competition. It appears that the total production of steel for the first six months of the current year was as much as 1,969,320 tons, or at the rate of 3,938,640 tons a year, which is by far the largest output of steel hitherto arrived at in a single year by any European country. The figures have, however, in several years been exceeded by the steel output of the United States. The largest increase of output appears to have taken place in the open-hearth steel industry, which, although not much over 25 years old, and scarcely worked on a commercial scale 20 years ago, now yields over 2,100,000 tons of material per annum. This is an advance which is without parallel in the history of any other branch of British ironmaking, and is perhaps unique in the history of British industry. The North of England, where only a few hundred tons of open-hearth steel were produced 15 years ago, is now producing that material at the rate of over 800,000 tons a year. Scotland is not making quite the same amount of progress, but even there the advance has been marvellous, seeing that 292,782 tons were produced in the first half of the current year, where only a few thousand tons were produced at the only works of the kind established in Scotland 20 years ago. The Sheffield district has not made such striking progress as Cleveland and Scotland, but still the advance has been material, and the same remark applies to Wales, Lancashire, Staffordshire, and other districts.

Speaking at a meeting of the committee formed for the purpose of establishing a Memorial of International Submarine Telegraphy, the Earl of Selborne said the business before them was to inaugurate an international submarine telegraph memorial in which all the nations of the earth proposed to take part in order to put on record their respect, he might almost say veneration, for this great invention, which had already had so large an effect on humanity and on the history of the world. It was intended to connect the memorial with the names of three men familiar to all—Mr. Cyrus Field, to whom belonged the conception of this great idea; Sir John Pender, who risked his capital and threw into submarine telegraphy the force of his character and ability; and Sir James Anderson, captain of the "Great Eastern," who, when scientists proved to demonstration that a submarine cable could not be raised, showed they were wrong by raising one. The first Channel cable was laid in 1851. There were now 162,000 miles of submarine cable, and the capital invested was not far short of £40,000,000. All those who were connected with commercial operations knew the value of this communication. It had constituted a revolution in the science of government. The first patent for electric telegraphy was taken out by Wheatstone on June 8th, 1837, and it was certainly one of the greatest triumphs of the present reign.

To make room for the usual small villas which are shortly to be reared on the site, one of the few old-world mansions now remaining in Chiswick has just been demolished. This was known as "Mr. Ranby's House," and was situated in Chiswick Lane, not far from Mawson Row, where Pope and his father resided for a time. The mansion, which was built in the early Georgian style—red brick, with stone dressings—stood in the vicinity of the old Manor House—now a private lunatic asylum—and another historic building known as Grosvenor House, and was made the subject of a special sketch by Hogarth, who, with his wife and sister, also repose beneath the shadow of the quaint old Church which forms such an interesting landmark on the river. "Mr. Ranby" held the post of surgeon to George II.

In London, the buildings associated with the name of Byron are rapidly disappearing or are being outwardly transformed. The house in which he was born in Holles Street has been pulled down; the building near Hyde Park Corner in which he lived after his marriage, and which was once occupied by Lord Glenesk, has been refaced with white stone; Long's Hotel, in Bond Street, which the poet used to frequent, and where he last saw Sir Walter Scott, has been rebuilt; and a house he once lodged in is undergoing extensive alterations. The building known as the Cocoa Tree Club, frequented by Byron, is, however, still to be seen in St. James's Street.

To those familiar with the interior of St. Paul's, the figure of Dr. Donne is known, and also as having been saved from the ruins of the old Cathedral. It appears that the fashion of having these emaciated figures, sometimes miscalled "skeletons," on tombs lasted for not longer than a century—that is from about 1450 to Dr. Donne's own time. In Salisbury Cathedral there are two of these figures. At Wells Cathedral there is one in Bishop Beckington's beautiful chantry, and at Winchester Bishop Fox is thus represented.

During the restorations in progress at the Church of St. Pietro in Ciel d'Oro, at Pavia, one of the oldest buildings in the ancient capital of the Longobardic kings, a stone coffin has been found, containing the bones of King Liutprand, who reigned between the years 712 and 744 A.D. The Church was enlarged and decorated by this powerful ruler of the Lombards, but it was not known that he was buried in it. Near the same place was also found the fragment of an inscription from the gravestone of his father, King Ansprand, and also inscriptions of the sixth century in the Longobardic language and in Latin.

The Church of Santa Maria degli Angeli, which will be the scene of the marriage of the Prince of Naples and Princess Helen of Montenegro, surpasses in grandeur and interest most of the Roman basilicas. In its vast transept is undoubtedly preserved the great hall of the baths of Diocletian. Some of the huge syenite monoliths that support the arches date from the fourth century. Tradition relates how thousands of Christians perished in the erection of the building, and the mark of a cross found here on the bricks is pointed out as a proof of the story. To these martyrs the structure owes its name, which was conferred by Pope Julius III. about the middle of the sixteenth century, when it first appears to have been consecrated. A few years later Pius IV. entrusted Michael Angelo with the entire remodelling of the edifice, and this was one of the last tasks of his noble life. To lovers of Art the place is sacred as containing the tomb of Salvator Rosa and the famous St. Sebastian, by Domenichino. Across the pavement of the Nave is drawn the meridian line laid down for Clement XI. by Bianchini and Maraldi, the famous astronomers.

In his last report to the Foreign Office, Consul Stevens, of Batoum, gives an account of the various branches of industry and trade which have contributed so much towards the prosperity of the town of Baku, and which, he says, have been the direct factors in elevating it to the dignified position of a first-class maritime port, and the most important commercial centre in the Caspian Sea. He states that this flourishing state of affairs has been brought about, firstly, by the discovery, several years ago, of an unlimited supply of naphtha at the mineral oil-fields in the neighbourhood of the place; and, secondly, by the fact that until the completion of the Beslan-Petrovsk branch of the Vladikavkaz Railway a couple of years back, Baku, owing to the absence of means of communication in other directions, was the only point at which Russian manufactured goods for Central Asian and Persian markets, and the produce of those two countries for the Russian market could be concentrated for dispatch to and fro. Recognising that a good deal has on previous occasions been said in respect to the enormous wealth of the naphtha supply furnished by the wells on the Apscheron Peninsula, and other points in the vicinity of Baku, he limits himself to now saying, that although the spontaneous flow of oil wells is probably not of such frequent occurrence as used to be the case from two to three years ago, yet oil is still being procured in unlimited quantities, and flowing wells delivering at the rate of from 3,000 to 5,000 tons a day are at intervals reported. During his stay at Baku one of these fountains was throwing up oil at the extraordinary rate of about 10,000 tons daily, and bringing in an income of nearly £6,000 per diem to its owner, and although it did not continue at this rate very long, nevertheless during the last two months this fountain has thrown up over 300,000 tons of naphtha, which, at the market rate that has prevailed this year, represents a sum of from £150,000 to £160,000. This oil was run into two large ponds which had been prepared for its reception, and from thence it was pumped, as fast as the capacity of the machinery would allow, direct into tank-steamers lying alongside the adjoining jetties for conveyance to Astrakhan. The numerous refineries call forth a steady demand for a large assortment of machinery, tools, and other appliances, as well as minor articles for the execution of repairs and other such like smaller work in connection with the plant erected, so that a very animated trade is likewise carried on in these commodities.

At the last meeting of the County Council an adjourned report of the Improvements Committee with reference to the Strand Improvement reported that the National Telephone Company, whose interest in the property on the eastern side of Wellington Street, at the junction with the Strand, had been acquired by the Council with a view to the widening of the road, had recently acquired the property Nos. 138 and 138A, Strand, in order to increase the size of the Company's building in course of construction at the corner of Wellington Street, and the Company had been asked upon what terms it would be prepared to sell sufficient land to continue the widening of the Strand at that spot. So far, however, no satisfactory reply had been received from the Company, and it became necessary for the Council to consider whether, in the event of the Company declining to sell at a reasonable sum the land required for widening the road, the Council ask the local authority (the Strand District Board) to acquire the land compulsorily under the powers conferred by the Act 57 Geo. 3, chap. 29 (Michael Angelo Taylor's Act), the Council possessing no compulsory power of purchase. The estimated cost of the improvement now proposed, including the cost of paving and other works, was £1,760. They considered that the widening of the road was desirable, and, the Council having already admitted the necessity of the improvement, they had decided to advise the Council to arrange for the carrying out of the work.

From Athens is reported the discovery at Patras, in the middle of the so-called Psila Alonia quarter, of a very fine mosaic, of Roman date. The portion at present above ground is about three metres in breadth and six in length, and is enclosed at the bottom by a border. However, it appears that the mosaic block continues still further underground. The length now open to the light contains two distinct representations. One of them exhibits some young nude athletes after the conclusion of recent games. In the second picture, which is only partially in good preservation, is seen a figure adorned in purple, holding a lute in his hand, and accompanying on it a band of young dancing companions, on whom his gaze is fixed. In the other corner of the same picture females in short dresses hold stringed instruments; one of them seems to be a flute-player. The colours of the mosaic are remarkably vivid.

An old Stockton institution is just now being removed from the High Street. The almshouses, which occupy a commanding site in the chief thoroughfare, are being dismantled. The property has been purchased by Messrs. Levy and Co., of West Hartlepool, and we understand that it is their intention to erect shops on the site. A sum of £5,000 was paid for the buildings and land, and this not only enables the trustees of the charity to build new almshouses in another part of the town, but to further endow the charity for the benefit of the several recipients. Almshouses existed in Stockton as far back as 1682. The old almshouses were taken down in 1816, and those which are now being dismantled were erected in that year.

Workmen will soon be engaged in erecting a long landing-stage and shanties on the banks of the Seine near the Cours-la-Reine, for the purposes of the Exhibition of 1900. A subterranean

railway line will also be commenced for the work of carrying building material from the river into the enclosures on the Champs-Elysées, where the new palaces are to be constructed. The contracts for these preparations will be out most probably next week. According to the roseate descriptions given of all the plans and arrangements, one would be led to believe that the buildings will be erected noiselessly, and that persons walking in the Champs-Elysées will not be inconvenienced by mortar or rubbish. It is also set forth that no damage will be done to the favourite walking and driving grounds of Parisians, but this can only be proved when the works are in progress.

IT has been definitely decided that French engineers are to construct the great naval and military arsenal for the Chinese Government at Foo Chow. The matter was discussed with M. Hanotaux, Minister for Foreign Affairs, by Li Hung Chang during the latter's stay in Paris. The Chinese Envoy and his experts made a most minute examination of French dockyards and gun factories while they were in this country, and hardly anything escaped their attention. The contract has been signed, and provides for the employment on the work of a large number of experts. Those selected will be under the orders of a marine engineer, whose staff will consist of two others of his profession, a designer, a secretary, and five foremen of works. All these are to start at once for Foo Chow, where they are expected to begin work in February next. It is also intended to attach a French civil engineer to the Russo-Chinese Bank. This official is to perform the duty of observing and reporting upon the works about to be undertaken in the Chinese Empire.

AT the recent meeting of the City Corporation, held at the Guildhall, Mr. Woodrow, Chairman of the General Purposes Committee, moved the adoption of the report of the Committee, which recommended that the Mansion House should be renovated at a cost of £7,550. Mr. Woodrow was of opinion that even more money than was proposed was required. He was in favour of an expert being called in to give a report on the subject—Mr. J. Judd hoped that some day some bolder Chairman would come before the Court with a proposal to build a new Mansion House on a more suitable site.—Mr. Elliss moved the omission of the flooring work, which brought the estimate down to £6,000.—Major Joseph said that the sum proposed would not half do the work. It was a shame to take a man from his comfortable house and "stick him in the dirty, gloomy house called the Mansion House," which ought to be sold for a million of money, which sum would build municipal buildings close to the Guildhall.—Mr. Lile said the Mansion House was a disgrace to the City, and was not to be compared with any of the municipal buildings in the great provincial towns. The report was agreed to.

WE understand that Messrs. George Bell and Sons hope to have ready by Christmas an elaborate book on the late Mr. William Morris's work as an industrial and decorative artist, preserver (as distinguished from "restorer") of ancient monuments, and general worker in the æsthetic movement of his day. The book, written by Mr. Aymer Vallance, a disciple of Mr. Morris's, is to be entitled "The Art of William Morris: an Illustrated Record," and will contain numerous coloured plates, photogravures, and collotypes, and reproductions of drawings in black and white, specially made for the work.

ICONOCLASM halts at Hampstead. For some time past a good deal of feeling has been aroused in the district respecting the proposal to convert the Chalybeate Spring in Well Walk into an ordinary drinking fountain. The fountain was famous at the beginning of the last century, the original having been connected with the well at the expense of the parish in 1700. Its water still possesses some medicinal qualities, but the outflow is gradually diminishing. In deference to public feeling the Works Committee of the Hampstead Vestry recommended that an additional basin and tap be provided, and ordinary drinking water turned on, without interfering with the present supply of mineral water, and this suggestion has been agreed to. Thus one relic of the past is saved from modernisation.

Professional Items.

SHREWSBURY.—The Bishop of Lichfield recently laid the foundation stone of a new High-Class School for girls, situate at Murivance, and estimated to cost about £7,000.

ILKESTON.—The Wesleyans have decided to build a new Church to accommodate nearly 800 worshippers, with a frontage to Bath Street, and the memorial stones were laid last week.

BRIDGEND.—Plans have recently passed the Council, of a large Sweet Factory which is purposed to be built in the town by Mr. C. E. Davies, according to drawings which have been prepared by Messrs. Lambert and Rees, Architects, Bridgend and Neath.

NEATH, SOUTH WALES.—Two new Hotels, one to be erected opposite the Neath (Great Western) Railway Station, and another at St. David's Street, Neath, the plans having been prepared by Lambert and Rees, of Neath and Bridgend.

CUTSYKE (YORKS).—In a limited Competition for new Board Schools at Cutsyke, for the Glass Houghton School Board, plans and designs by Mr. George F. Pennington, Architect, Castleford, have been accepted. The plans provide accommodation for 230 children in the mixed school and 120 infants, with a future extension of 230. The exterior of the building is in brick and stone.

EVERTON.—The new Branch Library, opened recently by the Lord Mayor, is to supplant the old North End Lending Library in Great Nelson Street. The Library occcupies the ground floor, and the Technical School the first floor and basement, and the whole covers an area of some 700 square yards. A special feature of the new building is that special rooms have been provided for women and boys.

PETERBOROUGH.—A new Roman Catholic Church was opened last week by Dr. Riddell, Bishop of Northampton. The edifice, which was designed by Mr. Leonard Stokes, is in the Gothic style of architecture, and arrangements have been made for its enlargement when required. The cost of the Church has already been collected by the congregation, assisted by several prominent Catholics in the country.

PITCAPLE, N.B.—The Free Church at Chapel of Garioch, after having undergone extensive alteration and renovation, has been re-opened by Rev. Professor Robertson, D.D., Aberdeen. The Church has been closed since early in the present year, and very great improvement effected in the interior of the building. In connection with the scheme of improvement, a new meeting hall (capable of seating 150 persons) and vestry have been erected at the rear of the Church.

DRIFFIELD.—Sir Tatton Sykes, Bart., has just completed the erection of a block of Estate Offices, with clerk's residence, at Sledmere. The new buildings provide for an agent's office, clerks' offices, drawing offices, map room, tenants' waiting-room, and all the conveniences necessary for the requirements of the estate, which is one of the largest in the East Riding. The designs were furnished and the work superintended by Mr. John Birch, of John Street, Adelphi, London, from whose designs the new Post Office at Sledmere is now being built.

PLYMOUTH.—The workmen's homes at Prince Rock were formally opened by the Mayor of Plymouth, on Thursday last. Nine blocks of houses, capable of affording accommodation for something like 500 people, were opened; but this undertaking only represents about five-eighths of the whole scheme, on which a large sum of money is to be expended. One block only is completed, but the remaining eight will be ready for occupation in the course of a very short time. The Architects are Messrs. Hine and Odgers, and the builder is Mr. May, of Plymouth.

LLANELLY.—The Estate Committee of the Llanelly Borough Council, recently held a meeting to consider certain suggestions for the better internal arrangement of the Market. In view of the continuous and probable further expansion of the Market, it was suggested that the land lying between the present market and Murray Street (including the site of the old baths) be acquired at a cost of about £4,000. Another suggestion was that the site of the old baths be laid out for a cattle, sheep, and pig mart. These two suggestions were referred to a future meeting for further consideration.

COVENTRY.—There is now being pulled down the house in Little Park Street, Coventry, where George Eliot's schoolmistresses lived. The Misses Franklin previously kept school at 29, Warwick Row, and there it was that the novelist lived with them. They afterwards removed to the Park, occupying a Queen Anne house, which is often erroneously described as George Eliot's school, though she often visited them there. The place is being pulled down (by Messrs. Gowing and Ingram, of Birmingham) for extensions to the Coventry Machinists' Company's cycle works.

HORFIELD.—At Manor Road a Women's Shelter Home is being erected, from plans by Messrs. Moncrieff and Rowley, and the builders entrusted to carry them out and to complete the interior of the ground and first floors are Messrs. Hughes and Weekes. The main building includes a partially separated dwelling for the superintendent, apartments for the matrons, the necessary domestic offices, kitchens and stores, bathroom and lavatories, entrance hall, two rooms for the use of inmates when not at work, and a dining room and sleeping accommodation for 20 women.

HULL.—It is proposed to erect at Jenning's Street, in the Kingston Circuit, a new Wesleyan Chapel to supersede a Mission School. The new structure is to have sitting accommodation for 650 persons, and the expenditure is estimated to be £3,500. In the Dewsbury Circuit, a Mission-room is to be purchased in Granville Street, at an estimated outlay of £600. At Marsett, in the Hawes Circuit, a new Chapel is to be erected to seat 110 persons, the estimated cost being £450. At Wilsill, in the Pateley Bridge Circuit, a new Chapel is to take the place of a rented room, with sitting accommodation for 90 persons, the outlay being £333. At Heapham, in the Gainsborough Circuit, a Village Chapel is to be built, to seat 100 worshippers, estimated expenditure being £450. Altogether the Chapel Committee has sanctioned proposals for the erection of new Chapels amounting in the aggregate to £20,300.

GARWAY (HEREFORDSHIRE)—The ancient Parish Church of St. Michael's, Garway (A.D. 1061), has been re-opened by the Archdeacon of Hereford, after a complete restoration of Nave, Chancel, and Knight Templars' Chapel, the work consisting of the repairs to all the walls, and re-roofing throughout. The old semicircular plaster ceiling has been entirely removed, and replaced by a boarded one divided into squares, with mouldings and the Knight Templars' and Knight Hospitallers' coat-of-arms introduced. The inside walls have been entirely renovated with Duresco paint and petrifying liquid. The old detached Tower still remains to be done, and, according to the Architect's report, requires immediate attention. The unique Norman Chancel Arch has not been touched in any way. The masonry work has been entrusted to Mr. Charles Tilley, and the joinery work to Mr. M'Colley, both of Garway, the whole being carried out under the directions of the Architect, Mr. Ernest G. Davies, Hereford.

CHELTENHAM.—The Lord Bishop of Gloucester and Bristol has consecrated the new Chapel which has been erected to commemorate the jubilee of Cheltenham College, which occurred in 1891. The building is a massive parallelogram, in the Gothic style. The ground plan is 164 ft. by 49 ft. 6 in., and the floor space inside is 148 ft. 5 in. by 33 ft., which will give seating accommodation to 630 boys, 50 masters, the College servants, and about 150 visitors. The Chapel is built of Cleeve Hill stone, with red Farleigh stone for dressings. One of its chief Architectural features is the East window, which is amongst the widest in the kingdom—viz., 26ft. 6 in., while its height is 25 ft. At present only the shell is erected, and this at a cost of

about £13,000. It is intended to spend a large amount on ornamentation. Messrs. Middleton, Prothero, and Phillott were the Architects (Mr. Prothero's design having been accepted in a competition). Messrs. Collins and Godfrey were the builders.

BARNSLEY.—The memorial stone of an Independent Chapel, now in course of erection at Sheffield Road, was recently laid by Alderman Batty Langley, of Sheffield. The new Chapel is being built to take the place of the oldest Nonconformist place of worship in the town, the old Independent Chapel, Sheffield Road, and will, with the alteration of the present premises into a school, cost about £1,500. Designed by Mr. George Moxon, it is to be of stone, in an early Gothic style of Architecture, and will occupy the centre of the graveyard, between the old Chapel and the street, from which it will stand back 30 feet. The entrance will be through vestibules, each having a staircase to the end gallery, which will extend the full width of the front, and be divided into compartments by glazed swing doors. The body of the Chapel will have two longitudinal aisles, and modern seating, with rostrum, and provision right and left for the choir. The roof will be open timbered, the internal woodwork of pitch pine, and the windows glazed with tinted glass. Vestries, class-rooms, &c., will be provided, and, the accommodation being for 400, provision for enlargement will be made.

NEWCASTLE.—A new Congregational Church is to be erected at the corner of Beech Grove and Westmorland Roads, to take the place of the West Clayton Street Congregational Church, which has been disposed of. The buildings, which have been designed by Mr. Stephen Piper, are to cost £8,000, that amount to include all the details of the work. The cost of the actual buildings is put down at £6,950, but the heating, lighting, &c., will bring the sum to £8,000. Mr. G. H. Mauchlen is the contractor. The Church is to consist of a wide Nave, with Transepts and passage Aisles, and the main entrances will be in Westmorland Road and Beech Grove Road. There will be accommodation for 700 adults in the Church. The school or hall is on the north end of the site, with two main entrances and staircases leading up to class-rooms on galleries. At the back of the school or hall, near the platform, are ladies' and gentlemans' cloak rooms, and a kitchen with the usual fittings, &c. There is also an infants' class room, with access from the school, and with a separate entrance. A Church parlour is placed on the first floor, and adjoining is a large room to accommodate 100 adults. The heating, ventilation, and drainage will be carried out on the most approved lines, and the buildings are proposed to be lighted by electricity.

PERTH.—The new Church building recently opened is not far removed from the site of the old Wilson Kirk, which had to be pulled down to allow of the formation of the new street. The exterior of the building is in free classic Renaissance Architecture. The principal entrance is in the centre, but there are auxiliary doors on each side. At the main entrance is a spacious vestibule with cloakrooms adjacent, and from this vestibule lobbies lead to the area of the Church and the galleries. At the hall entrance (from the side) another stair leads to the hall on the first floor, and the gallery is also accessible from this stair. A feature of the planning is that the hall, or, in fact, any other of the rooms, may be used with separate access, and quite independently of the Church, or all in connection. The interior of the Church is divided into a Nave and side Aisles by wide stone arches springing from piers at the end and columns in the centre. One column on each side forms the only obstruction to a view of the pulpit from all parts of the Church. There is a gallery over the entrance end next the street, and also at each side over the side Aisles, the side galleries being only three seats deep. At the opposite end of the building a massive stone arch covers the pulpit recess, and smaller arches on each side cover the organ chambers. The Architect of the building was Mr. John B. Wilson, Bath Street, Glasgow. The cost of the building and organ is over £10,000. The contractors were:—Messrs. Fraser and Morton, builders; Mr. Thomas Forgan, joiner; Mr. James Buchan, slater; Messrs. John Mackay and Sons, plasterers; Messrs. W. Frew and Sons, plumbers and gasfitters and heating; Messrs. Stalter and Boyd, painters; and Messrs. W. Meikle and Sons, glaziers.

FARNINGHAM.—A carved Reredos, of Kentish grown oak, designed by Mr. William Hilton Nash, has been erected at Farningham Church. The new Reredos is in the early Perpendicular style of Gothic Art, and has, in the main, three central compartments; the middle one having a grained and projecting Canopy, octagonal on plan. On either side are lean-to panels flanked by traceried buttresses which terminate with carved and crocketted pinnacles designed to rise diagonally out of the uttermost splay of the buttresses, old buttresses also terminating in crocketted pinnacles from the upright line of demarcation between the main panels, and the central canopied recess. The upper part of the fabric is one mass of crisp and delicate conventional carving, all of fifteenth century character, and the whole terminates with a pierced and carved cresting, alike light in conception, and exquisitely delicate in its manipulation. Over the altar and immediately below the super-altar is a long panel taking the full length of the altar table itself. In this panel are three shields. Upon the central one is Alpha and Omega entwined and taking the form of a monogram. These the first and last letters of the Greek alphabet, signify, of course, the Divinity and Eternity of Christ. On the shield on the dexter side of the panel are the Cross-Keys of St. Peter and on the sinister the swords of St. Paul in a like position. The double dedication in mediæval Churches to the combined glory of these two popular saints was a common one. There are no less than 230 mediæval Churches in the country so dedicated, whilst to St. Peter alone there are 830.

KEYSTONES.

THE Ilford Conservative Club is to be enlarged at a cost of nearly £700.

MR. RICHMOND, R.A., is engaged in designing a memorial to Lord Leighton, which will be placed in St. Paul's Cathedral.

THE Bishop of Exeter recently consecrated a new Church at Torquay. It has been erected at a cost of £12,000.

AN oak chest with carved panels has just been placed by the Dean and Chapter in the south aisle of the choir of Ripon Cathedral. There are seven panels in the front of the chest, and the upper portion of these are carved.

THE new schools belonging to the Free Methodist Churches in Cardiff have been opened by the President of the Annual Assembly. The large new church, which has cost £9,000, will be opened in a few months.

THE foundations of the Brighton Chain Pier are giving way. The structure has been inspected by the borough engineer, and certified as totally unsafe. We understand arrangements for its demolition will promptly be made as a portion of the pier has already been blown away.

IT is the intention of the Aire and Calder Navigation to construct a new dock at Goole, which will be located off Bridge Street, and adjacent to the Railway and Ship Docks. The work, we are informed, will be commenced early in the spring.

THE landing-stage at St. Leonard's Pier was washed away on Tuesday night of last week by the gale. The wreckage was driven against the ironwork of Hastings Pier, smashing five massive iron columns, and doing damage estimated at £500.

ON Thursday, the foundation stone of the new bridge which is being built across the Clyde at the foot of Jamaica Street, Glasgow, was laid. This is the third bridge to span the Clyde on the same site. The foundation stone of the first was laid in 1768, that of the second in 1833.

THE Leeds City Council has decided to apply to Parliament for power to spend £650,000 upon the construction of new reservoirs in the Washburn Valley, and to purchase lands to prevent the pollution of the existing and intended reservoirs. The work is expected to be completed in about 10 years.

A PUBLIC meeting was held last week in the Council Chamber, Newcastle, for the purpose of considering the proposal to erect a new Infirmary in Newcastle in commemoration of the long reign of the Queen. The total amount of subscriptions promised amounts already to £38,500.

IT having been stated that the Postal Authorities were likely to adopt a site at the north end of Castle Street, Forfar, for a new Post Office, the Council has issued a memorial, setting out that the site is most objectionable, and praying that a more central position be chosen.

FALKLAND PALACE, formerly the seat of the Dukes of Albany, and a monument of Scottish Architecture and decoration, is undergoing considerable repair, the fabric being in need of much attention. It is satisfactory to know that the Marquis of Bute, the owner, has decided that the work is not what is generally known as "restoration," but of preservation.

A GOOD deal of excitement was caused by the sudden collapse of about 150 ft. of the quay wall at Hendon Dock, Sunderland. The masonry carried with it a number of railway trucks and some timber stacks, while a huge travelling crane was also precipitated into the basin. Fortunately no one was injured, though several gangs of workmen had very narrow escapes.

PRINCESS CHRISTIAN last week opened the new buildings for a Boys' Club in Ben Johnson Street, Stepney, for which the Haileybury Guild of masters and old members have made themselves responsible. The designs for the building were drawn up and presented by Mr. Reginald Blomfield, himself an old Haileyburian.

AN interesting statement was recently made as to the year's building operations in Glasgow. The amount in the value of buildings was the greatest in any year since 1876 77, viz., £1,290,000. The total number of dwelling-houses up to and including four-room and kitchen houses was 3,398, against 3,197 in the previous year.

IN connection with a new house at Birchington, the men employed excavating came across a complete human skeleton within 3 ft. from the surface, making the third that has lately been found at this spot. By the side of the skull was a small Roman vase about the size of a breakfast cup, from which it is conjectured that the remains are upwards of 1,000 years old.

THE committee appointed to carry out the memorial to Sir Walter Scott in Westminster Abbey, having examined several copies of Sir Francis Chantrey's bust, has selected one executed by Mr. John Hutchison, R.S.A., and it has since been accepted by the Dean of Westminster. The amount required to purchase the bust and to defray the Abbey fees and other expenses is estimated at between £600 and £700, and an appeal is being made to raise this sum.

CONSENT has been obtained from the Dublin authorities to the expenditure of £12 000 in drainage, kitchen fittings, furniture, fire appliances, heating and ventilation, and acquisition of land for a new cemetery in connection with the Letterkenny District Lunatic Asylum; of £3,700 for the acquisition of lands for the Limerick District Asylum; and of £6,800 to provide and equip temporary accommodation at Portrane and Richmond Asylums.

IT is reported from Berlin that the Emperor William has caused a notification to be made to certain leading German steamship lines that, in future, all steamships owned by companies in receipt of State subsidies must be constructed in German shipyards. The notification, which appears to have been communicated verbally through a Ministerial channel, is said to have been called forth by the number of vessels which are in course of construction or have been lately finished by English firms for various German companies.

FOR some time the old cast-iron bridge which spans the Chesterfield Canal, just outside Retford, on the Doncaster side, on the Great Northern Railway, has been condemned, and a new steel bridge has been prepared to take its place. Everything was got as forward as possible, and so nicely was everything calculated that the old bridge was removed and the new one put in place without delaying a single train, and the actual time of putting the bridge into its place was only an hour and a half. The work was carried out under the personal superintendence of Mr. Johnson, the Company's Engineer.

Views and Reviews.

ARCHITECTURAL DESIGN.*

IT is difficult to criticise this Book. It consists of a thoughtful Preface or introductory Essay (with most of which we agree), and of a collection of 101 Plates (with most of which we disagree).

The Author's remark—that Archæology is not Architecture—is axiomatic. The former is a Science, *i.e.*, the collecting, assessing, and systematising of knowledge; while the latter is an Art governed by rules, *e.g.*, Truth of construction, Fitness of material, and Simplicity of treatment.

He laments that contemporary Architecture is little else than imitation of antecedent types. This was more true of the early stages of the Gothic Revival than now; but, at least, that imitation was of noble Work, and it was educational to those who practised it; and it was sufficiently elastic for all demands, and, further, was leading to a consistent domestic English style. Mr. Cotton, on the contrary, casts consistency to the winds; such of the plates of this work as we have seen show an incongruous combination of the worst features of the worst periods of Architecture—a mixing of the dregs of the Flamboyant with the vagaries of the Rococo, grafted on the unconstructional Horse-shoe Arch, while the ornamental details (in which there was a great opportunity) are poor. The design on Plate 45 is inconsistent in the use of the curve of Pediment with the triangular Shelf for a circular vase. The cabriole curve would have been appropriate for the plan of Shelf, and the triangle would serve for the Pediment (if one were needed), but this application of each in precisely the wrong place shows the attempt for Novelty—Put novelty in thy design—fitly if thou canst, but if thou canst not put it fitly: still I say, Put novelty in thy design.

It is difficult to understand why "an Art school" of all spots in the world should have been chosen as the unhappy place in which the design of Plate 101 is to be carried out; though it is possible that the students might require that treatment after five minutes' contemplation of the Fire-place. From the Joint lines (which are marked in some places and *omitted* in others) this is intended for stone; but cast-iron would be more suitable for the coarse and somewhat commonplace detail.

Plate 97 is for "a Shop Front in Iron." There is no feature or treatment about it to show that it is for Iron rather than for Stone, Terra-cotta, or any other similar material. With the very able Entrètien by Viollet-le-Duc, and the American experiments, before us, we have a right to expect from the writer of the Preface something more consistent than this.

The centre Window in Plate 48 is surely a Record for illogicality in the breaks of the cornice round the centre keystone and the pap-like protuberances at each side of the jambs; unless the design on Plate 74 should be held to out-run it. This latter might have been designed by the Jobbing-mason, shown as striving to placate the disgust of the Gentleman at the elaborate and expensive puerility.

It is easy to understand that these are the effect of a revulsion from the Pugin fetters in which the Author may have been brought up; but they are scarcely such as should be published as examples for Architects, in the New Style.

Mr. Cotton has a liking for that product of the Mahometan styles, the Horse-shoe Arch; out of 27 plates taken at random, 17 examples are found.

Window-tracery, an ingenious method of lessening the light and increasing the cost, is very fully shown, mostly of a debased Flamboyant character. The Tracery-panes are designed in apparent disregard of the custom of the Glazier to charge for the extreme dimensions of each piece of glass. There is no sense of the organic unity of the Bars, making the window-head a beautiful arrangement of Frames with rebates; but, instead of this, the bars are sometimes interrupted by Spirals, making them like the fragmentary Scrollery of the Rococo period or like the wooden curves applied in front of the Glass doors of "Chippendale" cupboards. This applied Tracery so darkens the upper part of a Window that it might well be omitted, and then the window could be smaller, and hence in Plate 45 there would have been no necessity for the interruption of the architrave and frieze, and the introduction of the commonplace and inappropriate pediment. Much of his Tracery is unconstructional. It consists, not of *arched* Bars (which support themselves), but of *festoon shapes*, which could not be used except in blocks of large, and therefore *wasteful* size. On Plate 32 the Stone-joints of jambs and lintels are elaborately shown, but those of the tracery are conspicuous by their absence; we wonder why. Is the tracery to be made of *cast-iron?* The centre tracery on Plate 87 is very funny; and might be described as "Tracery emerging from its shell." We hope this is, and may long remain, unique.

Dormers are another weakness of the author's; this is an eruption which often attacks younger Architects in their desire for "Sky-line"; but why spend time on these when he could refer to Daly, Sauvageot, and Raguenet.

The Superficial-ornament shown in the plates is commonplace; and the effect would be thin and thready without the introduction of bosses, which are the soul of relief-work.

This work is virtually a Pattern-book of Architectural Trimmings; but the New Style (if we are to have one!), or, at any rate, a Good Style (which we may all have), does not come by the application of Trimmings, but by the evolving of decoration from the nature of each Material and the necessities of Construction. It results from Joints and from Tool-marks, and patiently-continued Study of our great Legacy from the Past. We are grateful to Mr. Cotton for the care and thought he has bestowed on this Book—we would that he had, instead of these Suggestions, given us some worthier results of his Pugin Tour.

* "Suggestions in Architectural Design, prefaced with Thoughts on Architectural Progress." By John Cotton, F.R.I.B.A., Pugin Travelling Student and Medallist, 1869. London: Batsford, 1896.

MAHOGANY.

ITS DISCOVERY AND VALUE.

NEARLY two centuries ago British Honduras was first colonised by mahogany hunters, and the business of cutting this valuable timber is still of paramount importance. Princely fortunes are yet made in the same line, though not so rapidly in these days of iron ships as when wood was more largely used in naval Architecture. The whole coast region, stretching southward from the borders of Mexico to the Nicaragua Canal, abounds in precious woods, and British Honduras is its very heart and centre, rich, not only in mahogany, but in the hardly less valuable rose, ebony, tulip cedar, and sandal woods, vera, ironwood, and pelo de San Juan, and caoutchouc, or Castilloa elastica, the Central American rubber tree. The Governments of Guatemala, Nicaragua, and the Republic of Honduras allow anybody to cut the trees on contracts—that is, by payments of a certain stumpage; but not so in the Queen's possession! Nowadays all the Belize mahogany lands are in the hands of a few proprietors, who will not sell a foot of them, nor admit settlers on any terms. The mahogany is a long time in reaching maturity, 200 years being supposed to approximate its prime. In regard to its rapidity of growth, we are told that "it hardly undergoes a perceptible increase of size in the narrow span of a man's life." That is, no doubt, true, after a tree has come to great size, but mahogany merchants in Belize say that young trees grow so rapidly from the stumps of a clearing as to be large enough themselves for cutting in 25 or 30 years. The trees vary much in size in different sections, and in value of wood, according to the colour and beauty of its "curl." Single logs have sometimes realised £1,000 for cutting into veneer, the wood being too heavy to be used "solid" for most purposes.

LOGS 40 FT. LONG

and 2 ft. thick are common—some of them wonderfully figured, though generally the wood is plain.

It is said that the forests of Northern Belize are more dense, and the trees more valuable, than the softer, swamp-grown wood of the interior jungles of British Honduras. The mahogany tree attains its greatest dimensions in the limestone regions of Mexico, logs squared to 48 in. being often obtained, while 3 ft. is a common size. For its popularity as a cabinet wood mahogany owes its position to the celebrated Dr. Gibbons, who had a brother in the new world, who made him a present of a mahogany log for a curiosity. The doctor thought to increase the value of his curio by having it converted into a "settle" to stand in his hall, and he employed Walleston, the court cabinet-maker, to do the work. Walleston saw at once the beauty and value of the wood, and did his work with such skill that a *furore* was created in England for mahogany furniture; and to this day the imports of mahogany to Britain alone average 50,000 tons per annum. The labours and difficulties that intervene between the great tree growing in its native forest and the manufactured furniture are enormous. Far in the depths of the

ALMOST IMPENETRABLE JUNGLE

it stands — perhaps hundreds of years old, environed with enormous buttresses of roots, extending upwards of 15 ft. or 20 ft. around its trunk, fitting props to sustain the monarch through the storm of centuries. As a rule, the mahogany contractor enters into his agreement with the owner of the territory he intends to explore near the close of the wet season. His cutters secured, who are usually Caribs or half-bred Indians, he pays them six months' wages in advance, half in cash and half in "goods"—the latter meaning provisions and needed outfit. From 30 to 50 men is the average number of each camp, and these are divided into companies of ten, each company having its own "captain." The most important and best paid man of all is the "hunter," an experienced woodsman, who leads the way into the wilderness and finds the trees for the rest to cut. They follow up the rivers into the trackless forests, beset by dangers on every hand — alligators and boas, savage animals and the deadly creeping things that infest the jungle—and, when they find a favourable spot, begin operations by establishing their camp upon the edge of the river. A big thatched hut is built for the labourers, and a smaller one, set high on stilts to protect it from prowling creatures, in which to store the bacon, salt fish, and other supplies brought from civilisation. While the camp is being made the "hunter" is exploring. He climbs the tallest tree he can find comparatively clear, and from its top detects the foliage of the mahogany. He then counts the trees in line, and notes carefully the direction, distance, and every landmark. This done, he finds and marks the tree, and returns to camp.

BYLAND ABBEY RESTORATION.

THE Byland and Wass estates have recently passed into the hands of Sir George O. Wombwell, of Newburgh Priory, and on examination it was found that the ruins of the old Abbey at Byland were in danger of, in many parts, falling to the ground. Sir George, so as to preserve the historic building, has promised so much annually towards the restoration, and at present Mr. Cornforth, mason, of Coxwold, is engaged on the refooting of the various buttresses. The Abbey is of the Cistercian order, and can be easily seen from the line of railway between the stations of Coxwold and Ampleforth. In structure the Abbey shows indications of different periods, and is supposed to date back to 1177, and its ground plan, like many other Churches of the order, has consisted of a long nave with narrow aisles, two short transepts, and a short choir. The Abbey is distinguished by

THREE PECULIARITIES

not to be found in any other Cistercian house in the kingdom—the nave of extreme length, the transept with a western as well as an eastern aisle, and the choir with a transverse aisle at its extremity. Corbels indicate that there was formerly a Galilee porch attached to the west front of the nave—a fact corroborated by the desire expressed by one William Tiplady in his will, in 1426, to be buried "in the Galilee of St. Mary's Abbey at Byland." The nave has been 200 feet in length and 70 feet in width, leaving a space of nearly 39 feet for the central part. It has been a

matter of question whether or not Roger de Mowbray, the founder of the Abbey, was buried at Byland. However, what were supposed to be his remains were exhumed here from the north-west part of the Chapter House, in 1818, by Mr. Martin Stapylton, guided to the place by ancient MSS., and conveyed in a fearful storm to the Church at Myton-on-Swale. It is said that the Lady Gundrea, mother of Roger de Mowbray, was also interred here. The Abbey, previous to Sir George O. Wombwell purchasing the estate, belonged to the late Major Stapylton, of Myton Hall. The author of "Vallis Eboracensis" says, "Byland Abbey is a magnificent ruin, and the first impression it makes on the eye of the beholder is one of awe and wonder. Standing by the side of the superb Gothic entrance at the west end of the ruined pile, through which the Lords de Mowbray, and, after them, the Plantagents in their chivalry have passed, what visions of glory seem to glide before us. The cottagers of Byland seem to partake of the sentimentality of the place, being distinguished by a dignified repose and expression of countenance quite in accordance with the venerable relics which surround them.' Byland Abbey is situated about two miles from the village of Coxwold, where is situated Shandy Hall, once the residence of Lawrence Sterne, the author of "Tristram Shandy."

NATIONAL ASSOCIATION OF MASTER HOUSE-PAINTERS.

HELD in Birmingham last week, the third convention of the National Association of Master House-Painters of England and Wales was well attended. Though the Association has only been established about three years it has already done something to elevate the Craft, but naturally its earlier efforts have been mainly directed to organisation. There are now between 150 and 200 members of the central body, whilst local Associations which claim a membership of from 500 to 600 have become affiliated. The organisation has spread itself all over the provinces, but in London it has not taken root, the explanation being that the trade in the metropolis is too large and involves many conflicting interests. The Association aims at the extinction of inferior work, and at raising the status of the trade generally. Premiums are offered for the encouragement of high ideals among apprentices, and it is hoped that the stimulus to improved work may be extended with the development of the Association to masters and journeymen engaged in the trade. In connection with the convention, an exhibition of manufactures interesting to the trade, and of the handiwork of apprentices, was arranged at the Municipal Technical School. Included in the exhibits were several fine examples of decorative work by some past masters of the Craft, chief among whom are Mr. John Taylor, of Birmingham, President of the Association for the year. The department confined to apprentices' work contained nothing very noteworthy. Specimens of graining, marbling, and lettering, showed a fair amount of proficiency, and a few panels, but nothing suggestive of incipient genius.

Mr. Taylor, in his Presidential Address, confined himself chiefly to the subject of

Education in Colour.

He advised young men to study Nature in all her moods. It might be urged that as they had to adopt a conventional treatment it was unpractical to look at the matter thus, but he denied that. Whatever tended to raise a man's taste, whatever made him dissatisfied with coarse, vulgar, inharmonious blendings of colour, had a most distinct bearing upon his work, conventional though it be. Each season has its suggestions to offer, and their work, though more conventional than that of the artist, would ever gain by a loving nature study. If a love and a high ideal were not imparted to the craftsman's work, common honesty should at least be observed. If in specifying for a job they quoted a price which they knew well it could not be executed for with credit to themselves, then let them carry out the specification loyally.

In the evening the members met. Mr. E. R. Taylor, Head Master of Birmingham Municipal School of Art, contributed a paper under the title of "A few words on the Art and Craft of the House-Painter." He contended that if the profession was to be maintained, masters and workmen must become teachers and artists. In Birmingham the apprenticeship system was practically dead, but without that or something analogous to it they could not hand down the Art and Craft of the painter. Teaching had ceased, and the craft was suffering in consequence. Art was as necessary for the simplest and least expensive furnishing of a room as for the grandest Architecture, painting, or sculpture. Technique varied in quantity and direction, but the Art was one, and was expressive of a feeling for the right relation of visible things in line, mass and colour, and was based on Nature's harmonies. The endeavour to

Inspire their Workmen

with that Art-feeling, and to guide them in its expression, appeared to him the main object of their organisation. If the workmen could gain a little Art-training, which included individual observation and expression, then their commonest work would no longer be a monotonous slavery, but a handicraft, and all they did would be permeated with Art-feeling. A new interest would be awakened which would be good for master and for man, and as that power spread, new fields would be opened for its exercise.

Mr. Edward Breakspear delivered an address on "The Delights and Uses of Colour." Having premised that colour produced in the mind of man sensations of pleasure and of pain, of exhilaration and excitement, or of soothing and rest, the speaker dealt with the subject in its æsthetic rather than its scientific aspect, pointing out the intimate relation between taste in colour and the particular stage of civilisation of a people.

Every true Decorator

would love to develop the beauty of his craft in the adornment of public and private buildings, and the meanest cottage would be deemed not unworthy of his attention. It was the province of their Association to help to educate and refine public taste; and if it were true that by much sunshine longevity was promoted, might it not be equally true that health and long life were brought about by the environment of beautiful colouring? Let no master painter take a sordid view of his position. They existed to perform a useful and important part among their fellow men.

Mr. Walter Ratcliffe (analyst to the Assoeiation) read a paper entitled "Some Considerations on Oils and Pigments." He dealt with the relation of chemistry to painting, and pleaded for a more scientific basis for the Art and Craft of the house painter and decorator. Sooner or later, he said, science, and more particularly chemistry, would become an absolute *sine quâ non*. Every material they used, whether it were oil, turpentine, or pigment, and every process they employed, whether painting, varnishing, or plastering—even whitewashing—had an exact, perfectly definite chemical or physical basis, and it was only by a knowledge of those scientific bases that any stable structure was to be built up.

"Ancient Mural Decorative Art" was the subject of an interesting paper by Mr. Thos. Bonnar, of Glasgow, illustrated with a series of lime-light views and coloured drawings. The writer mourned the fact that, owing to the rough treatment of our ancestors, there was scarcely a vestige left in Scotland of the pre-Reformation ecclesiastical mural decoration. He described colour decoration on the groined roof of Glasgow Cathedral, and others at Dryburgh Abbey, the former dating from the twelfth century, and said a comparison with contemporary work in England —where circumstances had been much more favourable for the preservation of these sacred buildings — afforded inferential proof of there being an analogous resemblance in the decorative treatment of the interiors of ecclesiastical buildings in the two countries. In the fourteenth century there must have been liberal employment for the decorative craft in England, which would compare favourably with the boasted advance of artistic tendencies of to-day. During the fifteenth and sixteenth centuries the largest number of mural paintings were executed, and most of the existing examples dated from that period; but it was much to be regretted that, owing to less careful preparations of the surfaces, these were not in such good preservation as the remaining works of the earlier days. With regard to secular decorations, Mr. Bonnar thought the earliest examples must have exhibited, in form and colour, more refined qualities, there being evidences of decadence in the later specimens, as if the artist had been working from a higher example.

Other papers were contributed by Mr. M. Lewes Crosskey (Director of the Industrial Art Department, Glasgow), Mr. John Ratcliffe, Mr. J. C. M. Vaughan, Col. Robert J. Bennett, and Mr. J. F. Allon.

THE ARCHITECTURAL ASSOCIATION.

IN consequence of pressure upon our space we have been compelled to hold over the list of prizes presented at the opening meeting, which we now append.

A.A. Travelling Studentship, value £25, and Bronze Medal: C. de Gruchy.

Essay Prize, value £10 10s., and Silver Medal: A. Stratton.

The Andrew Oliver Prize, 1st Prize, value £3 3s.: A. C. Long.

Ditto ditto 2nd Prize, value, £2 2s.: J. G. N. Clift.

The Arthur Cates' Scholarship, value £10 10s.: J. S. Lee.

Lecture Side.—*Division I.:* A. Smithers, silver medal; T. Bee, bronze medal; J. E. Franck, hon. mention. *Division II.:* P. Morris, silver medal; E. H. Evans, bronze medal; V. Steadman, hon. mention.

Studio Side.—*Division I.:* E. Bates, silver medal and certificate; J. G. N. Clift, bronze medal and certificate; R. T. Miller, hon. mention. *Division II.:* No award.

Elementary Class of Design: G. C. Carter, silver medal, certificate, and £5 5s. scholarship; W. H. Ward, bronze medal and certificate; J. S. Lee, hon. mention.

Advanced Class of Design: W. J. Devlin, silver medal, certificate, and £5 5s. scholarship; T. H. Lyon, bronze medal and certificate; E. Nicholson, hon. mention.

School of Handicraft (Carpentry): E. F. Cobb, bronze medal.

Order of Merit.—*Division I., Greek and Roman Orders:* A. Smithers, certificate and book; T. Bee, A. M. Torrance. *Elementary Construction and Materials:* A. Smithers, certificate and books; T. Bee, J. C. Hawes; *English Architecture:* R. A. S. Macalister, certificate and books; T. Bee, A. Smithers. *Elementary Physics:* A. Smithers, certificate and books; T. Bee, H. A. Douglas. *Plane and Solid Geometry:* A. Smithers, certificate and books; T. Bee, A. M. Husbands. *Mensuration, Land Surveying and Levelling:* A. Smithers, T. Bee, certificate and books; W. H. May, O. C. Hills. *Formulæ and Calculations:* A. Smithers, certificate and books; T. Bee, A. M. Torrance.

Division II.—*History of Architecture:* E. H. Evans, P. Morris, J. H. A. Phillips. *Special History Subjects:* C. W. Surrey, C. E. Varndell, P. Morris, V. Steadman, E. H. Evans, T. Tyrwhitt. *Materials, their Nature and Application:* P. Morris, certificate and books; C. F. Dawson, F. G. Adcock. *Construction:* L. C. Gregory, E. H. Evans, N. M. Doncaster. *Stresses and Strains:* P. Morris, J. H. Coram. *Drainage and Water Supply:* P. Morris, C. J. S. Holcombe, T. T. G. Donaldson Selby. *Ventilation, Lighting, and Heating:* C. W. Surrey, P. Morris, F. Cattling, N. M. Doncaster, E. W. Sloper, V. Steadman. *Specifications and Estimates:* P. Morris, F. Catling, E. H. Evans. *Professional Practice:* P. Morris, A. Hannaford, C. W. Surrey.

Extra Subject.—*Elementary Ornament and Colour Decoration:* S. Perkins, J. H. Jones, H. I. Triggs.

Banister F. Fletcher, E. Howley Sim, } *Hon. Secs.*

The Architectural Association.—The Conversazione will be held at the Church House, Dean's Yard, on Friday evening next, at 8.30, by permission of the late Archbishop of Canterbury. Entrance should be made in Great Smith Street.

Trade and Craft.

PAPER TELEGRAPH POLES.

A new invention which, it is claimed, prolongs the life, cheapens the initial cost, and materially strengthens the structure, consists in making telegraph poles of paper pulp, mixed with certain ingredients which make such poles resist the rain, dampness, heat of the sun, and insects. These poles are cast in a long iron shell, and are hollow, thus increasing their strength. They have been subjected to a thorough and practical test, and it is hoped that the claim of the inventors that paper telegraph poles will last indefinitely will prove true.

RAILWAY EXTENSION.

The Langwith section of the Lancashire, Derbyshire, and East Coast Railway is making good progress. The station buildings, which are of the usual character, have been commenced by the contractors, Messrs. Bateman & Co., of Ramsey. A girder bridge, upwards of 100 yards in length, spans the platforms and sidings. A reservoir has been erected at Scarcliffe for the purpose of supplying the station with water. Messrs. Saxby & Farmer have completed a signal-box which contains nearly seventy levers. The permanent way and sidings will be shortly completed, and it is expected that the line will be opened for mineral traffic in November or December.

SMOKE PURIFICATION.

An Italian engineer, Signor Giovani Mugna, has been experimenting with a new system of smoke purification, which is especially applicable to engine boilers, and consists of a centrifrugal fan mounted close to the chimney, and drawing its supply of smoke from the chimney, discharging it into a closed tank of water. In this tank are revolving vanes or agitators, which create a vortex into which the smoke is drawn as well as forced by the fan—that is, the smoke is sucked into the water as well as being driven from above on to it—and thoroughly washed before being discharged into the atmosphere through holes in the top of the tank.

THE LABOUR MARKET RETURNS.

A memorandum prepared by the Labour Department of the Board of Trade, for the Board of Trade Journal, states that the returns for September show very little change in the general state of employment compared with August, though, judging from the trade-union returns, the percentage of unemployed has slightly risen. Employment continues to be considerably better than a year ago. Fifteen disputes took place in the engineering and ship-building trades, and 11 in the building trades. Over 4,000 building operatives and 18,000 workpeople engaged in the engineering and ship-building industries received increases. The decreases included 100,000 coal-miners and 7,000 blast-furnacemen, but the amount of the reduction in these cases was very small.

TO STRAIGHTEN A CHIMNEY STACK.

The straightening of a chimney stack at a brick and tile works located at Earnest (Pa.) was recently accomplished in the following manner:—The stack is 122 feet high, 11 feet square at the base, tapering somewhat at the top, and weighs 400 tons. The top was found to be leaning 45 inches from the vertical line. To right the chimney, 10½ inches of brick work were removed from the foundation on three sides. As the bricks were removed square blocks of wood were inserted, until three sides of the structure rested on the blocks. Between the blocks substantial brick piers, 6 inches high, were built, leaving a space 4½ inches between the top of the piers and the bottom of the undermined brickwork. The blocks were then set on fire, and kept burning evenly and uniformly, and as the blocks were reduced to ashes the stack slowly righted. The entire work consumed one day, and the reduction of the wooden blocks to ashes required one hour.

SOCIETY MEETINGS.

The Edinburgh Architectural Society.—On the 10th inst. the members paid the first visit of the winter session to the Electric Lighting Station. There was a good attendance. The party was conducted over the building by Councillor Mackenzie, Convener of the Lighting Committee, and Mr. Newington, the Resident Engineer, who explained the machinery in an instructive manner; as some new plant was in the course of erection it added greatly to the interest of the visit.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if any of your readers could inform me whether it is possible to *restore* a faded pencil drawing—one which has been done some 30 or 40 years. Is there any process which would bring out the pencil lines to something like their pristine blackness?

Yours truly,

"ARCHITECT."

KEYSTONES.

INSTRUCTIONS for the preparation of plans and estimates for new baths at the pierhead have been given by the Baths Committee of the Liverpool City Council. The cost is not to exceed £30,000.

PLANS for re-building the Old Bailey were, on Thursday, ordered by the City Corporation to be forwarded to Her Majesty's judges for their observations. The cost is estimated to amount to £120,000, and the report relating to the whole question will be discussed at the next meeting.

A FURTHER appeal is being made on behalf of the restoration and extension of St. Peter's Church, Derby. Three eminent Architects have reported that the tower must be pulled down and re-built. The total cost of the scheme is £6,800, towards which scarcely £2,000 has yet been promised.

AT Goole, the new Market Hall, now completed, is to be opened to-morrow. It has cost about £5,000, and, though a plain building, is large and capacious, and well-adapted for market purposes. Since the old building was burnt down, six years ago, the weekly market has been held in the streets.

ONE of the oldest buildings remaining on the Long Row, Nottingham, is about to be demolished. The structure dates back to the middle of the seventeenth century, and is largely constructed of oak. The old panelling of the room on the second storey, with its carved oak chimney-piece, is to be preserved and replaced in one of the rooms of the new buildings. It has been suggested that the Castle Museum Committee might find room at the Castle for the colonnade, which consists of old oak, and which fully shows the character of the period at which it was erected.

LIKE many other great painters, Paul Veronese was given to eccentric moods and odd habits. On one occasion he accepted the hospitality of a family at their country villa. He assumed great liberties during his visit, claiming absolute possession of his room, and allowing nobody to enter. He slipped away without bidding the family good-bye. On entering the room the servant found the sheets of the bed missing, and, after careful search, a roll was found in a corner, which proved to be a magnificent picture of "Alexander in the Tent of Darius." It was painted on the missing sheets of the bed and the artist had chosen this curious way of recompensing his hosts for their generous hospitality.

A SHORT time since a District Council was ordered to pay £3,000 to the wife and family of an inhabitant who had died owing to the insanitary state of the district administered by the Council. This judgment is being appealed against, but another District Council—the Golborne—has just succeeded in achieving a victory over the Liverpool, St. Helens, and South Lancashire Railway Company. For not completing two bridges according to Act of Parliament the Company has been fined £5 per day from May 3rd, and the fine already mounts up to £1,190.

A NEW wing of the Derbyshire Royal Infirmary has been opened for the reception of patients. The whole cost of its erection, which has been borne by Mr. Walter Evans, amounted to £12,000. The wing is intended as a memorial of Mr. Evans' late wife, and is to be called the Susan Evans wing. It will contain 42 beds.

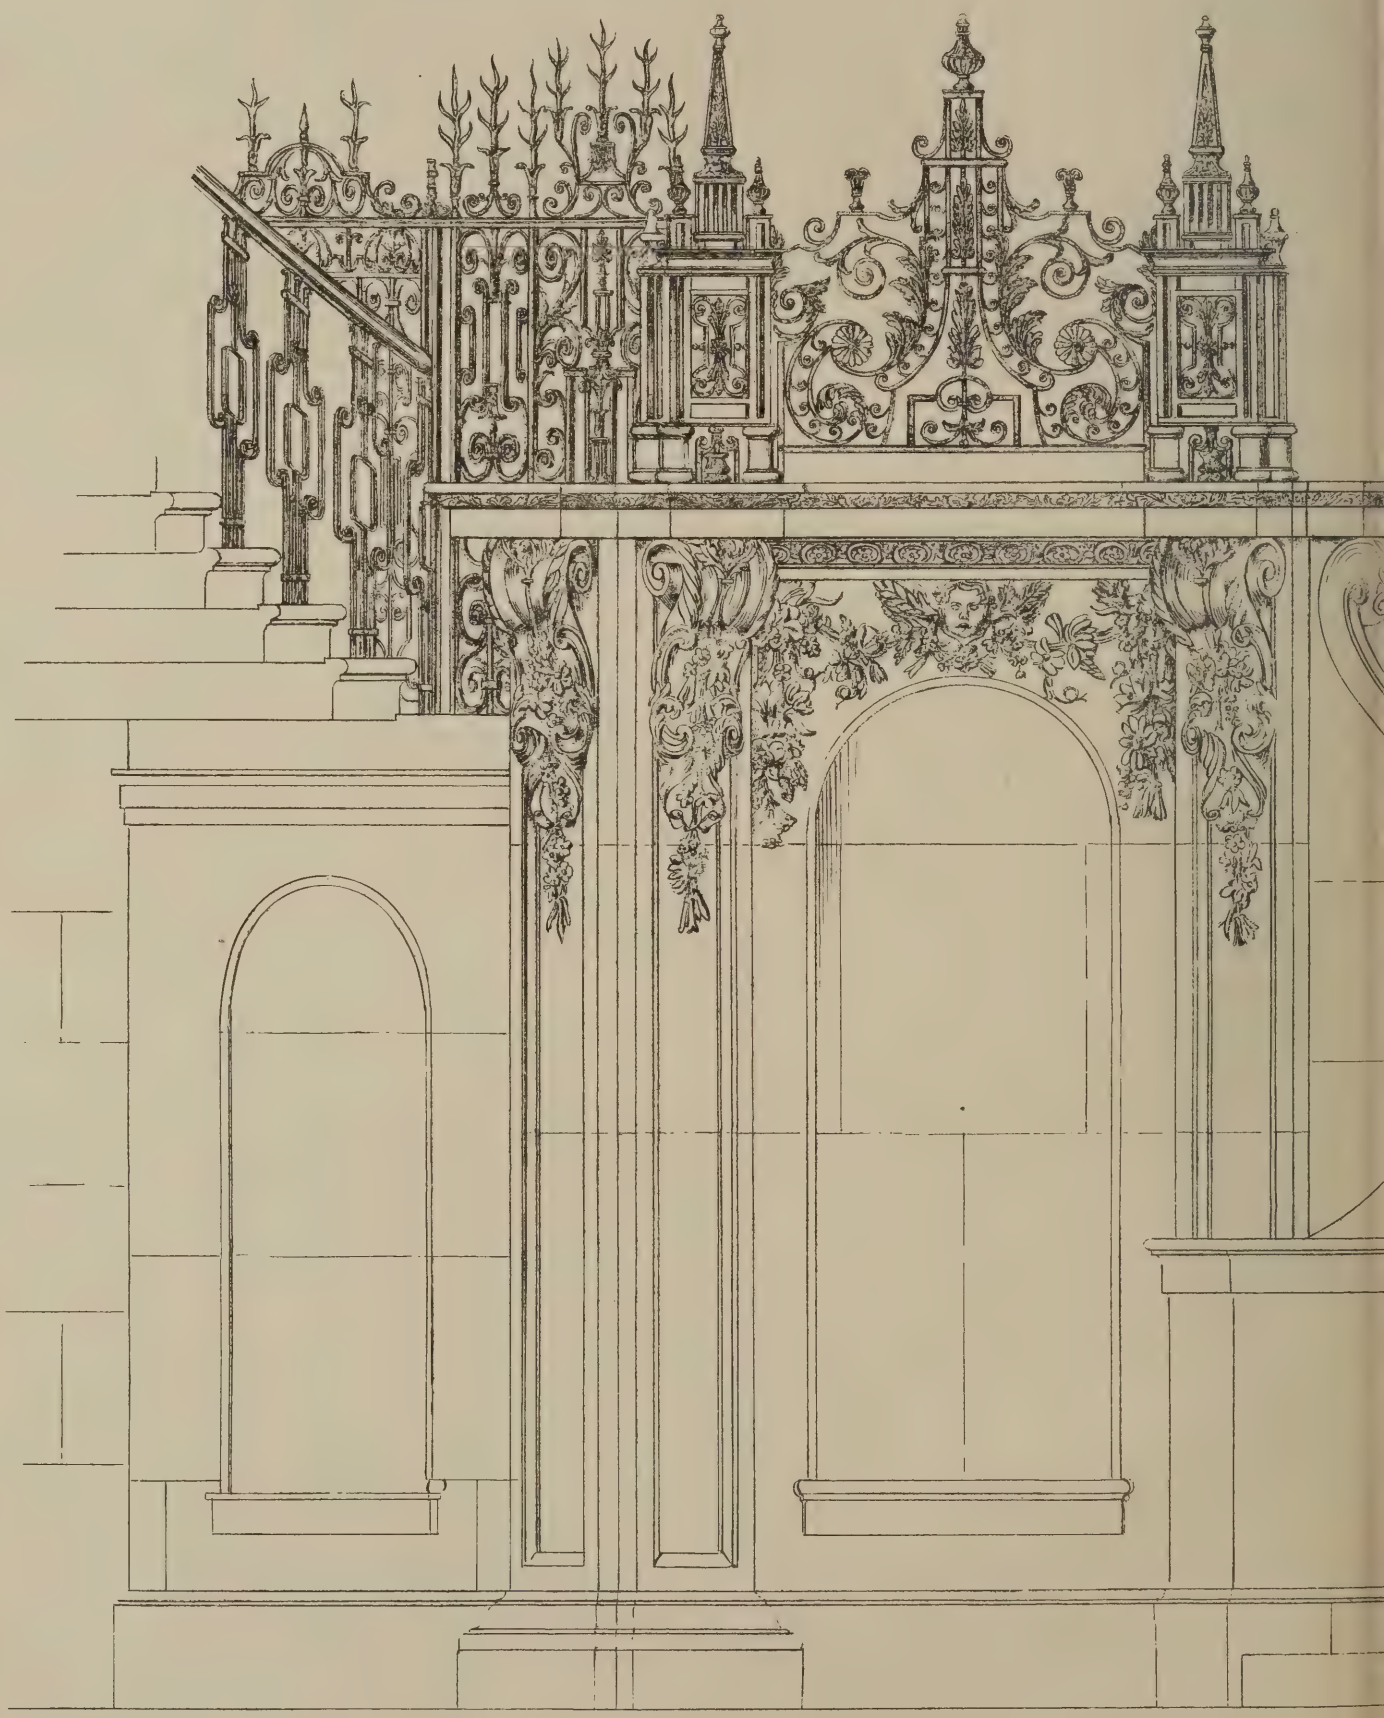
DURING the recent gales a Goliath crane, weighing over 100 tons, employed on the Dover Harbour works, was blown over. A squall snapped the chains which held it and drove it along the rails to the head of the embankment, where it fell completely over on to the brea - water, the boiler exploding with a loud noise as it did so. Great damage was done. Not only was the crane ruined, but much timber work was destroyed.

IN China bamboo is of universal use. The windows are delicate lattice work of bamboo, and the furniture is of slender bamboo, bent and curled and plaited. The water-bucket is a good big stalk sawed off just below the joint, and made as deep as is needed above it. For a bottle a slender piece is taken and treated in the same way. If, in the confusion of building, a knife is mislaid a good sharp edge of a bamboo is taken, and it does just as well for everything, except cutting bamboo, as if it were Sheffield steel.

AN interesting addition has just been made to the Guildhall Museum, a Wood Street firm having presented to the Corporation the sign of the Ape and Apple. This inn was one of those old galleried hostelries for which the city was formerly famous, and it stood in Philip Lane, the site being now occupied by some of Messrs. Rylands' extensive premises. The date inscribed upon the effigy is 1670, and the initals B. I. M. probably represent the initials of its former owner. Strange to say, a similar piece of sculpture was recently on view in a street called the Sparrengasse, at Basle.

THE Mile End Guardians are now engaged in bringing their Cottage Home School Scheme into reasonable dimensions. As originally planned, accommodation was to be provided for 400 children, these being placed 15 in each cottage. The estimated cost was £80,000. It has been resolved by the Guardians that this sum was too heavy for the parish to bear, and revised plans have now been approved by which the cost is reduced to £59,000. It is proposed to accommodate only 320 children, and to place these 20 in each cottage, instead of 15. A deputation has been appointed to wait on the Local Government Board to obtain sanction to the new proposals.

A MEMORIAL tablet has been put up in the south transept of Ely Cathedral to the memory of the late Dean Merivale, who was for 24 years Dean of Ely. The tablet is of white Italian marble, surrounded by a moulded border of Verona marble, and bears a medallion likeness of the late Dean in oval shape. An inscription by the Master of Trinity College, Cambridge, records the fact that the late Dean was the historian of the Romans under the Empire, and adds that he was rich in learning, caustic in wit, just, wise, tender, and magnanimous.



THE Northern Hollanders have come into possession of a very interesting source of lighting. About 40 years ago borings for water in the polders round the Haarlem Lake, at farms below the level of the surrounding sea, brought up inflammable gas; but as this gave no light it was neglected. Now, however, this gas is being systematically bored for, and it comes up mixed with sweet water which it makes to effervesce. The effervescing water is brought under a gas-holder, and the gas is liberated while the water flows on. About six cubit feet per hour is thus collected from each boring.

FOUR new first-class cruisers of 11,000 tons displacement have been ordered by the Admiralty. The "Argonaut," to be built and engined by Messrs. J. and G. Thomson, Clydebank; the "Ariadne," to be constructed by the Fairfield Company, Glasgow; the "Amphitrite," to be built by the Naval Construction and Armaments Company, Barrow-in-Furness; and the "Spartiate," to be built at one of the dockyards. The engines of the last named are to be made by Messrs. Maudslay, Sons, and Field, London. The vessels are to be of the same type as the "Niobe," of which four were ordered last year, one each from the three Companies name. The contract price for each cruiser is said to be about £445,000.

William Henry White : A Monograph.

WILLIAM HENRY WHITE deserves something more than formal notice. In him the Royal Institute of British Architects has lost a loyal and zealous Secretary. He was the son of Dr. William White, of the Bengal Service, being born in January, 1838. His Architectural education was firstly gained under the late Mr. George Morgan. Shortly after the termination of his pupilage, in the year 1861, when 23 years of age, he went to France for further study and improvement, entering the office of a Parisian Architect as an assistant. At that time the wave of Romanticism was not yet spent, and the Gothic Style was much affected for domestic work, aided as it was by the great and increasing influence of Viollet-le-Duc ; and the studies of young White were directed towards the logical and commonsense Gothic that we in England see. Small wonder that Paris soon exercised its magical spell over him, and, after a very short time, instead of returning, he decided to remain and endeavour to make practice there. The usual patriotic French motive would somewhat militate against his early efforts, as the average Parisian prefers that his house should be built *by* a Parisian, who knows what is necessary, and what is possible under the French Building Laws. He, however, overcame their reluctance, and was making a good practice when the sad war of 1870, that ended the Imperial *régime*, made havoc among the very circle from whom his clients were derived. Among his work there is the Château de Martinvast, showing admirable restraint, such as was inculcated by Viollet-le-Duc and De Baudot. Returning to England, he found difficulty in starting practice again, and so was glad to avail himself of the influence still attaching to his father's long service in Bengal. He went to Calcutta in 1871, and was engaged in the Public Works Department of the Indian Government, designing several official buildings. Two years in India proved long enough, both for his health and his temperament ; and he left, returning to London in 1873. His Indian influence helped him again in obtaining the appointment of Examiner in Architecture at the Indian College at Cooper's Hill, and he also took up literature and journalistic work. William Henry White was distinctly well read ; he was thoughtful and individual ; he had seen much, had clear views, a quaint and pleasant sense of the humorous side of questions, and a clear incisive method of putting things ; and he soon made the influence of his presence felt in various papers he contributed to the Institute and the Association, and in certain pamphlets he published. He read a Paper, 23rd March, 1874, before the Institute, on "Government Architecture in Bengal," which was an exhaustive account of the official methods existing at that time, full of suggestiveness for improvements, and was termed by the late Sir Gilbert Scott "a very talented paper." His Indian experience made him the proper person to write the Memoir of Fergusson which appeared in the Annual Report of the Royal Asiatic Society, May, 1886, and it was sympathetic and thorough. One of his cleverest writings at that time was "On the present state of thought concerning Architecture," which he read before the Architectural Association on 23rd January, 1874. This, with an original design illustrative of it, was published, and the design (which he quaintly said had been prepared "by a friend whom I have known all my life") showed divided pediments having chimney-pots running through, with much other of the kind of

HISTORY AND ART : FLORENCE. THE CREATION OF ADAM AND EVE, BY LORENZO GHIBERTI.

detail then being introduced into Architectural design under the

CHARITY-LIKE NAME OF QUEEN ANNE,

and recessed bay-window, recalling those just designed for the New Zealand Chambers in Leadenhall Street. It was, indeed, a thinly-veiled caricature of the contemporary style of Mr. Norman Shaw, R.A. Mr. White then enunciated various principles, and proceeded to criticise his *pasticcio* very severely. Some of us remember the "Battle of the Styles," commenced by Pugin, joined in by Fergusson and others, and carried on for 20 years by various smaller men. The *odium architectonicum* was thus raised anew by White, and continued by other mediævalists, at the manner in which one of their ablest men, the designer of Cragside and Wispers, had succumbed to the blandishments of the Queen they had asserted to be dead. The effective reply White made to the foolish article in the Quarterly Review of October, 1884, was read before the Institute on 14th December following. The writer in the Review had said—"the emancipated workman, gloriously impelled, must always be and is, the only real hope of English Architecture," and White's mixture of banter and fact was a fitting rejoinder. His "Protest against the amended design for the proposed Admiralty and War Offices," published as a pamphlet in 1885, was trenchant and powerful, though a taint of political partisanship detracted from the cogency of his statements. His French sojourn left its mark on him. He was an accomplished speaker and writer in French; and he dearly loved an opportunity of reading, officially, any correspondence in that language; and to those acquainted with this amiable foible his *gargouillage* was always delightful.

FRENCH SYMPATHIES

were shown in the "Brief Review of the Education and Position of Architects in France since the year 1671," read before the Institute on 4th February, 1884. He elaborated the ideas of this into a small but very clever book—"Architecture and Public Buildings: their Relation to School, Academy and State, in Paris and London." He therein writes: "The contrast between the great works of Architecture in Paris and London is startling, even when regarded from a material and not an æsthetic point of view. On one side are conspicuous the evidences of method, refinement and care; on the other, of inexperience, hurry and confusion. A superabundance of knowledge perplexes both communities, but in Paris exuberance of fancy is subordinated to scholarly judgment; in London it is morally and materially uncontrolled. This country, it is true, has an advantage in the possession of what is called public opinion, which, in all national matters, except those relating to science, literature, and the higher Arts, is of value, and English opinion, though anything but dumb in difficult questions affecting Architecture, is incoherent. Individuals may in one case offer an alternative to ugliness, in another formulate a remedy for abortion, * * *; but even if public opinion had the power of arriving at any decision in such questions, no organization sufficiently representative to collect its suffrages, or record the result, is at disposal in London. The authorities of Paris, on the contrary, have definite artistic views. They possess a standard of taste and a power of imitation of which Londoners are wholly devoid; and throughout France there is an abundance of carefully-prepared professional talent, at the service of the State, for the design and execution of national monuments and buildings. During my

TEN YEARS' CONSECUTIVE RESIDENCE IN PARIS,

the authorities seemed to know, not only what the inhabitants wanted for the alteration and adornment of their city, but also to obtain for them what was wanted; during my ten years' consecutive residence in London, the authorities seemed not only to ignore the prevalent desire for improvements, but also quite unable to carry to completion the alterations they devised—alterations which, in almost every case, have been deemed inartistic by experts, and unsatisfactory by the public." The book is a comparison of the two systems, and contains a severe attack on the Vestrydom which had continued to rule London. Its influence has helped to rouse the Institute to a sense of its power and its duty, and to consolidate it, and further to raise the status of Architecture by improving professional education and professional tests by examinations and otherwise. In 1874, Mr. White read a Paper on "How Parisians Build Houses in Flats," and on 22nd March, 1878, gave a statement of "Paris Building Laws." This had been preceded by a Paper "On Middle-Class Houses in Paris and Central London," read before the Institute on 19th November, 1877; and he further published a pamphlet, addressed to the Duke of Bedford, entitled "Houses or Homes." This was a plea for Flats, and for such alterations in the tenure of leases as would permit of their being built. All this was

AT A TIME WHEN THERE WERE NO FLATS

to speak of, before the great development of the Flat system, and no doubt he was instrumental in that development. In his Institute Paper he had, taking an actually existing block in Regent Street, showed how that could be made healthy and comfortable, instead of the reverse, and how, without increasing the height of the building, be made more profitable as a rental investment. A pamphlet, dated 19th December, 1884, "The Antechamber," which was a spirited account of old French and English plans, as resulting from social habits and customs, was a further elucidation of his desires. Mr. White was appointed Secretary to the Institute in 1878. No doubt, at an early meeting of that body, we shall have an exhaustive and authoritative account of his work there; but we may, without descending into personal questions, note what a difficult post he had to fill. It was a period of transition, with many conflicting views, and much antipathy to new methods. The Transactions and Journal of the Institute are a monument of his indefatigable energy. He was proud of his work, and gave unflinchingly the best of his life to it. His work, gratuitously given to the Architects' Benevolent Society, deserves kindly remembrance. His labours were constant and exacting. Often the holiday recess was in great part absorbed in seeing publications through the press; and this, all sedentary, with no sufficient exercise, told at length on a constitution already slightly affected by the Indian climate. The warning came about eighteen months ago, and it was repeated in severer fashion last April. Since that time, with much pain and some anxiety about his beloved work at the Institute, he has been waiting for the relief which came in the early morning of the 20th instant. The funeral took place at Nunhead on the 22nd, in the presence of Col. White, his brother, of the President of the Institute, Professor Aitchison, A.R.A., Mr. Macvicar Anderson and Mr. Waterhouse, R.A., past Presidents, of Messrs. Emerson, Aston Webb, Phéné Spiers, Slater, Graham, Blashill, Hall, Searles Wood, Arthur Pite, and other members of the Institute, of Mr. Beazeley, Mr. Taylor, and other officials, of Dr. Wethered, his medical attendant, and of several private friends.

ON WEDNESDAY NEXT, NOVEMBER 4TH.

The Premier and Authoritative Architectural Magazine.

The Architectural Review.

EVERY MONTH. PRICE SIXPENCE.

Superbly Illustrated for the Architect, Artist, Craftsman.

The Editors announce the following contents of the first number:

THE WORK OF JOHN L. PEARSON, R.A., with reproductions of some Twenty Drawings, Designs, and Photographs. Mr. PEARSON has actively collaborated in the selection of the Illustrations. The Article will, therefore, be of a most comprehensive and complete character. The Letterpress by JOHN E. NEWBERRY, with Portrait of Mr. PEARSON, as a frontispiece.

LONDON CITY HALLS—STATIONERS' HALL.—By special arrangement the whole of Mr. JOSEPH PENNELL'S Pen and Ink Drawings illustrating the City Halls—never before published—will be reproduced as a Series of Articles. No. 1, Stationers' Hall.

THE OLDEST CHURCH IN LONDON — ST. BARTHOLOMEW THE GREAT: Its Restoration. By ASTON WEBB, F.S.A., F.R.I.B.A., illustrated by Mr. ASTON WEBB'S original Drawings and Plans, showing the Restoration, with Mr. ASTON WEBB'S own Notes.

THE WORK OF NELSON AND EDITH DAWSON, Designers, Ironworkers, and Enamellers: Illustrated by themselves.

ARCHITECTURE: COMPETITIVE AND CURRENT. The North Bridge Street Reconstruction, Edinburgh. With illustrations of the Premiated Designs, by special arrangement.

"LEADED LIGHTS AND OPEN VIEWS." A Series of Editorial Articles and Notes, contributed by a staff of leading Architects and Designers who will regularly contribute to this feature.

Amongst the contributors to the first and early numbers will be:—

BELCHER, JOHN, F.R.I.B.A.
BELL, E. INGRESS, F.R.I.B.A.
BRYDON, J. M., F.R.I.B.A.

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

Perspective in Every-day Practice.

By W. N. Cumming, A.R.I.B.A.

No. I.—EXTERIORS.

IN order to explain this important subject in as simple manner as possible, I think it is best to assume that we have before us a building that we desire to put into perspective. The term "perspective" is derived from the Latin verb *perspicio, perspexi, perspectum,* "to see through"; from this we understand that an object is said to be in perspective, when viewed through a transparent medium such as a sheet of glass, and that the rays of light passing from the object through the transparent medium to the eye, form upon it an image, differing from the object as we understand it, but at the same time conveying a living representation of that object to the mind. If we look at the construction of the eye, we can understand how the rays of light act, so as to convey a correct impression of any object to the brain. Fig. 1 shows a section of the eyeball, from which you will see that it is in the form of a circular chamber; this is enclosed by a hard shell called the "sclerotic," which forms this chamber and protects the delicate interior structure. The interior of this chamber is lined with a dark film called the "choroid," which acts like the blackened interior of a photo camera, so as to absorb all the superfluous rays of light, and prevents blurring of the sight. The front part of the eye has on its surface a transparent convex membrane similar to a watch-glass in appearance, and behind this again is a diaphragm with a small circular opening in the centre; this is the "iris" or pupil of the eye, through which all rays of light pass; behind this again we have the lens of the eye, a structure filled with aqueous humour, which is exactly similar to a magnifying glass, and at the back of the eye is the screen or "retina," upon which all rays of light are focussed, to which is attached the "optic nerve," which conveys the impression created upon the "retina" to the brain

The rays of any object, such as a lighted candle as shown in Fig. 1, pass through the "cornea, "iris opening," and lens to the "retina," but are changed in direction in passing through the lens, and finally project the image of the object, "inverted" upon it; from this you would naturally suppose that we would see objects upside down, but this is not the case, *except under certain circumstances;* what process takes place in the brain to rectify this is one of Nature's marvellous phenomena, which is beyond human ken. Having now glanced at the construction of the eye, it will be easier for me to convey to you how the optic rays act to produce perspective.

Let us suppose the rays of light to be represented by lines, as shown in Fig 1, these passing from the top and bottom of the object diminish as they proceed from the object and converge upon one point at the centre of the lens; this then is the point termed in perspective "the point of sight." If I were to introduce a plate of glass between the object and the point of sight, it is evident that it would be posssible to draw upon the glass plate a diminished representation of the object; this image then may be called a perspective view of the object, and the glass plate forms what is termed the picture plane.

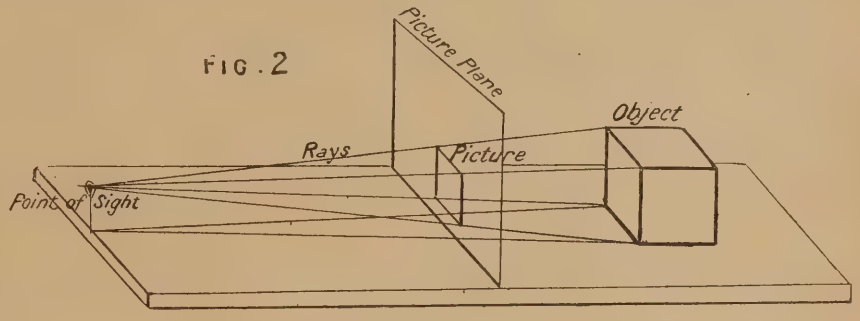

FIG. 2

To illustrate this more clearly, take a sheet of glass and set it up edgeways on a table or drawing board, about the middle, and at one end fix in a piece of wire shaped like an ordinary meat skewer with a loop at one end, and on the other side of the glass place an object such as a cube; now, by placing the eye at the loop in the piece of wire so as to look through the glass screen at the cube, you are able to draw on the glass, by means of a piece of soap, an exact representation of the cube in a diminished form. I use this illustration simply to let you understand what I mean by the cutting of the rays of light by the picture plane. Now we have clearly three separate things essential to perspective, (1st) the object, (2nd) the picture plane, and (3rd) the point of sight. If we take a cube and place it square on to the picture plane (by this I mean that one side of the cube shall be parallel to the surface of the picture plane), and we place the eye at the loop in the piece of wire, we shall have four distinct rays passing from each corner of the cube through the picture plane to the eye (Fig. 2), and these rays will be cut by the picture plane in such a manner that we shall be able to fix the four points on the sheet of glass, and, joining them, produce an exact representation of one side of the cube, viz., a square, upon the sheet of glass; on a smaller scale such a representation may be called a parallel perspective of the cube, inasmuch that we have no vanish, that is to say, no sloping of the lines, at top and bottom, to one side or the other.

If we place the cube with one corner towards us, so that we see two sides of the cube at them to some extent, but not so much as the rays passing from the corner C, D, which have not such a wide angle in consequence of this corner of the cube being at a greater distance from the eye; these rays, C, D, will therefore be cut at a greater distance from the object than the rays A, B, and therefore will be smaller. If you now make points on the glass where the rays A, B pass through, and also points where the rays C, D pass through, you will find that the distance A, B is greater than C, D, join A, C: B, D, and you will have two sloping lines on the glass: the one sloping downwards, the other upwards; it is evident then that these lines being produced will meet in a point, and this point is called the vanishing point; produce the rays from E, F similarly, and join as before with A, B, and you will have a similar vanish to the left.

We have now arrived at a general understanding of what is meant by the terms "object," "picture plane," "point of sight," and "vanishing point"; there is one more essential term in perspective, which I will explain before proceeding further, and this is the "horizon line."

You will, no doubt, have observed, that if you stand on the seashore and look at the line of the sea where it meets the sky, that it appears to be a definite horizontal line, and you may also have observed, that if you go to the top of a hill or mountain, that this supposed line rises with you as you climb, and, when at the top, appears to be still at the level of the eye.

If you glance for a moment at Fig. 4, the cause will at once be apparent. Let the line A, B represent a section of the world at the surface of the sea, and D the height of a man's eye. It will be evident, that if the sight be directed towards the point E, the sea will appear to meet the sky at that point at the level of the eye of the spectator. If he now ascends some high building or hill, say at the point F (Fig. 5), directing his gaze at the same point E, it will still appear to be at the level of the eye, and if he turns his head, directing the gaze to different points of the compass, each point will appear to rise in succession to the level of his eye; joining these points an apparently straight line will be formed, and this then is the horizon line.

This line is that upon which all vanishing lines

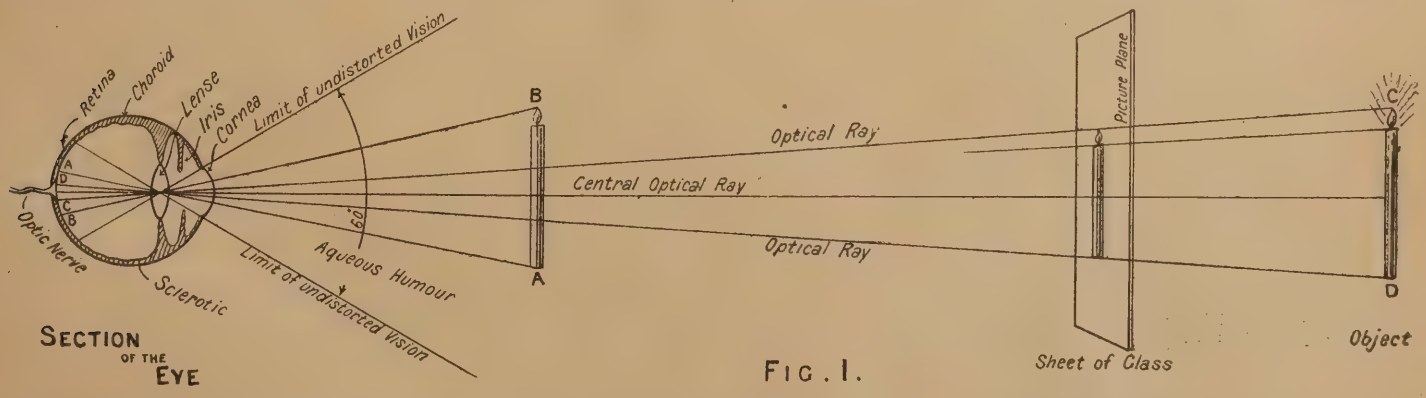

FIG. 1.

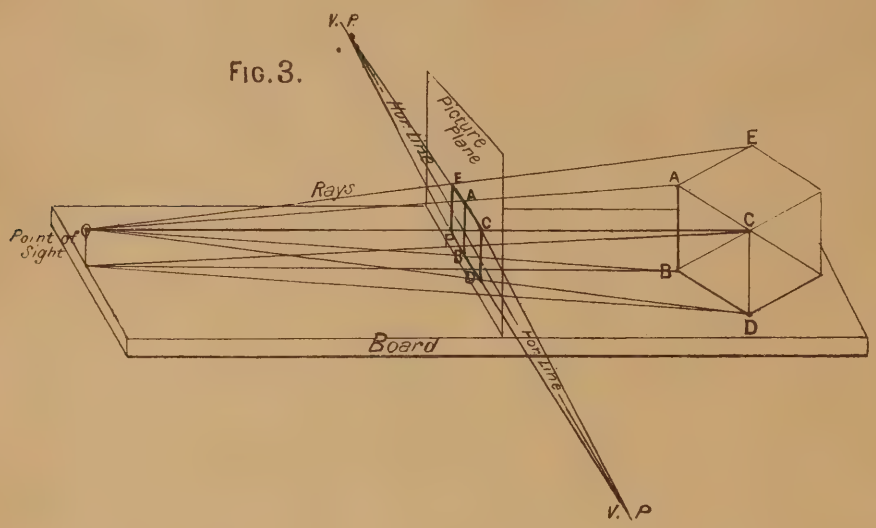


once, we shall be able to understand how this vanish occurs. Keep in mind that the nearer the picture plane approaches the eye, the more diminished objects appear. Let us take the corner of the cube, which I have called A, in diagram No. 3; it is the nearest part of the cube that is presented to the eye, and therefore the rays passing from the top and bottom A, B, have the widest angle, and it is evident that the picture plane cutting these rays at a certain point, will diminish converge, and producing these lines to their utmost limit, upon which they will ultimately meet at a point. To refer again to Fig. 3, if after producing the sloping lines at top and bottom of the cube A, C: B, D till they meet, and A, E: B, F, you join the points at which they meet, you will find that the line drawn on the sheet of glass connecting these points is level, and we have now come to understand what the fifth term used in perspective means, viz., the horizon line. Having generally

explained what is understood by these five terms, I am able to explain how to proceeed in putting any object, such as a building, in perspective.

The first process necessary is that a careful tracing be made of the ground plan of the building, showing all the various projections, openings, etc., such as wings, turrets, doors, windows, and other features. Having carefully traced this in black ink, take the various floors, 1st, 2nd, 3rd, etc., and trace them in a similar manner on the same sheet, but using a different colour for each floor, proceed with the roof plan in the same way, and you will have all the information necessary to proceed with your picture. Having completed this part of the work, fix the point of view that you wish the building to be seen from. This should never be so close as to make the extreme rays proceeding from the building to the point of sight at a greater angle than 60°, otherwise the picture will be distorted, nor should it be at such a great distance as to make the vanishing points too far away to be convenient for manipulation on the drawing board.

I generally fix the point of sight at about once and a half times the extreme width of the picture, but the exact distance suitable to each subject will come with practice. Having fixed the point of sight the next process is to fix the position of the picture plane. Should you require that the picture be smaller than the scale to which the building is drawn, you must place the picture plane between the building and the point of sight, moving it towards the point of sight to diminish, and towards the building to increase the size. That is to say, if your building is drawn to $\frac{1}{8}$'th scale, and you are desirous that your picture be drawn to $\frac{1}{16}$th, it is only necessary that you should fix some distance, such as 10 ft., upon the building, and drawing the rays from the extremes of this distance to the point of sight, shift your picture plane so that the distance of 10 ft. shall be reduced by one-half, and you will then find that all points drawn down from your building to the point of sight through the picture plane will be in exact proportion upon the picture plane, and that all heights may be put down to the $\frac{1}{16}$th scale, saving endless trouble and securing greater accuracy, especially if you are working from figures. Having then fixed the point of sight and position of the picture plane, the next process is to choose what point of the building you prefer that the eye of the spectator should be directed at. This point, I have found, generally is best taken as being the nearest corner of the building. Draw a line from this point to the point of sight and you have what is termed the central visual ray; this central ray forms an important factor in your perspective process, inasmuch as it gives you a basis upon which you work to form your picture plane in this way. Assuming that you have fixed the position of your picture plane so as to arrive at a definite scale for your picture, fix this position by a point on your central ray, and through this point draw a straight line at right angles to your central ray and you have the picture plane. Now draw rays from your plan through the picture plane to the point of sight; these rays must be taken from all corners, projections, sides of openings, &c., as shown (Fig. 7). I find it best in practice to draw these in the various coloured inks corresponding to each floor of the building: by this means one can readily distinguish the positions of the various features on the picture plane. The point where the central ray cuts the picture plane is called the measuring point, and it is from this point that you will measure all the horizontal distances on the picture plane.

FIG. 3.

The next thing to do is to find the right and left vanishing points. This is accomplished by drawing a line through the point of sight parallel to the side of the building for which you require a vanishing point: in other words, in the case of a cube, parallel to the two sides of the cube nearest the eye, and producing this line till it cuts the picture plane; this will be the vanishing point for the respective side to which this line is parallel. In practice it will be found that this line frequently cuts the picture plane at such a distance from the measuring point that it is inconvenient, and sometimes impossible to produce this line till it cuts the picture plane, but a remedy which will be found in every way practical is to divide the central ray between the picture plane and the point of sight into so many parts, say four to six. Marking these points on the central ray, draw through one of them, that is, the one nearest the picture plane, a line parallel to the face of the building for which a vanish is required, and produce till it cuts the picture plane, in a similar manner to the process described before. For instance, say you divide the central ray into four equal parts, then taking the fourth part nearest the picture plane, draw the line through this point till it cuts the picture plane, then this point will be a fourth part of the distance from the measuring point, that the vanishing point for this side of the building will be, and you have only to extend this distance four times on your picture to get your vanishing point. Having accomplished all the preliminary processes on the plan it is necessary to proceed with the picture. Now fix the height of the horizon on the elevation, that is to say, the height at which the spectator's eye will be when viewing the building. This depends to a great extent upon the situation of the building; should it happen to be on level ground, the natural height of the eye, say about 5 ft. 6 in., will be found most suitable, but in the case of the building standing upon raised ground it will be better to ascertain the height of the rise from the point upon which the spectator stands, and, deducting 5 ft. 6 in. for the height of the eye, the difference will give you the depth below the ground line of the building that the horizon should be; this is sometimes called a "toad's-eye view." Again, should the building be on a lower level than the ground upon which the spectator stands, proceed as before, with one exception, namely, that the height of the eye must be added instead of deducted.

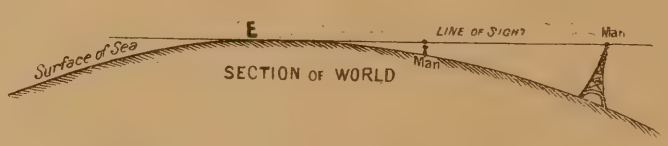
There is another point of view, and that is a bird's-eye view, and in this case the height of the horizon should be kept well above the highest point of the building. This form of view is very desirable when you are dealing with a large extent of building, such as a hospital, where an ordinary perspective view would give a very limited idea of the extent of the building, and enables you to show in perspective the various wards, &c. Having then fixed the height of your horizon, draw a line at this point through your elevation from end to end, and from this line you will take all your perpendicular measurements, above and below.

We have now got a general idea as to the extent of our picture from the plan, by taking the distance between the extreme external rays on the picture plane. This we must mark by points upon our paper, then we measure the distance from one of these rays to the measuring point, and mark this. Taking a T-square we draw a perpendicular line through this point and mark it MP. From this line all our horizontal distances will be measured.

Next we draw our horizon line; the best position for this is, I think, at about one-third of the height of the picture. Now upon this line we mark our vanishing points, measuring them on the picture plane, taking the distance from the measuring point, remembering, if you have found your vanishing point by taking a fourth of the distance from the point of sight to the picture plane, that you must extend this distance to four times on your picture in order to get the correct distance of the vanishing point. Proceed in like manner with the two vanishing points, and we are now ready to draw the building.

I must now digress for a moment or two to point out one or two things which will be of great assistance to you in working at your perspective. One of the worries of the perspective draughtsman's life is the extreme distance of the vanishing points, on occasions necessitating a recourse to some means by which lines may be vanished to the vanishing point without that point being actually present. The usual instrument for this purpose is known as a centrolinead, and, for the benefit of those who have not seen or used one, I may say it consists of a long arm terminating in a brass plate with two projecting

FIG. 4.



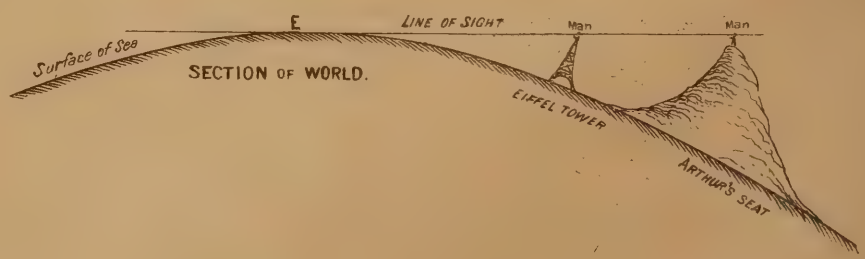


FIG. 5.

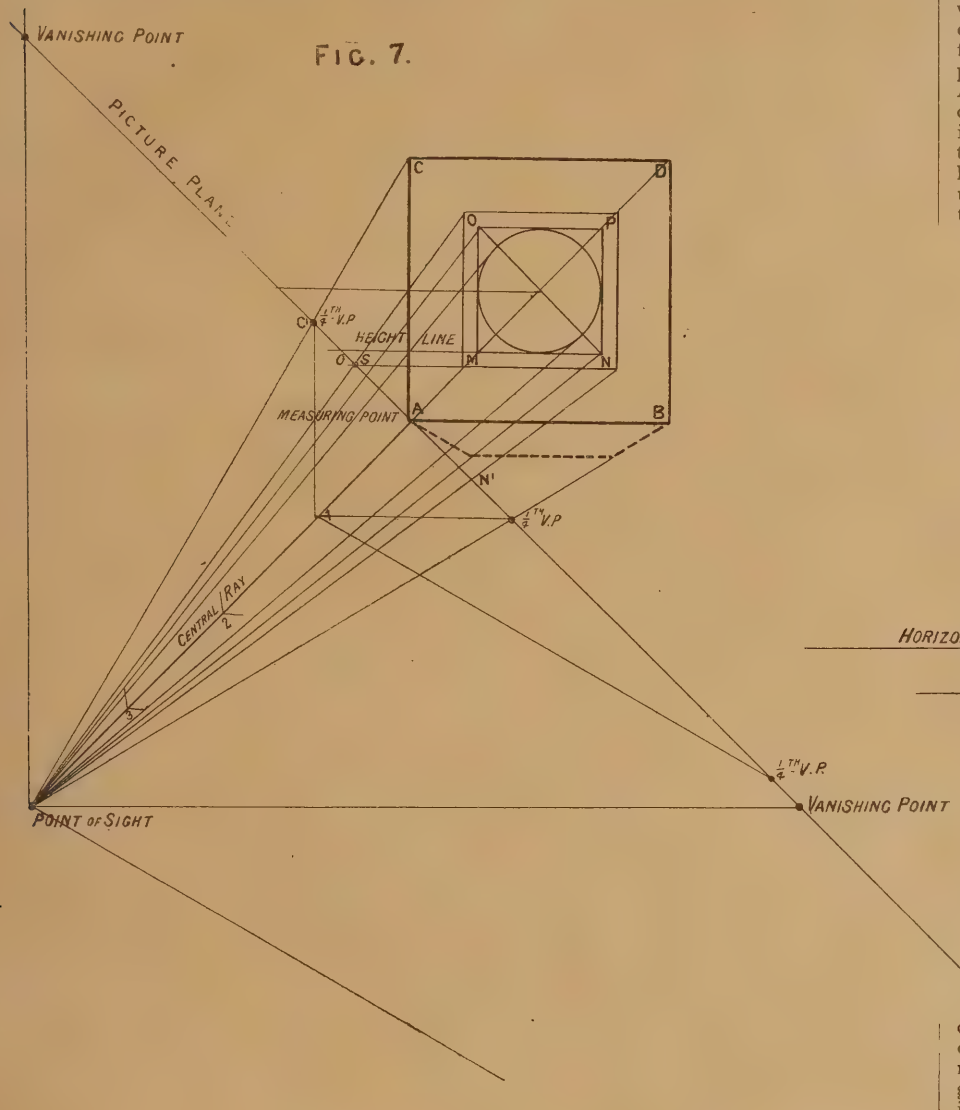


pins: to this is attached, by means of a thumb-screw, another brass plate having two semicircular slots. There are two arms attached to each other by means of a sector joint of brass, and two thumb-screws are provided, screwing into two holes in this joint. The centre pin of this joint is prolonged, and fits exactly into a small hole in the centre of the brass plate before referred to, between the two semicircular slots. The two short arms are attached to the long arm by means of the thumb-screws at the sector joint which pass through the slots in the brass plate and at the same time permit of the arms being moved within a certain limit, so that they may be set at a more or less acute angle and clamped by means of the two thumb-screws. When fixed at the required angle these arms work upon two pins placed in the board at a certain distance on either side of the horizon line, and all lines drawn along the upper side of the long arm will converge on the required vanishing point.

The centrolinead, useful though it is, has however many disadvantages, and I think a better method is to procure a thin flat piece of wood (which I shall refer to in future as the guiding lath), about two feet long, and two and a half inches broad, pin this to your drawing board in convenient position, say about 12 inches from the edge of the board, taking care that the centre of the guiding lath is placed on the horizon line, then with the vanishing point as a centre, and from it to the top edge of the guiding lath as radius strike a curve with pencil bows or beam compass, according to distance. Now remove the guiding lath from your board, first marking its position accurately, and with a fret or bow saw cut the wood to the curve marked, replace the guiding lath and pin down as before, and using your T-square in the ordinary way, with the head working on this curve, you will find that all lines drawn with the T-square will tend towards and meet exactly at the vanishing point. The ease with which the T-square can be used marks this method as being greatly superior to using a centrolinead.

(To be continued.)

FIG. 7.

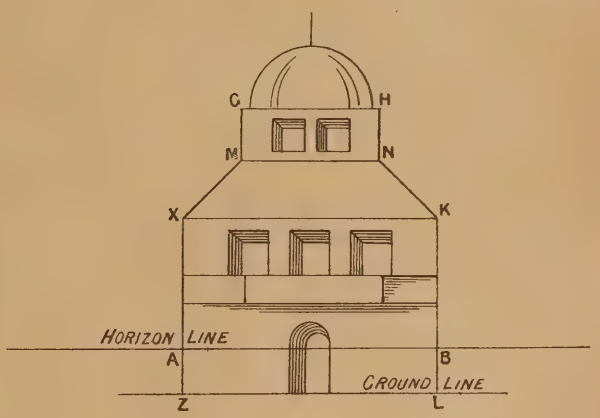
ON the 27th inst., in Beeston Road, Leeds, a block of property near the Golden Lion Inn is to be demolished, by which the street will be made 50 ft. wide.

THE Nelson Corporation has resolved to expend £40,000 upon developing their gasworks, and putting down machinery on the most modern principle, and laying down new mains in Brinfield and Barrowford, as well as their own district.

A serious accident recently occurred at a house in course of erection at the corner of Wheeler Street, Vauxhall Bridge Road. A number of men were at work assisting in the concreting of the roof, when suddenly and without any warning it collapsed. The men on the roof were precipitated to the next floor and several sustained severe injuries, while others, who were at work underneath, were also injured by the falling débris.

IN Dublin the Governors of the Rotunda Hospital are now having important alterations effected in the entrance to the Round Room. A new flooring is being constructed of concrete, which will give much easier access to the building and will be an undoubted advantage to the public attending enter ainments there.

AT a recent meeting of the County Council, the Chairman of the Asylums Committee stated that the capital expenditure now contemplated for asylum accommodation was £350,000; but that, in addition to the amount a ready sanctioned, it was intended to spend about £600,000 during the next five years. The accommodation for patients would, by this means, be very largely increased.



HISTORY AND ART.—A FLORENTINE OUTLINE.

(Concluded.)

BY JAMES A. MORRIS, F.R.I.B.A.

CONTEMPORANEOUSLY with the birth of European national life Florence rises into greater prominence, already filled with those dim yearnings for that individual freedom she was the first to realise, and in the struggle for the attainment of which she held the first place, even in advance of the rest of Europe. Always the most notable, although not the earliest city of that brilliant period in Italy, Florence issued from the obscurity of her earlier days during the opening years of the 11th century. With the last days of the previous century had passed away, unfulfilled, the almost universally prevalent belief that the close of the year 999 would see the end of all things earthly. But as the new century opened, and the years rolled on, and the end came not, the gloom which had gathered over Europe gradually passed away, reviving hope rose anew in men's hearts, fresh activity entered into their lives, and the era of the Middle Ages was at hand. In all countries was this influence felt, the mental strain, where not deadened, was relaxed, and human energy swung back into the national life of Europe. The religious fervour in the beginning of the century, induced by the fear of the Last Day, found expression in the erection of Churches and Monasteries, the arts received a fresh impulse, and Architecture took a new lease of life, the most brilliant since that of Greece, and flourished in all the great countries of Europe. The Crusades followed, the East was again opened to the West, where its influence was felt anew, and Italian commerce enriched her own cities and Europe with its treasures. Pisa and Genoa, among the earliest of the Republic Cities, were, with Venice, approaching the zenith of their fame. A great Art period would soon shed its first rays over the land, and already above the grey mist of its early morning were rising, bathed in its roseate light, those many mountain peaks of art, by and bye to focus on themselves its golden beams and cast them back in undiminished splendour, till flashed from point to point with unstinting hand the whole land should be enveloped in one blaze of Art. Florence concentrated on herself the high noontide of its beauty, and on the fair city of white lilies lingered longest its rays. Writing broadly, it may be taken that from the time of Cimabue (1240–1302) to the close of the 16th century there was little or

FIG. 8.

ELEVATION

NO DIVORCE BETWEEN THE ARTS.

Art, like its disciples, was many-sided, and it is difficult to say in which branch it most excelled

or whether its followers were pre-eminently Architects, Sculptors or Painters. Of the training of these men we have record and tradition, but whence came their superabundant inspiration and unfailing power we have but faint knowledge. Simple craftsmen for the most part they were; and this most of all perhaps in the earlier days. Workers in gold and silver, iron, bronze, wood or stone, their workshops often open to the streets, and whether working beneath the shadow of their own signboard, or in the less generous and more artificial atmosphere of the palaces of their patrons, of this only can we be sure, that in their Art they were simple because natural, and they did their work well because it was not in them to do otherwise. Curious it is to read the quaint old-world stories that have come down to our day, and to learn from them what manner of men they were who laboured and left those works that are so still and solemn, so far beyond our lesser selves, and our lesser work. Glowing with a wealth of colour and of colour drawing to which we cannot attain, with a delicateness of detail which we cannot rival, with a sense of bigness and directness and simplicity, of power and of reserve, of the very life and soul of Art, these men towered above our heads, their eyes beheld things to which our eyes, save through theirs, are blind, and beside their works our works, I fear, are less even than the shadow of their substance. Then think again of the times in which they lived. Cities vied with one another in arms and proud splendour, bitter feuds were rife, and factions everywhere, but Art apparently knew none such; peace-loving folk its followers for the most part seem to have been, and we read of none who came to a violent end. From one city to another they passed, welcomed and required alike by all, and they careless seemingly whether Guelph or Ghibelline ruled the land. Even the fierce tumult of street-fighting, and the enticing charm of a party brawl, seems to have but small delight for them, and failed to break the gentle tenour of their way, above whose simple calm, almost alone among Artists, rises the proud spirit of Michael Angelo, not, however, to be spent in petty feuds, but raised against the armed might of the Pope himself, and his genius reared those grim Florentine walls, before whose brown heights the armies of the Holy Church for nearly ten months were held at bay. But Pope Clement had need of Michael Angelo, and all men were not so readily forgiven as was the Great Artist, and less fortunate had been the lot of Dante, who, once exiled from his beloved Florence, its gates were never again opened to him, either in life or in death. But Dante was a politician before he was a poet, and who knows save that for the bitterness of the great death that passed over his soul in his severance from Florence, and his hopeless exile, the Divine Comedy would ever have been written as it is, if written at all! When Dante was born, in 1265, Cimabue was a young man of twenty-five. Arnolfa, seven years older, was even then probably working somewhere, as a pupil of Niccola Pisano, perhaps at Pisa, as he certainly was at Siena three years later, one of a band of journeymen or craftsmen under that great Sculptor, then an elderly man of sixty. As showing the immediate surroundings under which these men worked it is well to remember how fiercely bitter were the feuds between Guelph and Ghibelline, not only in Tuscany, but also in Florence, for upon one occasion the city was only preserved from internecine destruction by the noble efforts of the Ghibelline, Farinata, Degli Uberti, who curbed the mad fury of his victorious party, and for this his after-time enemy, Dante, commended him, and in Hades his shade utters these noble words:

> "But singly there I stood, when by consent
> Of all, Florence had to the ground been raz'd,
> The one who openly forbade the deed."

Then when in turn the Guelph had driven out the Ghibelline, they refused to allow the

PALAZZO DELLA SIGNORIA

to be built in the centre of their great public square, but only at one side; as otherwise, then in part its foundations would touch soil upon which had once stood a palace of the accursed Uberti family. Grim Gothic fierceness enough, this, surely! At this time, 1298, Arnolfa was not only beginning the great palace, but the greater Cathedral and the Church of Santa Croce had been getting themselves built by him for over four years, and many another stately edifice was rising throughout the city; and Macchiavelli says:—"Never was the town in a more happy or flourishing condition than at this time, rich in population, treasure, and aspect, having 30,000 armed citizens, and the whole of Tuscany either allied or subject to it." In 1300, Dante was chosen Chief Magistrate. Two years afterwards he is its ambassador at Rome, and in that same year, he was exiled from Florence. These were the restless times, then, in which these great buildings were reared and made rich with frescoes and paintings. Gothic Architecture had been transplanted to Assisi in 1228, fully equipped from the north, by a German named Japoco. Many Churches and Cathedrals followed in the same style, but each in succession becoming more influenced by the spirit of the land, and these were the buildings enriched by an endless succession of famous Artists, each entering upon his own inheritance, till their walls were ablaze with beauty and power. Niccola Pisano, Cimabue, Arnolfa, and Giotto, were among the giants who built and embellished in Tuscan cities, and

MADE FLORENCE RENOWNED

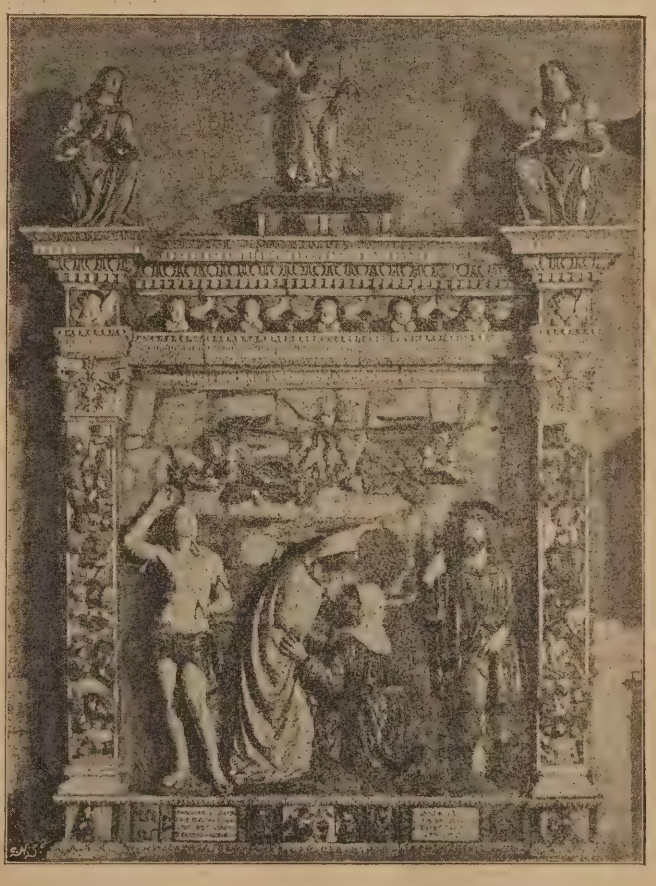
above all others in Italy, for love of and joy in the Arts. These men all knew each the other, and must have worked at times the one in the same building with the other. Dante, too, was of them, and, it is said, visited Giotto at Assisi, and saw his work there fresh and bright as it came from his hand; certain it is, that he got himself painted by Giotto on the walls of the Bargello in Florence, for there his portrait remains to this day. And in the Spanish Chapel of Santa Maria Novello, are painted by Simone Memmi, not only Cimabue, Petrarch, and Boccaccio, but his master Giotto also, and Arnolfa; and with Arnolfa his Cathedral, not as it is built, but as he had planned it to be. Madonna Laura, too, is there, and these all met and often talked together, and helped, doubtless, the one the other in their work, as do all true Artists of whatever time or country, willingly, and with gladness. Italian Sculpture before Niccola Pisano was not only nude but dead also. This man, however, was strong enough, not only to think, but to act for himself, only like others he had first to see, and sight came to him in certain Greek sarcophagi brought to Pisa by her commerce; and a diligent study of these opened for him a door into a new world. From labouring at the ornamental Sculpture of the Pisan Cathedral, he passed to his pulpit in the Baptistery, and eight years afterwards, when he was a man of sixty-three, he amplified his design in the pulpit of Siena Cathedral. As Niccola changed the spirit of Sculpture, so, too, Cimabue began to overstep the Archaic limitations imposed upon Painting. Greek influence was again, as with the Sculptor, the cause, and Vasari says, Cimabue "achieved little less than the resurrection of painting from the dead." His great picture of the Virgin, in the Church of Santa Maria Novello, was carried in solemn procession, and with much honour, through the streets of Florence, from the painter's house to the Church. Cimabue was a man quick and proud in disposition, and if a work failed to please him, he hesitated not to destroy it, no matter how valuable it might be; and from this surely we, too, may deign to learn. And now we come to Arnolfa, a man trained as a Sculptor and achieving renown as an Architect. In 1280, the Florentines resolved to build a great Church in honour of St. Mary: a Church which should surpass in grandeur everything previously erected. Arnolfa was chosen Architect, and by his labours therein, as well as in other buildings, Architecture made equal progress with the Art of Painting under Cimabue, by whom, indeed, Arnolfa had been instructed in the Art of Design, as he had also been in the Art of Sculpture by Niccola Pisano, the inaugurator of the revival of that Art. The Arts were now in the ascendency, men gloried and rejoiced in their creations, and between its various forms of expression there was no severance; for the men who painted, built also, and embellished their own designs with the work of the Sculptor's chisel.

GIOTTO FOLLOWED ARNOLFA,

and completed the quintette in this magnificent brotherhood of Art. He raised for him a stage higher than the walls of his Cathedral, and in the prodigality of his genius, planted by its side

HISTORY AND ART. RICCARDI PALACE, FLORENCE, BY MICHELOZZI, 1430.

FLORENCE. THE VECCHIO PALACE, BY ARNOLFO DE CAMBIO.



the fairest lily in all the fair city of Florence. Listen to Ruskin :—"The characteristics of power and beauty occur more or less in different buildings, some in one and some in another. But all together, and all in their highest possible relative degrees, they exist, so far as I know, only in one building in the world, the Campanile of Giotto." Giotto also enriched with his frescoes almost every Church in Florence, and in Santa Croce is to be found perhaps his most valued works ; but Rome, Naples, Assisi, Ravenna, Padua, Pisa, Lucca, and Milan, knew him also, and now share in the glory of his name. Within a period of nine years, and within 35 years of Giotto's death, had been born Brunelleschi, Ghiberti, and Donatello. Brunelleschi, who gave to Florence her blood-red heart, that dome so restful and so beautiful ; Ghiberti who made those Baptistery doors of which Michael Angelo said they were "worthy to be the gates of Paradise" ; Donatello, gentle and sweet of disposition, yet strong enough to bring back Sculpture to idealised realism, from the pictorial character Ghiberti was imparting to it. This great Triumvirate of Art, comprised men who in their early youth, the eldest just then twenty-four, had competed with others in most gracious spirit for those Baptistery gates, which Ghiberti won. And then all know the quaintly pathetic story of Brunelleschi's and Donatello's rival crucifixes, and how in the end Donatello generously said to the other, "to thee it is given to make the Christ, to me only the contadini." Brunelleschi's crucifix is now in the Church of Santa Maria Novello, and from looking at that crucifix, go to his great Pitti Palace, sublime too, but in simple mass and grandeur, and learn from it what can be done by the power of love. With these men, yet a little later, worked also Luca della Robbia, first trained, as were Brunelleschi and Ghiberti, in the art of the goldsmith. Craftsmen ever and always were these men, and being craftsmen they were

Also Great Artists.

From Fiesole, the Etruscan mother-town, subjugated long years before, came, in the divine revenge of love, Fra Angelico to paint, and Mino da Fiesole and other of her children to decorate, and make more beautiful if possible than before, this fairest of cities. Massaccio marks the advance of realism in Italian Art, and this not only in the figure but in drapery and landscape also ; and many succeeding Artists, Michael Angelo amongst them, studied, and studied most gratefully and carefully, his work in the Church of the Carmine. Massaccio gave promise of being one of the greatest masters of his age, but his early death, at twenty-seven, forbade its realization. The pictures of Botticelli, to my mind, are so full of dignity and rhythmic composition, that from them one can learn much of the spirit of Architecture. The grace, not less than the culture, which characterized all his work are doubtless his own, but the latter must have been much quickened by the noteworthy gatherings at the Palace of Lorenzo the Magnificent, wherein met all the men of the day, famous in Art, Literature, and Science ; and if you desire to learn in a delightful and popular manner who were his contemporaries, then read George Eliot's "Romola." Botticelli came strongly under the influence of Savonarola, and for some reason gave up altogether his Art, espousing instead the cause of the Reformer. Michael Angelo also came for a time under the same influence. and I think I have read somewhere that he destroyed many drawings in consequence. Of this great man, Architect, Sculptor, Painter, Poet, and much else besides, one cannot speak at length tonight ; but I think it is Vasari who has a most interesting paragraph in his book, and one which it may be good for us to consider and lay to heart. Writing of a time shortly before his death, and this was, of course, long years after Savonarola's martyrdom, we are told that "he burnt a large number of his designs, sketches and cartoons, that none might see the labours which he had endured and the trials to which he had subjected his spirit in his resolve not to fall short of perfection. If the world could judge of the Art of Michael Angelo only by the perfection of the Madonna della Fabbre, or by the Vault of the Sistine, it might not, perhaps, suspect how laborious were the means by which his works were accomplished. The series of studies for the Sacristy at San Lorenzo, show by what hazardous and successive degrees Michael Angelo elaborated his great designs. Well can the true Artist understand the jealous spirit which prompted Michael Angelo to destroy such studies, his painful essays towards some finished work and what appeared to him as the waste and marble-dust of his workshop, and it was just this waste that Michael Angelo, having ever that sense of some unattainable perfection present in his mind, sought to hide and put away." But time would fail me, and the richness of the names would overpower us, were I to tell you, even if I could, of the great princes of Art : of Alberti, Michelozzo, Bramante, of Filippo Lippi, Luca Signorelli, Ghirlandaio, Mantegna, the Bellini, Da Vinci, Raphael, Giorgione, Titian, and a whole firmament of others ; of how they laboured and attained to human perfection, in much pain, travail and disquiet, with periods of alternating exaltation and despair, as do all true Artists : despair, that is, of ever attaining to their own high ideal, and the higher, the less selfish, the more noble is that ideal, the better and the richer must ever be the work. Each individual man, while learning from others, must yet make his own Art ; and that, too, whether it be in continuance of tradition or severance therefrom, just as did these old Florentines, and as does always each true Artist, be he great or small. Accept this then, as the foundation of all good work, that a

Man's Art must be His Own,

and not another's, no matter how good that other's may be, else will his Art surely be, if not a dead, then at best to him but a dying Art. Giotto dared to break away from the accepted teaching of his day, in a simple and inoffensive manner ; and, in quietly going about his own work, and attending to his own business, he revolutionized all succeeding Art. Enthusiasm and energy are good, but quiet enthusiasm is best of all, and most potent, being without hurry or fear, because it is born of faith. Now, here is a thought, if it be worth having. The waves of the sea may cease from being still, they may rise and thunder in their might, but if you look down at them from a height, beneath which stretches a long bay you will find that not one of these waves ever hurries or breaks its solemn onward swelling roll, and yet they all reach the shore at their appointed time. I have refrained from confining myself exclusively to Architecture, for Architecture is not to be taught by me. Everyone must learn for himself, just as did Brunelleschi, who, from his continual digging about the ruins of ancient Rome, was called the "treasure seeker" ; so too by much patient and careful measuring and study of old buildings, nearly all the most able men of our own day have done, and are still doing ; and I would say, see and study such buildings by night as well as by day, and if perchance you wander through some dim aisle,

LAMPORECCHIO. ALTAR IN GLAZED COLOURS IN THE CHURCH OF ST. STEPHEN, BY DELLA ROBBIA.

or beneath the arches of a great choir, roofed or unroofed, it matters not, when the moonlight fills the whole and casts deep fantastic shadows, and streams in through traceried window and leaded glass, lighting up to life again some old tomb, and you see the spirit of the dead clay move, till

the place becomes peopled with the life of the past; then, too, from the wind sounds, and the quivering moonbeams playing in mystic fashion on ragged wall or pillar, arch, and pinnacle, then from these you will see and hear also of new forms and colours, and learn from sources you little thought of before, that "there are more things in heaven and earth than are dreamt of in our philosophy," and that Art is like the spirit, divinely born; blowing like the wind where it listeth, none knowing of its coming or going, its times or its seasons. It is from sources such as these, not visionary, but real, as real as the material elements, that I would urge you to go to learn of your Art, just as much as from Sculpture and Painting. These things are what I would call the correctives of our work, the things that lift us up a little beyond the level of our daily task; and I know of no better test than for a man to go straight from his drawing-board—although Architecture is not existent wholly there—to go straight to the picture of some early Italian master, and having been touched by its Art, to return again to his board, and see if he be satisfied with the work he has there done. Be careful above all else that your Art be a living Art, your own in truth, and not an archæological reproduction, however fine, of anything already achieved. Let "the dead past" in that sense "bury its dead." Seek to know and understand the life and the needs of your own day, the wants of your fellow men; and then, knowing these, and knowing also your Art, be not afraid to go forward though none else follow.

STRAY NOTES ON THE ARCHITECTURE OF NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

MENTION was made, towards the close of the last of this series of papers, of the transverse triapsidal plan exhibited by many Churches in the neighbourhood of the Lower Rhine, and also of the tenacity with which their Architects clung to the old national Romanesque types long after the Pointed styles had been perfected elsewhere. Both these interesting features are brought into curious juxtaposition in the Church of Gross St. Martin, at Cologne, whose tower—a sixteenth-century erection in the old Rhenish Romanesque style—rises from the crux formed by the apsidal transepts and eastern limb with a grandeur of effect perhaps unparalleled in this region of semicircular apses. The similarity borne by the Cologne Churches of St. Martin, the Apostles' and St. Maria in Capitolio, to those of Northern Italy, is too marked to be overlooked by the student of Architectural localisms. Italian Art first spread down the Rhine, and that the designer of these grand transverse triapsidal German buildings, with their clustering steeples, was greatly influenced by the Lombard Churches of Bergamo and Pavia is very evident, for, in many cases they present features absolutely identical with those North Italian examples, which, however, are less grandiose in dimension, and in general effect hardly so fine. There are several other features in connection with the Rhineland Churches to which I must draw the attention of my readers, before passing on to those in other parts of Germany. Many of these features are peculiarly local ones. The frequent use of the western apse, or, as the Germans call it, the western choir, is very noticeable. Four of the great typical Rhenish Churches present specimens of this Western apse, viz., Trèves, Laach, Mayence, and Worms. This, however, is not confined exclusively to the Rhine Provinces, for we find it—to mention only a few examples—in the transitional Church of Naumburg, in Saxony, and in the Bavarian ones of the Cathedral at Bamberg, and St. Sebald at Nuremberg. Another grand external feature of the Rhine Churches, and one to which passing allusion was made just now, is their cluster of steeples. The Abbey Church of Laach nobly exemplifies this. It is a

TYPICAL CHURCH OF THE RHINELAND,

and, although by no means hugely dimensioned, boasts no less than six, arranged thus: Flanking the short eastern limb, and in the angle formed by it and the transept, is a pair of slender square towers, terminating in low pyramidal coppings, while from the crux, in almost too close proximity, rises a low octagonal tower with a pyramidal capping of the same shape. Then, at the western end of the nave we have one of those lofty screen façades rising considerably above the roof line, flanked north and south by a circular turret, and surmounted, in the centre, by a square tower gabled on each side, and terminating in a low quadrilateral spire of a type the Germans were so fond of, and of which an interesting example occurs in Sompting Church, near Worthing. Similar spires crown the western towers which add such dignity to the Church of Andernach, as well as all those of St. Castor, at Coblentz. The Apostles' Church, at Cologne, has a noble group of steeples, which cause that building to approach nearer the North Italian models than any other, while splendid Architectural *ensembles* are presented by such clusters as those of Bonn, Mayence, Limburg, Gelnhausen, Worms, and Spires. It is worthy of note too, that the grandly dimensioned tower, central or otherwise is of much more frequent occurrence in this part of Germany than in any other. The western steeple of St. Quirinus, at Neuss, bears a striking similarity in its outline to that of our own Tewkesbury. St. Andrew, at Cologne, has an octagonal tower and spire, dwarfed, however, on its eastern side by the lofty Late Pointed choir. Gross St. Martin's, in the same city, has already been mentioned. Very pleasing are the solitary central steeples—both octagonal—of Sinzig and its neighbour, a little higher up the Ahr Valley, at Heimersheim. The former is only a very moderately sized parish Church, but the care bestowed by the Architect upon its proportions has invested it, especially when viewed from the east, with an almost minster-like dignity. It is at Sinzig that we see, on a remarkably grandiose scale, one of those peculiarly Rhenish internal features, the Männerchor, or, as it is there termed, the Mannhaus. In some degree these Männerchöre correspond to our triforia, and to the French tribunes.

IN ENGLISH AND FRENCH WORK

their existence is almost invariably concealed on the outside by a lean-to roof, though there are examples to the contrary, as in our three great Romanesque naves of Norwich, Ely, and Peterboro', whose triforia are lighted by large perpendicular windows, thus giving a double tier to the aisles viewed externally, while at Laon, where we find one of the most grandly developed triforia in Northern Europe, the same mode of fenestration, retaining, however, its original First Pointed character, prevails. In Germany, these Männerchöre play a very important part in the seating of the congregation,* and, as their name implies, are apportioned to the men. In most cases a flight of steps in the side aisle wall conducts to these galleries, which in one instance—viz., at Limburg Cathedral—extend completely round that Cruciform Church. It is, however, a remarkable fact that the Männerchor only exists in the Rhineland Churches built after the old German method early in the thirteenth century. We first encounter this gallery in St. Quirinus', at Neuss, where great importance is given to it by the slender nook shafts of black marble sustaining the pointed arcades opening from the nave. This part of the Church is invariably vaulted, and all the workmanship quite as carefully finished as in the other parts.† The Liebfrau-Kirche, in Coblentz, presents us with another very grandly developed example of these spacious galleries. None of the great Cologne Romanesque Churches have the Männerchor, the main portions of their fabrics, which escaped the conflagrations of the end of the twelfth century, having been completed before the feature in question had been so grandly developed. One Church in Cologne, only, has the Romanesque Männerchor, *i.e.*, the Anlys Kirche of St. Maternus, a rather small one, lying in a network of streets between the river and St. Maria in Capitolio. It turns up very unexpectedly though in another but little visited Church in the city,

ST. COLUMBA OF SENS,

an altogether strikingly picturesque building inside. It is, in the main, a Late Pointed Church, which has grown up around a Romanesque steeple and nave, and the Männerchor is found in the outermost of the two southern aisles, where it is formed over a vaulted gallery, dividing the arcade at half its height.* The arrangement of the chancel of this Church of St Columba, at Cologne, is highly picturesque, the altar being placed beneath an Italian Renaissance baldachino of black and white marble, with the choir stalls, etc., ranged behind it in the apse. No student of German ecclesiology should emit visiting either this Church, or those of St. Alban (hard by), St. George, and St. John Baptist. By the general run of visitors to Cologne they are neglected. The presence of the Männerchor necessitated, as I have just now mentioned, the introduction of another tier of windows above those lighting the aisles. Consequently the aisles, viewed externally, have a much too lofty appearance for true picturesqueness of grouping, as is too evident in the short naves of the cruciform Churches at Neuss, Sinzig, and Bacharach. Andernach and Boppart being transeptless, this disagreeably stilted appearance is considerably mitigated by the unbroken length of those two Churches, though even here the clerestory wall appears somewhat disproportionately low to that of the aisles. The fenestration of some of the Rhineland Churches is too curious to be passed over without comment. Although their designers persevered in Romanesque traditions, it is very clear that they were desirous of adopting a form of window that should admit a greater flood of light than those of that style. Tracery had, to a certain extent, been adopted in the buildings of France and the Netherlands at the end of the twelfth and beginning of the thirteenth centuries, and this idea the Rhineland Architects sought to carry out by the introduction, as in the nave aisles of St. Cunibert at Cologne, the Minster at Bonn, and the Liebfrau-Kirche at Coblentz, and in the clerestory of Sinzig, of foiled circles and semicircles. Of these the huge foiled circles in the nave of St. Cunibert's are the most pleasing of their class. Less so are the half-circles. But most ungainly are the elongated three-quarter ones employed in the Sion-Kirche at Cologne and in the clerestory at Boppart; they are much more objectionable than either the elongated quatrefoils with which the drum of the octagonal dome at Neuss is pierced, or than those fantastic keyhole-shaped windows which we encounter in the side aisles and Männerchor of the same Church, in the nave of the Minster at Gladbach, and in the transepts of Sinzig.

* It may not be out of place to remark that in such Catholic towns of Northern Germany as Neuss, Cologne, Münster, Paderborn, Limburg, and Coblentz, the Churches on Sunday morning are so crowded that it is impossible to effect an entrance at certain services. On such occasions these Männerchöre, filled with occupants, have a most imposing appearance. In England and France, the triforia are seldom, if ever, used for congregational purposes.

† At Bacharach, between Coblentz and Mayence, the wall dividing the aisle from the steps to the Männerchor is pierced by a most elegant triple arcade. The arches are round-headed ones, much stilted, and spring from slender pillars with boldly foliaged caps, more like French work than German.

* The use of the Männerchor was very curiously revived during the early part of the seventeenth century, in the great Jesuit Churches of the Assumption of Cologne, and of St. Ignatius, at Paderborn, where a balconied gallery cuts off the lofty arcades of those structures at about half their height.

(*To be continued.*)

WE understand that Mr. J. Hatchard-Smith acted as Architect for Messrs. Lyons in the erection of the Trocadero Restaurant, Mr. Ancell being the joint Architect.

LORD CARYSFOOT has offered to build a Protestant Church at Arklow, and to furnish the same with all requisites, including organ, the whole to cost not less than £25,000.

THE Local Government Board has sanctioned the borrowing of £17,000 for the Hebden Bridge main drain and sewerage scheme, with disposal works at Redacre Holme, Mytholmroyd, providing that the system of sewage purification chosen is a satisfactory one.

A SURVEY has been ordered with a view to carrying on an extensive enlargement of the Folkestone Harbour, and a loan of £450,000 required for the work has already been guaranteed. One part of the plan is stated to be an extension of the present mail packet pier.

TO improve the school accommodation of Pudsey, the Pudsey School Board has decided to erect a large central school to serve for the Littlemoor district and to relieve Richardshaw Lane and Greenside Schools.

Bricks and Mortar.

Talbot House, Arundel Street,
October 28th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—John Ruskin.

One interesting fact about the foundation of William Morris's furniture company has escaped record, and that is, that Dante Rossetti asked Mr. George Allen, the now well-known publisher, to join him and Morris, and work in their company. Rossetti was then helping Ruskin teach the Art Class at the Working Men's College. George Allen was one of the best pupils in the class; he was then (to quote Mr. Ruskin). "an entirely honest and perfect working joiner." Ruskin, Rossetti, the College Executive, and Allen's uncle, all knew him as a man of high character, with good eyes and brains, and cheery ways. And just at the same time came to him offers from the four sources: Ruskin asked Allen to come and work for him: Rossetti asked Allen to join Morris and him, and carpenter and do joinery for them; the College asked him to take the Hon. Wm. Cowper's offer of an inspectorship of furniture under the Board of Works; and Allen's uncle offered him a share in his carpenter's and joiner's business. Of the four offers Allen liked the last least and the first best. He went to work with Ruskin, and gradually became his publisher.

At a time when all over the country recollections of Trafalgar are being revived, it may be interesting to recall the history of Trafalgar Square, and its column. On a portion of what is now Trafalgar Square once stood the Royal Mews, while the remainder of the space was covered by a ramification of unsavoury streets and alleys styled the Burmudas, frequented by those "Town Pirates" mentioned more than once by "rare Ben Jonson." It was not till nearly a quarter of a century after Nelson's victory that the Square, whose name it was to commemorate it, was commenced, while twelve years more elapsed before Londoners saw it completed, as it is to-day, in 1841. But though this year saw the Square complete, the column remained unfinished till 1849. The statue of Nelson, designed by E. H. Baily, R.A., and ironically described as the "beau-ideal of a Greenwich pensioner," was hoisted to its lofty position on November 4th, 1843. It is, though one would hardly imagine it, full 18 ft. in height, and is formed from two stones from the Granton quarry. Those bas-reliefs at the base of the column seldom examined, we think, represent the Death of Nelson, the Battle of the Nile, the Bombardment of Copenhagen, and the Battle of St. Vincent, and they were the work of four well-known sculptors—Carew, Woodington, Ternouth, and Watson. As for Landseer's magnificent lions, which give so grand a finish to the work, they, though long talked of, only put in a tardy appearance in 1867. It must always be a matter of regret to the Londoner of to-day that the grand designs for Trafalgar Square, prepared by Sir Charles Barry, were rejected, for reasons familiar to many an Architect eager to improve the metropolis—their costliness, to wit. But, alas, the richest country in the world has always proved a niggard in such matters. What was the cost of the Square as it now exists we cannot say, but the granite work is stated to have cost a round £10,000, while the total expense of that column, which to-day receives the tributes of an awakened public, was £46,000.

The latest addition to the National Gallery is a symbolical representation of the Crucifixion by Giovanni Mansueti, a scholar and imitator of Gentile Bellini. Visitors to Venice will remember large pictures by Mansueti in the Academy, which are chiefly remarkable for their illustrations of costume and Architecture. The Architectural setting of the Crucifixion, now in the Octagon Room at the National Gallery, is quaint and interesting. The mention of Mansueti reminds us of Carpaccio, and leads us to refer to the admirable rearrangement and redecoration which have recently been carried out at the Academy at Venice. When Mr. Ruskin "discovered" Carpaccio, now some twenty years ago, and wrote up the famous St. Ursula series in the Academy, many of these pictures were very badly hung. They have now been collected into a separate room, which has been decorated in a very pleasing manner, and so arranged as to exhibit the series in proper order and "on the line."

In Liverpool, according to the statement of the Chairman of the Health Committee, during the past year five miles of streets had been imperviously paved, which made a total of 122 miles, or nearly 2,000,000 square yards, of impervious pavements. As many as 27,600 yards of flagging had been laid, including passages, and 76,000 lineal yards of pavement of various descriptions had been reinstated after disturbance by gas, water, electricity, and sewerage operations. Considerable repairs and renewals of the tramway lines had been executed. The length of roads and streets now in the city was 415 miles, as against 277 miles before incorporation. Five and a half miles of sewers had been constructed or reconstructed by the department, as against 2½ miles last year, and 3½ miles constructed by builders had been supervised. Nine and three-quarter miles had been thoroughly cleansed prior to repairs, 243½ miles of main sewers had been flushed four times during the year, and all the private drains twice, as usual. Five miles of sewers had been ventilated, as against half-a-mile last year, and 383 gullies had been constructed. In connection with the private drainage of houses, &c., the department had attended to no less than 17,000 cases, as against 12,000 last year. The total length of the sewers now in the city was 668 miles, as against 557 miles last year. Considerable works had been carried out at the sewage farms, which were now working satisfactorily. All this should speak well for the sanitary state of the city.

HULME GRAMMAR SCHOOLS, OLDHAM. J. W. FIRTH, ARCHITECT.

Alphonse Daudet has returned to Paris in fully-restored health. According to an interview published in Gil Blas, he intends to devote all his time to furthering the wishes of his late friend, M. Edmond de Goncourt, in founding the literary academy which is to bear his name. Daudet denies emphatically the rumours which have been recently circulated as to there being any hitch in carrying out the scheme. "The two Concourts between them," says M. Daudet, "enjoyed an annual private income of £480. It was the dream of their lives to found an institute which would render as many writers as circumstances would permit independent for life." According to the inventories the eighteenth-century collection is found to be a remarkably good one, and M. Daudet proposes calling shortly a meeting of experts to go into the other collections. The house, he fears, will come under the hammer along with the collections unless a syndicate can be found to buy it and devote it to the purpose of the deceased. In conclusion M. Daudet announces his intention of proposing M. Céard, the well-known author, to fill one of the two vacancies left, and regrets his inability to bring about a reconciliation between the pair before the great master died.

SCULPTURED portraits of modern statesmen and politicians have been recently introduced into Ecclesiastical Architecture. An example of this novelty may be seen in St. Giles's Church, Camberwell. Instead of the conventional Gothic grotesque heads and figures, the Ssculptor has utilised Lord Salisbury, Mr. Gladstone, and others whose names and reputation belong to the present generation. The present Prime Minister is not treated so kindly as Mr. Gladstone, for he is displayed with the ears and legs of a dog, whilst the latter bears wings. Close by Mr. Gladstone appears the late Mr. Bradlaugh, with a pair of horns on his head and a hump on his back. John Bright and Lord Randolph Churchill also figure, the latter with wings but with his mouth open, probably to indicate the power of his speech.

AT the Middlesbrough Trades and Art Exhibition, last week, many thousands of people visited and inspected the novelties. But perhaps the most notable exhibit is that of, in the crypt, a collection of fretwork models, exhibited by Mr. Old, which includes cabinets, a clock, an altar, a model of St. Paul's Cathedral, card trays, baskets, and attracts a good deal of notice. Standing out preeminently above all other models, however, is a finely executed model of Milan Cathedral. About 8,000 hours have been occupied in completing this piece of work, and between 5 000 and 6,000 pieces of wood have had to be prepared, cut, and fixed. The stained glass window, which is the largest in the world, occupied eight hours in cutting, as it required much delicacy in handling. Several of the pieces are so small that they had to be placed into position and held there on the point of a needle. The whole structure is held together with glue. The inside parts are composed of sycamore, the walls almost entirely of white chestnut, and the outer trimming of white holly. From the roof of the church there are 16 flights of stairs containing several hundred steps. The scale is almost 1 in 100, and the measurement at the base is 5ft. 2in. by 3ft. 4in., the height being 3ft. A clock which stands in the corner of the case is made of one kind of wood, and contains 400 pieces. Its height is 4ft. Mr. Old works with a machine of his own construction, into which he has introduced a pair of automatic bellows to blow away the dust which is caused while working. The machine, which was constructed ten years ago, he has improved in various ways. Owing to the proficiency now attained in this work, Mr. Old is enable to turn out the finest and most intricate work without the use of a file. A model of St. Paul's contains 400 pieces of wood, of which there are four kinds—chesnut, mahogany, walnut, and orange woods. The scale is 1 in 200.

SPEAKING at the annual meeting of the Leicester Technical Schools, Mr. W. Woodall, M.P., late Financial Secretary to the War Office, who has recently returned from a visit to Würtemberg and Bavaria, said there was hardly a great centre in any German State where the passion for higher education did not show growth of enterprise as surprising as were the evidences of what was being done when he and his fellow Commissioners visited the country in 1883. Würtemburg was until the other day given up to agriculture and forestry. It had long enjoyed a splendid school system. He and his friends visited Stuttgart, the capital of Würtemberg, and Nuremberg, long famous as the chief manufacturing city of Bavaria. Rapidly as they had lately grown, neither was more largely populated than Leicester, but it was difficult to say in which of these two centres the public provision for education was on the more generous scale. At Stuttgart, in 1884, the Polytechnic was enlarged at a cost of £75,000, and included departments for chemistry, physics, and agriculture. Since then, however, in deference to the urgent demand, imposing buildings had been erected for separate instruction in electricity, chemistry, and for building. Each of these cost about £50,000 for erection, and as much for equipment. The Industrial Museum, recently erected at a cost of £200,000, was a noble edifice, completed and furnished admirably.

THE Royal Society of Antiquaries of Ireland recently made excursions to Lucan and Leixlip, including the Parish Church of Chapelizod, where a number of rare objects of antiquarian interest were exhibited in the church porch, and the old silver plate was seen. Chapelizod was one of the manors which, at the Norman settlement, was reserved to the Crown. It continued to the 14th century part of the Royal demesne. It was then alienated, and became the property of the Delafeld, and afterwards of the White family. In the 17th century the Crown had again become possessed of a house here. Dalton says that it was situated to the left of the road entering the village from Dublin on a meadow sloping to the river It had, in his time, been pulled down, but a turret near the river indicated the position of the gardens. It was locally known as "The King's House," from having been used by William III. During the commonwealth it was occupied by Colonel Jomes. It is sketched on the Down survey as an Elizabethan mansion. It fell into decay in the last century, and was afterwards sold by the Crown. The site is now occupied by a modern house, though still called on the Ordnance Survey Map "The King's House." The turret or small towerlike building (roofed) is still to be seen at the river's bank, though a local tradition calls this the Leper-house. During the last century a considerable part of this manor was purchased to extend the Phœnix Park. Lucan, at the Norman Settlement, fell to Alard Fitzwilliam, who soon after conveyed his possessions to a Hampshire gentleman named Werris de Peche. Werris settled here, married the daughter of his neighbour, the Lord of Leixlip, built a castle, and propitiated the church by erecting a priory on the part of his land nearest to Leixlip. Before the end of the 13th century, the manor had passed to the family of De Hanstead. The town, at that time, consisted of two or three dozen of houses, with a mill and a manor court.

A REPORT has been presented to the Common Council, recommending the rebuilding of the Sessions House in the Old Bailey on its present site, at an estimated cost of £120,000. The report and plans will be ready for circulation in a few days. Some years ago the Home Office was approached with a view to the appropriation of a site for the new building on the Thames Embankment. The scheme, however, fell through, and, in the meantime, the Guildhall School of Music and the City of London School for Girls have been erected in close proximity to the spot then suggested for the New Sessions House, rendering the removal for sessions business there undesirable. The Old Bailey is by no means without its drawbacks as a site, but many of its present disadvantages might be mitigated by suitable plans. How far this has been done we shall be in a position to judge when the plans and report are ready.

LITTLE is now heard of Daguerre, the celebrated Frenchman who brought to perfection the photographic discoveries of his fellow-countryman, Niepce. The municipal councillors of the little town of Bry-sur-Marne, where Daguerre expired, in 1851, are not satisfied with the monument erected to him in his native town of Cormeilles-en-Paris, in the Seine-et-Oise, and intend to place a monument close to the house wherein the famous chemist and artist died. The plan has received Government sanction, and the monument, consisting of a marble column surmounted by a bronze bust of Daguerre, will soon be unveiled. Strictly speaking, Daguerre's house does not exist now in its original state, for it was sadly damaged by the Prussian bombardment in 1870, and the high tower wherein he made his experiments was completely destroyed. Since then the place has been utilised as a convent of the Sisters of Sainte Clotilde, who enlarged the little that remained of the old building and re-embellished the grounds which had been ploughed by shells and shrapnel. Daguerre who was by no means rich, led a very simple life in the town. He painted a picture for the parish church, and when not engaged in his own work was occupied in organising local charities and in fulfilling his duties as a municipal councillor.

ONE of the most interesting memorials of Molière, to whom the Church refused burial, is hidden away in the garden of a Dominican convent in Paris. It is a classical temple in the taste of the last century, and was built by the Duc de Praslin, the pre-Revolutionary Foreign Minister. Little is left of the original structure save an elegant but decaying peristyle, with an entablature bearing the words :—"*Ici fut la Maison de Molière.*" Scarcely 50 yards away, in the Rue Théophile-Gautier, another house has an inscription stating that it was the suburban abode of the dramatist about 1667.

WITHIN the last few years a large sum of money has been spent in Brighton to keep pace with modern needs and requirements. £73,000 was laid out in the formation of Preston Park. Another improvement has been the widening of the King's Road, including the erection of a large free shelter, with lavatories and other arrangements for persons of both sexes. In the Madeira Road, a public shelter hall and a lift leading from the Madeira Road to the Marine Parade, has been erected. This terrace is now in course of extension. A public swimming bath has been built, and a free public lending library has been formed. A technical institute has been built, at a cost of £16 000 or thereabouts, which will be shortly completed. The town also boasts a refuse destructor, and a public abattoir containing both public and private slaughter-houses. Additional outfalls have been provided to come into operation in the event of a heavy fall of rain. A site has been secured for the formation of an additional waterworks pumping station. Works have been built for the supply of electricity, the capital expenditure of which at present amounts to £140,000. Already the King's Road, the Marine Parade, and other important roads are lighted by means of incandescent electric lamps. A new street, consisting of artizans' dwellings, has been constructed, and is named Ewart Street, in memory of a late Mayor, Sir Joseph Ewart. Old dilapidated dwellings have been pulled down and new streets erected, with improved dwellings for the working classes.

AN unconscious humour is often noticeable in the reports of public bodies. An instance occurred in a recent agenda paper of the London County Council. A messenger in the Architect's Department has reached the age of 65, and under ordinary circumstances would consequently be placed upon the retired list. His conduct, however, "has been exemplary, and his knowledge of places and persons and the matters which at any moment may be required of him is such that inconvenience would certainly be caused by his leaving." His retirement is, therefore, postponed on the ground that it it took place it "would cause inconvenience to the public service." It is amusing to learn that the efficient discharge of the Council's duties is dependent upon the retention on the staff of so humble a worker as a messenger. The very least the Council should do is to grant so valuable a public officer a substantial addition to his salary.

THE question of establishing a gigantic waterway from India to St. Petersburg is once more suggested. From the confines of Afghanistan this route would pass by the Amou Darya and across the Caspian Sea to reach, by way of the Volga and the Marie river system, our capital and the Baltic. The whole project depends on the possibility of directing anew the water of the Amou Darya into their ancient bed leading to the Caspian Sea. Immediately after the occupation of Kranovodsk, in 1869, and the capture of Khiva, in 1873, a number of expeditions were sent into the Turcoman steppes to examine the ancient beds of the Amou Darya. The principal of these was that which carried on its labours from 1879 to 1884. After five years of unceasing labour the expedition reported in favour of the restoration of the ancient bed of the majestic Amou Darya, which would restore their ancient fertility to the oases of the country, and, by re-establishing the irrigation of the Turcoman steppes, would procure for the whole region abundant crops.

THE oldest Persian inscriptions are those found in large numbers at Murghale, deep down in a valley near the ancient Persepolis, and near to the much-frequented caravan road to Yezd. These inscriptions are nearly all of the period of Cyrus, are almost the only inscriptions of any note belonging to this King. They are for the most part historical, and nearly always contain a long invocation to the god Ormuzd. This deity appears to have been the sun-god, and the only god known to the ancient Persians, who were practically monotheists. Mr. Loftus discovered a large number of inscriptions belonging to Artaxerxes II. in the ruins of the royal palace at Susa, where he also found a large hall supported by columns.

These, however, were not so good as those which had been previously discovered at Persepolis. The most important and by far the largest Persian inscription known, is the one inscribed on the Behistun rock. This inscription was to the cuneiform method of writing what the Rosetta stone was to the hieroglyphs of ancient Egypt. It was the key which was to unlock the casket containing the mystery of the Babylonian and Assyrian inscriptions. This inscription was inscribed by order of Darius Hystaspes, and gives an account of the various wars in which the King was engaged. There appears to have been a general revolt of all the Persian tributary provinces about this time, which was mainly in the hands of eight conspirators, who made themselves especially troublesome by usurping the thrones of the different affected States.

THE Lancet states that the ventilation of Churches in which the worshippers are packed with an irreducible minimum of floor space, which no excess of height can compensate, is notoriously defective, and, indeed, is worse in proportion to the thoroughness of the heating, since the higher the temperature within the building the more carefully are cold draughts excluded, and were congregations generally composed of the class of persons who throng the police and county courts, the state of the atmosphere at the close of the service would be well-nigh intolerably offensive. We, therefore, have read with interest the description of a new departure in the system of combined warming and ventilation introduced by Professor H. Fischer, in the new memorial Church at Berlin, which in its general plan resembles St. Paul's Cathedral in London, though of smaller dimensions, the height of the nave and transepts being 82 ft. and of the dome 237 ft., the corresponding measurements in St. Paul's being 100 ft. and 360 ft., respectively. To the height of 80 ft. from the floor the walls are traversed by hot-air chambers, so that from the ground to the galleries 22 ft. above, there is no perceptible difference of temperature, the air being kept constantly at 15 deg. C. (60 deg. F.). The aim of the engineer has been the removal from the space occupied by the congregation of the paths followed by the currents of air conveying the warmth from the sources of heat to the radiating surfaces by placing the heating apparatus high up in the neighbourhood of the cooling surfaces, maintaining, in reversal of the usual procedure, a higher temperature in the upper portion of the building and intercepting and re-heating the cooled air in its descent towards the lower part occupied by the congregation. There are, thus, four strata of air of different temperatures. On the ground floor and in the galleries there are very few coils, but along the first entablature, at a height of 95 ft., they are sufficiently numerous to counteract the loss of heat through the walls, which are there no longer traversed by hot-air channels, and to maintain from this level to that of the second entablature, at a height of 145 ft., or 50 ft. above the first, a temperature a few degrees Centigrade higher than that in the parts below. Other coils are fixed above the second entablature and in the lantern of the dome. To avoid the dangerously chilling draughts that would follow the opening of the doors in the intense cold of a Prussian winter the entrances are provided with double swing doors and coils placed in the intervening passage. Professor Fischer maintains that the system of heating the upper more than the lower regions of the air is the only proper course in such lofty buildings as churches, for whereas with the ordinary method the air heated on or below the ground level is cooled on reaching the roof and fouled by the products of respiration, descends again on to the heads of the congregation unless withdrawn by some such exhausting arrangements as is carried out in our Houses of Parliament, in his system the fresh air is warmed to an agreeable temperature in its passage through the channels in the walls, and its ascent is favoured by the coils between the first and second entablatures, those in the dome, although they do not contribute to the warming of the parts occupied by the worshippers, serve effectually to prevent the descent of the foul air by securing its continued ascent towards, and escape through, the apertures in the lantern that crowns the edifice.

EXPERTS in book illustration will be interested in a volume which Mr. Walter Crane has been preparing for a long time for the Ex-Libris Series. His book, which may be expected about the middle of November, is entitled "Decorative Illustration of Books, Old and New." The illustrations are very numerous, and include about forty reproduced from the unique collection of early printed books which belonged to Mr. William Morris, as well as a large number of designs by modern artists.

BY petitioning the trustees to provide them with a room in which their productions may be shown and offered for sale, the copyists at the National Gallery are endeavouring to find a remedy for the bad times which have befallen them. They hint that if a portion of the Gallery is allowed to be used as a shop for the sale of mechanical reproductions by a foreign firm, English Artists who try to make their livelihood out of a similar means should at least be equally favoured. There is everything to be said in favour of such an argument, but the copyists must on their side be prepared to execute as faithful transcripts of the originals in colours as the photographers do in monochrome. Any one who visits the Gallery on students' days will find that this is usually very far from being the case.

RIPON'S New Sewage Disposal Works were opened last week by the Marquis of Ripon. These works have been constructed on Fisher Green, a mile east of the city, at the confluence of the rivers Ure and Skell, with a view to the purification of the sewage before it is discharged into the river Ure. The scheme now completed covers 30 acres of land, only 12 acres of which have at present been laid out for sewage treatment. The sewage has been diverted from the rivers Skell and Ure, by laying intercepting sewers. The land is laid out in level plots, with carriers and distributing channels. The sub-soil drains for carrying off the clarified water are laid at a depth of six feet below the surface, and the sub-soil of gravel and sand is very suitable for that purpose. The population provided for when the whole area is laid out is 10,000 persons, and the capacity of the works can be increased by putting down tanks for chemical treatment. The scheme was sanctioned by the Local Government Board, after an inquiry in 1894, and borrowing powers to the extent of £19,000 were granted. The expenditure upon the scheme so far, including portions completed or in progress, has been about £8,300, and a further amount of about £4,000 has been paid for land and incidental expenses, making the total outlay up to the present time £12,300. About £7,000 of this expenditure has been intrusted to Messrs. A. Braithwaite and Co., contractors, Leeds, and they have completed the work within six months of the specified time of completion.

WRITING to his friend Sir Charles Gavan Duffy, in the early years of the Australian gold discoveries, Thomas Carlyle expressed a characteristic doubt whether, if enough gold was produced to build a bridge from Australia to England, the world would be any the better for it. This dictum of the Chelsea sage is worth recording at the present time, when Western Australia is regarded by nearly everybody in no other light than that of an actual and potential gold-producing colony. Judging, however, from the large crop of mines and the small quantity of gold it has so far produced, this view may have to be seriously, and to the investor painfully, modified. As a matter of fact, to the millions who have to use the streets of London, Western Australia is of far more immediate importance and utility as the place where the jarrah timber grows, than as an auriferous region. Jarrah is the strongest and most durable timber in existence, and is being largely employed by the local authorities of London and other large towns for wood-paving purposes.

THE marked increase in the number of people who have visited the National Portrait collection since it has been housed in its new quarters would suggest that public interest has at last been awakened to the value of the Gallery. Beyond doubt, a good deal of this interest is to be ascribed to the fact that our national portraits have for the first time been given a setting which implies that they have some importance in official eyes. While these pictures were treated as so much lumber, worthy of house-room only in some shed or other, popular appreciation was hardly to be expected. Only a few enthusiastic experts would be likely to make a pilgrimage to a loft at South Kensington or to a branch museum in the East End of London; the general public certainly could not be expected to go on voyages of discovery in search of treasures which official stupidity had decided to hide away as unworthy of attention. The moral of the whole affair is that any collection of Art objects must, if it is to be properly appreciated, be given a surrounding that will assort reasonably with its value and importance. It is, however, not much to our credit as a nation that for this setting of the portrait collection we should be beholden to the generosity of a private individual. Had not Mr. Alexander come forward to provide the new building in Charing Cross Road the National Portrait Gallery would have still been in exile at Bethnal Green, where, certainly, it could not be said to serve any conspicuously useful local purpose. Our parsimony in Art matters has this ridiculous result, that we actually dissuade people from educating themselves by withholding from them the material that they want to study. Exactly the same absurdity is being perpetrated at the South Kensington Museum, where, for lack of space, collections of the greatest possible value remain unavailable for educational purposes.

M. MARTEL, who has exhausted most of the cave districts in Europe, is now investigating the Balearic Isles, and on Majorca he has been turning his attention to the Manacor Grotto, and has discovered a new gallery more than half a mile long and containing a lake about 200 yards in length, and between forty and fifty feet deep. The roof above is sustained by five stalagmite colonnades. M. Martel describes Manacor as marvelous, and places it in line with Adelsberg.

THREE ancient cities, Homolobi, Cleylon, and Chaves, in New Mexico and Arizona, have during the last twelve months been successfully explored by Dr. J. Walter Fewkes. Dr. Fewkes reports that in the course of the explorations he made he brought to light no fewer than fifty boxes of pottery and other relics of great importance. The collection is remarkably rich, not only in the number of the pieces, but in the high grade of the ware and the elaborate symbolic decoration painted on most of the vessels.

BY a study of the specimens of Negro Art from the West Coast of Africa in the Museum of the Trocadero, Paris, M. Felix Regnault has come to the conclusion that, in order to judge of the artistic culture of a people or a race, one should first study all their works, and not a few specimens, as is frequently done. Negro Art in copper, ivory, and wood is sometimes far above the rudeness which, by most Europeans, is supposed to characterize it.

AMONG the most recent additions to the Egyptian collection at the British Museum is a curious alabaster jar, with an inscription of Queen Amenartas praying that the gods Khnum and Basht may protect her body from her enemies. Queen Amenartas was an Ethiopian, and belonged to the same dynasty as Pharaohs Necho and Tirhaka. This dynasty appears to have reigned principally in Lower Egypt, where they made Thebes their royal city, about B.C. 500. We have also to notice three other objects of interest. A very fine red sandstone portrait statue of a scribe holding a shrine of Osiris. The scribe is represented with the usual Egyptian wig and false beard, and has a line of well cut hieroglyphs down the back. There is also a broken statue of another scribe holding a roll of papyrus. This figure is also inscribed, but the hieroglyphs are very faint. These two objects are of the period of the 18th dynasty, about B.C. 1500.

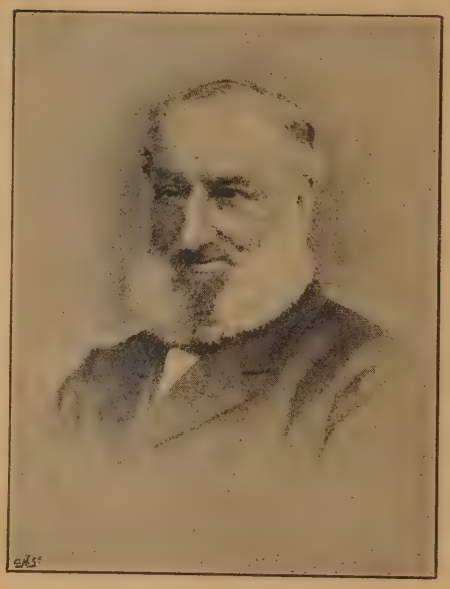
NEW buildings for the Royal Masonic Institution for Boys are proposed at Bushey, and at the recent Quarterly Court of the Governors and Subscribers, the Chairman of the Board of Management laid before the meeting a decision come to by the Board for purchasing some 68 acres of land at Bushey, Hertfordshire, for £13,000, on which to build a larger and more commodious school than the existing establishment at Wood Green, and stated that £650 had been paid by way of deposit.

ECCLESIASTICAL CARVING.

A VISIT TO MESSRS. JONES AND WILLIS, OF BIRMINGHAM.

WHILE the Arts and Crafts Exhibition at the New Gallery is attracting attention to work accomplished, it must not be overlooked that the work shops of several of the leading firms in London and the Provinces are in themselves highly interesting. It is almost a truism in Art that a thing in process—especially if it be within the range of Craft and Design—is capable of producing as keen an interest and as lively a suggestiveness as the thing completed. Especially is this the case in Carving, where an idea may be embodied in wood or stone under the Craftsman's own eye and hand. More particularly in Ecclesiastic work of this kind Art has had its chance during the last decade, and in this Renaissance such firms as those of Messrs. Jones and Willis have undoubtedly succeeded in re-habilitating what threatened to be almost as lost an Art as stained glass; an Art which, moreover, is much more domestic and comprehensive in its appeal: we refer to Carving in wood and stone, and restrained and dignified metal work. For some considerable years, Architects have been combating the difficulty of obtaining work of this kind, which shall be at once Architectural and correct in Design, and Ecclesiology for long remained without the pale of the ordinary professional practice. Men like Street and Paley set their faces in the right direction, but few followed.

Nor is this to be wondered at when we consider the low and debased level to which most interior Architectural work had fallen twenty to thirty years ago. The effect of many of our finest Churches has been utterly marred by fittings of an utterly unsuited character, and to the more educated taste of the present day the great majority of our immediate ancestors must be condemned as entirely lacking in appreciation of true Design, while the hideous outlines, the weak mouldings, the flatness and deadness of the Carving, and the coarseness of the tracery, demonstrate, surely, how far the most elementary principles of Design were disregarded. No doubt the great factor in this decadence was the apathy of Architects themselves, for few of these carried their services so far as to Design the interior fittings of their Churches. When the structure was roofed their interest in their handiwork ceased, and the fitting was left—save the mark!—in the hands of the local builder, who possessed the regulation facilities in the way of machine mouldings and stock tracery panels. Even *dilletante* knowledge of the same class of work in the present day gives one the assurance that the old machine method is fast dying out, and that now it is the exception if the Church Architect fail to carry his superintendence right through, even to the smallest detail.



The firm of Jones and Willis has had an honourable share in this revival. Founded by Mr. Blankley Perrins Willis, in 1844, and now carried on by his three sons, the firm has its principal offices and works in Birmingham, which are under the immediate superintendence of the senior member, Mr. William Edward Willis, assisted by his son, Mr. W. P. Willis.

A glimpse round the works demonstrates the experience of the firm in matters relating to Church work. There are, also, the large works at Hornsey, and the show rooms at Great Russell Street, London, and each of these is under the personal supervision of one of the firm.

The skilled Craftsmen to be seen in the "shops" at Birmingham, work from details supplied by the Architect; the Carving, one finds, is vigorous and free, yet at the same time it is never allowed to over power the Archi-

THE JOINERS' SHOP.

tectural line; the mouldings are spirited and frank, in contrast to the machine productions turned out, per the thousand feet.

It is acknowledged that Messrs. Jones & Willis have long recognised the great benefit accruing from a close connection between the Designer and the Workman. Their works are open at all times to Architects or others, for whom they are executing commissions, so that any work in progress may be examined, or suggestions or alterations made.

A representative recently made a tour of these works, and found much interesting work in process: thoroughly well seasoned stacks of Oak, Walnut, and other woods, suitable for the delicate Carving employed in Ecclesiastical work, surround you in the yard. On the ground-floor you see the machinery used for doing the rough and laborious part of the work, shaping the various sections until they can be passed on to the skilled workman. Above this floor is the joiner's shop, recently enlarged to twice its original size. You may here see all kinds of work in process. Pulpits, Stalls, Screens, the sections fitted and adjusted with precision. From this shop you reach the Carver's shops: there it is, certainly, the most interesting part of the whole work, for you watch the quaint, the grotesque, or the beauteous of line grow under indomitable appeal of the chisel. From here you proceed to the stone and marble shops, where, among other work on hand, was the large and handsome Font in Alabaster, for St. James' Church, Handsworth. The sculptor was just completing a figure panel of the Baptism of Christ; here, too, was a very fine Memorial Cross, in Sicilian marble. The firm do a considerable amount of this class of work.

A glance through the turners' shop and the packing rooms completed our representative's visit to the works. The earnestness and capability of the firm's workmen strike you as you go through these "shops"; and it is to this fact, no doubt, that the high position attained by the firm of Jones & Willis is to be largely attributed. Spirit and sympathy, precision and care, are the essentials in all Craftsmanship.

THE STONE SHOPS.

At the fine rooms in Edmund Street, compact and well arranged suites of offices land you to offices of the Draughtsmen employed by the firm. Above these are the work rooms of the Embroideresses, which would serve as a model of what work-rooms should be. A large staff is engaged in the working and blending of richly coloured silks of various designs on many different kinds of fabrics. In designing for Ecclesiastical embroidery it is highly necessary that the Artist should be well versed in the technical knowledge of the various kinds of stitches required to produce the desired effect.

If this is not considered, much unnecessary labour may be caused, and still the result prove unsatisfactory. There were many beautiful frontals, antependia, stoles, and banners in hand, from the first sketch design to the final mounting and edging on the silk or other material. Adjoining is the room in which all the fringes required in connection with this class of work are made.

Laces, cords, and tassels of all kinds are also made in this department. These rooms form a frontage to Edmund Street, behind which are galleries used for work on view. The stand of lecterns included a replica of the ancient example from Southwell Minster, which was conspicuous by the dull gold colour of the lacquer; this being the ancient method of finishing brass. The many effects that can be produced by different lacquers and scratch-brushing were then pointed out. Close at hand were cases filled with choice examples of silver and goldsmiths' work, full of delicacy of engraving and spirit.

Here, too, are kept textile fabrics. The colourings of these, being for ecclesiastical use, are kept very soft and subdued, and woven in such a manner as to accent the principal lines of the design. This is a most important factor in Churches where it is desirable to obtain a bold effect without crudeness or sudden contrasts of colour.

WOOD CARVERS' SHOP.

Some of the firm's finest productions in the way of embroidery are also exhibited here, including the celebrated frontals executed for the 1851 London Exhibition, from the designs of the late Sir George E. Street.

A fire recently occurred at Messrs. Plant's iron foundry, Longton, Staffordshire, and the premises were completely destroyed.

VENICE has been the scene of an inundation such as has not been experienced there for eighteen years. Many of the quarters adjacent to the Grand Canal have been submerged in consequence of abnormally high tides.

IN Corea the first railway is to be built by an American, Mr. J. R. Morse. It will connect the port of Chemulpo with the capital, Seoul, which is only twenty-five miles distant. The cost is estimated at £370,000. The only engineering work of any magnitude will be a railway bridge over the Han River, 1,600 feet long.

A CHURCH Institute has been erected at Newport in keeping with the Norman style of the Church which it adjoins, and is designed to supplement the existing schoolrooms and classrooms. Whilst doing this the fine old fabric of the Church, the foundation stone of which was laid nearly 40 years ago, has been re-roofed, the interior has been renovated, electric light provided.

ON Saturday afternoon the students attending the Glasgow and West of Scotland Technical College day and evening classes in Architecture, visited Langside New Free Church, by kind permission of Mr. Alexander Skirving, Architect. There was a very large attendance of students, and they were guided over the building by Mr. Sim, the Clerk of the Works. At the close, Professor Gourlay proposed a cordial vote of thanks to Mr. Skirving and to Mr. Sim.

AT the banquet held after the election of a new master and wardens of the Painter Stainers' Company, last week, Mr. J. D. Grace referred to the antiquity of the Company, remarking that they were assembled on the same site as that on which the poor wounded soldiers and sailors under Charles II. were tended and nursed, the old hall being at that time used for the purposes of a hospital. From the time of its foundation the Company had been concerned in great charities, and had identified itself with the prosperity of the painters' art. Mr. Rowland Plumbe, the Past Master of the Company, also spoke.

Professional Items.

CARDIFF.—It is proposed to restore the Tower of St. John's Church. Mr. Fowler, in the report he recently drew up, estimated that the cost of restoring the portion that was absolutely necessary was £1,194, but the total cost would be £2,596 17s.

BELFAST. — Donegall Street Independent Church New Mission Hall and Schools have been commenced and the foundation stone laid. The plans have been prepared by Mr. T. H. M'Caul, Architect, under whose superintendence the work is being carried out; and the contractor is Mr. Geo. Alexander.

IPSWICH.—A home for aged people in poor circumstances has been erecte dduring the past few months in Stoke; and the opening of the building, which has been named the Nethaniah Home, took place last week. The Architect has been Mr. Brightwen Bunjer, and the builder, Mr. R. Girling.

BRENTFORD.—The Duchess of Teck has formally opened the buildings on the confines of Isleworth parish which have been erected as an infirmary by the Board of Guardians. It is about two years since the first stone was laid, and the work as it now appears complete shows a series of four pavilions connected by corridors, and each having three floors.

SHIPSTON-ON-STOUR.—On Wednesday last, the Bishop of Worcester opened, at Shipston-on-Stour, a cottage hospital, which has been erected at the cost of Mr. Richard Badger, of Leamington. The actual cost of the building was £1,940, and Mr. Badger has also endowed it with a sum of £3,000. Mr. E. W. Mountford was the Architect.

BITTON (GLOUCESTER).—Considerable additions have been made to Hanham Court, Bitton. A wing has been built containing kitchen and new offices. The walling is Pennant stone rubble with Bath stone mullions and dressings to match the original structure, which is an interesting specimen of the old Gloucestershire mansion. The builders were Messrs Haywood and Wooster, of Bath; the Architect, Mr. R. W. Goddard, of London.

ABERDEEN.—At the last meeting the Aberdeen Town Council had before it a report by Mr. Young London, as to the practicability of rearranging the Municipal Buildings on the present site. Mr. Young shows what can be done by a rearrangement of the buildings, and submits two schemes for consideration. The cost of the design he favours is estimated at £10,679, which would be reduced if certain suggestions he makes were carried out. Against this, however has to be set the cost of providing accommodation for the housekeeper outside the buildings. If the plan he recommends is adopted, it might not, he states, provide everything that is wanted, but would give a much improved municipal building, and in his opinion one equal to the requiremen s of the city for many years.

BENTLEY.—At Bentley, near Doncaster, the Archbishop of York last week dedicated a new Church, erected at a cost of between £7,000 and £8 000, by the late Mr. C. E. S. Cooke, of St. Catherine's. The Architect was Mr. J. Codd, of St. John's Wood, and the contractors Messrs. Shillito and Sons, of Bury St. Edmunds. The Church consists of nave, about 80 ft. long, and 30 ft. wide, with extremely narrow aisles; the chancel is 25 ft. long, and 19 ft. wide, and has an open timber roof. The organ was built by Mr. F. C. Nicholson, of Newcastle, and the East window, which was designed by Messrs. Clayton and Bell, of Regent Street, is illustrative of scenes in the life of Christ.

WIGAN.—Extensive improvements have been effected at the Public Hall. It is better lighted and ventilated, a new floor put in, and the platform re-modelled. The joiners' work has been done by Mr. D. A. Ablett, of Wigan; the anteroom has been constructed by Mr. H. L Gee, of Wigan; Messrs. Livesey and Parkinson have been responsible for the plaster work; the lighting and ventilation are by Messrs. Pickup and Co., Limited, of Bury; Messrs. Lea and Son, Rodney Street, Wigan, were the painters; and Mr. W. Mackenzie, of Ince, was the contractor for the Mosaic and masonry work; Mr. R. T. Johnson, of Wigan, prepared the plans and designs, and generally superintended the improvements.

YSTALYFERA.—The informal opening of the Ystalyfera Intermediate Schools took place on the 20th instant. The site on which the Schools are built was given by Mr. R. Fleming Gough, and is about two acres in area. The building provides accommodation for 80 boys and 40 girls, and the Schools have been arranged so as to afford every convenience coupled with economy. For the boys, chemical laboratories, workshops, &c., have been provided, and, for the girls, cooking class rooms, music rooms, &c., besides the usual class rooms and a large assembly room. Great care and attention has been paid throughout to all the sanitary arrangements,—&c. The contractor was Mr. David Rees, of Ystalyfera, and the designs were prepared by Messrs. Wilson and Moxham, architects, Swansea, and were placed first in an open competition out of a number sent in.

KILCURRY, IRELAND.—Cardinal Logue has laid the foundation stone of the new Church of St. Brigid at Kilcurry, some three miles from Dundalk. Mr. H. Byrne, of Suffolk Street, Dublin, has prepared the plans, and the execution of the contract has been given to Mr. James M'Adorey, Dundalk. The Church is to be in the Romanesque style of Architecture, comprising nave, with circular apse, transepts, side chapels, and square tower. The entire length will be 110 feet; the width across the nave, 28 feet; and the width across the transepts, 64 feet. Local limestone will be used in the erection of the Church, faced entirely with Newry granite, and lined with bricks. The dressings of the windows and doors are also to be of limestone. The arcades between the transepts, the side chapels, and the nave will be of richly-mounted Bath stone, while the columns will be of polished Newry granite. The ceilings of the apse and side chapels will be richly groined in timber, and in the nave and transepts the ceiling will be of pitch pine, open and divided into panels.

PERTH.—The style of Architecture of the new Post Office is a free treatment of the Renaissance. At the corner rises a large tower, 100 feet in height. The principal elevation will be to High Street, with a height of three stories; the elevation to the new street will be only one story high. The main entrance is situated at the base of the corner tower, there being also a private entrance in High Street, and a postmen's and mail entrance in the new street. The accommodation provided within the building is as follows:—On the ground floor is the public office. Entering from the public office are the chief clerk's room and an apartment for public telephone boxes. Adjoining the public office, and communicating with it, is the sorting office, which is of a T shape, lighted principally from the roof, and containing about 3,400 square feet of floor area. In the portion of the sorting office facing the High Street are placed the posting boxes. Along the south and east sides of the sorting office are the postmen's retiring room and lavatory, store room, bag room, strong room, and basket room, and entering from the new street is a large shed in which the mails may be received and despatched under cover. The staircase is situated at the north-east end of the High Street building, and behind it, on the ground floor is the telegram delivery room, which will communicate by pneumatic tube with the instrument room on the second floor. On the first floor are the Postmaster's rooms. On the second floor are situated lavatory, telephone room, and the telegraph instrument room, which is a lofty apartment about 40 feet long by 24 feet wide. In the basement are situated the furnace room, linesmen's room, mechanics' room, telegraph engineers' store room, and the battery room, in which will be placed the batteries required for working the telegraph instruments.

MESSRS. JONES AND WILLIS.—A CORNER OF THE CARVERS' SHOP. SETTING OUT THE CARVING.

NEWPORT, MON.—The work of carrying out the alterations and improvements at Newport Railway Station, at an estimated cost of £5,000, will be commenced forthwith. The contract for the work has been secured by the firm of Messrs. A. S. Morgan and Co., Newport. The alterations will be chiefly on the down side, that is to say, the nearest High Street, and include an independent luggage office for the convenience of passengers for the Western Valleys. The telegraph office, waiting rooms, and lavatories are to be enlarged, whilst on the up side of the platform a booking-office will be provided.

GOOLE.—The new Market Hall that has recently been erected at Goole, from the designs of Mr. W. J. Tennant, of Pontefract, was opened on Thursday. The site for the erection of the building was purchased from the Goole Market Company by the Goole Local Board, for the sum of £4,000, when the original Market Hall was burnt down five years ago. The building has cost upwards of £4,000, a total of close upon £10,000 being paid for the site and hall.

CARDIFF.—A new Schoolroom in connection with Bethel Chapel, Mountstuart Square, the Docks, was opened on Thursday afternoon. The Schools have been entirely pulled down and re-built, taking in an additional piece of ground which the committee fortunately were able to acquire. The structure has been substantially erected from plans under the superintendence of Messrs. J. P. Jones. Richards, and Budgen, Architects, the contract being let to Mr. G. H. Parr, for £1,090. The building being at the rear of the Chapel, and bordering upon the canal, no attempt has been made at ornament, the main idea being a large central hall on the ground floor, with gallery running all around, from which numerous class-rooms are entered. Access is given to the gallery from the ground floor by two staircases adjacent to the platform, and also by a wide staircase in the entrance lobby.

LIVERPOOL.—In the matter of educational facilities Everton is quickly attaining a position which will make the township in this respect at least the envy of some of the less favoured districts of Greater Liverpool. It was only the other day that a magnificent new library and technical school was formally opened in Everton. Besides this, there is an elementary day school, which is being erected by the Liverpool School Board, approaching completion. The building is erected upon the gardens of two old Everton mansions. After a keen competition, the designs of Mr. Wm. Rushworth, of London, were accepted, and from his plans the school has been built. In point of size, perhaps, the building is not superior to what is considered the Board's best school—the Rathbone; but in many respects it excels, compared with almost all the others. The building is divided into four separate departments, viz., infants, mixed juniors, senior girls, and senior boys. In the aggregate the school will accommodate 1,312 children—412 infants, 300 mixed juniors, 300 senior girls, and 300 senior boys. The contract price was £13,147.

GLASGOW.—The Duchess of Montrose on Thursday performed the opening ceremony in connection with the new Glasgow Hospital for Cancer. Six years ago was inaugurated the institution which the one just completed is intended to replace. The accommodation having become insufficient to meet the demands, the Directors purchased two detached dwelling-houses in Hill Street, Garnethill. These were altered and joined according to plans prepared by Mr. Andrew Myles so as to form one large and convenient building. The work has been carried out, and there is now accommodation for thirty-three patients, as well as for a staff of fifteen nurses, besides a pathological department, an operating theatre, and rooms for carrying on the growing outdoor dispensing department. In every respect the hospital has been well equipped; it is lit by electricity; and the various rooms are connected with the administrative department by telephone. When completed it is expected that the work will have cost £7,000.

GLASGOW.—In connection with the Glasgow High School Construction Classes, it is intended to pay monthly visits to buildings of note in progress in Glasgow, and the first of these was held on Saturday, when about 50 to 60 of the students visited the Empire Theatre under the guidance of Mr. Bennett Dobson. The building is seated for 3,000, the pit and stalls alone accommodating 700. Gas and electricity are employed jointly, and there is an arrangement whereby in the warm weather a large portion of the gallery roof will slide back. The stage, which is provided with a fireproof curtain, worked by hydraulic power, is about half the depth of the entire house. The style adopted is that of the Italian Renaissance. The building will cost about £40,000, and will be completed in February next. The Clerk of Works is Mr. James Davie.

BEMERTON.—St. Andrew's, Bemerton, near Salisbury, widely known as the Church of which the great George Herbert was pastor, has been under restoration for the past two years from the designs and under the direction of Mr. Charles E. Ponting, Architect, of Marlborough. The practically finished work was dedicated by the Bishop of the Diocese on the 20th inst. The walls, which, before the renovation, had nearly fallen in, have been straightened; the nave roof, formerly plastered, has been reconstructed of open oak, as much of the old material as possible being used therein. The chancel roof is entirely new. The chancel floor has been laid with Sicilian marble by Messrs. Powell and Sons, of Whitefriars, E.C., and the nave has been paved with oak blocks. The altar is of Devonshire marble, with mosaic inlaid, and there are new altar rails of oak. The carpentry generally is by Mr. G. Powell, of Bemerton, and Mr. Barrett, of the same place, carried out the masonry. The total cost has been about £520.

POUNDSTOCK.—The Parish Church, after partial restoration, was opened on Wednesday last. It has been a very arduous task, and about £1,800 was only sufficient to do a part of the Church, leaving a debt of £200 on account of the partial restoration. The tower, transept, and porch have had to be left untouched, and about £500 is wanted only to put the Church into decent order. There is nothing (not so much as a stove) to warm the Church in winter; the old bench ends cannot be repaired; the old communion rails and remains of the old screen have been packed away for want of money to repair them; there are no reading desks, lectern, or choir stalls, and in fact another £1,500 is required to make the Church anything like what it should be and was in olden times. The present work was begun about 11 months ago, and was carried out according to the plans of Mr. Fellowes Prynne. The contractor was Mr. Wiffen, of Holsworthy. Many interesting old pieces of work have been found. One old gravestone was used as a window sill, and on turning it round it was found that it had a fine large cross on it, evidently shewing that it was centuries old. There was evidently a very much older and smaller Church on the same site as the present. The arch at the south-west entrance is very old, and looks like Doulting stone, the quarries of which date from more than 1,000 years ago. The font is of Transition period, twelfth century, and shews what a long time there has been a Church in the parish. Most of the old work, however, is fifteenth century, with a Jacobean pulpit elaborately carved and in a fine state of preservation. The Puritans, evidently with axes and hammers, did away with much of the carved work, plainly having hacked out the east window, and otherwise mutilated what was interesting and beautiful. The old stocks for a long period have been used as a seat in the belfry.

A BUST of Sir Joseph Barnby, subscribed for by the members of the Royal Choral Society, was unveiled at the Royal Albert Hall last Monday.

AN inquiry was recently held by Colonel Langton Coke, M. Inst C.E., one of the Inspectors of the Local Government Board, into the Blackburn Corporation's application for power to raise £28 000 on loan for electric lighting, and £10,000 to be applied to the purposes of electric traction.

THE Duke of Devonshire has written to the secretary of the newly-formed Thames Navigation Committee, expressing his approval of the proposal that a new lock should be constructed in the Thames near Wandsworth, and promising to assist the movement by promoting a Bill in Parliament if necessary.

WOOD CARVING AT CARPENTERS' HALL.

AN instructive collection of works in wood and wood-carving was opened in the hall of the Worshipful Company of Carpenters, near the Broad Street end of London Wall, on Monday. The organizing of the Exhibition is the joint work of the Carpenters' Company and the Worshipful Company of Joiners, and, until the middle of November, will be free to the public from 11 to 6, and on Mondays and Fridays from 7 to 10 also. When so much is being said about British shortcomings in technical skill it is gratifying to hear that these successive displays have each shown a very perceptible advance in work of this kind. There seems to be no doubt that our technical schools of one sort and another, and the efforts that some of the City Guilds have been prodded into making of late years, are telling powerfully on Industrial and Artistic affairs. There are said to be specimens of work in this Exhibition which have taken no prizes, but which would have occupied a position in the first rank in the earlier shows. It is believed, too, that this year's display would have been even better than it is but for the fact that wood-carving during the past twelve months appears to have been in great request, and many who might have been competing in this exhibition have been too busy about other work. That, at any rate, is the suggested explanation of one or two conspicuous defaults in the collection. For instance, the offer of a special prize of £20 and a gold medal for a carved oak font-cover, which might have been expected to call forth the best efforts of a great many competitors, has, in fact, brought only five specimens of work, and neither of them has been deemed by the judges to be of sufficient merit to deserve awarding the prize. The Exhibition consists of two sections, one for the display of new work by any British subject, the other a

LOAN COLLECTION

of any objects of interest connected with the general subject of the Exhibition, ancient or modern. Among the most interesting collections on loan is that of Mr. Phipps, of Norwich. This collection consists of types of all the most important insects known to be injurious to forest trees and timbers, and is part of Mr. Phipps' unique collection of damaging insects and collection of damaged woods. The insects are well preserved and shown in suitable cases, with clear, brief notes appended. The specimens of damaged wood are substantial pieces, and have been collected from numerous quarters; for instance, four have been taken from the Royal Mail Jetty, Holyhead, and show the ravages of three classes of insects on four kinds of timbers; a barrel stave from India, barks from Canada, leaves and galls from the Continent, hard wood of various kinds from timber yards in all parts of the world, two pieces of fir from Lowestoft Harbour, and others, too numerous to detail, but well deserving a visit and inspection by students in Economic Forestry, and those interested in works in wood. Mr. Leopold Rothschild has sent a carved seat on loan, and Mr. Guy F. Lakin contributed a very interesting 15th-century oak cabinet. South Kensington Museum lends a fine chimney-piece of carved oak, from a hunting lodge of King James I, at Bromley-by-Bow. It is dated 1606, but it looks almost new. It is an admirable piece of work, but it has not been publicly shown before, simply because South Kensington has no room to show this and a vast store of other interesting things. An exceedingly beautiful piece of work, in the form of a jewel casket, carved in pearwood, is shown by Messrs White, Allom and Co. The other section of the Exhibition is ranged in six divisions, which may be cited as affording an idea of the scope of it. Division I. is for Models in Constructive Carpentry; Division II. is for Models in Ornamental Carpentry; III., Models or Specimens of Joinery; Division IV. is for "the trade" in Cabinet-making and Art Wood Manufacture. Divisions V. and VI. are for various branches of handwork carving. In the first division, which is sub-divided into 6 classes, Mr. Joseph Fisher takes the first prize of £5 and a bronze medal for a model of a "Queen post roof truss." A similar award is made to Mr. A. H. Blackwell for a model of a "Hanover beam roof" in class 3. In class 5, a first prize of £4 and a medal falls to

Mr. John Perrin for a model of a grand stand, and in class 6, Mr G. H. T. Smither takes the leading prize of £4 and medal for a staging for carrying a steam crane. In several other classes only minor prizes have been awarded.

FOR CARVING WORK

in Division V, Class 9—"Any newly carved works," the first prize, consisting of a gold medal, is carried off by Mr. Mark Logers, jun., for a clever piece of work in the form of a carved wood clock frame. The silver medal in the same class and division had to be duplicated, Mr. Charles Stephens taking one for a carved oak mirror frame, and the other going to Mr. T. Osmond for a case of carvings. The third prize in the same class fell to Mr. Charles Maytum for a very striking bit of original work in the form of an oak panel. The collection on the whole does not present much that is of special and striking individuality. There are few things of very distinguished merit, but the general average of the work is undoubtedly good, and there are many things of a very pleasing and interesting character.

ARCHITECTURE AND THE MANCHESTER GUARDIAN.

ONE cannot but admire the spirit which actuates the Manchester Guardian to defend its buildings and Architecture in face of the remarks made by the Pall Mall Gazette, in a recent review of a book upon that city, and the following quotation from that paper is interesting:—"It is in substance an attack upon Mr. Waterhouse, and we quite admit that there is too much of Mr. Waterhouse in Manchester. His work is wholly devoid of charm, and looks as if it were conceived, and almost as if it were constructed, in cast-iron rather than in stone. Still it is possible to exaggerate Mr. Waterhouse's demerits, and we think the Town Hall, and still more the Assize Courts, must be admitted to have a certain dignity, while even Liverpool, which, according to this amazing writer, has 'a monopoly of beautiful Architecture,' has gone to the same Architect for its university buildings. Dr. Ward not long ago spoke of Mr. Waterhouse as the Architect, not merely of the Owen's College but of the Victoria University, and unfortunately it is so. Then our writer goes on to admit—quite inconsistently—that Walters's Manchester and Salford Bank, in Mosley Street, is 'a more than fairly respectable design,' and even that it is possible to point with pride to the Exchange. He says something, but not enough, of the Cheetham Hospital, a little too much of the Cathedral, and nothing—wherein he shows his incompetence—of St. Ann's Church. Nor is the new Rylands Library thought worthy of mention, and indeed the writer appears to imagine that Mr. Champneys belongs to the same 'school of Architects' as Mr. Waterhouse. As to Liverpool, a man who will call it, from the Architectural point of view, 'picturesque, becoming, satisfactory' is, as Voltaire said of the prophet Habakkuk, 'capable de tout.' St. George's Hall is a really fine building, and the prime need of concentration has not been ignored, as it has been in Manchester, with the result that St. George's Square is a finer whole than anything we have to show. But the streets are in general no better, the approaches to the centre of the city are, if anything, worse, and there are no Liverpool parallels to the Cathedral, St. Ann's Church, or Cheetham Hospital. It is only in the upper residential portions of the city, where there is one fine boulevard, that we find a distinct superiority in Liverpool, and the way in which Liverpool has neglected its opportunities of opening out vistas to the river is as stupid as anything done or undone in Manchester—or even more so. The fact is that Manchester and Liverpool are in the same boat as regards their misuse of Architectural opportunities. Of the great English cities, Birmingham is the only one that has shown real intelligence in this matter." It is quite an unlooked for blessing to find a daily contemporary sufficiently interested in Architecture to take up the cudgels in its behalf, and we must perforce forgive the Pall Mall's strictures if only for having awakened the apathy of so mighty an organ as the Manchester Guardian.

PROFESSOR HERKOMER AND WELSH ART CULTURE.

IN an Address at the Inauguration of the Liverpool Welsh National Society, Professor Herkomer said no nation could have filled in an intellectual sense its entire mission until the graphic and the plastic Arts have been adequately represented, and it was with a desire to help Wales to attain this that he held out heart, hand, and experience at this juncture. At the National Eisteddfod held at Llandudno he could do nothing, but the National Eisteddfod of Newport for 1897 was entirely open to him, and he wished to acknowledge his appreciation of the way in which the local committee had met him by readily giving him all that he asked for. Having planned the Art prizes for that occasion he should get a real start. It would be the first step in a new era for Art in Wales, and, although it might be insignificant, it would not be a halting or a false one. He saw the certainty of ultimate success. It was no idle dream to imagine this new era growing until it became an all-absorbing power, making its influence felt far beyond the borders of the Principality. When Wales was once thoroughly aroused and eager for the Art fray it would do in 10 years what England did in 20. The history of Wales accounted amply for the Art faculty lying dormant. But dormant was not dead, and the faculty lay deep down in the nature of the present Welshman. He was full of music and rhythm, he loved the vast and the ideal, and was full of receptivity. The present Gorsedd of Wales sought to maintain an ancient custom only so far as was found compatible with the exigencies of modernism. The Gorsedd was wise in confining its rites and rituals to the broadest and simplest dogmas that had been handed down from the age of ages. The Gorsedd was an institution for serving the national interests by bringing together for a special purpose all classes of thinkers interested in the welfare of their country. Proceeding to speak of the picturesque side of the Gorsedd, Professor Herkomer explained the changes that he had made in the dress of the arch druid. Wales was never more loyal than it was to-day, but to attempt to deprive Wales of her national feeling would be to neutralize her identity. Let them stick to their identity, and let them stick to their Queen. What was required in regard to Art in Wales, was that rational Art training should be substituted for the present national Art training, and that there should be a further interest for the establishment of permanent Art galleries in various towns of the Principality. All teaching must be conducted on a personal basis, and the Art master must be the student's best friend. Under the system adopted at South Kensington, a young man or young woman might receive a certificate for this and the other subject, and yet be as far removed as possible from the Artistic, or even hope of attaining the Artistic. True decorative Art was rarer than the pictorial Art, and the teaching of the decorative was met with more obstacles than was the teaching of the pictorial. The unwieldy system of South Kensington was not of a kind likely to unearth intellectual talent. He wished to lay the strongest possible emphasis on the importance of personality in teaching. The pupils must be around a strong man who was a system in himself, and the applied Arts needed this method of personal teaching more than did the pictorial. Wales required the introduction of masters who would establish Art Schools on a more rational basis altogether, and a tremendous motive-power ought to be set in motion at once. Might he live to see great Art works, at least in the applied Arts, branded with the phrase "Made in Wales."

SOCIETY MEETINGS.

Architectural Association.—The annual conversazione of this Association, which was very largely attended, was held at 8 P.M., on 23rd inst., at the Church House, Dean's Yard, Westminster, by the kind permission of the Corporation of the House. The Architectural Association, which is now in its jubilee session, is the largest Architectural educational body in the world, and many of the designs of its pupils adorned the rooms. The guests, who numbered nearly 700, were received in the large hall by the President, Mr. Beresford Pite, and by the members of the Committee. In respectful deference to the wish of the late Archbishop of Canterbury, there was an exhibition of Ecclesiastical drawings and tapestries; furniture, fittings, and metal work were also on view. Amongst the carved woodwork was a very fine reredos in oak for Munaton Church Devonshire, designed and carved by Mr. G. H. Fellowes-Prynne, in the perpendicular style. There are three panels in the centre, upon which are painted incidents in Christ's life. Smaller panels on either side, filled with figures of the Apostles, were executed by Mr. E. A. Fellowes-Prynne. Another interesting exhibit was a number of choir stalls in teak wood, also in the perpendicular style, designed by Mr. W. D. Caröe, and carved by Mr. A. Robinson, for All Saints', Leek Wootton. The collection also included a very handsome carved reredos, with painted panels, exhibited by Messrs. Lonnie and Co.; altar cloths and frontals, by Mr. Alfred Stalman were much admired. One of the frontals, specially made for the Church of St. Martin-in the-Fields, is in richly embroidered damask and silk velvet in the Renaissance style. It is interesting to know that the work is the product of English hands. The exhibition of drawings by students of the Association did great credit to the training provided by the Association in Architecture and Design. Selections of music were given during the evening by the band of the Honourable Artillery Company. Amongst those present we noticed Messrs. W. D. Caröe, E. W. Mountford, Hampden W. Pratt, W. H. Seth-Smith, A. W. Earle and John Begg.

The Edinburgh Architectural Society.—At a meeting of this society, held on the 21st inst., Mr. W. N. Cumming A.R.I.B.A., read a paper upon "Perspective," which we are able to give in full in another column. The subject is treated in a broad and simple manner, avoiding all unnecessary complications. Mr. Alf. Greig was the critic and a discussion followed, in which several members took part, bringing out several practical hints and useful suggestions.—The hon. President's report on the first Design Competition, "A Riverside Lodge," was read, the first three being placed in the following order:—"Mullet Sable," "I ride thro'," and "Nadir."—On the 17th inst. the members visited Bruntsfield School, which has lately been completed and is considered to be the best in Edinburgh, being provided with gymnasium, swimming bath, and workshop, &c. The party were conducted over the building by the Architect, Mr. Wilson, and Messrs. Gray and Ferrier, Members of the School Board.

KEYSTONES.

WE hear that the Queen proposes to have a window placed in Crathie Church to the memory of Prince Henry of Battenberg.

A SITE has been secured at Knighton, Radnorshire, on which it is proposed to erect a new Baptist Church and Schools, at a cost of £2,000.

THE contract for the building of the Newcastle Electrical Exhibition has been secured by Messrs. Bruce and Still, of Liverpool.

As some workmen were removing a ceiling at Crediton Church, they found a leathern bag, containing 500 old silver coins, one of them dated 1470. The bag and its contents weighed 19¾ lbs.

THE Mersey Docks and Harbour Board has adopted a recommendation of the Warehouse Committee to carry out alterations at the Birkenhead Grain Warehouses, at an estimated cost of about £4,500.

NEW premises in City Road have been opened by Mr. T. J. Lipton. It is not generally known that Mr. Lipton keeps his own architect and solicitors on the premises, special apartments being set aside for them.

SIR WILLIAM HENRY WILLS, Bart., M.P., chairman of the Court of Governors, will lay the foundation stone of the new College Chapel at Mill Hill School, on the 31st inst. The Chapel will cost between £4,000 and £5,000.

THE members of the Edinburgh Architectural Society recently paid a visit to the electric lighting station in Dewar Place. Councillor Mackenzie, Convener of the Electric Lighting Committee, and Mr. Newington, the engineer, conducted the members over the building.

The Duties of the Academy President.

It would be difficult to find a more heterogeneous body of men than the Royal Academy. Some are very rich, others are not; some are learned, others care no more about books than a sporting squire who lives the year round in the country. The Art of some is antiquated as a statute by Gibson; the Art of others is living and vital as a growing plant. The Royal Academy, in electing members, let it be said to their credit, take no account of social qualifications. In fact, they would seem to favour those outsiders who address their letters from humble rural districts or outlying suburbs. This is quite as it should be. A man should be chosen by his work, and the promise he shows of future performances. But when the moment arrives to elect a President, this seemly rule is no longer observed. He must be a great Artist, and a dozen other things besides—a scholar, a linguist, a social light, a host of a courtier, a Sandow in physique and endurance, an orator, and he must also produce a certain number of pictures each year, which, in the eyes of the public, are not derogatory to his high office. Small wonder, then, that since the lamented death of Sir John Millais there should have been persistent rumours that the Presidentship has been offered to this painter and that painter, and been refused. An Artist who likes his work better than most things in the world, shrinks from the demands imposed upon him by the acceptance of such a monstrously exacting appointment. The salary is not large, and a painter who still feels a call to devote the best of his time and strength to his Art, would grudge the time and energy that a President of the Royal Academy must give to his official and social duties. The ordinary man cannot paint and act as a sort of glorified and picturesque Lord Mayor at one and the same time. Nature is chary of her Lord Leightons. So we arrive at the conclusion that it is impossible to find a painter with the qualifications that the custom of our generation has ordained should be united in the person of the President of the Royal Academy. If it is necessary that the Presidentship should be given to the most venerable, one of the most capable, and the most honoured of English painters, then the mantle should fall on Mr. Watts' shoulders. But Mr. Watts has expressed a strong disinclination for the honour. Neither by temperament nor physique is he suited for the onerous duties, and if he could be induced to accept the post, it is probable that a sort of junior President would also be appointed, who could relieve him of the more ornamental of the duties. Such an arrangement could be but temporary. The Royal Academy would surely be wiser to face the difficulty, and to define the duties of the President on the supposition that the world will not produce again such an ideal head of their institution as Lord Leighton. The other Societies require no more of their Presidents than that they should be learned, eminent, and distinguished in their calling. It was a mere accident that Sir Joshua Reynolds and Lord Leighton were Admirable Crichtons. Let the duties of the President be frankly curtailed. He need be called upon to do but little more than to preside at the banquet, the *soirée*, and the Council meetings, and to conduct the Prince and Princess of Wales around the Exhibition-rooms in the early part of May. The world could even spare the bi-annual discourses. The social side might well be dropped altogether. What has painting to do with sociality? A dozen years under this new *régime*, and the President of the Royal Academy would be no more in request at dinner parties than the President of the Astronomical Society. The *rôle* of Art adviser and encourager of budding talent

OLD FOUNTAIN, LINLITHGOW PALACE. FROM A PHOTOGRAPH BY A. LINDSAY MILLER.

might also very well be deleted from the list of Presidential duties. It is only the weaklings who cry for advice and guidance while they are still in their teens. The general supervision of the Academy schools, wise words of advice on the occasion of the election of new members, and a constant effort to improve the standard of the annual exhibitions—these should be the chief aims of the new President. There is no reason why his duties in the Art world should be more onerous than those of Sir Henry Irving in theatrical circles. This curtailment of the showy duties of the office must be the new President's own doing, under the sanction of the Royal Academy, given at the time of his election. He must be strong enough, and suave enough, and diplomatic enough to make the change so gradually that it will hardly be perceptible. He will profit by the example of the recent history of the *Société Nationale des Beaux Arts*, where, a few years ago, M. Puvis de Chavannes was elected to the Presidential chair. His predecessor, Meissonier, was a man whose love of pomp and display was enormous, and as he was the first holder of the Presidentship of the Champ de Mars secessionists, it might have been thought that the precedent created by him would be followed by his successor. But M. Puvis de Chavannes is a man of rarer metal. He accepted the honour, he has performed the duties courteously, and with dignity, but he has not altered the course of his life. He remains one of the greatest of decorative Artists. He does not live in the shadow of the Presidentship of the *Société Nationale des Beaux Arts*, but the Society is illumined by the light of the genius of its President. Here is an example for the members of our Royal Academy to follow. The man should distinguish the office, not the office the man. If such a change were adopted, the difficulty of choosing a new President, which now appears to be almost insuperable, would become comparatively simple.

R. Norman Shaw, R.A.

The Daily Chronicle, which always takes the lead in all literary and Artistic things amongst the great London dailies (indeed it is probably the only morning paper which publishes intelligent and Artistic Art criticisms), deserves just now the especial gratitude not only of Architects in particular, but of all Artists generally, for its wise and weighty words in connection with the coming Presidential Election. We would advise our readers to look at the issue of Saturday last and read the articles on the above subject, concluding with the recommendation of Mr. Norman Shaw, as the new President. The writer of that article is so entirely in sympathy with our own views of the question, and puts the case so clearly and ably, that we should, but for consideration of space, produce his writing word for word. The concluding sentences, however, we feel bound to give:—"There yet remains another man, whose name we do not think has even been mentioned, who is a great Artist, who has had a vast influence on the work of his own time, who possesses the experience and knowledge to carry out the social and the official functions, and the leisure to attend to the manifold and unnecessary duties which have grown up around the office of President, and this man is Mr. Norman Shaw, the Architect. Surely, if the Academy be an *Academy of* ART, *and not of Oil Painting*, here is a solution. Some might raise the question heatedly as to whether Architecture is an Art or a Profession. None, however, will deny that Mr. Norman Shaw is a great Artist. And if the Academy wishes an Artist to preside over it, rather than the momentary leader of a little faction, Mr. Norman Shaw would be a proper selection." That the election of Mr. Shaw to the Presidency would come as a surprise to the outside world and to many Artists who are not Architects nobody will deny, but we venture to think that, if a man's past work is to be the measure of merit for that exalted position, or the abiding nature of it considered, and the claims of a dignified personality allowed, Mr. Shaw has no equal competitor amongst his colleagues. He is head and shoulders above them all, and easily the greatest Artist there. The world's greatest men have often passed through it comparatively unknown, and it is no argument against Mr. Shaw's fitness for the position to say that the average visitor to the Annual Exhibitions would be unacquainted with his name. It would doubtless astonish the majority of people if they were told that, in the opinion of those best able to judge, Mr. Shaw is not only one of the noblest Artists in British history, but incomparably the greatest Architect that England has produced since the time of Wren. However surprising and, perhaps, to some folks, unaccountable his election would seem, we are assured that no other course the Academy may take would, eventually, have such an enduring and complete justification. We are sure that all our readers are wholly with us in the wish that by the time these words are printed, his election will be an accomplished fact.

KEYSTONES.

SIR WALTER GILBEY, Bart., has accepted the chairmanship of the committee appointed to consider the practicability of establishing a light railway in North Essex. The estimated cost of the scheme is £26,500.

THE tender of Mr. Isaac Gould, Contractor, Hunslet, Leeds, for the erection of the new chronic blocks in connection with the Wakefield Asylum has been accepted (subject to the confirmation of the West Riding County Council). The new buildings will entail an expenditure of £80,000 or £90,000.

CONSIDERABLE damage has been caused by a fire at the Portman Chapel, which is at the corner of Adam Street and Baker Street. The gallery is a total wreck, and a portion of the roof has been destroyed. Much damage was also done to the pulpit and the lower part of the building by fire, heat, and water. There is little doubt that the fire was due to overheating of the heating apparatus.

SEVERN END Mansion, near Malvern, the residence of Sir Edmund Lechmere, has been entirely destroyed by fire. The valuable collections of manuscript and the family relics were all burnt, and also the furniture. A portion of the place was saved. The mansion had belonged to the Lechmeres since the Conquest.

AT Bristol, the Cotham Grove Wesleyan Chapel, which was erected 18 years ago, at a cost of £11,000, has been entirely destroyed by fire, although the school-room and class-rooms, constituting two blocks at the corner of the Chapel, were saved.

THE Villa Magni at San Ferenze, Shelley's home on the Gulf of Specia, is threatened with destruction to make room for a row of villas. Not long ago a monument to the Poet was placed on the shore at Viareggio, and the spirit which animated the subscribers, Italian as well as English, may, it is to be hoped, come to the rescue of what should be regarded as a sacred shrine.

THE Municipal Council of Ravenna, where Dante died, has again taken under consideration the proposal to erect a monumental tomb for the reception of the remains of the poet. The proposal to erect a tomb was made more than thirty years ago, but the amount then subscribed, about 18,000 lire, was insufficient. This sum is still in hand, and it is hoped that additional subscriptions will be obtained.

Owing to the enormous demand, and the impossibility of a reprint, the Publication is deferred until November 11th.

The Architectural Review.

EVERY MONTH. PRICE SIXPENCE.

Superbly Illustrated for the Architect, Artist, Craftsman.

The Editors announce the following contents of the first number:

THE WORK OF JOHN L. PEARSON, R.A., with reproductions of some Twenty Drawings, Designs, and Photographs. Mr. PEARSON has actively collaborated in the selection of the Illustrations. The Article will, therefore, be of a most comprehensive and complete character. The Letterpress by JOHN E. NEWBERRY, with Portrait of Mr. PEARSON, as a frontispiece.

LONDON CITY HALLS—STATIONERS' HALL.—By special arrangement the whole of Mr. JOSEPH PENNELL'S Pen and Ink Drawings illustrating the City Halls—never before published—will be reproduced as a Series of Articles. No. 1, Stationers' Hall.

THE OLDEST CHURCH IN LONDON — ST. BARTHOLOMEW THE GREAT: Its Restoration. By ASTON WEBB, F.S.A., F.R.I.B.A., illustrated by Mr. ASTON WEBB'S original Drawings and Plans, showing the Restoration, with Mr. ASTON WEBB'S own Notes.

THE WORK OF NELSON AND EDITH DAWSON, Designers, Ironworkers, and Enamellers: Illustrated by themselves.

ARCHITECTURE: COMPETITIVE AND CURRENT. The North Bridge Street Reconstruction, Edinburgh. With illustrations of the Premiated Designs, by special arrangement.

"LEADED LIGHTS AND OPEN VIEWS." A Series of Editorial Articles and Notes, contributed by a staff of leading Architects and Designers who will regularly contribute to this feature.

Amongst the contributors to the first and early numbers will be:—

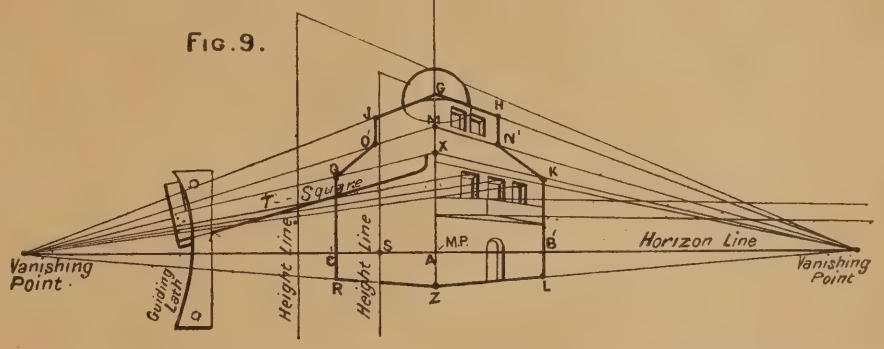
THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

Perspective in Every-day Practice.



BY W. N. CUMMING, A.R.I.B.A.

No. I.—EXTERIORS.

(Concluded.)

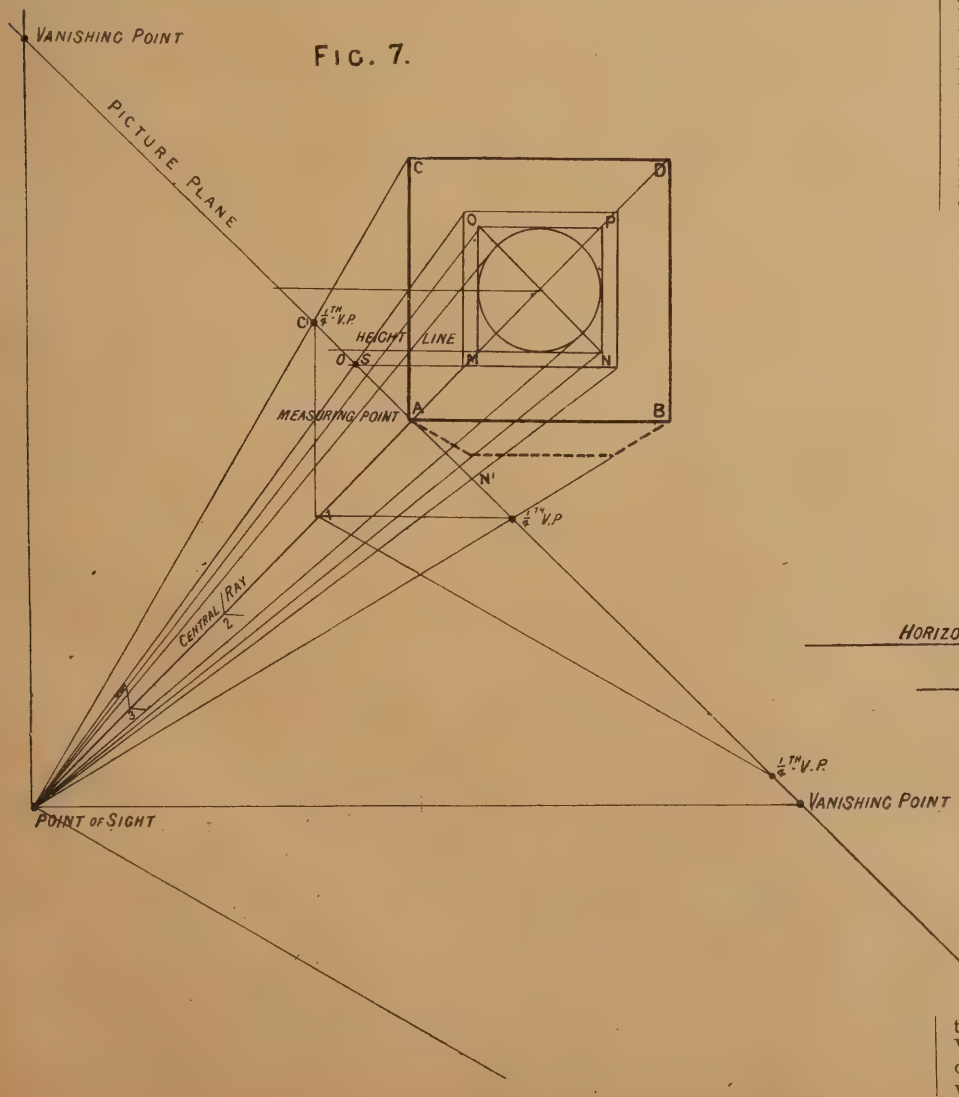
HAVING mentioned these two practical methods of dealing with a distant vanishing point, I will now return to where we left our picture. We will suppose that we have got our material all in order, our horizon and measuring lines drawn, our vanishing points fixed, and "guiding lath" in position. It will be evident on glancing at the plan (Fig. 7), that the corner A of the building through which the picture plane passes, will be the actual height to scale of the building, because it touches the picture plane, but that the corner B will be reduced in proportion to its distance from the picture plane. In order to find this reduced height, take the distances AB′, AC′ mark off these on your horizon line (Fig. 9), through B′C′ draw indefinite perpendicular lines, then take the perpendicular distance AX, AZ on your elevation, and set these up on the line MP, through the points XZ draw lines to your right and left vanishing points, cutting the line B′C′ in the points KL, QR, and you have the reduced heights KL, QR, of the corners B′, C′, due to their distance from the picture plane, and you have an exact representation in perspective of the square part of the building ABC. I think I have now clearly shown all the details necessary for the representation of any square object or portion of a building when the picture plane is in direct contact with any portion of that square.

FIG. 9.

We now come to a part of the building which is not in direct contact with the picture plane, and matters become a little more complicated. I refer to the square marked MN, OP. We have to find the height of the corner M, this will be reduced in proportion to its distance from the picture plane, as in the case of the corner B. First take the distances AN′, AO′, and mark these on your horizon line, setting up perpendiculars through these points as before. In order to find the reduced height of these corners, we must have a height line upon which to mark the real height to scale, and this is found in the following manner:—Produce the line MN till it meets the picture plane in the point S, and take the distance AS, placing it upon the horizon line of the picture set up a perpendicular through the point S, and upon this the actual height to scale from the elevation. Then take the distances of the corners O′N′ from the picture plane, and set up these as before, through the points MG draw lines to right and left vanishing points, cutting lines O′N′ at points JH, and you have the reduced heights of these corners. This method applies to all faces of the building or object which do not come in direct contact with the picture plane. The heights of all openings, such as windows, &c., on the face AB of the building, will be set up on the line MP, and similarly all heights on the face MN will be set up on the line S, and each face which does not touch the picture plane at any point, will have its separate height line as in the case MN, which has S for its height line. Also, all faces of the building parallel to AB will vanish to the same point, that is to the right, and all faces parallel to AC will vanish to its respective point, *i.e.*, the left.

We have now to deal with faces of the building which are not parallel to these two. In this case we will take the face of the projection which is at an angle to the face AB, this will have a separate vanishing point, which will be found by drawing a line through the point of sight parallel to it, and meeting the picture plane in the point VP², if this is too distant we can take a fourth of the distance and proceed in the same manner as with VP′.

FIG. 7.



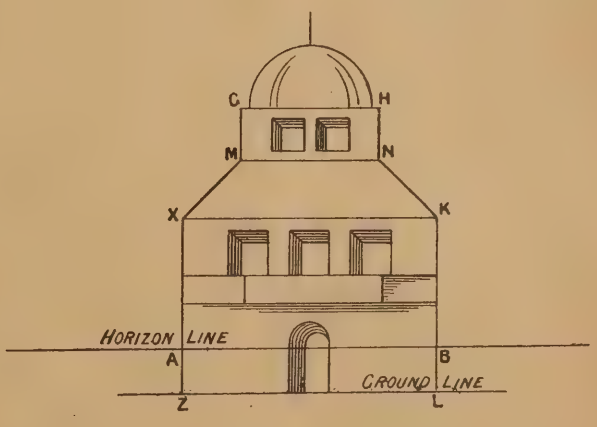


FIG. 8.

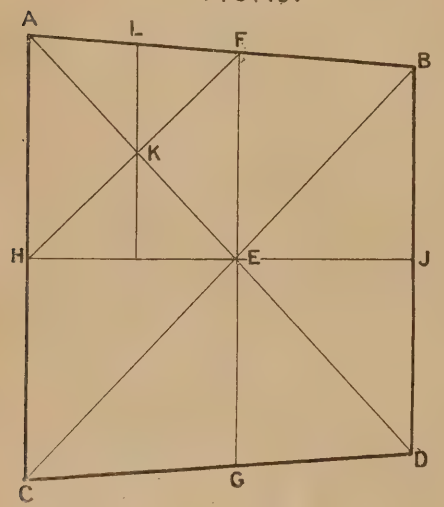

ELEVATION

We now come to the circular dome on the top of the building (*see* Fig. 8). Here we have no straight lines or faces to deal with, so cannot proceed in the same manner as with the lower part of the building. The method of putting a circle into perspective is not, however, so complicated as one would imagine at first sight. Some authorities on perspective, however, make this a very complicated matter by taking numerous points all round the circle, and finding the height for each by a separate height line for each point, but I think for all practical purposes such an elaborate method is unnecessary, and the simplest way is to enclose the circle with a square with sides parallel to the square sides of the building, and having found a height-line for this square, put it into perspective in the ordinary manner, draw diagonal lines through the corners of the square and through the point where the two diagonals cross, draw vanishing lines to the two vanishing points cutting the sides of the squares in four points. Having ascertained the extreme width of the circle on the picture plane, set this up from the measuring point on the picture, and draw perpendiculars till the two lines cut the diagonals of the square. Through these two points draw lines to your vanishing points, cutting the opposite diagonals.

You have now ascertained the height and position of eight points of the circle, it becomes

FIG. 10.

then an easy matter to draw a circle within the square, which shall pass through the eight points which you have marked, and this circle will be to all intents and purposes in perfect perspective. Having now the base of the dome in perspective, it only remains for you to complete the dome itself. This would be best done in the case of a dome of somewhat conical shape by dividing its height on the elevation into so many parts. Forming squares on the plan corresponding to the decreased diameter of the dome at this point, and put these several squares into perspective as you did with the square enclosing the base of the dome. Then draw circles lightly within the squares, and by joining the extremes of these circles you would develop a curved line, which would be an exact representation of the dome in perspective. But as we are dealing at present with a circular dome, it is evident that whatever way we look at it, it will always be in the form of a semicircle. We have therefore only to find the top at the centre, which we can easily do by means of a height-line drawn to the picture plane parallel to the square at the base of the dome, and then having three points given, viz., the two extremities of the base-circle, and the top, to describe a semicircle, which will be the dome in perspective.

The door and window openings are all that are left to complete the perspective of our building, and these will be arrived at as I have described, viz., their several heights will be put on the height-lines of the several faces of the building which they pierce, and their position ascertained in the usual manner. These comprise the principal points necessary to put a simple building in perspective, and I will now endeavour to explain how, by applying a few simple rules you will be able to put any object in perspective.

First, then, it is not necessary to invariably apply to the plan for distances, divisions, centres, &c., as these may be ascertained by the following method, saving much time and trouble. We will suppose it is necessary to find the centre line of the side of a cube. I have, in Fig. 10, a square in perspective marked ABCD; it is required to find the centre of the square in perspective. Join the diagonals AD, BC, and through the point where the diagonals cross, draw a perpendicular line cutting the sides AB, CD in the points F, G. These then will be the perspective centres of the lines AB, CD. Now through E draw a line to the vanishing point of the square, cutting the two sides AC, BD in the points H, I: these will be the centres of the lines AC, BD. It is possible to further divide the square ABCD into any number of equal parts in perspective. Join FH, and through point K draw a perpendicular line as before, cutting AB in the point L, and you have another division of the line AB. Proceed by squares, diagonals, and perpendicular and vanishing lines in the same manner, and you will be able to divide A, B, or any side of the square, into any number of points that you may desire.

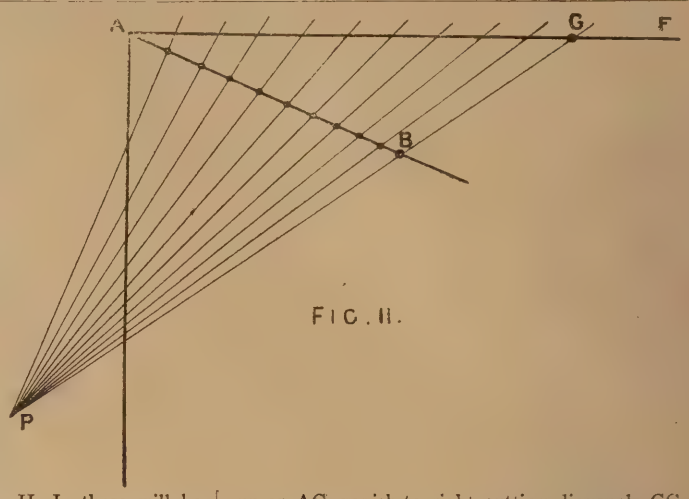

FIG. 11.

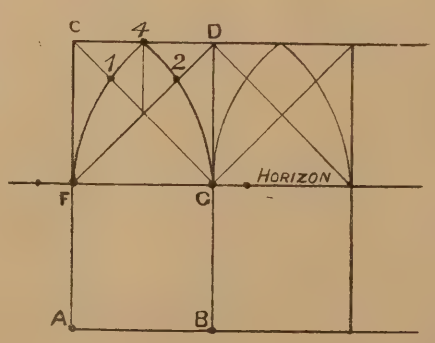
There is another method of dividing a line into a number of equal parts, which I have found extremely useful. Suppose it is required that the line AB (Fig. 11), be divided into so many parts, say ten. Through A draw the straight line AF at right angles to AC, and produce it indefinitely, then take any point P outside the line AC, and from P through B draw the line PB cutting AF in G, then divide the distance AG into ten equal parts, and through each of the parts draw lines vanishing to point P, then the line AB will be divided into ten equal parts, in perspective, by the vanishing lines.

Assuming that we require to put a row of arches or openings, in perspective, this may be done in the following manner:—Suppose Fig. 12 to be a row of arches or an arcade. Having found your horizon, vanishing points, &c., in the usual manner, take the distance AB from your plan and set up perpendiculars from these points, then take the height to the top of the arch from the horizon and mark this on the perpendicular line AC and vanish to right, cutting DB in point D, vanish A in same manner. Divide line AC into two parts cutting BD in point G, draw a diagonal from C through G cutting line AB in point A, and through H draw a perpendicular line cutting CD, FG in points K, L, and proceed as before, drawing diagonals through DK cutting AB in point M., and so on; this will give you the division of the arches or openings. To find the curve of the arch head, draw diagonals on the elevation CG, FD cutting the arch head in the points 1, 2, and draw similar diagonals in the perspective view, then take the height of the points 1, 2, and set up on AC, vanish to right cutting diagonals CG, FD in points 1, 2 through point 3, where the diagonals cross, set up a line cutting CD in point A, and you have the apex of the arch. You have now three points A, 1, F, and it is an easy matter to describe the segment of a circle through these three points, and you have one side of the arch complete; proceed with the other side in the same manner, and also with each of the other divisions, and you have the row of arches required.

There are many other points which occur, especially in interior perspective, which I should like to bring before your notice, so these will form the subject of a separate article. I think I have given you sufficient ground to go upon to enable you to set an exterior perspective of a simple building. I shall, at a future time, give you, in detail, all that is necessary to put into perspective the most elaborate subjects. Having mastered the geometric rules of perspective, you have still before you the most difficult part of the work of the perspective draughtsman, viz., the artistic treatment of the subject. I would suggest that you begin by making a careful study of the work of Messrs. Mallows, McGibbon, Raffles Davison, Horsley, and other well-known perspective experts, and that you do not, as many do, blindly copy the *technique* of their work, because each of these men has acquired his peculiar characteristic style through long and tedious labour, and what in them is a charming touch of genius, would become in you a mere trick of the pen or pencil, which, at best, would be a poor reproduction of the original. Strive, therefore, by study of good masters, so to develop your hand and eye that you form an original style of your own, and avoid, above all things, the same manner of draughtsmanship to every building you produce in perspective. Each subject requires its special treatment, and this will only come by study and practice.

FIG. 12.



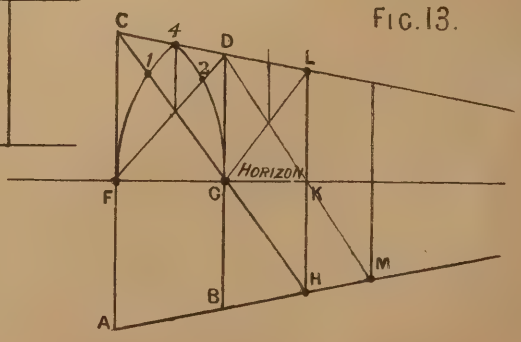


FIG. 13.

KENT AND SUSSEX COTTAGES AND ROOFS.

Specially illustrated by FRANK LISHMAN.

IN designing for the country, one of the most difficult points to succeed in is to make the building fit the site—to make it "sit" well. And whether it be for the squire's mansion or the labourer's cottage, the village inn or the village Church, no more suggestive or instructive district, to help us in this particular, can be found than the stretch of country lying more or less between Maidstone, in Kent, and East Grinstead, in Sussex.

It is true that a characteristic Kent or Sussex cottage would be quite out of place in a bleak Northumberland pit-village, and equally so on the slopes of the Hambleton Hills; but a study of the first ought not to unfit us for a proper conception of the requirements of the others.

The roadside cottage with its oast-house, to be met with hereabouts, forms as essential a feature in the landscape as the orchard or the hop-field. They verily appear to have grown with everything around them. It is almost impossible to separate the one from the other in our mind's eye. What do the rounded masses of foliage on that elm tree not owe to the tall, straight chimney-stack, which seems almost to bury itself in the wealth of foliage hard by? And what does that straight vertical timber framing not owe to the fact that a vine of many summers wriggles across it and up it? We are almost inclined to suspect that the builder of old must have been in league with Nature herself.

AT PLAXTOL, KENT.

We may not be able to make trees grow exactly as we would wish, and so anticipate Nature as we build, but we may at least respect her, as we may chance to find her in possession ere ever the 100-foot chain has traversed the site.

We cannot respect Nature unless we have that sympathy and love for her which only comes by intimate acquaintance with her. To wander along rough lanes (where the bicycle cannot go), to plunge through a hop-field and across a broad meadow (a foot-path may invariably be found), into an orchard or a garden of flowers, where many bees hum, to study broadly and narrowly, and to sketch and measure what there is to see, is a pleasure and an experience which the Architect would do well to avail himself of more than is his wont. As we cross that meadow, with perhaps nothing but a common-place roof and chimney to be seen of the cottage over the hedge, and we find that common-place roof and chimney in the blueness of the distance and the smoke from the latter combined, exercising quite an irresistible charm for us—a charm which is not dispelled on our nearer approach, but rather increased, and still increases as our eye discovers, and pencil draws, the many subtleties of design and workmanship upon which its success so much depends.

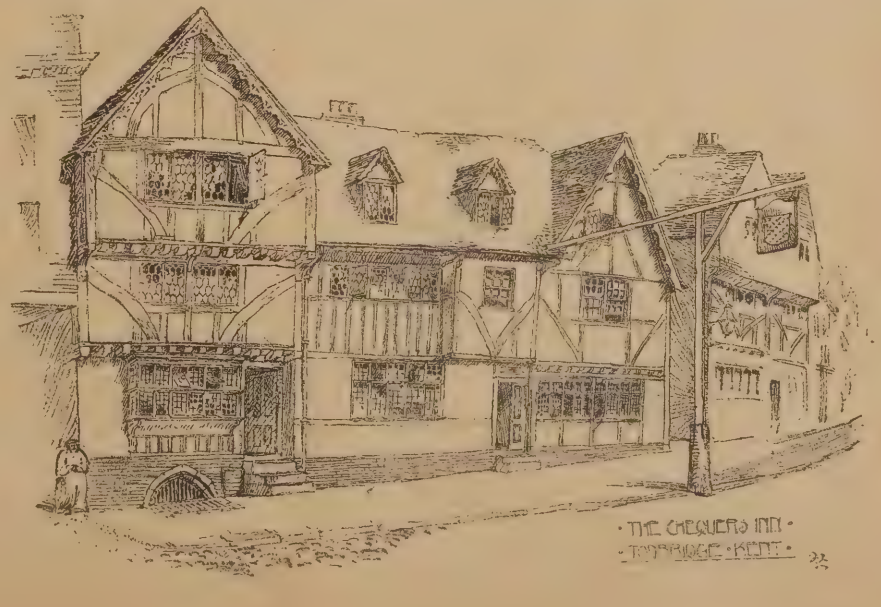
There is doubtless a charm and fascination in the natural colouring of the materials employed: the browns, reds, purples, and yellows of the bricks and tiles; the silver grey of the oak framing, weather-boarding, and shingling; with the plaster—either rough or smooth—which seems to contain, in the most delicate hues, all the tints to be observed in the more permanent materials. The smallness of the bricks (at Hartfield four courses measure 11 inches), with the wide mortar joints used in setting them, also assist the scale, and add to the texture of, and interest in, the wall surfaces; this being emphasized by contrast with the comparatively wide-coursed and smooth appearance of the vertical tiling, where it is employed.

It is a severe test for a building owning great charm of colour and material to proceed to sketch it in plain pencil—no colour-box, perhaps no shading; it is then that we find wherein its success lies—this will usually be found to be in the lines of the roof and in the position of the chimney or chimneys. If the position of the chimney were only more considered in the designing of our present-day houses, we should have more pleasure in beholding the result, and probably enjoy a greater amount of comfort in occupying them. To design the roof is to design the house, for the roof cannot be considered without

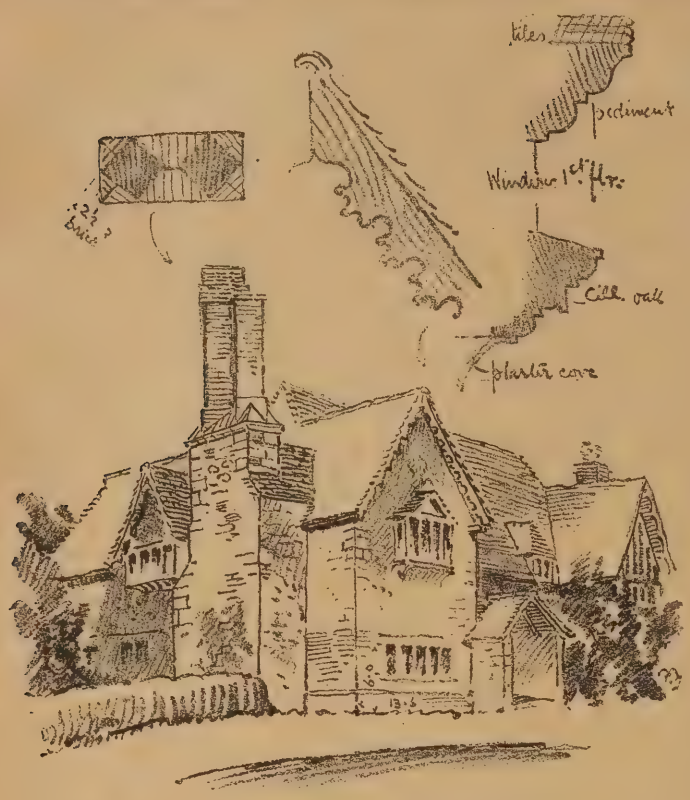
AT PENSHURST, KENT.

the chimneys, nor the chimneys without the fireplaces, and what house can be called a home unless the fireside be inviting and free from draughts and other inconveniences of bad planning and construction.

Although the roof lines and the chimneys are the features of greatest interest in the Kent and Sussex buildings, yet there are many valuable lessons to be obtained from a notice of the wall surfaces, windows, and timber framing. It is nevertheless noticeable, that as the elaboration of the design of the timber framing and plaster work increases, so does the design of the roof, and, therefore, the real expression of the building loses in interest. A glance at some of the accompanying sketches will show this. For instance, the three timber gables of the house near Penshurst (situated two miles south of Penshurst by the road to Speldhurst) are all well designed and quite characteristic of Kentish work, but they may be studied as three gables, and three gables only; any one or two of them might be removed without detracting from the merit of the remaining one whit; the cut-up roofs and the lost-looking chimneys have to answer for this. The U-shaped plan and the sturdy brick walls up to the first-floor level, however, are worthy of a better sky line.



What a very different impression one receives from a close study—for small and simple as they are, they are worthy of the closest attention—of such cottages as the three near Plaxtol, Hadlow, and Tonbridge respectively. Their lines are so subtle that to analyse them is not easy. In the first place, the straight and plain chimney rising from the ground (if we blind our eyes to the recent addition of a wooden shed) is probably the making of it, and owing to the vertical tile hanging being only flush with the back of the chimney, instead of the chimney being partially housed into the gable end, the sturdiness of the shaft is yet the more emphasized. The manner in which the tiling of the lower roof is twisted to meet the tiled slope of the chimney, and also to soften the junction with the tile hanging of the gable end, is as skilful a piece of the tiler's art as it is rare.



The cottage situated nearer Hadlow shows a good treatment of its vertical surfaces with weather boarding, timber framing, and plain plaster surfaces; but the manner in which the square plan at the ground level is changed in the roof to an L-shape, with the chimney, apparently to the eye, still in the centre but in reality far out of it, is very suggestive. The somewhat larger cottage passed as we near Tonbridge, has a remarkably piquant appearance, with its irregularly placed windows in its tile hung gable end, and the slight hipping of the apex. The plan of the main chimney and its position on the side instead of in the centre of the ridge, ensures interest when viewed from either front or back, besides preserving the dignity of the whole. The side to the road has a range of three gabled dormers to light the attic floor.

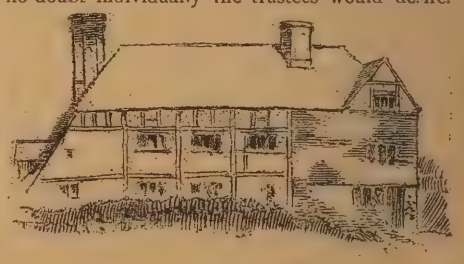
In Tonbridge itself, the "Checquers Inn" is a good example of timber framing in its larger gable, but the other gable is not worthy of its position; nor is the grouping good, whether viewed from either up or down the street, owing to the absence of any chimney stack to give point to the roof line. The "Checquers" has not been improved in recent times by the insertion of unsuitable casements and lead glazing to the

ground floor windows; the insertion of some sash windows in the first floor at an earlier time, has done less harm to the appearance, as a whole, than is caused by these casements. For characteristic Kentish timber framing and good roofing combined, the Post Office, in the little old-world village of Chiddingstone, is as perfect an example as may be seen anywhere in the district. The treatment of the bay windows, with their overhanging gables, varied in each, is very successful, the whole looking in perfect repose in spite of so much timber and plaster; this latter quality is owing not a little, perhaps, to the substantial stone base course up to the level of the ground

IN IGHTHAM, KENT: BY F. LISHMAN.

floor. Absorbing as is the detail of the various brackets, pendants, and barge boards, it may be doubted whether the manner in which the roof of the largest gable is treated, in combination with the partially hipped end to the long main roof, does not give more individuality to the whole than all these combined.

Immediately opposite this old timber and plaster house stands the Church, its fine western tower of stone being as valuable a lesson in simplicity as the house is in variety of treatment, a simplicity which is the more apparent by its close proximity to the latter. The sturdy and broad effect gained by the way in which the stair turret is placed on the south-east angle is particularly worthy of study, as is also the method adopted at the top of the turret, by which the crocqueted pinnacle is allowed to survive, instead of the turret being carried up above the level of the tower battlements, and entirely displacing the angle pinnacle as may sometimes be seen.



For extreme simplicity, quiet dignity, breadth of effect and perfect balance of parts, it is difficult to conceive a more satisfactory design for an English homestead than the farmhouse which may be seen lying back from the roadside about a mile north of Speldhurst. There are few Churches which can boast of such a fine situation, and which add more to the interest of the landscape than the Church at Speldhurst, as seen across the valley from Bidborough on a misty August morning, its square tower rising above the wealth of trees by which it is embowered; one only regrets that the music of its merry peal of bells may not travel so far; however, as the bells will not come to us we resolve to go to the bells. At close quarters the Church is disappointing, the hand of the modern restorer being too much in evidence. Opposite the Chuch is the Old Manor House, now the St. George and the Dragon Inn, which although possessing nothing worthy of note externally, yet contains a fine fourteenth-century oak roof; a floor has since been inserted at about the level of the wall plate, so the roof may be now studied at close quarters, the effect, therefore, can scarcely be properly judged. There may also be seen in the village some good examples of herring-bone and other patterns in brickwork in the walls of some cottages. From Speldhurst Church, with its stone tower, across the country to that at Cowden, where not a stone is used in either tower or spire (A.D. 1320), is but some four miles, yet the contrast is great. Its vigour and independence impart to it a character and individuality which its mere picturesqueness would not alone produce. Oak is the making of it, inside and out—thick and strong, as the stone walls are at the western end of the nave, the British oak asserts its superiority over them; the tower being carried from the floor level (with the exception of brick piers, 18 in. square, and about 4 ft. high) on massive oak balks, beams, struts and braces entirely free from the walls, some of the timbers measuring as much as 18 or 20 in. square, the tenons to the curved braces of the lowest staging being 6 ft. in length. As an example of carpentry, time spent in measuring it would be amply rewarded. Externally, the whole of the tower and spire is covered with shingles, as is also the western part of nave roof. The main part of nave roof has a tile covering, and is of a slightly flatter pitch than that of the shingle roof. The manner in which the shingling is twisted to effect this increase of pitch, shews great resource in the art of dealing with the material. Compared with the usual size of openings in the belfry steps of stone towers, the louvres in this case appear small and mean: but for a belfry of this description louvres are necessary only for ventilation. To hear the bells rung in a tower like this, is as necessary for a just appreciation of its purpose, and the material used in its construction, as it is in the due appreciation of a fine Cathedral, such as Durham, to hear the full organ peal forth through its aisles, and linger in recesses of its vaulting. Picturesque as many of the towers and spires, such as Eynesford, Hever, West Peckham, or Edenbridge, may be, a light shingle spire on a heavy and strong stone or flint tower, never seems quite satisfactory. The change of material is too sudden and harsh; this is the more apparent at Hever, where the shingle spire starts immediately over and flush with a boldly moulded stone oversail, which looks as if it were almost intended to carry a parapet. Lead would be a more suitable roofing material for such a tower—lead looking all its weight, whereas shingles have a way of looking lighter than they really are.

(*To be continued.*)

THE position of assistant surveyor to the Strand Board of Works is vacant. The salary offered is £120 per annum. Applications must be sent to the Clerk, at 5, Tavistock Street, not later than 4 o'clock on Wednesday, 11th prox.

THE POSTMEN'S PARK.

ALLITERATIVE it certainly is, but the title of The Postmen's Park, applied by the Times to the Churchyard garden of St. Botolph, Aldersgate, is not appropriate from any other point of view. It is misleading, as tending to give rise to the impression that the garden is chiefly used by the postal officials. As a matter of fact, such constitute an unimportant minority of the visitors; indeed, only rarely a postman is seen therein. The title of the article is, however, but a minor point, compared with the main object in view, which is the ventilation of the grievance the authorities have against the charity trustees. On its north side the churchyard is separated from Little Britain by a small piece of land which was at one time thrown into the garden, but which is now fenced off, and is the scene of inchoate building operations. Amongst the objects prescribed by the City Parochial Charities Act, is the preservation of open spaces, and it might be expected, therefore, that the trustees would find little difficulty in enlarging the garden by the addition of the fragment of land in question. They work, however, within limits laid down by the Charity Commission, and it is said that there are technical difficulties in the way of an arrangement which no doubt individually the trustees would desire.

AT SPELDHURST, KENT.

As a building site, the land, small as it is, is of substantial value, and it is said that the trustees have no right to sacrifice the revenue which they might gain in perpetuity from a building lease, although they are distinctly empowered to make grants from time to time out of their annual income, in aid of open spaces. It will be a pity if some way cannot be found of getting over any such difficulty, for a row of houses on the fringe of land between the existing garden and Little Britain, will be a serious eyesore. Backing on to the garden, they will substitute for an open thoroughfare, letting in light and air, grimy walls and offices, and all the least attractive features of business premises. A London garden cannot have too many frontages. Put away amongst houses, it becomes airless and gloomy. Opening on to busy thoroughfares, it gains brightness and light, while in turn it refreshes not only those who enter upon its walks, but those who, passing along the street outside, see its trees and grass.

FROM A SKETCH BY F. LISHMAN.

In the present case, moreover, if the Postmen's Park is extended to Little Britain, it will border on two sides the Church of St. Botolph, Aldersgate, which will form an interesting and appropriate feature of the garden. In the very heart of the City, every inch of open ground is invaluable, and the expression of the hope that some means may be found of averting the threatened building, and preserving and improving the Postmen's Park. Is it too late to induce the trustees to give way? It appears by a letter from the vicar and churchwardens that they are willing to do so to some extent. The price asked for the ground is £12,000, but it is hoped £10,000 will be accepted; and as the post-office authorities are willing to contribute £5,000 towards a purchase fund, there is only a further sum of £5,000 required to secure the threatened area as an open space. Donations towards that amount can be paid to the vicar or churchwardens, or to the Aldersgate Street branch of the National Provincial Bank of England.

KEYSTONES.

SOME of the pavement in use on the streets of Vienna is composed of granulated cork, mixed with asphalte and other cohesive substances. It is compressed into blocks of convenient size. Its advantages are cleanliness, durability, and economy.

GREAT preparations are being made for a Scandinavian Art and Industrial Exhibition, to be opened at Stockholm, on May 15, 1897, in connection with the twenty-fifth anniversary of King Oscar's reign. The object is to represent the artistic and industrial products of the Scandinavian countries and of Russia.

THE reconstruction of Carfax Tower, Oxford, appears to be arousing a contention as heated as that which blazed around St. Mary's, further down the High. The Corporation have for the present declined to have anything to do with Mr. Hare's reconstruction plan, which substitutes a picturesque building for the present stucco remnant.

AT Sydney, the Australian Museum has received a grant of £6,000 from the New South Wales Government for building purposes. It will be needed, for a slight accident to the plaster has revealed the fact that the woodwork of the entire roof over the central part of the building has been destroyed by white ants. The building has been temporarily supported, in order to make it safe, for the destruction has been complete, and it is a wonder that the roof did not collapse.

SEVERAL years ago, whilst ferreting among some old curiosity shops in Norwich, Mr. Rider Haggard espied what he at once recognised as a life-size bust of Nelson cut in oak. After completing the purchase he discovered upon the back of it the words, "Nelson. Wood of the Victory, 1812." It may be added that at Bradenham Hall, the seat of the Haggard family for many years, there is the mahogany washstand which stood in Nelson's cabin on board the "Victory."

MR. HARRISON, the Sheffield steeplejack, who was commissioned by the Office of Works to inspect thoroughly the Nelson Column, after the stripping off of the decorations, with a view to ascertaining what, if any, repairs are necessary, reports that, although the monument is perfectly safe and stable, some minor repairs are desirable. Some of the interstices in the masonry require pointing, and it is expected that the Office of Works will order the necessary repairs, which will be carried out by means of swings suspended from the head of the column.

ON a hill in Mill Valley, California, the wonderful force of the roots of growing trees is demonstrated, a laurel having split a huge boulder into three pieces. An examination of the tree and its surroundings shows that the boulder is one of the largest stones in the vicinity, and cannot weigh less than 500 tons. The location of the tree is almost exactly in the middle of the stone and about five feet from the end of the split. This rift in the rock is about 15 feet long, and at one end is only a few inches wide. At the end where the tree is it is at least three feet. To prove that it was the tree that caused the split there is a crack in one of the halves of the boulder showing that the force of the growing roots was so much that it cracked the rock where it could not move it.

THE ELECTION OF INSTITUTE FELLOWS.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

IN his opening address on Oct. 22rd, as President of this Association, Mr. W. Henman enlarged upon a subject touched upon by Mr. Penrose last year, viz., the falling off in the class of Fellows of the Institute, and gave his ideas as to how this might be remedied and the Institute strengthened, while, at the same time, the provincial Societies might be placed on a sounder footing. The Council of the Institute took the matter up, and appointed what has been termed "The Fellows' Special Committee," upon which, together with a number of metropolitan Architects, the Presidents of allied Societies, then on the Council, were requested to act, and several meetings were held. At first the inclination was to make as little change as possible in the *régime* of the Institute, and a draft report was drawn up, which, while affecting little in the way of useful reform, contained suggestions which, if adopted, would in all probability have stopped for a time further action; it was at the next meeting withdrawn, and the session ended, after which the committee was reappointed, and strengthened by the addition of all the Presidents of allied Societies, and an interim report of a colourless nature was laid before the Institute, which, after a desultory discussion, was adopted and circulated, together with a statement that during the recess the views of the allied Societies would be ascertained, after which a further report would be submitted. Continuing, Mr. Henman said: "It is to be regretted that those opinions were not arrived at and formulated at an earlier date; but the holiday time was unsuitable for the consideration of so important a matter, and it is more than probable that the same reason prevented many of the allied Societies taking up a more decided attitude than they have in respect thereof. It is not, however, too late to hope that the business-like views of your Council may yet form a rallying point around which the majority of the allied Societies will arrive at an understanding, and by united action force a full discussion of the subject. I am not at liberty to detail the views expressed by other allied Societies at present. Of the fourteen allied Societies, thirteen have through their Councils expressed opinions upon the 'interim report.' Two only adopt, without further suggestion, the recommendations thereof. Eight desire that the subscriptions of provincial members should be materially reduced, or, what is equal thereto, that a larger percentage should be contributed to the provincial Societies. Five desire that the library and rooms of the Institute be made more available for use by provincial members. One other Society adopts, with slight modifications, the opinions formulated by your Council, and at least ten of the Societies in various ways, but somewhat indefinitely, appear to realise that some such reform of the Institute is desirable in the interest of the profession at large, and particularly in a manner favourable to provincial members. Anxious as I am that decided action should take place, I am still more concerned that the agitation should not

DEVELOP ANTAGONISTIC FEELING

between country and town; that, in my opinion, would be contrary to the interests of the Institute as well as of the provincial Societies, and conse-

FROM A SKETCH BY F. LISHMAN.

quently of the profession generally. One reason I have for particularly demanding your attention at the present time is to endeavour to make clear to you, and to those concerned, that the action of your Council is particularly directed towards the consolidation of the Institute and the strengthening of all the provincial Societies. With regard to the opinions formulated by your Council the recommendations of the interim report of the Election of Fellows Committee are considered altogether inadequate, if it is desired that the Institute should become the actual representative body of the British Architectural profession throughout the country. Now, the recommendations of this interim report run thus:—'A.—That the proportion of one vote against, to two in favour, exclude from election, in place of one against, to four in favour, as at present. B.—That the form of voting papers be altered, so that the names on the list voted against have to be crossed out. C.—That attention be called to the requirements of the Council as to the drawings, &c., to accompany an application for Fellowship. D.—That a circular be issued to all Associates who have been over ten years in that class, pointing out that in the interests of the Institute Associates who are eligible should come forward for election as Fellows.' Is it at all likely that such mere alterations of the voting papers and method of voting will encourage a single additional practising Architect to become a Fellow? Or will it add, in any way, to the honour conferred upon those who come forward for election, because the voting in their favour might be just over two to one? Or would any man feel more dishonoured by being blackballed by one in two than he would be by one in four? Or is it simply a question whether, by a stroke of the pen given, those who are undesirable will be rejected, and, if withheld, those who are worthy will be elected. Your Council have had the courage to place on record that such recommendations are 'altogether inadequate to meet the requirements of the profession throughout the country.' At present the allied Societies, all constituted for very similar purposes,

GO THEIR SEPARATE WAYS,

having, with few exceptions, the least possible influence locally, and practically no support or influence throughout their respective districts, and no opportunities whatever for collective action, and yet some of them, so far, I regret to say, fear to attach themselves to the greater body, and unite together for mutual support and influence. Our opinion is that it is quite possible to secure close union throughout the country, and yet that each Society may possess perfect freedom of action locally, freedom fuller than any at present enjoyed, because strengthened by having the whole body of the Institute and all 'Branches' at its back. Should it be determined to form 'Branches' of the Institute, the identity of no existing provincial Society must be lost, its title in all cases to be retained with the addition of the words 'a Branch of the Royal Institute of British Architects.' As the planets revolve around the sun, influenced thereby and influencing one another, each with its distinctive name and functions, yet all members of one solar system, let each 'Branch' retain its distinctive title and exercise its duties, proud of its connection with the parent stem and all its ramifications. That each 'Branch' should be managed by a President, who must be a Fellow of the Institute, two Vice-Presidents (either Fellows or Associates), a suitable number of members of Council, and other officials, at least one-half of whom must be Fellows or Associates of the Institute, the remainder being ordinary members of the local Society. It is in the governing bodies of the several 'Branches' that intimate connexion with the Institute and with one another must be sought, and, therefore, it is urged that there must be therein at least a predominating number of Fellows and Associates of the Institute. Some may question why all should not be such. The answer is that at least for some time to come it would be unwise to shut out those who have not so far seen fit to join the Institute, or those who have not yet advanced sufficiently to pass the examination, from taking part in the management of local Societies, because such Societies have been, and are now, principally supported by those classes. Yet I sincerely hope and believe that if 'Branches' of the Institute be formed on a broad and liberal basis, there will be far greater interest taken by senior members of the profession in the doings of local Societies than there is at present. Upon the subject of reduction of subscription, there is a very strong feeling among provincial members, and inasmuch as there is no bye-law of the Institute regulating the contribution which may be made to 'Branches,' whereas, under Bye-law No. 81, that to allied Societies is limited to one-fourth of the subscription of those members who are also members of such Societies, it is evident that without the revision of such bye-law no further contribution can be expected from the Institute to the allied Societies, yet by the formation of 'Branches' there is an opportunity for arranging an increase of the contribution made, which is much needed for local purposes. What we now have to deplore is not only the callousnes and even the

HOSTILITY OF PROVINCIAL ARCHITECTS

to the claims of the Institute, but also that they neither encourage the local Societies by their presence nor by subscribing thereto. If by liberal measures of reform it will be considered, as I trust it soon would be, a voluntary necessity for every practising Architect of repute, as well as of every advanced Assistant, to become a member of the Institute, what an accession of strength would accrue not only to the Institute but also to all 'Branches' constituted on the lines suggested. Mr. Bradley, in his recent address as President of the Liverpool Architectural Society, touched upon the financial connexion of the allied Societies with the Institute. Presuming that his figures are approximately correct, there is a return of about £200 from the subscriptions of members of the Institute to the allied Societies, or an average of little more than £14 to each. There are, however, at the present time some 240 Fellows and 364 Associates in the provinces, whose total subscriptions amount to £1,772, consequently, if all such members be connected with the several 'Branches,' as suggested, the contributions from the Institution would, in the proportion proposed, amount to a total of £886, or an average of about £64 to each 'Branch,' if formed in the fourteen districts as at present mapped out. Naturally, some will ask how it would be possible for the Institute to bear such a financial strain, and no one with a knowledge of its present resources and necessary expenditure would expect it could. It is, however, not too much to hope that there would be no difficulty in quickly doubling the number of provincial members, and that would result in securing an income, greater than at present received, even

AFTER DOUBLING THE CONTRIBUTION TO PROVINCIAL SOCIETIES.

What would such an accession of strength mean to the 'Branches?' Why, instead of a paltry £200, there would not only be £886, but about £1,750 to divide among the fourteen Societies in proportion to their strength, and, in addition, the subscriptions of ordinary members. Consider what advantages may result from such an accession to their funds, for instead of, as now, dragging on from year to year in an impecunious state, unable to undertake any useful functions, they would have money at their command which, if judiciously employed, might add greatly to their influence and powers for good. It is possible I may be over-sanguine in this matter, but of this I feel convinced that now is the time for action. If the Institute is well-advised, it will make a forward movement in the hope of strengthening itself as well as of giving greater vitality to the provincial Societies, otherwise it is to be feared that the time is not far distant when each will shift for itself and the national character of the Institute will be lost. It is not likely that unreasonable opposition will again be offered to the

ELECTION OF QUALIFIED MEN

of repute, and therefore the existing method of election may in its essentials be retained for a time, but the intention of the last clause, respecting the recommendation of Architects residing in the district, by the Council of any 'Branch,' is intended to be effective, and that such recommendations should only take place after careful inquiry and consideration by the local body, and, when made, should be accepted by the Institute Council without question, and the candidates put forward for election at once in the ordinary way. The reason for this must be obvious, because the Architectural status of such candidates must be better known, or more easily ascertained, by the local than by the general Council; but to prevent any personal or local prejudice acting unjustly towards a candidate, it may be necessary to provide for some form of appeal to the general Council. The opinions of your Council and the views of the allied Societies will, on the 3rd November next, be taken into consideration by the Committee appointed—a large and representative body, consisting of no less than 39 members, of whom 17 are from the provinces. What may be the result of their deliberations it is impossible to say; but from the large correspondence I have had on the subject, and by attendance at the Council and Committee meetings, I have reason to hope that the necessity for some decided action is making itself known to the minds of many metropolitan as well as to most provincial Architects. Now for the practical reasons why our Association should press this matter forward. We are, I hope, all proud of our connexion with Birmingham, and to hear it designated the Midland Metropolis. In its trade, its manufacture, its commerce, and to some extent in its Art matters, it may fairly claim such a distinction. But are we satisfied with its Architectural position, either as regards its buildings or the status of the profession? Last year I mentioned that out of the 41 senior members of this Association only four are Fellows of the Institute, and yet there are no less than 120 practising Architects whose names appear in the Birmingham Directory, while our district comprises the five counties of Warwickshire, Worcestershire, Staffordshire, Shropshire, and Herefordshire. Is it likely that such a minority can command the influence and respect which ought to be accorded to an Association covering so large and important an area? How slight are its opportunities, as at present constituted, for obtaining suitable support and recognition or power to cope with the work it ought to undertake. In London the strength of the Institute enables it not only to make its influence felt by the County Council, which has taken its opinion on many important matters, such as the Metropolitan Building Bye-laws, the laying out of new streets, and of the various improvements contemplated; but it is also recognised by Parliament, and exercises, under statutory powers, the examination for district surveyors in London, and of building surveyors under Local Authorities. In some provincial cities I find that Architectural Societies obtain greater recognition than we have hitherto secured, their opening meetings year by year being graced by the presence of the Lord Mayors, Mayors, and civic magnates."

THE celebrated Holbein, possessed by the Barbers' Company, representing Henry VIII. granting the charter to the Barber-Surgeons' Company, which was exhibited at the Guildhall Gallery during the recent Art Loan Exhibition, has returned to its old home in Barbers' Hall, Monkwell Street. The attempt to purchase it by public subscription has failed, the amount subscribed being so small as to render any further prosecution of the idea at the present time out of the question.

THE Exeter City Council has adopted a report of the Navigation Committee, which recommended extensive dredging operations in the estuary of the river Exe, whereby the area of anchorage in the bight would be largely increased, and the channels deepened and widened throughout. The dredging will be undertaken by Sir John Jackson (contractor of Keyham Extension Works), and the operations are expected to extend over five or six years.

IT is reported from Athens that the Government will introduce a Bill during the approaching Session for holding quadrennial Olympic games in the Stadion. M. Averoff, who partially restored the Stadion for the games on the last occasion, has now, in a letter to the Crown Prince, offered to defray the entire expense of reconstructing the Stadion in Pentelic marble. This offer will cost 3,500,000 drachmas.

AT a meeting of the Streets and Buildings Committee of the York Corporation the specification supplied by Professor Kennedy, for the electric lighting of the city was discussed, and it was resolved, in accordance with the instructions of the Council, to at once advertise for tenders on the basis of that specification.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
November 4th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

AN addition to the number of open spaces has been made by the London County Council, which has now sanctioned the purchase of a piece of vacant land in East Street, Walworth, for the purpose of a public recreation ground. The area is about seven-eighths of an acre, situated in a thickly occupied district. The Council rightly thinks that the acquisition of this ground will tend to brighten the lives of thousands of children whose only opportunity of play is the already overcrowded streets, where they incur danger to themselves and are a serious inconvenience to the traffic. The land costs £5,375, of which the Newington Vestry pays £2,500, and the Metropolitan Public Gardens Association £375, leaving the Council to contribute a sum equal to that of the vestry. The Gardens Association, moreover, is prepared to spend nearly £1,000 in laying out the ground.

THE recently unveiled Cameron Memorial fountain is situated at Charing Cross, the junction of Woodside Crescent and Sauchiehall Street, Glasgow. It stands in the centre of the street in line with and a little to the west of the Grand Hotel. The structure is designed in the style of the French Renaissance. The lower part or base is formed of Peterhead granite, the basin being polished, and the other parts "ringed;" the base stands about 4 ft. 6 in high. The upper part is formed in Doulton ware of a brown buff colour, and rises to a total height of 27 ft. above the pavement. The top of the memorial is dome-shaped with space for the illuminated clock with four dials. The space under the clock is occupied by two iron grill panels, and on the other two sides bronze medallions of Sir Charles Cameron have been inserted. The medallions were modelled by Mr. Tinworth, of London. Beneath the medallion is the following inscription framed in Doulton ware:—"In honour of Sir Charles Cameron, Bart., D.L., LL D., in recognition of his many services to this city and to Scotland during 21 years in Parliament, 1874–1895."

AT the St. George's Gallery, Grafton Street, the autumn season has been opened with an exhibition of paintings by Stadislas Lépine, who was the pupil of Corot. Last winter was devoted to the Romanticists; this winter, apparently, we are to be shown the work of their followers. Lépine cannot by any means be ranked with the men from whom he borrowed style and methods. He studied in a good school, which is so much in his favour, and he studied intelligently. But he was without originality of observation; his work has no special individuality. Pictures, which we fancy must be those of his later years, are full of a pleasant atmospheric quality—see the little "Seine at Rouen" (7)—and are an immense improvement upon his early landscapes, which are flat and hard, as, for instance, "Low Tide at Havre" (8). But from first to last, his work strikes one as a re-echo of somebody else. It is not always Corot whose influence can be traced, though there is no mistaking it in such a painting as "The Studio at Montmartre" (4), where the trees are quite Corotesque; or, as "The Banks of a River" (31), where the arrangement, with the little boat on the stream below the thick clump of foliage and the distant white town climbing mistily up the hillside, or something very like it, we have seen in any number of the master's canvases. But to Daubigny, it is clear, he went as often for inspiration; look at the "Sunset" (42), or "The Seine" (36); while here and there are passages in his work that recall Diaz or Rousseau.

COWDEN CHURCH, KENT: BY F. LISHMAN.

LAST month was commemorated the foundation of St. George's Hospital in Grosvenor Place. In the year 1719 a home was opened at Petty France, in Westminster, for the benefit of the sick and lame in that locality. As funds increased it was moved to Chapel Street, and became the infirmary for Westminster. This excellent institution, fulfilling a want so much felt in the neighbourhood, met with such hearty support that the governors found themselves, fourteen years afterwards, in a position to acquire larger premises. The majority of the body decided to transfer the infirmary to Castle Lane, Westminster. An influential majority, however, determined to seize the opportunity of renting Lanesborough House, Hyde Park, at £60 a-year, chiefly on account of its more salubrious position—a course which they accordingly carried out on the 19th October, 1733, and thus there were two institutions instead of one. Lanesborough Mansion became an infirmary, with sixty patients, and displayed on the façade a distich, "It is my delight to be both in town and country." It was rebuilt in 1831, and is now the well-known St. George's Hospital, with 351 for the total number of beds.

EYNESFORD CHURCH, KENT.

AN energetic plea for its existence has been issued in pamplet form by the National Society for Checking the Abuses of Public Advertising. The pamphlet directs attention to the disfigurement of picturesque places by the horrid art of the bill-sticker and his congeners; but the fact is that in towns the evil is in a fair way of righting itself. There is at least a perceptible hope that our hoardings may gradually lose a great portion of their hideousness. From a purely practical point of view, advertisers have begun to understand that, although an advertisement must attract attention, it need not and should not invite detestation. It is not a recognition of the principle, laid down in the Society's pamphlet, that "the eye has rights," which has induced the designers of posters to adopt the Artistic methods of Cheret and his school, but simply the growing belief that in pleasing the eye rather than in shocking it is the most effective publicity promoted. With the desire of the Society to prevent the desecration of rural places where even the most masterly of posters is an outrage, most people will fully sympathise, though we may be allowed to express a painful doubt whether the æsthetic education of the masses is likely to fight successfully against the temptation to get a profitable advertisement wherever found.

THE question of the erection of the proposed new Church for Greyfriars, Edinburgh, is being pressed on the attention of the University Court and the Town Council. Apparently it is being feared there is some danger of not getting after all the new £20,000 building. The University Extension Fund is exhausted. It was only by a special effort that there was raised, a few months ago a sum sufficient to secure the erection of the new south wing of the Marischal College buildings. There is nothing left, and no prospect of anything being obtained for some time for the removal of the old Greyfriars Church, and the erection on its site of the proposed "administration block.' In these circumstances, therefore, the common sense course obviously is to allow the old Church to stand and wait until circumstances are ripe for another effort in the way of extension. If the Church may seem to stand more or less in the way of the College, that should not concern the authorities of the Establishment, seeing that the amenities of the building have been vastly improved, and its Architectural beauties brought into public view by the operations in connection with the new University buildings; and as its removal is not necessary to clear the site for the new Physics Department,

there is no reason for the University authorities doing anything further with respect to it in the meantime. And there is one very good reason for their not seeking to hurry on its re-erection in the fact that they ought to retain in their own hands the site proposed to be given up to it as a site that is sure to be required by and bye for University purposes.

IN connection with the Birkbeck Literary and Scientific Institution, the annual exhibition of drawings and paintings by the students of the School of Art was held recently in the Art School at the Institute, Chancery Lane. The exhibition was very interesting, and the work, taken all round, showed considerable merit, and earned the commendation of the examiners. Eight of the pictures were selected by the Science and Art Department for the National Competition, and, although no special medals were won by the students of this School, the works selected showed considerable promise, especially one of the still life subjects, and the work of one of the students in the life class. A scholarship at the Royal Academy was, however obtained by René A. Breun. This success, together with the exceptionally high percentage of first-class passes gained in the May examinations, shows that the usual high standard reached by the students at this School, under the care of Mr. A. W. Mason, has been fully maintained, if not exceeded, during the past year. The number of students attending the School during the year has been 346, of whom 95 attended the classes during the day. At the May examinations 121 students attended and obtained 145 first-class passes 82 of which were for advanced subjects, five papers being marked excellent.

ST. ANDREW'S PRO-CATHEDRAL, Dundee, after having been closed for the past six weeks in order that the interior might be repaired, redecorated, and generally improved, has been reopened. The work of repainting has been designed in accordance with the best examples of ecclesiastical decoration, and in harmony with the building. Special care has been bestowed upon the Sanctuary, and the rich Altar has been taken as the keynote for the tone and general effect of the surroundings. The ceiling is finished in pale blue, relieved with gold stars, a light and aerial effect being gained by radiations in gold and dark blue from the top of the cornice. The cornice itself is finished in soft tints, relieved with gold, and further enriched by a fringe worked out in geometrical forms. The walls of the Sanctuary are coloured in buff, relieved in diaper pattern of gold *fleur de lis*. The rich colouring of the dado and responds—the former being designed in intricate arcading and ornamental ashlar work—is particularly effective. The main walls of the Church are coloured in a soft sage green, the spandrils of the arches and along the top of the dado being relieved with free decorative stencil work, while the ceiling is coloured light buff, panelled and relieved by the main ribs of the roof, which are decorated with colour and relieved with gold. The spandrils under the front of the gallery have been treated in the same manner as the large spandrils of the roof. The work has been carefully carried out by the contractor, Mr. J. Thomson. The whole of the improvements and decorations have been carried out from the designs prepared by Mr. T. Martin Cappon, Architect.

GALASHIELS has organised a Fine Art Exhibition, which is being held in the Masonic Hall, where the works, to the number of over 300, have been hung as satisfactorily as the accommodation will allow by Messrs. Tom Scott, A.R.S.A., and Pollok Nisbet, A.R.S.A. Oils and water-colours are pretty equally divided, and in addition there are a few works in black and white, and several Architectural drawings. To strengthen the Exhibition with loan works, neighbouring collectors have given freely, and the result has been to impart a wider and more varied interest to the display than it could have enjoyed had it been confined to purely local achievement. Among those to whom the Committee are indebted for loan pictures are Provost Dickson, Mr. Andrew Brown, Mr. George Dickson, Mr. G. Bathgate, Mr. James Sanderson, Woodlands; Mr. John Murray, Glenmayne; Mr. J. B. Anderson, Selkirk; Mr. A. L. Brown, Mr. T. Craig Brown, Selkirk; Mr. Kenneth Cochrane, and Mr. T. J. S. Roberts, Abbotsford. The chief place of honour on the walls has been assigned to a loan picture—Sir George Reid's "St. Mary's Loch," seen in the Academy Galleries some years ago—a work remarkable for its solemn and peaceful beauty. The Dutch painter, H. W. Mesdag, is represented by three characteristic sea pieces; there is a choice example of Montecelli; the Provost has sent a charming Corot; and Anton Mauve, P. H. Pavy, W. B. Tholen, and Blommers may also be studied from specimens of their work which the Committee have been fortunate in securing.

THE memorial of the late Dr. Bruce in St. Nicholas' Cathedral Church, Newcastle, was recently unveiled by the Earl of Ravensworth. The memorial, which occupies the centre of the porch, is a Renaissance altar tomb, and is the work of Mr. George Simonds. The lower part is a sarcophagus of the grey marble commonly known as Sicilian marble. It is ornamented at the foot with the coat of arms of the Bruce family, while at the corners there are corner pieces of ornament consisting of poppy leaves and poppy heads, symbolical of the peaceful sleep of the subject. The sarcophagus is supported by four lion's feet. On the top of the sarcophagus is a bier richly carved, of white statuary marble. On the bier is a recumbent figure of Dr. Bruce in his doctor's robes. At the foot there is a fragment of a mural tablet that was found by Dr. Bruce buried in the walls of a farmhouse, together with an open book, on the leaves of which is engraved a quotation from the third edition of his "Roman Wall."

A FRENCH archæologist, Baron de Bay, has been occupied for some months past in the neighbourhood of Tomsk, Siberia, in excavating *kurgans*, the old turtle-backed burying mounds found in many parts of Russia. Fifteen of these *kurgans* have been opened, and a curious and significant discovery made. These mounds, which date back to before the Russian conquest of Siberia, contain quantities of beads, earrings, knives with artistically finished bone hafts, copper kettles, engraved rings, and silver ornaments, bracelets, &c. The oldest of these belong to the thirteenth century. Those *kurgans*, on the other hand, which date only from about three centuries ago (Tomsk was founded in 1604) contain comparatively little of anything, hardly any articles of metal, except a few of the rudest forms of wire rings and earrings, and, for the most part, arrowheads, knives, buckles, &c., of bone, showing a much poorer stage of civilisation.

AT Mungsten, between Remscheld and Solingen, the loftiest viaduct on any railway in Europe is now being constructed by the Prussian State Railway Department. It will eclipse, both in height and width, even the celebrated Douro Bridge at Oporto. The total height of the Douro Bridge is 68 yards, whereas the viaduct at Mungsten will attain an altitude of 353 feet. The span of the central arch at Douro measures 530 feet, while that at Mungsten will be 570 feet. Upwards of 1,700 tons of ironwork will be required for the principal arch; the total for all the branches will amount to 5,000 tons. Six colossal side pillars will form a support for the remaining portion of the bridge. The cost of the viaduct is estimated at £225,000.

AMONG plans privately discussed for raising a national memorial to the late Primate, is one for a Benson Tower to Truro Cathedral. The Cathedral building was the scheme of Dr. Benson while he was Bishop of Truro, and he took close personal interest in it. Many valuable special gifts have been made in the way of extras and accessories, but although the original estimate of £80,000 has been largely exceeded, something like £40,000 is required to complete the building. The design is cruciform, but at present only the choir and the two transepts exist, giving the building an ugly, uncouth exterior, though it is very beautiful within. The great central tower and the nave have to be added, and it is thought they would constitute a suitable memorial to the great Archbishop.

AN Austrian Naval Architect, Herr C. A. Gagstatter, has defined the limitation of the rule that the longer a vessel the better she is for speed and carrying capacity. If a steamer could be built one mile long and about 60 ft. wide, with ample motive power, she could undoubtedly attain fabulous speed. Only one-thirtieth part of her length would have to overcome the water's inertia, while the rest of the vessel would experience only surface friction. But such a vessel involves a dangerous, yielding, unsolid structure, exposed to enormous strains, and is liable to be broken in two. He consequently fixes the limit of length at nine widths.

A CORRESPONDENT calls our attention to the following delicious effusion in the advertisement columns of the Daily News, which he thinks is worthy of diffusion among Architects, as an example of clerical methods of raising the wind:—

NELSON AND BURNHAM THORPE.

He who taught Englishmen to do their duty,
And girt with wooden walls his native isle,
Asks for ONE SHILLING to restore to beauty
The church which brooded o'er his infant smile.

Burnham Thorpe Rectory, Lynn, October, 1896.

The last line is inimitable; the Laureate could not do better. Nelson's father was rector of Burnham Thorpe, and the memory of the hero of the Nile and Trafalgar is invoked to scrape his church.

IT is not generally known that the very interesting Norman Church of Barfreyston, about six miles from Canterbury, was entirely rebuilt at the beginning of the century. It appears from a paragraph in a recently published work "The Gillmans, of Highgate," by Alexander Gillman (p. 30), the Rev. James Gillman, the then rector, who was the grandson of James Gillman, surgeon, the friend of Coleridge, finding, as it is alleged, that the foundations of the Church were defective, pulled down, about 1837, the principal walls of the building to the foundation, the stones being numbered and afterwards replaced under the superintendence of Mr. Twopenny, the Architect. This accounts for a certain air of newness and absence of texture on the stonework which is noticeable in the Church. The same operation was carried out some years ago to one side of the choir of St. Saviour's, Southwark, with very lamentable results.

SOME time ago it was decided that a statue of Mr. Walker, the late Chairman of the North British Railway Company, should be erected in the reconstructed booking-hall of the Waverley Station, and designs were invited from a number of Scottish sculptors. Seven of these took part in the competition, and the Committee have now selected the design of Mr. Birnie Rhind, and have entrusted him with the commission of carrying it into effect. The late Mr. Walker is represented seated on a chair of old English design, in a slightly recessed niche formed in one of the bays in the booking-hall of the reconstructed station. The moulded rectangular pedestal supporting the statue projects 3 feet 6 inches from the wall, and is 5 feet in height. On the two front angles are bronze acanthus ornaments, which terminate on a shaped base with lion's claws, while in front under the cornice will be placed a decorative bronze panel bearing inscription. The niche behind the figure is elliptical on plan, with semi-circular top enriched with clam shell. The pedestal and niche will be executed in yellow Prudham free-stone, the material of which the hall is being built. The cost will be over £1,000.

A HOUSE built of tubes is the latest invention. The advantages are, according to the inventor, who is a German, a constant temperature, and, incidentally, strength, comfort, and beauty. He first put up a frame of water tubing, allowing continuous circulation to a stream of water. Around this frame he put up his house in the ordinary way. The peculiarity is that all floors and ceilings are crossed and re-crossed by the water pipes. The water, having passed through horizontal tubes under the floors and ceilings, passes through the vertical tubes until all have been gone through. In the summer, fresh, cool water circulates under pressure through the network of tubes, cools off the walls, and, after having run its course, flows considerably warmer than when it entered. In its course it has absorbed much heat, which it carries away. During the long and severe winter, the water entering through the basement is first heated to nearly 100 degrees and then forced through the

ceiling. Of course much of the heat is left all over the house, and at the outlet the temperature of the water is about 40 degrees. The speed of the circulation of water can be regulated so as to allow fixing a certain temperature, equal throughout the building.

HEVER CHURCH · KENT ·

FROM A SKETCH BY F. LISHMAN.

"THE City of Gold," it is rumoured, will be to the Paris Exhibition of 1900 what the Eiffel Tower was to the last great show, ten years since. There had always been an idea of reconstructing in effigy the Pont du Change, the Rialto of mediæval Paris, and this suggested the far more grandiose project of illustrating the whole history of money and the industries connected therewith. The aim, in the first place, is to trace gold, silver, and copper coinage from mine to mint and from mint to mart, each step in the progress being exemplified by working models, if not by the machinery in actual use. The substitution of paper for specie will then be dealt with, and it is proposed to reveal the intricacies of the entire credit system as carried out in great banking establishments, though one can hardly conceive how such an object-lesson can be rendered intelligible or interesting to a passing crowd of sightseers.

IN the course of excavations made in connection with the main-drainage works, Ormond Quay, Dublin, some 20 ft. below the surface, the workmen came upon an ancient vessel, the bow projecting towards the river. It is supposed that she was swallowed up in the sands which formed the bank long before the quays were built. The timbers are almost all fastened together by wooden plugs, very little iron having been employed. A quantity of coal and a 14-lb. iron cannon-ball were found. The remains of a second ship were unearthed having the same peculiarities of construction. It is believed that these vessels are as old as the days of Charles I. or even Elizabeth. Near to the spot the workmen also dug up a large number of tobacco pipes, seemingly made of glazed clay, the bowls being in almost a straight line with the shank. It is probable that these will immediately be submitted to skilled antiquarian inspection.

THE retirement is announced of Mr. J. R. Bell from his position as consulting engineer to the Government of India. Mr. Bell was educated at the University of Aberdeen, and served his articles as an engineer with Messrs. Gardner and Sons, the railway engineers. After the completion of his articles he was first appointed resident engineer of the Potteries, Shrewsbury, and North Wales Railway. In 1868 he entered the service of the Indian Government as a first grade assistant engineer, and in that capacity he was connected with the construction of no fewer than eleven railways and four State bridges. The first work that brought him to the front was the Adamwahan Bridge, a gigantic engineering undertaking, and this was followed by the laying of the line from Ruk to Sibi in an unprecedentedly short space of time, and under the greatest difficulties. It was on the Muttra Jumna Bridge that he first introduced the twin well system, now universally approved; and he is also well known in the profession by his invention of dredging tools.

AN advance copy of the Motor Car Regulations has been issued. In the order a motor car, or "light locomotive," is defined as a "vehicle propelled by mechanical power, which is under three tons in weight unladen, and is not used for the purpose of drawing more than one vehicle (such vehicle, with its locomotive, not exceeding in weight unladen four tons), and so constructed that no smoke or visible vapour is emitted therefrom except in temporary or exceptional circumstances." As to the construction of motor cars, the order provides that if a car exceeds three hundredweight in weight it shall be capable of being so worked that it may travel either forward or backward, and, whatever its weight, it must not exceed 7½ ft. in width, measured between its extreme projecting points. As to tyres, the order says that if a car weighs between three-quarters and one ton the tyres must be not less than 2½ in. wide; if between one and two tons, 3 in.; and if between two and three tons, 4 in. There must be no bosses or projections, except in the case of pneumatic tyres, when there may be bosses or projections of the same material as the tyres. Every car must be provided with two independent brakes, in good working order, and the brakes must be so powerful that if the car is travelling at the rate of fourteen miles an hour it can be stopped within a distance of 50 feet. As in the case of ordinary vehicles, the name and address of the owner must be written upon the side of the car, which must be driven by a person competent to control it. Lamps must be carried at night, and, with the view of further safe-guarding the public, it is provided that the driver shall, whenever necessary, give audible and sufficient warning of the approach and position of the car by sounding a bell or by other sufficient means. The driver must also, on the request of any police constable, or of any person having charge of a restive horse, or on any such constable or person putting up his hand as a signal for that purpose, cause the car to stop and to remain stationary so long as may be reasonably necessary. On the important subject of speed, the Act provides that motor cars shall not be driven along public highways at a greater speed than fourteen miles an hour or any less speed that may be prescribed by the regulations of the Local Government Board. The present order makes no regulations on this subject, and the Local Government Board states that it proposes to make no order regarding the question of speed until the general regulations have come into operation, and the local circumstances bearing upon the question have been fully ascertained.

AT the Louvre a special hall has been opened for the reception of the collections obtained from the excavations at Delphi undertaken by the French school in Athens, and presented to the museum by its director, M. Homolle. Considerable success has been accomplished at Delphi by the French school. The "Apotheosis of Hercules" is one subject, the exploits of Theseus form another design, and, among other interesting objects which are deserving of particular notice, are a sphinx and two statutes of Apollo.

IN the Museum of Antiquities at Constantinople may be seen a most interesting but battered tablet, with a long Greek inscription in it of seven lines. It was discovered in Jerusalem about the end of May, 1871, by the French archæologist, Clermont-Ganneau, at a considerable depth below the ground, in the foundations of an Arab house, not far from the Mosque of Omar, on what might have been the site of the Temple of Herod. This is one of the very few relics of that magnificent structure which have survived to our day. The inscription is in capital monumental letters, and may be translated thus: "No stranger can enter within the balustrade round the sanctuary and enclosures. Whoever is caught will be responsible to himself for his death." Josephus gives a graphic description of Herod's Temple, and mentions that the court of the Gentiles was separated from the part that was restricted to the Jews by two parallel walls, about 15 ft. apart. The outer wall was about 4½ ft. high. It was an elaborately carved stone balustrade, with thirteen doors in it, each of which had a pillar in front of it, bearing an inscription in Greek and Latin, forbidding any foreigner to enter the enclosure on pain of death. The prohibition in question, however, was long regarded as apocryphal, even although Philo spoke of the inscription, and corroborated the statement of the Jewish historian. But the discovery of Clermont-Ganneau has placed the matter beyond dispute. The tablet which he found was part of one of the columns guarding the inner sanctuary from the approach of unhallowed feet. According to Clermont-Ganneau, the tablet is the most ancient, as well as the most interesting, Greek inscription which archæological investigation in Jerusalem has produced. It supplies a standard of comparison by which to distinguish Herodian sculpture and palæographic works from those of previous or later date.

THE new Glasgow Improvement Bill which the Corporation has drafted for promotion in Parliament, contains a number of important provisions. One is for the widening of Nelson Street, a narrow lane leading from the Trongate, near Glasgow Cross, to the Central Police Office at Bell Street. Power is also sought to deal with

EDENBRIDGE CHURCH, KENT.

districts of the city which may at any time after the passing of the Act be in such a congested, insanitary, or unhealthy condition as to require to be reconstructed or improved, or which may require to be dealt with in order to have street improvements effected. The bill also contains provisions as to the character and procedure of the arbitration in cases of compulsory purchase. Authority is asked to take down the whole or any part of buildings acquired, and lay out the lands in such manner as they deem expedient; and to erect and maintain dwelling houses (including model lodging houses) for mechanics, labourers, and other persons of the working and poorer classes. The Corporation undertakes not to eject any number of the labouring classes exceeding five hundred without a certificate from the Sheriff that other and suitable accommodation has been provided, or exists, within the city or its immediate neighbourhood. As the improvements will substantially and permanently increase in value the lands in the neighbourhood, the Corporation asks powers to place an improvement charge on such property. The owner, lessee, or occupier may apply to the Sheriff to appoint an independent valuer, who shall take into consideration only the value of the lands independent of the improvements. Other clauses of the Bill deal with the Corporation's purchase of the Govan Tramways, the reduction of the Lord Provost's tenure of office to one year, the annexation of certain lands in Lanarkshire, and the use of school-rooms for municipal election purposes.

SIR JAMES RAMSDEN, the maker of Barrow, whose death was recently announced, acted in his early days as assistant-engineer to the Furness Railway, and subsequently became general manager and secretary. From 1866, he was a director of the Company, and only resigned that post last year. Barrow-in-Furness owes to him not only the development of the railway system there, but the creation of the Hematite Steel Company, and the Barrow Shipbuilding Company. The impetus thus given to the town's trade led, in 1866, to a request for incorporation, which was soon granted, and in 1867, Sir James, hen Mr. Ramsden, was elected first mayor of the town. His public services were acknowledged by the inhabitants of Barrow, in 1872, by the erection of a bronze statue of him, by Noble, which was unveiled by the Duke of Devonshire. He was knighted the same year.

IT is always refreshing to listen to the utterances of an optimist. Under this cheerful category we must certainly reckon Mr. Alma-Tadema, who, in the little address he delivered at Southwark at the opening of a Free Picture Exhibition, committed himself to the declaration that Art is a great moral power; that it opens our eyes to the beautiful and makes us discard the ugly; also that this is the reason why Artists, as a rule, are happy beings. Mr. Alma-Tadema is an expert, and due weight attaches to his evidence, which we confess to finding very agreeable. Assuming its accuracy, we trust that our Artists will continue to cultivate their felicity, if only as a set-off against the prevailing misery which appears to afflict their literary colleagues.

THREE further instances of vagaries in tendering have been sent by correspondents. In the case of the competition for the provision of certain engineering works at the Gore Farm Hospital of the Metropolitan Asylums Board, the highest tender amounted to £6,260, and the lowest to £2,068; for the erection of a block of shops at Stockton-on-Tees, the tenders varied between £10,829 and £6,737; and in the competition for docking and repairing the s.s. "Bazalgette," for the London County Council, the top price was £405, and the lowest £180 16s.

UPON the subject of technical education in London, Mr. E. Bayley, Chairman of the Borough Polytechnic, says:—"The existing class-rooms and workshops of the Borough Polytechnic Institute are in constant use, and are quite insufficient to accommodate the large number of students now in attendance, and it is impossible to open new classes in the present buildings. The largest room in the Institute, now used for lectures and concerts, will only hold 350 persons, and is very inconvenient. The governing body desires to erect a building consisting of five workshops in the basement, with a gymnasium above which can be used when required as a hall, and to build over one of the existing rooms a cookery class room. The cost of workshops and gymnasium and fittings is estimated at £5,815, and of the cookery class-room and fittings £870, together £6,685, or a total expenditure, after payment of Architects' fees and law charges, of £7,035. To meet this cost there is in hand or promised a sum of £2,930. The governing body appeals for sufficient funds to enable them to carry out the proposed building extension.'

AT the Mansion House, on Wednesday, was opened the annual exhibition of hand-turning in wood, which is held under the patronage of the Turners' Company. The display, though small is of an interesting character, which accounts for most of the exhibits being nearly all sold, and from the judges' report it is fully up to the standard of excellence looked for in quality of work, utility, and design. The apprentices this year have done well, whilst the amateurs have in a degree exceeded all previous efforts. In competing for the prizes there are a number of conditions from which the candidates may make a choice, but it should, however, be stated that very often first awards are given for excellence of tuning as applicable to the simplest objects of every-day use. The qualities which the judges take most into consideration in giving their decisions, refer to the beauty of the design, the general excellence of the workmanship, its fitness for the intended purpose, and symmetry of shape. The first prize was awarded to the collection of balusters sent in by Mr. W. Watson, of Finsbury Park, N.; this includes, besides a silver medal and five guineas, the Freedom of the Company, and, subject to the consent of the Court of Aldermen, that of the City of London. Mr. F. Powers, Andover, came second with an oak-turned table, which can be put to several useful purposes. He was followed by Mr. T. W. David, Cardiff, with a lock-rail for drawing-room door; and other awards for good work fell to Mr. Gleeson, Cardiff; Mr. John Howard, jun., Newington Butts; Mr. J. Howard, Guildford; and Mr. Brocklebank, Southwark. In the apprentices' class, Howard, of Newington Butts, was first; and in the amateur class, first certificates of merit were won by Mr. S. H. Harding and the Rev. C. C. Elison for some pretty designs in ivory.

AN offer has been made for the old "Herber Tower," Newcastle, for the purpose of razing it to the ground, and erecting on the site a new bake-house. The Armourers', Curriers', and Feltmakers' Company, who are the owners, have, however, offered it to the Newcastle Society of Antiquaries before accepting the offer made them, and at a recent meeting of the members it was decided to appoint a committee to endeavour to arrange the purchase with a view to keeping the tower intact. The town walls of Newcastle were originally 12 feet high and 8 feet thick, but authorities vary on this point. They were strengthened by a wide fosse. One interesting feature about them was the towers and turrets which commanded them at intervals. These latter were for the most part made square, "with the effigies of men cut in stone upon the tops of them, as though they were watching, and they were called garrett, which had square holes over the walls to throw stones down" (Bourne). There are the remains of four of these towers in the west walls—three of them, seemingly, in tolerable repair. But the fourth, Durham Tower, which is the nearest to the Westgate, is now a complete wreck and ruin. Herber Tower was repaired in 1620, at the expense of the Company of Feltmakers, Curriers, and Armourers, whose meeting-place it then was. In the books of this Society its name is given as Harbot Tower. At the time when the proposed removal of the Carliol, or Weavers' Tower, to make way for the Free Library, was the subject of much local controversy, it was urged that there really was no great reason to preserve that building, inasmuch as this Herber Tower was a much better example of these old places, and, in Architecture, much more in accordance with the ancient pattern; and this argument, as it turned out, had considerable weight with some of the authorities.

IT has often been said of George Fripp, whose death was chronicled a few days ago, that heaven would be no heaven for him if there was not plenty of yellow ochre to be found there. Certainly no water-colourist has ever utilized that pigment so thoroughly, or evolved so much sunlight out of it. Another feature of his work was the elaboration he bestowed upon his preliminary pencil-work; and on the more important of his Scottish mountain subjects his outline oftentimes occupied him for weeks. As a result there have been few water-colours produced in which one could travel up and down the breadth of their lands with more delight. In his deer-forest subjects every crag would be recognized by a gillie, although the artistic completeness in no wise suffered from this accuracy. His drawings were almost always a reflection of the sunniness and charming simplicity of his manner; and with his disappearance from the scene goes another of the race of gentle painters whose lives were so thoroughly attuned to their Art.

MR. BRITON RIVIERE has, in deference to the wish of some of his colleagues, agreed to allow his name to be placed on the list of candidates for the Presidentship of the Royal Academy. The election this week will be of an Academician not an Associate; and it is said that the choice will lie between Sir A. Blomfield and Mr. Leader.

IN issuing a further appeal for funds for the restoration of Clonfert Cathedral, Canon M'Larney states that it is more than two years since the first appeal was made. At that time it was only contemplated to expend a comparatively small sum on the building, to keep it water-tight, so to speak. But, on consultation with Mr. J. F. Fuller, F.S.A., Architect to the representative body, it was considered that, in order properly to restore the building, an expenditure of £1,500 would be required. Up to the present, £463 is all that has been collected. It is very difficult for a country clergyman in the West of Ireland to collect such a large sum as £1,500. A considerable portion of the work of restoration has been carried out during the last twelve months by Mr. A. P. Sharp, builder and contractor, of 17, Great Brunswick Street, Dublin, and the work has been done in sections. At present the chancel is being restored. It would be a pity to have to stop the work for want of funds. The Cathedral is one of the smallest in the kingdom, and dates from the year 558. It is a most interesting historic building. The beautiful Hiberno-Romanesque twelfth-century doorway is well known to antiquarians.

A COMMUNICATION has been addressed to Lord Cromer, by the Society for the Protection of Ancient Buildings, upon the subject of the defacement of the Nile scenery caused by the blasting operations now being carried on to obtain limestone for the purpose of embanking the river. The engineers, in order to obtain the necessary materials, have taken to blowing up the cliffs, some of which run to the height of four or five hundred feet, and afford the most magnificent scenery. In this way much of their beauty has been seriously damaged. Many of the ancient tombs and quarries with which the cliffs are honeycombed, some of which contain drawings of columns and similar things of considerable historic value, are being blown to pieces. It is pointed out that although from time immemorial the stone has been used in enormous quantities, yet the ancients did not get it in the wasteful manner now practised, but seem to have taken the greatest care to cut out what they required, and no more.

THE Bridgewater Trustees have decided to remove their Worsley Depôt, which was founded a century ago by the Duke of Bridgewater, to Walkden, where the majority of their extensive collieries are situated. Near the old depôt is the entrance to one of the most wonderful canals in the world. The canal runs underground from Worsley to Deane Moor, near Bolton, and is connected by means of junctions with the whole of the Trustees' collieries, from which the coal was formerly conveyed in boats to the open Bridgewater Canal. The total length of the canal, including the junctions and arms, is not far short of 44 miles. This wonderful piece of engineering was carried out by Brindley, the Engineer.

PROFESSOR AITCHISON AT THE INSTITUTE.

THE PRESIDENTIAL ADDRESS ON MONDAY NIGHT.

IT has been said in the words of authority that "to every thing there is a season." It seems to me that on this opening of a new year, other things may be put aside for a general view of the Fine Art we profess, and of its inventors. I say inventors, for it seems to me that Architecture even more than music, has been invented by man; for music, however it may have come about, has, up to a certain point at least, the harmonious tunes of singing birds to imitate, however far it may have progressed since. While the shapes of leaves and flowers, of peaks and mountains, of glades and woods, and "arched walks of twilight groves," are certainly farther removed from finished masterpieces of Architecture, than an oratorio is removed from a choir of singing birds—I say this in no boastful spirit, but as a circumstance, I suppose generally acknowledged. I address myself to this subject in the thankful spirit that Dante felt when he looked at the stars, and in the ecstatic way in which Linnæus was affected when he saw the moor ablaze with blossoming gorse. I think the villager who said to the divine, "A thankful heart is the best worship an ignorant peasant can offer," was truly answered by the reply, "Or a learned prelate either;" and those divinely-gifted men, who created the Architectural masterpieces of the world, were as much "heaven-sent" as the flowers or the stars. The sublime, lovely, or frowning pieces of Architecture that still remain, besides the emotions they raised in the nation when they were built, have been a source of intellectual and æsthetic interest to all the cultivated since, and have been as well the means of raising the standard of excellence among semi-barbarous people; besides bearing witness to the past greatness and cultivation of the nation. It would perhaps not be amiss to point out now, what the

FINE ARTS DO FOR A NATION,

as in the midst of our great material prosperity their importance is apt to be overlooked. Those to whom all the Fine Arts are a closed book, are apt to say, when pressed, "What do these much vaunted Fine Arts do for mankind? They merely help to wile away an idle hour for those who profess to admire them." What they really do is this: they both instruct and charm mankind in the only way in which the bulk can be instructed and charmed; for the bulk of mankind have little time to spare from earning their living. They appeal to the emotions and thus convey, almost unperceived, the lessons that should be taught. As an American writer* says, "It becomes a serious question whether, without Art, the human race, in spite of the great work of science, would not sink into barbarism." They show to remote posterity the place a nation once held in civilisation; they give delight to those of each subsequent generation, who are capable of feeling æsthetic emotion, and they form a standard by which the excellence of present work can be measured; as J. A. Symonds said, "Nothing is imperishable but high thought, to which Art has communicated the indestructible form of beauty." That astute tyrant, Augustus Cæsar, by humouring the whims of the poets of his time, and by encouraging Architecture, came down, for twelve centuries at least, as the "good Augustus"; while Frederick the Great, by revenging himself on the avaricious caprices of Voltaire, has been handed down to us as "the image of some flaming devil's head, done in phosphorus on the walls of the black hole." Just consider the wealth and luxuries of Greece, when it had received Alexander's plunder of Asia; of Rome when, besides the plunder it had taken, it enjoyed the taxes of those countries that extend from the Danube to the Lybian desert, and from Anglesea to the Tigris. What remains of all this wealth and all these luxuries? You might as well ask, where are last year's snows? A few poems and pieces of eloquence, a few statues and bas-reliefs, some engraved gems, coins, plate, and jewellery; a little music, a few buildings, and many crumbling ruins.

* Mr. Leopold Eidlitz, "The Nature and Functions of Art."

To those visitors who are not Architects, but are patriotic, I may point out

THE SUPREME IMPORTANCE OF ARCHITECTURE

to a nation: the monuments marking the very places that once were great, and expressing the main characteristics of the nation. The poetry, the eloquence, and the music of the past become the cherished possessions of all civilised nations. The statues, the bas-reliefs, the engraved gems, the coins, the plate, and the jewellery, are spread over the civilised world; the Architectural monuments alone point out the places where the great life of the past nation once throbbed, and still enable us to penetrate the thoughts that created them, and to see the skilled handiwork of their people. Every Fine Art is more or less the exponent of the tendencies of its time. This is peculiarly the case with Architecture, as it is essentially a thing of the present; for whether it be for mere use, for use and adornement, or for glory alone, it is to meet the urgent needs of the present. The poets may give us episodes from ancient Greece or Rome, from Egypt, Assyria, Persia, or the Holy Land, from the ancient Britons, or from the days of the Gothic invasion. The painters and sculptors may give us subjects evoked by their imagination from the past, but Architecture must be of and for the present; past Architecture is only to be found in the countries that produced it, or in the scenes of the theatre. Unless the public will understand and highly appreciate Architecture, how can they expect it to be good? For it is only by the people cultivating a knowledge of Architecture, and so appreciating its beauties and emotional qualities, that a passionate love for its masterpieces can be engendered and the Architects rewarded; for the Architect's principal reward is the enthusiasm and gratitude his works excite.

ARCHITECTURE AS A FINE ART

probably arose from man's desire to propitiate his deities, or to express his gratitude for their protection, and to immortalise himself and his nation, rather than from a wish to improve his dwelling or to adorn his public buildings. Doubtless, in the dim past, before history was written, the main laws of Architectural composition were discovered, such as proportion, repetition, and variety, while the value of contrast in form, and in light and shadow, was probably a discovery coeval with that of these laws, if it did not precede their discovery. The great pyramids of Gizeh are the grandest examples of contrast I know. On the first glimpse of them you are struck by the value they give to the long unbroken line of the desert, while their shape was possibly suggested by a triangular sail on the horizon. Civilisation has been built up, as it were, grain by grain; it is like the coral reefs made by innumerable tiny and insignificant insects; but at last the reef defies the might of the stormy ocean; while the Fine Arts are the crowns of the different phases of civilisation. I am not going to drag you through the dim past, but only as far back as the Greeks, to whom we are indebted for the civilisation of Christendom.

THAT NOTHING COMES FROM NOTHING

is nowhere more apparent than in Architecture. The Greek temples are but glorified reproductions of the two-roomed Greek hut surrounded by a verandah. The Greeks, or at least the Ionians, were endowed with the gift of *definiteness*, before them unknown to the world, and saving them, the world was still imbued with vagueness. The Attic Greeks were blessed with a love of beauty, endowed with high intellectual capacities and with every artistic gift. The Greek creed even now is excellent: the possession by each man of wisdom, courage, temperance, and justice. Their daring to withstand the tyranny of Persia, then the overwhelming power in the world, shows a courage and resolution that has never been matched; and their victories at Marathon, at Salamis, and at Platæa, appear to us miraculous; while their perfection in all the Fine Arts is still supreme. Their masterpieces in poetry, in oratory, in history, in sculpture, and in Architecture, have never yet been equalled; and if one of their great paintings should ever be discovered, we may expect to find it inimitable too. The restraint they exercised in using ornament, and the simplicity and purity they attained, made their masterpieces the standards for the world, and this perfection was not confined to what may be called the great Fine Arts, but was exhibited in the products of the common trades and in the meanest utensils. So imbued were they with the highest beauties of nature, that when we see a fine specimen of the Indian water nut, or the shell of the king crab, we say these seem designed by a Greek Artist.

SIMPLICITY,

without which nothing great is achieved, was their constant aim. M. Anatole France has put this admirably: he says we all know what is meant by a simple style, although it is really the most elaborate. Nothing, for example, is simpler than sunlight, yet pure and white as it is, we know it to be composed of the seven prismatic colours. There is one thing to be remarked here, that this simplicity was easier to be attained when life was less complex, and wants were more restricted than at present. The pose of the savage is generally nobler than that of civilised man; so the Greek temple, surrounded by similar columns and with its half-dozen mouldings, was possible to be perfected; while life is not long enough to perfect a building of many chambers and many stories with domes, towers, and spires to express complex emotions. When Vitruvius gave rough rules for obtaining some of the Greek optical

REFINEMENTS IN BUILDINGS,

his meaning could not be understood by any Architect or scholar in Christendom, from the days of Charlemagne until Wilkins published his solution in 1812, and it was left for my predecessor in the chair, Mr. Penrose, to prove to the world the existence of these refinements in the buildings of the Acropolis. These refinements have made the Parthenon, the Erectheum, and the Propylæa like Nature's work, which never palls; for by the prolonged study of them you only find fresh beauties and fresh wonders. Those who have seen these buildings and have fitted themselves to enjoy them, are as thankful for them as for the beauty of the honeysuckle or the scent of the violet. It is quite refreshing to read the enthusiastic admiration of these monuments by so positive a philosopher as Renan. The Roman race, which was but a branch of the Greek family, may be called the practical brother, who seized on every invention of others that suited him, and who had the great art of welding together a vast empire by diplomacy and laws; as Professor Mommsen says, it is ridiculous to complain of the Romans because they could not carve like Phidias nor write like Aristophanes. The Romans were not born Artists but constructors, with a deep insight into the advantages of Architecture, and who certainly achieved in their monuments dignity and magnificence. No artistically cultivated person has passed those still remaining columns of the Forum of Nerva, without being struck with their dignity, nor the Triumphal Arches of Rome without appreciating their magnificence; while, from the combination of harmonic proportions with dramatic lighting, the inside of the Pantheon produces the most sublime effect in Europe. What sublimity, vastness and proportion will produce, when every scrap of moulding, sculpture and colour has been destroyed, may be seen in the halls of Caracalla's Baths! The Romans brought the arch, the groined vault, and the dome within the pale of Architecture. That continuation of Roman Architecture we call Byzantine has not, as far as I recollect, produced many effective exteriors; for St. Mark's, at Venice, owes its external charms to the middle ages. Structurally the Byzantines perfected the dome on pendentives, and invented the dome on a drum, which they often used to light interiors and passages.

BYZANTINE INTERIORS,

however, are mostly wonderfully striking in their shape, splendid from the effects of lovely marbles and gorgeous mosaics; and charm us as well by their judicious lighting. The effect of vastness in Santa Sophia, at Constantinople, with its dome "pendant by subtle magic," its suffused light, its peculiar and striking shapes, and the splendour of its decoration, make it one of the masterpieces of the world. Who would lose the glories of San Vitale, or the delicate sweetness of the Monastery in the Fields (Μονὴ τῆς χώρας); the plain and simple duomo of Torcello, or that jewelled casket of the West, St. Mark's? Who is not thankful for the mosques and minarets of Cairo, for the gorgeous chambers and courtyards of

the Alhambra, with their intricate patterns, magic stalactites, and splendid colouring? I do not attempt to give a list of all the masterpieces of the world since the Greek days, but only to mention a few that I have seen and been struck with. In Romanesque days Architects were only learning to build and to design, but they were great men with grand thoughts. Who has not been struck with the Romanesque Churches of Germany, with the doorway of Rochester Cathedral, with the naves of Durham and Southwell, and with the apse of Strasburg? Who would lose the fronts of St. Trophime at Arles, and St. Gilles, or the north-west doorway of the Cathedral at Rouen, if this last can be called Romanesque? At the emergence of Gothic in the 13th century, the Architects had learned to build stone ceilings to Churches in the shape of vaults, and to abut their thrusts by flying buttresses, and eventually to use stone with a mastery that was never possessed before or since; though perhaps a greater mastery over iron has been shown by our civil engineers. The Gothic Architects were too, perhaps, the most logical that the world has seen, and they lived at a time when the Greek and Indian geometry and mathematics were not only fashionable accomplishments but studies for which there was a passion, and doubtless the Saracen buildings the mediæval Architects had seen, gave them the idea of rivalling the monuments of their enemies; for it must be borne in mind that at the time of the Crusades the Saracens were the most civilised people in the world. Men's minds in the West were then filled with a mysterious and terrible theology, while Architects then realised that their knowledge, skill, thoughts, and aspirations,

COULD ONLY BE EXPRESSED BY BUILDING.

We see how the violent emotions of hope and fear, and of adoration were expressed by interiors of disproportionate height, by lofty towers, spires and pinnacles, by tracery as mysterious as the eddies of a stream, and, relatively to the monument, as fine as a spider's web; while the Sculptor lavished his work on every part that was to be ornamented. There was then a passion for the excessive and the mysterious, and a striving after the apparently miraculous. No Architect ever goes into a Gothic Cathedral without asking himself why it does not fall down. I suppose that Architecture has never been so closely and persistently studied for so many centuries by energetic races, unfettered by national or clerical conservatism. Besides this, Architecture and its accompanying Arts then offered the only career except fighting, to men who wished to exert every mental power without the fear of imprisonment and torture, or of death by fire. Who is not thankful for these pages of history, in which the thoughts, tastes, and aspirations and terrors of the Middle Ages are, as it were, petrified for our observation and delight, and are spread over all Europe, even to the Fortunate Islands? Who is not thankful for Nôtre Dame, for Amiens, Rheims, Coutances, and Rouen; for Lincoln, Salisbury, York, and Peterborough; for Toledo and Seville, and for the Cathedral of Las Palmas; for the Town Hall and the Cathedral of Siena; for the hospital, and for the bell tower of Giotto? If we want to have a corroboration of

MEDIÆVAL HISTORY AS WRITTEN IN ITS BUILDINGS,

we have but to read Dante, in whose Divine Comedy the spirit of the thirteenth century is enshrined. Even in Dante's days a new phase of life was being prepared. We see that he had studied some of the Roman writers; these and others were still more deeply and more fervently to be studied after his death. Sculpture even then had got new life from the study of Roman remains, painting had begun to throw off Byzantine fetters, and there was a hungering after a knowledge of Greek, as the fountain from which Rome drew her inspirations. Through the studies of scholars—and who at the latter part of the fourteenth century was not something of a scholar?—the whole vista of the life of classical antiquity was opened out to the Italians, and this world seemed to them suddenly changed from a prison full of misery and terrors into a lovely and fertile valley to be admired and enjoyed. They saw Greece and Rome bringing the uncivilised people of the earth to live under law, and teaching these savages the advanced Arts of life. The Italians found in the classic writers a style they longed for but despaired of attaining. A skill and idealism in sculpture, in die-sinking, and in gem engraving, that threw them into raptures; monuments and ruins of a magnitude and majesty that astonished and charmed them, and an unchecked and blameless pursuit of all the pleasures of this life; not to speak of perfect freedom in the unravelling of the mysteries of nature. Is it surprising that they fell down before the feet of the ancients and worshipped them? This attitude was natural, though unfortunate; still we have lovely work by the quattro and early cinquecentisti, who were mostly goldsmiths, sculptors, and painters; though it was certainly not

PROGRESSIVE ARCHITECTURE.

The host of lovely things at Venice alone would be too long to enumerate, from the Church of Santa Maria dei Miracoli to the Palazzo Vendramin, but there are beautiful monuments throughout Italy. The inside of Alberti's Temple to Isotta at Rimini, the Cancellaria and the Church of Santa Maria del Popolo at Rome, by the divine Bramante; the Town Hall at Brescia, the Casa dei Signori at Verona, and the beautiful palaces at Piacenza. Many of the sixteenth-century monuments, though heavier and duller than the earlier ones, in certain respects, excite our admiration: they were built after Vitruvius' work had been rediscovered and read, and his work was supposed to be a book of receipts for true Architecture, to be illustrated by the Roman ruins that had been measured. In spite of its glaring faults, the Palazzo Farnese is a majestic monument. The Pesaro Palace and the Church of Santa Maria della Salute of the seventeenth century, though somewhat *rococo*, will keep Longhena's memory alive. In London we have the portico of St. Paul's, Covent Garden, by Inigo Jones; St. Paul's Cathedral and the steeples of Wren, now, alas, fast disappearing; Somerset House by Chambers, Newgate by Dance, University College and the National Gallery by Wilkins, and the Bank of England by Soane, though these last two were after the Grecian revival. For the charming grafts of revived classic on Gothic structures, we must go to France, to Flanders, to Spain, to Portugal, and to Southern Germany. Who has failed to be grateful for Blois? That side of the palace that faces St. Vincent's Square is a masterpiece. There are, too, beautiful monuments of the early French Renaissance, including Chambord, scattered all over France; and we have Woolaton Hall in England. I must point out to you that all the lessons that Architecture has to teach have by no means been exhausted. It is, perhaps, more than any other Fine Art, the expression of the tendencies of the age in which its monuments were built, and this has not as yet attracted the attention of philosophers, though I think it will receive their attention in the future. If Cuvier could construct the effigies of extinct animals from one of their bones or talons, surely, in the future, philosophers will be able to learn the skill, and the tendencies of an epoch from its

ARCHITECTURAL MONUMENTS.

When the Architecture is genuine, more of the character and tastes of the people and the tendencies of the age can be learned from it than from paraphrase of deceased Architecture; yet even these show the acquirements of the Architects and Sculptors, the skill of the workmen, and some of the tendencies of the time. To wantonly destroy these built records is worse than to burn unpublished written ones, as the monuments contain much more history than most written records, and in destroying them you destroy an important lesson that is read to all, the embellishments of a city and a perennial honour to the country. "The accursed greed of gold" is destroying all the virtues of our people, as it did those of the Romans, and makes it hold nothing as sacred where gold is to be got by its destruction. The beautiful Hanover Chapel in Regent Street, designed by C. R. Cockerell, the most refined and accomplished of modern Architects, is now being pulled down to make way for shops, which pay heavier rates and taxes. The magnificent Church of St. Mary, Woolnoth, the masterpiece of Nicholas Hawksmoor, and a proof of the former piety of London, is threatened with destruction for a railway station.

(*To be continued.*)

Professional Items.

CHORLEY.—A new Church has been erected adjoining the old corrugated iron building in Brook Street, which partakes of the Perpendicular style. The materials used are Yorkshire Parpoints relieved with Runcorn red stone. The Architect is Mr. E. Kerby, of Liverpool, and the cost will be about £12,000.

HUDDERSFIED.—The inadequate accommodation afforded by the Rashcliffe Schools has necessitated the erection of larger premises, and a new school is in course of erection, on a site in St. Stephen's Road, opposite St. Stephen's Church, and will be Gothic in design, in consonance with the Church. It will contain a central hall, 31 ft. 6 in. by 24 ft., and two class-rooms, providing accommodation, in all, for 185 children. The divisions between class-rooms and hall will be movable glazed partitions, so that all the rooms can be throwu into one for large meetings. There is also a cloak-room and lavatory; the principal entrance will be from Bland Street. The accepted tenders amount to the sum of £1,510. The plans have been prepared by Mr. J. Berry, Architect, 9, Queen Street, Huddersfield, and the works are being carried out by the following contractors, viz:—Masons, Messrs. B. Graham and Sons; joiners, Messrs. Hampshire and Armitage; plumbers, Messrs. Sanderson Bros.; plasterers and slaters, Messrs. T. Longbottom and Sons; painters, Messrs. Haigh and Shaw; concreter and stone macadem asphalter, Mr. John Cooke; heating engineers, Messrs. Calvert and Co.

LOANHEAD.—A new Church has been built at Loanhead, at a cost of £1,800, and has accommodation for 350 persons. It is built of red Cumberland stone, and the characteristic features of the design are of the early Scottish period. Mr. Macnaughton, Glasgow, is the Architect.

BARNOLDSWICK.—The corner-stones of a Conservative Club were recently laid. The new building, in addition to the usual features of a political club, will have a large assembly room for meetings, and is being erected at a cost of £3,000, from the designs of Mr. J. W. Broughton, of Skipton.

LINLITHGOW.—St. Michael's Parish Church has for the last two years been undergoing restoration. The work embraced the removal of the stone partition which used to separate the chancel from the nave of the Church, and the entire removal of the galleries, and stairs leading thereto, these alterations opening up the Church from end to end, and leaving open to view the massive stone pillars and the handsome groining of the arches. The Church has also been refloored with stone, and has been reseated with oak pews. Billings, in his "Baronial and Ecclesiastical Antiquities," states that Linlithgow Church is the finest specimen of a pre-Reformation Church still extant, and that in respect of antiquity, dimensions, and Architectural beauty it is well worthy to rank with the ancient Cathedrals of St. Mungo, in Glasgow, and St. Giles, in Edinburgh.

LEEDS.—Emmanuel Church, after having been closed for some time for cleaning and decorating, has been re-opened. The decoration consists mainly in a series of frescoes, which have been painted upon the walls of the Chancel, Nave, and south Transept, by Messrs. Powell Brothers, of Park Square, Leeds. The Artists have introduced a good deal of outline, in strong Egyptian red, richer colouring being used only in the Chancel and Nave. The chief subjects on the Chancel walls are the Expulsion from Eden, the Annunciation, and the Adoration of the Magi. Upon the large space above the Chancel arch is shown the Saviour under the symbol of the Lamb, holding the banner of the Resurrection, and surrounded by a choir of Angels adoring and playing musical instruments. On either side of this picture are life-size figures of the twelve Apostles, these being carried upon both sides of the Nave walls; and in the Clerestory, between the windows, a series of niches contain many representatives of the prophets and martyrs—there being in the Clerestory alone twenty-five figures. The whole work has been executed under the personal supervision of Mr. Henry Walker, Architect, of Leeds.

LIVERPOOL.—Improvements and alterations have been carried out at St. Bride's Church at an outlay of £1,200. The east end has been improved by the addition of a window in the north side of the chancel, and the floor has been raised and a handsome choir formed, with tiled floor and new choir benches. The north bay under the gallery has been enclosed with a screen, forming an additional vestry, having an extra entrance from the outside, and on the south side a similar screen encloses the organ, and occupies the south bay under the gallery, and is carried from the ground floor to the ceiling. The organ, built by Messrs. Gray and Davison, in 1866, has been rebuilt by Messrs. Norman Brothers and Beard, of Norwich, and enlarged. The work of reconstruction was entrusted to Messrs. Woolfall and Eccles, Architects; the contractors for the work being Messrs. Brown and Backhouse, and the decorations by Messrs. Jelley and Co., both of Liverpool.

RASTRICK.—A new cookery school has been built, in conjunction with the Longroyd Schools, Rastrick, by the Brighthouse School Board, and also a science department at the Rastrick Grammar School. Mr. B. Stocks, of Huddersfield, was the Architect.

BRIGHTON.—The Lord Bishop of Chichester has consecrated the new Church of St. Augustine, Preston Park. The portion of the Church now built, consists of the nave of six bays, with north and south aisles, the total cost of which was £7,000. The nave is intended to seat 724 persons, but as the temporary arrangements for the accommodation of the choir will greatly reduce the number of the sittings, it is hoped that sufficient funds will be forthcoming, to enable Mr. Kirke and his committee to proceed with the chancel in a very short time. Moreover, the district to be assigned to St. Augustine's contains a population of about 6,000 people, and as the population is rapidly increasing, it is fully expected that the further accommodation afforded by the completion of the east end of the Church will soon be required. The interior of the new building is 86 ft. by 62 ft. 6 in., the height is about 50 ft., and in addition to the nave there are north and south aisles, north and south porches, temporary vestibule with main entrance at the west end. It is built of Sussex sandstone and red brick stone. The Church cannot be described as belonging strictly to any of the distinctive periods of Church Architecture. It is largely Gothic, and, generally speaking of the Early Perpendicular style. There are clerestory windows, slanting bays bringing in the nave by a gradual curve to the chancel arch, the roof rising up from fan-vaulting over-windows. The floor is laid with pitch pine and oak blocks. The Architect is Mr. Granville E. S. Streatfield; Mr. T. G. Jackson, A.R.A., being the consulting Architect; and Messrs. Longley and Son, of Crawley, the builders.

LLANCILLO.—The Parish Church of St. Peter, Llancillo, near Abergavenny, has been re-opened by the Bishop of Hereford, after undergoing thorough restoration, at a cost of about £500, which has been carried out by Mr. Newton Taylor, of Hereford, the Architect being Mr. Godsell.

BERRIEW, MONTGOMERYSHIRE.—An elaborate oak reredos is now being erected at St. Beuno Church. The design consists of a bold centre compartment filled with Sculpture, the subject of which is "Feed my Sheep," in bold relief. Flanking the centre are four niches, which contain figures on pedestals of four renowned Celtic saints of great local interest—(1) St. Gwen'rewi (Winifred), with royal crown, a plain cope-like cloak with Celtic ornament on the morse, sword of martyrdom in left hand, and model of her well in her right hand. (2) St. Beuno, the patron saint of the Church, and one of the Celtic saints best known to history. He lived in the end of the sixth and early part of the seventh century, was a fervent preacher and orator, the founder of many Churches, also the founder of "Bangor Beuno," a great monastic institution, where he spent a great part of his life as abbot. "Beuno's stone," from which he frequently preached, is in the neighbourhood. (3) St. Asap (Asaph) is in full pontificals, and in the attitude of benediction, his chasuble of ample size, his mitre a low one, his staff in left hand, the crook enriched with Celtic ornament and turned outwards. (4) St. Melangell (Monacella), whose life and works are well known, is represented as an abbess, her staff turned inwards, and a crouching hare at her feet. Her dress is arranged by much the same rule as that described for St. Beuno. The gradine is double, and the wall space on either side of the reredos has traceried panels. A small brass is fixed near the reredos with an inscription. The work has been carried out from the designs and under the superintendence of Mr. F. R. Kempson, of Cardiff and Hereford.

LONDON.—New chemical and physical laboratories and carpenter's workshop have been added by the Technical Educational Board of the London County Council to Tenison's School, Leicester Square. The rooms are commodious, and one of the class-rooms, a very lofty building, has been somewhat reduced in height, the space thus provided being utilised as an additional floor. The two laboratories measure 30 ft. by 25 ft., and the carpenter's workshop 20 ft. by 20 ft. In both the chemical and the physical laboratory about twenty boys can be accommodated. The architect was Mr. C. Mason; the builders, Messrs. Lee, of Warwick Street, while the appliances for the laboratories came from Messrs. Hanna, of the Strand.

GLOUCESTER.—The Local Government Board has sanctioned a loan of £7,500 for purchasing the Tuffley Court Estate as the site for a new workhouse.

LIVERPOOL.—There has been a wonderful response to the appeal made for funds to rebuild the Hospital for Consumption and Diseases of the Chest in Mount Pleasant, Liverpool. The new hospital, which will contain 76 beds, will cost about £50,000, of which £14,000 has already been promised. Plans of the new building, prepared by Mr. W. E. Willink, are on view, and from them it will be seen that the site at disposal will be used to the best possible advantage.

DUNDEE.—Mr. William Alexander, the City Architect, has reported to the Works Committee of the Council with reference to the recent underbuilding of the Albert Institute. He stated that the under-building and making good of the foundations of the structure had, so far as authorised, been completed. The operations extended over nearly twelve months, the walls being under-built in small portions at a time for the sake of greater security. There was not the slightest appearance of subsidence of any portion of the walls which had been dealt with, but the north-east and cross walls all showed evidence of subsidence at points. The entire cost had been £980.

LLANELLY.—Permanent buildings of the Llanelly Intermediate School are being erected in the Marble Hall Road, opposite the Infirmary, and will provide accommodation for 200 scholars, in the following proportion, viz., 120 boys and 80 girls. The buildings are being built of brick faced externally with pressed Cwmbran bricks, relieved with Corsham Down stone and terra-cotta. The floors throughout are to be wood block, and the roofs covered with best green slates with red tile ridge crestings. Special arrangements are to be made for ventilation and heating. The buildings and boundary walls will cost £5,000, and they are being erected from the designs and under the superintendence of Mr. W. H. Dashwood Capel, Architect, of Cardiff. The builder is Mr. Edgar G. Groom, Marble Hall Road, Llanelly.

SHEFFIELD.—A novel structure is being erected in High Street, on the small plot of land at the end of George Street, recently sold for £1,750. On the ground floor there is to be a shop, with basement, containing the usual offices. The first floor is to be used as a show case. Above these are four tiers of advertisement spaces, each about 7 ft. long by 3 ft. high. The structure will be mainly of iron and glass, and, considering the exigencies of the site, it will be fairly ornamental. Mr. George Webster, of Sheffield, is the contractor. The ironwork is being supplied and erected by Messrs. George Wright and Co., of Burton Weir Works, Rotherham. The Architect is Mr. Herbert W. Lockwood, of Pinstone Street.

STOCKTON.—New Almshouses are to be erected at the corner of Dixon Street and Mill Lane. The charity dates back to 1682, when almshouses for four persons were erected. In 1816, a new suite was built in High Street with the proceeds of a bequest. They accommodated 18 persons, and have been occupied as such till recently, when, by the authority of the Charity Commissioners, the trustees sold the property for £5,000. With this money a new site has been obtained in Dixon Street, and a building is to be erected which will also provide offices for the Stockton Overseers, and the Stockton Dispensary. Mr. T. W. T. Richardson, of Stockton, is the Architect, and Mr. W. Perks, of Stockton, is the contractor.

BILSTON.—A new Technical School is being erected on the Willenhall Road, at a cost of £5,600, in addition to which there will be the cost of internal fittings. The site of the new schools extends to over 1,433 square yards. Mr. C. L. N. Wilson (town surveyor), is the Architect, and Mr. Thomas Tildesley, Willenhall, the contractor, the contract price being £5,087. It is hoped the building will be ready for use in September, 1897. It is built of red brick, with terra-cotta facings, and contains a large lecture room, an examination room, and 14 smaller rooms, to be used as class rooms, laboratories, and workshops.

BARROW.—The Church school buildings are to be enlarged. The accommodation for infants at the school is very good, there being room for 120, but for the mixed school there is only accommodation for 96, and a small class-room, which has been condemned by the Education Department. At a recent meeting, plans prepared by Messrs. R. J. and J. Goodacre, of Leicester, were adopted, which did away with the old stuffy class-room, and provided for the erection of two fairly-sized rooms to accommodate respectively 40 and 60 scholars. The cost of building will be £800, and another £100 is required for the furnishing. Towards this £500 has been promised.

HELEN'S BAY.—Memorial stones of a Presbyterian Church, which is in course of erection at Helen's Bay, were recently laid by the Marquis of Dufferin. Messrs. Young & Mackenzie are the Architects, Mr. William Kerr, Builder, being entrusted with the work of construction. The work was commenced in June last, and the building, which occupies a site adjacent to Helen's Bay Railway Station, has now reached an advanced stage towards completion. It was arranged that a simple treatment of the Gothic Architecture, similar to other examples in the County Down, should be adopted and carried out with a like description of stonework. Scrabo sandstone from the Glebe Quarry is used for the dressings of the doors and windows, and Silurian slate for the walling. A portion only of the contemplated cruciform edifice is now erected. It comprises a single-span nave, twenty-six feet wide and fifty feet long, and is approached from a square porch, one side of which forms the base of a future tower and stone spire about one hundred feet high. The doorway is deeply recessed, with nook shafts, having moulded bases and carved caps, carrying a boldly moulded pointed arch, encircled with dog-tooth ornament. A prominent feature in the front gable is a five-light traceried window. Three small trefoil leaded lights are placed below it. At the angle rise double buttresses with gablet terminations and bold finial. Double light lancet windows, separated by weathered buttresses, are placed in the side wall. A stone eave course, with moulded spout, separates the walling and the roof, the latter being covered with Westmoreland green slates of subdued tint. An open timbered roof, with curved braces resting on stone corbels, spans the interior. Pitch pine sheeting is used for the ceilings and wainscotting.

THE directors of the Kendal Bank for Savings, which is being voluntarily wound up, will have a substantial surplus, which they have decided to apply for the benefit of the town. Part of the money they have decided to expend in the purchase of the Museum building; another part they have applied in the purchase of the Abbot Hall estate, valued at £3,750, as a recreation ground. The directors propose to hand this estate over to the Corporation for public purposes.

ABERDEEN'S NEW TRADES COUNCIL BUILDINGS.

IT is hoped that the Trades Council Buildings will be ready for the opening ceremony by the end of the month. The present premises are on the west side of Belmont Street, and the new buildings are projected behind the present buildings, towards the Denburn Valley. The new buildings are perfectly distinct from the present ones, though intercommunication is provided for, and the main entrance is in Belmont Street adjoining these present premises, which will continue to be used as committee rooms. The dimensions of the buildings are—total length, apart from the 70 feet of entrance corridor, 100 feet; height from the ground level, at the western end, 60 feet to the eaves, and 74 feet to the apex of the roof. The Architectural features of the western elevation are the large window of the main hall and corner turrets. The wall is of hammer-blocked ashlar. The side walls are plain, in pointed ashlar, the expectation being that in due time buildings will be erected in the immediate vicinity which would obscure any exterior embellishment that might be attempted. The main entrance is formed by a gateway with elliptical arch, on which is inscribed the title "Trades Hall," and the date of erection, "1896." This leads into a large tiled corridor, 12 feet wide, and between 60 and 70 feet long, leading directly into the main hall. Half way along the corridor, however, a stairway leads down to the lower floor, where there are no fewer than ten committee rooms, provided on either side of a corridor running longitudinally along the building, and, at the western end of which is a small hall, 42 feet long by 25 feet wide, and 16 feet high, with capacity for a meeting of about 150 people. Here the Trades Council will hold their fortnightly meetings. At the western end of the hall is a platform, with ante-room on each side, and ample lavatory accommodation. Four of the committee rooms are convertible into two by the use of folding partitions. Modern lavatories are provided for this floor near the foot of the staircase, and, like the corridors, are laid with tiles. In a basement floor, below the lower hall, are the furnace room, cellars, and other store-rooms. Leading from the main corridor is the hall, capable of seating an audience of from 1,200 to 1,500. At the eastern end, above the entrance, is a small gallery; and at the opposite end is the platform, raised four feet and a half from the floor. The ceiling is formed by circular coves that rest on a bold cornice that encircles the hall. The coves are divided into oblong panels by moulded beams, while the main ground of the ceiling is divided into three large elliptical panels by the same decorative process. At the platform end the elaboration is still fuller. At each side of the platform rises a lofty pilaster, with richly ornamental cap, carried up to the height of the entablature of the cornice, and between these pilasters is formed, over the front of the platform, a large elliptical arch with moulded architrave and ornamental key-blocks. The buildings will be heated by hot water, and lit throughout with the electric light. The cost of the new buildings will be close on £5,000. Messrs. Ellis and Wilson are the Architects; and the contractors are—Mason work, Charles Gordon; carpenter, John Henderson; slater, James Wilson; plumber, Blaikie and Sons; plasterer, Rodger and Baxter; painter, Donald and Sons; heating apparatus, Robert Tindall.

AMONG the many wonderful things at Blenheim Palace, which the Prince and Princess of Wales will visit at the end of the month, is a magnificent painted ceiling by Reynolds, valued at £40,000, which, oddly enough, had a narrow escape from being cut up into sections. Sir Joshua, wishing to have a reduced copy made, had the painting removed to the studio of one of his pupils, where it was seized for a debt. The pupil confessed his liabilities to Sir Joshua, who interfered just in time to preserve his work from destruction.

A GREAT telescope has just been completed by an Irish firm, that of Sir Howard Grubb, Dublin. It is designed for the special purpose of stellar photography, and it is to be erected in the Greenwich Observatory. The object glass has an aperture of 26 inches, with a focal length of 22 feet 6 inches.

SOCIETY MEETINGS.
